

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

THE NEW INTERNATIONAL ENCYCLOPÆDIA

BIG-ENDIANS, THE. The name of the sect in *Gulliver's Travels* under which Swift satirized the Catholics, so called because the Big-endians dogmatically asserted that an egg must be broken at the larger end. They were opposed to the Little-endians, the Protestants, who were equally stout in their contention that eggs must be broken only at the smaller end.

BIG HATCHIE, häch'ī. A small river of the United States, rising in northeast Mississippi, one head branch in Prentiss County, but the larger one in Union County (Map: Mississippi, H 1). It flows through a fertile cotton region north into Tennessee, and then northwest, joining the Mississippi River 5 miles above Randolph, and nearly 40 miles above Memphis. It is nearly 200 miles long, drains an area estimated at 4000 square miles, and is navigable for small steamboats for about 100 miles to Bolivar, Tenn.

BIG HEAD' (OSTEOPOROSIS). A bone disease in which the bones become more massive and less compact by reason of an increase in the cancellate tissue. The disease affects horses and mules of all breeds and ages. The enlargement of the head is the most conspicuous symptom; hence the name. A peculiar lameness precedes or accompanies other symptoms. The animal takes short steps. The ribs undergo certain changes so that a round-barreled horse becomes flat-sided. Recovery from the disease is rare.

BIG HORN. A river of the Rocky Mountain region of the United States, rising in the Wind River range in Fremont County, Wyoming, near the central part of that State (Map: Wyoming, E 3). It flows northward into Montana, and following thence a northeasterly course it empties into the Yellowstone River, of which it is the chief tributary. Its principal headstream is the Wind River, which rises in the Shoshone Mountains in Wyoming, southeast of the Yellowstone National Park. Its source is between 8000 and 9000 feet above sea-level. The principal tributaries of the Big Horn are the Grey Bull and Stinking Water rivers in Wyoming and the Little Big Horn River in Montana. Its total length is

about 450 miles and it is navigable up to its juncture with the Little Big Horn at Fort Custer. The famous Custer massacre took place in the valley of the latter in 1876. The Big Horn drains an area estimated at over 20,000 square miles. The scenery along the river's course is magnificent.

BIG HORN'. The popular name in the United States of the Rocky Mountain sheep, on account of their immense, semi-spiral, argali-like horns. These sheep, in one or other of their species, were formerly to be found throughout the whole Rocky Mountain system from New Mexico to the Arctic Circle; and they are still numerous from Montana northward and only less so southward, in the higher ranges. They are gregarious, fond of the highest pastures, wary, and much hunted not merely for sport, but because the flesh is excellent and the horns make handsome trophies.

"To many American sportsmen and naturalists," remarks William T. Hornaday (*Fifth Annual Report New York Zoological Society*), "there is no other wild animal on this continent which challenges admiration equal to that bestowed upon the mountain sheep. Unfortunately, it is only those who have made the acquaintance of this animal in life, and upon its own ground, who have a fair conception of . . . the true character of this hardy mountaineer, in whose anatomy strength is combined with agility to an extent which is nothing short of marvelous. Its home is the loftiest rim-rock of the high mountain plateaus, or the most rugged and forbidding Badlands of the middle altitudes. In summer its favorite pastures are the treeless slopes above timber-line, and in winter it paws through the snow of the mountain meadows to reach the tallest spears of grass. . . . All the year round this animal is both well-fed and well-clad, and its savory flesh invites constant pursuit and attack from the mountain lion and hunters both white and red. Unlike its dull-witted neighbor, the mountain goat, the mountain sheep is wide-eyed and wary, and difficult to approach."

The best-known species is the common bighorn (*Ovis cervina*), which is very stoutly built, stands about 40 inches high at the shoulder, is

grayish-brown, with the face ashy, a dark line along the spine, and the under parts and conspicuous 'caudal disk' on the buttocks whitish. The horns of the ram are massive, thick and keeled on the outer edge, springing backward and then downward in a majestic sweep, and measuring 42 inches in largest specimens around the curve; those of the ewe are short and ribbed. It dwells in bands sometimes containing fifty or more of all ages throughout all the high mountains from the Dakota Badlands to Arizona, California, and northern British Columbia. A smaller and paler variety, inhabiting the central basin, is called Nelson's bighorn. A second species is Stone's bighorn, lately found in northern British Columbia, which is larger, and has comparatively slender, pale-brown outward-curving horns; its general color is a blackish-brown grizzle, with the spinal stripe, throat, chest, sides, buttocks, and tail and hoofs almost black. Another species belongs to the mountains of Central Alaska, north of 60°, named *Ovis Dalli*, which is altogether white, in winter perfectly free from the few brownish hairs that may appear in its summer coat. The horns are of moderate size, and of a clear amber color. A fourth species, also Alaskan, has been described as *Ovis Fannini*, and resembles Dall's sheep, except that the body is brownish-gray, leaving the head, neck, breast, belly, and rump white. See Plate of WILD SHEEP, ETC.

Consult: Mayer (editor), *Sport with Gun and Rod* (New York, 1883); Roosevelt, *Hunting Trips of a Ranchman* (New York, 1883); Baillie-Grohman, *Camps in the Rockies* (London, 1882); and *Fifteen Years' Sport and Life in Western America* (London, 1900).

BIG JAW. See ACTINOMYCOSIS.

BIG LAUREL. See MAGNOLIA.

BIGLOW, HOSEA. See LOWELL, JAMES RUSSELL.

BIGLOW PAPERS, THE. The title of a series of satirical poems in the Yankee dialect by James Russell Lowell. They appeared in two parts. Part I., voicing the New England opposition to the Mexican War, was brought out in 1848, and Part II., concerned with the Civil War, was published as late as 1867. The whole is under the fictitious editorship of the Rev. Homer Wilbur. Lowell's wit and humor are here unstinted. Written rapidly and with great personal delight, the work was warmly received, and parts of it are still very popular.

BIGNON, bé'nyôn', LOUIS PIERRE EDOUARD (1771-1841). A French statesman and historian. After serving as secretary of legation in Switzerland (1797-99), he was sent in the same capacity to Berlin (1800), where he became chargé d'affaires in 1802. He subsequently was minister plenipotentiary to Cassel (1804-06), and, after the battle of Jena, was administrator of finances in the Prussian provinces occupied by the French (1806-08). After serving in the same capacity in Austria (1809), he was sent as special envoy to Warsaw, where his encouragement and advice contributed to arouse the Poles to an energetic resistance against Russia and Austria (1813). After the return of Napoleon from Elba in 1813, he successively became under-secretary of state and minister of foreign affairs. From 1817 to 1837 he was a member of the Chamber of Deputies, where his eloquence and

sound views and liberal policy obtained for him considerable popularity. His principal work is entitled *Histoire de France depuis le 18 Brumaire jusqu'en 1812* (1829-38).

BIGNONIA (named after the Abbé Bignon). A genus of Bignoniaceæ embracing about 100 species of twining shrubs. Most of the species are South American, although one, *Bignonia capreolata*, occurs in the southern United States. Many of the species are cultivated in green-houses for their striking habit of growth. They climb by twining and by tendrils. The flowers of many are very handsome. The long flexuous stems are frequently used as cordage substitutes, and the natives of French Guiana are said to weave the split stems into mats, baskets, etc.

BIGOD, big'od, HUGH (?-1176). First Earl of Norfolk. He was a son of Robert Bigod, who had come to England with William the Conqueror. The origin of the family name has been traced to the oath 'bi got,' frequently used among the Normans. Bigod is said to have secured the throne to Stephen by swearing to Archbishop William Corbois immediately after the death of Henry I. that the latter on his deathbed had quarreled with his daughter Matilda, and had disinherited her in favor of Stephen of Blois, whose arrival in England shortly afterwards seemed to substantiate this statement. In recognition of his services, Bigod subsequently received the earldom of Norfolk.

BIGORRE, be'gôr' (from the Gallic people *Bigerri*, or *Bigerriones*). A mountainous district in the southwestern part of France, formerly constituting a part of Aquitaine and subsequently of Gascony. It is now included in the Department of Hautes-Pyrénées. In mediæval times it was ruled by counts of the houses of Foix and Albret, and was united to France on the accession of Henri IV. Tarbes (q.v.) has been the chief town since the days of the Romans. Consult Troidour, *Mémoire du pays et des états de Bigorre* (Paris, 1892).

BIGORRE, L'ABBÉ. The pseudonym signed to Voltaire's *History of the Parlement of Paris*, published in Amsterdam, in 1769.

BIG RAPIDS. A city and the county-seat of Mecosta County, Mich., 55 miles north of Grand Rapids; on the Muskegon River, here crossed by two bridges, and on the Grand Rapids and Indiana and the Père Marquette railroads (Map: Michigan, H 5). It has a public library, and a fine courthouse and jail, and is the seat of the Ferris Institute. Good water-power is supplied by the river, and the city has an extensive lumber trade and manufactures of furniture, veneer, doors, sash, blinds, bed-spring frames, stoves, and cast-iron pipes. Settled in 1859, Big Rapids was incorporated ten years later. It is governed by a charter of 1887, revised 1895, which provides for a mayor, elected annually, and a city council. The waterworks are owned and operated by the city. Population, in 1890, 5303; in 1900, 4686.

BIG SANDY. A navigable affluent of the Ohio River, formed by the junction of two main forks on the border between Kentucky and West Virginia and flowing north to the Ohio, separating these two States (Map: West Virginia, B 3). The east fork, called Tug Fork or Tattarawka River, rises in West Virginia near

BIGNONIA, ETC.

1. BIRCH (*Betula populifolia*).
2. BLADDERNUT (*Staphylea trifolia*) - a, fruit enlarged.
3. BLADDERWORT (*Utricularia vulgaris*); a, an utricle of Bladderwort, entire and opened to show valve.
3. BLADDERWORT (*Utricularia vulgaris*); a, an utricle of Bladderwort, entire and opened to show valve.

4. BIGNONIA CHERE.
5. MOONWORT (*Botrychium lunaria*).
6. BOX (*Buxus sempervirens*).
7. BOX ELDER (*Negundo aceroides*) - a flowering spray.
8. BOX ELDER, a mature leaf.

the Virginia line, and flowing northwest, forms with the Big Sandy the southern boundary between West Virginia and Kentucky. The west fork, called the Levisa Fork, rises in southwest Virginia, and flows northwest into Kentucky and then northeast to its junction with Tug Fork. Both branches pass through a heavily wooded country, but the best timber has been removed. The river drains an area of over 4000 square miles and lies in the Ohio coal-producing area. It empties into the Ohio River near Catlettsburg, Ky., and is navigable for small boats for 100 miles.

BIG SPRING. The county-seat of Howard County, Tex., 270 miles west of Fort Worth; on the Texas and Pacific Railroad (Map: Texas, D 3). It is an important railroad town, with division shops, offices, etc., of the Texas and Pacific, and has a considerable trade in the products of the surrounding region, principally live stock, hides, fruit, and agricultural produce. There are extensive deposits of salt underlying the town, and in the vicinity is an immense spring from which it derives its name. Population, about 2000.

BIG TREES. See SEQUOIA.

BIG WARRIOR. See BLACK WARRIOR.

BIHAČ, or BIHATCH, bē'hōch. A fortified town of Bosnia, capital of a district of the same name. It is situated on an island in the Una, near the frontier of Dalmatia. It has been the scene of frequent contests during the Turkish wars (Map: Austria-Hungary, D 4). Population, in 1895, 4330, chiefly Mohammedans.

BIHE, bē'A. A portion of the Portuguese West African colony of Angola (q.v.).

BIJAPUR, bē'jā-pūr' (Skt. *viṣaya*, victory + *pur*, city). A decayed city in the Presidency of Bombay, British India, on an affluent of the Kistna, 245 miles southeast of Bombay (Map: India, C 5). Bijapur was for centuries the flourishing capital of a powerful kingdom, falling therewith under various dynasties in succession, Hindu and Mussulman, till, in 1686, it was captured by Aurangzeb. Early in the Eighteenth Century it passed into the hands of the Mahrattas. On the overthrow of the Peshwā, in 1818, it was assigned by the British to the dependant Rajah of Satara. Bijapur presents a contrast perhaps unequaled in the world. Lofty walls, of hewn stone, still entire, inclose the ruins of a city which is said to have contained 1600 mosques and 100,000 dwellings. With the exception of an ancient temple, the sole relic of aboriginal domination, the ruins are Mohammedan, and consist of beautiful mosques, colossal tombs, and a fort of more than 6 miles in circuit, with an inner citadel. An additional wonder of the place is the largest piece of brass ordnance in existence, cast at Ahmednagar. Population, about 17,000. Consult: Fergusson, *Ancient Architecture in Hindostan* (London, 1847); Fergusson, *The Study of Indian Architecture* (London, 1867).

BIJNS, bins, ANNA (c.1494-1575). A Flemish poet. She was born at Antwerp, and was the first writer of the Sixteenth Century in the native language. Her best-known verses are collected in her *Schoone Refereynen Schruftueren ende Leeringen teghen Talle Ketereyen* (1528; with commentaries by Van Helten and Jonckbloet,

1876), which were frequently republished and won for the author the name of 'Sappho of Brabant.' Most of these refrains are energetic epigrams against Luther and his adherents, but all are written in a language of singular purity for that period. Those which are free from religious intolerance show much more poetic fire than is found in the works of her contemporaries. A collection of ninety-four of her other poems was published by Van Helten (1886).

BIKANIR, bē'kā-nēr'. The capital of the native State of the same name in Rajputana, India, situated in a desolate tract, 250 miles west-southwest of Delhi in latitude 28° N. and longitude 73° 22' E. (Map: India, B 3). Population, in 1891, 56,300; in 1901, 53,100. It is surrounded by a battlemented wall 3½ miles in circuit, and from a distance presents a magnificent appearance with its carved Jain monasteries, palace, and buildings, but inside, the streets are narrow, and, like the inhabitants, dirty. Immediately to the northeast is a detached citadel, of which the Rajah's residence occupies the greater part. The State of Bikanir is in latitude 27° 30' to 29° 55' N. and longitude 72° 30' to 75° 40' E., measuring, in its extremes, 160 miles by 200 miles. It contains 23,340 square miles. Population, in 1891, 832,000; in 1901, 584,700. The Rajputs are the predominant race; but the Jats form the great body of the inhabitants. Though the people find their principal resource in pasturage, yet water is remarkably scarce. In the whole territory there is not one perennial stream; while wells, as precarious and scanty as they are brackish and unwholesome, average 250 feet in depth. In 1868-69 nearly half of the population were destroyed by famine. The temperature varies greatly. In the beginning of February ice is formed on the ponds; and in the beginning of May the thermometer stands at 123° F. in the shade. In the beginning of November each period of twenty-four hours, according as the sun is above or below the horizon, presents such extremes of heat and cold as often to be fatal to life.

BIKELAS, bē-kā'lās, DIMITRIOS (1835—). A modern Greek poet and historian. He early attracted national attention by his patriotic hymns, and has rendered into modern Greek several plays of Shakespeare. His chief historical works have appeared under the titles: *The Greeks of the Middle Ages* (1878); *The Role and the Aspirations of Greece in the Eastern Question* (1885); and *Greece, Byzantine and Modern* (1893).

BILANE, bē-lā'nā. See VILANE.

BILBAO, bēl-bā'ō (Basque *Ibaizabel*, 'under the hill'). A seaport town of Spain, capital of the Province of Vizcaya, situated in a mountain gorge on the Nervión, about 8 miles from its mouth at Portugalete (Map: Spain, D 1). Bilbao is well built, the principal streets are straight, and the houses substantial. Five bridges, one a stone bridge of the Fourteenth Century, cross the river which divides the old town from the new. There are several fine public walks, numerous fountains, but no public buildings of any note. The city is purely commercial. It has many extensive rope-works, and manufactures of hardware, leather, hats, tobacco, and earthenware. There are also docks

for building merchant vessels, and in the vicinity are iron and copper mines. The Nervión has been deepened so as to be navigable by vessels drawing twenty-two feet, and at present Bilbao is one of the most important trading ports of Spain. The imports consist chiefly of cotton and woolen manufactures, colonial produce, fish, jute, spirits, hardware, machinery, railway materials, etc.; and the exports consist of wool, iron, fruits, oil, flour and grains, wines, madder, minerals, liquorice, etc. The women here do almost all the heavy portering. Bilbao owes its present prosperity to the iron-mines which stand on the left bank of the Nervión. Their valuable deposits were known to exist from the earliest times, but the mines have only been worked within the last decades of the Nineteenth Century. Bilbao was founded in the year 1300 by Diego Lopez de Haro, under the name of Belayo, i.e. 'the fine fort,' and, being well situated and little disturbed by the civil wars of Spain, it soon attained great prosperity. In the Fifteenth Century it was the seat of the most authoritative commercial tribunal in Spain. It suffered severely in the wars with France, first in 1795, and again in 1808, when 1200 of its inhabitants were slaughtered in cold blood. Population, in 1897, 74,100.

BIL/BERRY. See HUCKLEBERRY.

BIL/BILIS. An old Celtiberian city of Spain, about two miles east of the modern town of Calatayud, in the Province of Saragossa. It is chiefly celebrated as the birthplace of the poet Martial, but is also famed for its highly tempered steel blades. Under the Romans Bilbilis was a municipal town with the surname of Augusta.

BIL/BOES. See IRONS.

BILDERDIJK, bil'der-dijk, WILLEM (1755-1831). A Dutch poet, philologist, and philosopher. He was born in Amsterdam, September 7, 1755, studied law in Leyden, and then practiced it at The Hague. In 1795 he was exiled as an anti-Revolutionist, and went to London and Brunswick, after a discreditable love affair with Katherina Schweikhardt, redeemed later (1802) by marriage. Katherina was herself author of a narrative poem *Rodrigo the Goth*, and of graceful *Poems for Children*. On Bilderdijk's return to Holland (1806) King Louis made him librarian and patronized him in various ways, but he was rather overweening and ungrateful, and at last, refusing to live in Amsterdam, went to Leyden (1817), where he lectured on history till 1827. Bilderdijk's industry was indefatigable. While in Germany he translated *Ossian* and wrote *Country Life and Patriotic Love for Orange*. After his return he wrote *The Disease of Genius*, *Leyden's Battle*, several dramas, and his poetic masterpiece, *The Destruction of the First World*. His entire production approaches 100 volumes. His poetry had no deep sentiment, and never caught the romantic inspiration. In politics he stood, in later years, almost alone as an ultra-conservative. His greatness lies in a mastery of language that no Dutch poet since Huygens had approached. Bilderdijk's *Works* are collected in 15 vols. (1856-59). Consult Gorter, *Bilderdijk* (Amsterdam, 1871).

BILE (Lat. *bilis*, bile, anger). A fluid secreted by the liver. It is golden-red in man,

green in herbivorous, brownish-yellow in carnivorous animals. The primary cells of the liver (the hepatic cells) separate the bile from the blood of the portal vein, and discharge it into small ducts, which unite to form larger ones, and eventually the right and left hepatic ducts. The latter unite to form the common hepatic duct, which is soon joined by that of the gall-bladder (the cystic duct). This junction forms the common bile-duct, which pierces the second part of the duodenum, and, running obliquely in its walls for a short distance, opens on its mucous surface. Between twenty and fifty ounces of bile are secreted daily, principally within an hour after eating, and to some extent during the intervals of digestion. Some bile remains stored in the gall-bladder, where it becomes viscid and of darker color. If it becomes solidified, gall-stones are the result, causing great pain as they pass through the gall-duct. Bile passes into the intestine and assists in the digestion of fats, stimulates the peristaltic motion of the intestine, and disinfects the contents of the large intestine. If the escape of the bile into the intestine be prevented by swelling of the part by the duodenum where the common bile-duct empties, the bile is carried by the blood into various parts of the body, causing jaundice (q.v.). Bile is composed of water, fat, resinoid acids (glycocholic and taurocholic), mucus, various salts, and soda. Its specific gravity is 1.026. It has a bitter taste and a peculiar strong odor. The bile of salt-water fish contains potash, while that of land and fresh-water animals contains soda. See CALCULUS; DIGESTION; JAUNDICE; and LIVER.

BILFINGER, bil'fing-ēr, or **BÜLFINGER**, byl'fing-ēr, GEORG BERNHARD (1693-1750). A German mathematician and philosopher of the Leibniz-Wolffian school. He was a son of a Lutheran minister of Kannstatt, Württemberg, and, like several others of his family, was born with twelve fingers and twelve toes. He studied at Halle under Wolff, became professor of philosophy in 1721, and of mathematics also in 1724. In 1725, on Wolff's recommendation, he obtained a professorship in Saint Petersburg, whence he was recalled in 1731. He gained the prize (1000 crowns) offered by the Academy of Science of Paris for a solution of the problem of the cause of gravity. Later in life he was a privy councilor at Stuttgart, and greatly advanced the interests of public instruction and agriculture. Among his numerous works, the most important is *Dilucidationes philosophice de Deo*, in which he expounded minutely and defended against its opponents Wolff's division of metaphysics into four branches.

BILGE (akin to *bulge*, a rounded protuberance, Lat. *bulga*, a leathern bag). That portion of the bottom of a ship which is nearer horizontal than vertical. The bend in the frames which joins the bilge to the side is called the *turn of the bilge*. If the turn of the bilge is sharp, the vessel is said to have a *hard bilge*; if rounding, to have an *easy bilge*. If the bilge frames amidships run nearly horizontal, the ship is said to have very little *dead rise*; if they incline upward at quite an angle as they leave the keel, she has considerable *dead rise*. When a vessel strikes the ground with such force as to cause serious

injury in the bilge, she is said to be *bilged*. The upper side of the floor-timbers in a wooden ship, and of the inner bottom in a modern vessel, form, near the midship line, natural drainways for any water which may leak into or be formed in the ship, and are called *bilges*. The largest circumference of a cask is called the *bilge*.

BILGE BLOCKS. A series of blocks on which the bilges of a ship rest when she is in a dry-dock.

BILGE KEEL. A V-shaped keel riveted to a ship's bottom near the turn of the bilge for the purpose of checking her rolling. These keels are very effective, and few large ships are now built without them. A comparison of the behavior of two 15,000-ton British battle-ships, one fitted with bilge keels and one without them, showed that the gain in a rough sea was very great; at one time the ship without bilge keels was rolling 28 degrees each way, while her sister ship with keels 30 inches deep only rolled 11 degrees.

BILGE KEELSON. An internal longitudinal stiffening plate or timber inside the bilges.

BILGE-WATER. The water which collects in the bilges. It has a peculiar fetid odor which is very strong if the bilges are not kept as clean as possible. In the ships of the navy bilges are pumped out at least once a day and carefully cleaned once a week. In wooden ships it is very difficult to keep the bilges clean, and sickness on board has often been ascribed to their foulness.

BILGEWAYS. A series of timbers on the launching ways. The cradle, which supports the body of the ship in launching, rests on the bilgeways.

BILGUER, bil'gwër, PAUL RUDOLF VON (1815-40). A German chess-player, born at Ludwigslust. He was at an early age one of the most accomplished players of his day. He frequently gave exhibitions of memory feats, such as playing two games simultaneously, without watching the board. His *Handbuch des Schachspiels* (completed by Von Heydebrand and Von der Lasa, 1891) is regarded by many as the authority on the subject.

BILHANA, bäl-hä'nä. An Indian poet of the Eleventh Century. He was born in Kashmir and is supposed to have died in the Deccan. His most celebrated work is the *Caurisurata-pancāṅkī*, a lyric poem of about fifty strophes, of which several versions have been preserved. Consult Höfer's metrical translation in the *Indische Gedichte* (Leipzig, 1844).

BILIM'BI. See CARAMBOLA.

BILIN, bē-lēn' (Bohem. *Bilina*, from the river *Biela*, white). A town of the Austrian Crown-land of Bohemia, beautifully situated in the valley of the Biela, about 6 miles southwest of Teplice. It has important agricultural industries and is famous for its alkali springs. Over one million bottles of the water are exported annually. Population, in 1890, 6000; in 1900, 7800. In the vicinity rises the remarkable isolated clinkstone rock, called the Borschen, or Biliner Stein.

BIL'IO'SO. A character in *The Malcontent*, a tragic-comedy by Marston (1604).

BILIOUS FEVER. See FEVER; INFLUENZA.

BILL, or **BEAK.** See BIRD.

BILL (LLat. *billa*, for Lat. *bullā*, anything rounded; seal, stamp; edict, bull). In legislation,

the common name for a proposed legislative act. It was found a more convenient form of enacting laws than the old Parliamentary method of petition to the sovereign. Bills are of two kinds, public and private, according as they by their terms affect the particular interest of any person or persons, whether private individuals or corporations, or the interests of the people at large. In the United States Congress bills for raising revenue must originate in the Lower House, but the Senate may propose and make amendments. See LEGISLATION; JUDICIAL NOTICE; CONGRESS; BILL OF ATTAINDER, etc.

IN THE LAW OF PLEADING. A general term descriptive of various forms of pleading by which actions are instituted, both at common law and in equity. In criminal law, the written accusation or presentment of a grand jury is known as a bill. See INDICTMENT; GRAND JURY; BILL IN EQUITY, etc.

BILLAUD-VARENNES, bē'yō' vā'rēn', JEAN NICOLAS (1756-1819). A French revolutionist. He was a member of the National Convention in 1792, voted for the execution of Louis XVI. within twenty-four hours and for the death of the other members of the royal family, and favored in every way the most violent measures. He was subsequently president of the Convention and a member of the Committee of Public Safety. Though he assisted in the overthrow of Robespierre, he ultimately shared the fall of the Terrorists and was transported to Cayenne in 1795. He visited New York in 1816, but was coldly received and went to Haiti, where he died, 1819.

BILLBOARD. See ANCHOR.

BILLET (Fr. *billet*, a ticket, dimin. of *bille*, bill, note). A naval term denoting the station or employment of an individual. A *sleeping billet* is the numbered space assigned to a member of the crew in which he is required to swing his hammock. A *station billet* is a memorandum of his station and duties furnished to each member of the crew; one is given to him when he first comes on board, and if he be afterwards changed to another division or part of the ship, his station billet is changed accordingly.

BILLET-HEAD. A scroll-head of a ship at the end of the timbers underneath the bowsprit. It replaced the old figurehead in vessels of the middle and latter part of the Nineteenth Century.

BILLET. In architecture, an ornament consisting of a series of short cylinders spaced along a straight line and formed by cutting a molding—generally a round molding—into notches, so that the parts left resemble billets of wood. When used in several rows, the billets and empty spaces are placed interchangeably. It is frequent in Norman buildings.

BILLET. See HERALDRY.

BILLET, bē'yā', FÉLIX (1808-82). A French physicist, born at Fismes (Marnes). He became professor of physics at the University of Dijon in 1845, and dean of the faculty in 1873. His name has become associated with the apparatus known as the "Bilentes de Billet." His numerous important works include the following: *Sur les changements de volume des corps par le passage de l'état solide à l'état liquide* (1845); *Condensations électriques de deuxième et de troisième espèce* (1851); *Traité d'optique physique*

(1858); *Mémoire sur les demi-lentilles d'interférences* (1862).

BILLETING (Fr. *billet*, ticket, dimin. of OF. *bille*, bill), or **QUARTERING**. A system of provisioning and lodging soldiers, when not in camp or barracks. Before the era of permanent barracks in England, soldiers were billeted or quartered on the citizens, who were compelled to support them. The abuses and hardships endured by citizens generally because of this arrangement brought about the erection of permanent barracks. (See **BARRACKS**.) One of the grievances which led to the American Revolution was the quartering of British troops upon the people without their permission. At the present time 'quartering' is restricted in the United States by the third amendment of the Constitution. In England it is confined to troops on the march and individual soldiers traveling on special duties. The keepers of inns or public houses, or citizens—failing the former—on whom troops may be billeted are paid according to a scale fixed by the Government.

BILLFISH. A fish having the snout much drawn out in the form of a bill, as: (1) A **gar**. (See **GARFISH** and **GAR-PIKE**.) (2) **SPEAR-FISH** (q.v.), or some similar form.

BILL-HOOK. An intrenching tool, used for cutting underbrush in clearing passages through jungle-growths, etc., and clearing camping-grounds, or bivouacs. It is also used for securing materials for gabions, fascines, and other defensive supports. The regimental pioneers of European infantry carry a bill-hook as part of their equipment. The bolo of the Filipinos and the machete of the Cubans closely resemble it, both in practice and general use. See **ENGINEERING**, **MILITARY**.

BILLIARDS (Fr. *billard*, originally the cue, from *bille*, a log of wood, cf. Eng. *billet*). A game of skill, whose development as a scientific indoor game is wholly modern. Its origin is obscure. Some assert that it was brought from the East by the Crusaders. Cotton, in his *Complete Gamester* (1674), wavers between Spanish and an Italian origin; but there is better reason to believe that de Vigne, an artist of the Court of Charles IX. of France (c.1571), designed tables and drew up a code of rules. In any case, it was known in England soon after this time. Spenser, in his *Mother Hubbard's Tale* (1591), speaks slightly of those who play—

With dice, with cards, with balyards far unfit,
With shuttlecock, misseeming manly wit.

It was originally an outdoor sport, played on the ground, at first with round stones, later with two balls, an ivory post, an upright cone called a king, and two sticks called masts (maces), made of heavy wood and tipped with ivory. It was then played in a similar form indoors upon a table, still with two balls, an iron arch being used through which the ball was driven; beyond this was the king, and pin pool is a survival of this primitive form. In the Eighteenth Century holes, called 'hazards,' and suggested probably by the iron arch, were cut in the bed of the table—first in the centre, then at the corners and sides—into which the balls were driven. Then the French added the third, or red ball, introducing the carambole or carom game, which involves striking both the other balls with the cue-ball.

The next period of development is marked by improvements in the materials of the game. Where the end of the cue had been simply made rough with a file so that chalk might adhere to it and prevent slipping off the ball, the French player Mangin introduced leather tips (first used in the United States in 1823), and a little later marble and slate came to be employed instead of wood for the bed, and india-rubber for the cushions. In 1854 a new cushion, possessing great durability and elasticity, was invented by Michael Phelan, the father of billiards in America, and the game in the next half-century attained a wonderfully scientific precision.

The English game is played with three balls, two being white and one red, which generally measures 2 1/16 inches in diameter. One of the white balls has a spot upon it, the purpose of which is that one ball may be distinguished from the other. The red ball is placed upon a spot at what is called the top of the table and about 13 inches from the top cushion, but exactly in the centre width of the table; at the other, or lower end of the table, and at a distance of 2 feet 4 1/2 inches from the lower-end cushion, and exactly in the centre width of the table, is placed a spot and from this spot is drawn a semicircle, with a radius of 21 inches to 23 inches, of which the spot is the center base; the space within the semicircle is called 'balk.' The object of the player is, by striking his own ball against the red ball or his adversary's, to drive either it or them into the pockets, or else effect a 'cannon'—i.e. to strike both balls with the player's ball. The general limit of each game is '50 up,' as it is called, although any number of points may be agreed upon.

The method of play is as follows: for the lead and choice of balls, the players 'string'—i.e., placing their white balls within the semicircle, they cause them to strike the furthestmost cushion and to rebound; the striker whose ball stops nearest the bottom cushion may take which ball he likes and play or direct his opponent to play; the red ball must, at the opening of the game, be placed upon the top spot and replaced after being pocketed or forced off the table, or whenever the balls are broken—i.e. when the balls are played as in the opening stroke; the game is adjudged in favor of whoever first scores the number of points agreed upon. Two points are scored for a cannon or carom; two for a white hazard (pocketing the opponent's ball); three for a red hazard (pocketing the red ball). The following strokes count against the player: a simple miss, one point; a losing hazard (pocketing your own ball), two; and doing both at once, three.

Billiard-tables vary in size. The English table is 6 feet wide and 12 feet long and has six pockets, one at each corner and one at each side at the centre; the standard size in America is a table 5 feet wide and 10 feet long, although in public rooms, clubs, and private houses the size generally used is 4 feet 6 inches in width and 9 feet in length. In the United States the game of billiards is now played almost exclusively on carom-tables, pocket-tables being reserved for the game of pool. The bed of the table is made of slate and is covered with fine green broadcloth, while rubber cushions are used at the sides and ends of the table, against which the balls strike and rebound. Three and

four balls are used in playing the game, the balls being propelled with cues, which are generally made of ash or maple, and in length vary from 4 feet 6 inches to 5 feet. A billiard-cue is about 1½ inches thick at the butt end, while the tip runs to a point, in size from ⅝ to ¾ inch. In weight most cues vary from 14 to 22 ounces. Ivory balls are generally used, and in America and France the standard ball measures 2⅝ inches in diameter, in England 2 1-16 inches.

The original American four-ball game of caroms and pockets was played upon a 6 × 12 table, with six pockets. Two white and two red balls (light and dark in color) 2⅝ inches in diameter were used, but it is so seldom played now that it needs no further notice, its place having been taken by the four-ball carom game, which in turn is giving place to the more popular three-ball carom game. This is played in America and France with two white balls and one red. In professional contests a 5 × 10 carom table is used—i.e. a table without pockets, although it can be played on a table with pockets, counting only the caroms. A semicircle is drawn at the head of the table, with a radius of 6 inches, the base of which is an imaginary line drawn through the centre of the white-ball spot. The billiard-table has three spots in a line, dividing the table lengthwise, running from the centre of the head cushion to the centre of the foot cushion; one of these spots cutting the line in two equal parts, is called the centre spot, and the other two are situated half way between the centre spot and the head and foot cushions. The spot at the head of the table is called the white spot and the one at the foot the red spot. The centre spot is only used when a ball, forced off the table, finds both white and red spots occupied. Should the white ball forced off the table find its spot occupied, it would be placed on the red spot, and *vice versa*. In beginning the game, the red ball and one white are placed on their respective spots; the other white remains in hand and is placed near the white spot previous to the opening stroke in the game. The player can take any position within six inches of the white spot, but he must strike the red ball first before a count can be effected. The cushion-carom game, in which the cue-ball is required to strike one cushion after having hit the first object-ball, is now very general, while the two-cushion and even three-cushion contests are not infrequently played by amateurs as well as professionals.

What has come to be generally known as the 'balk-line game' is a development made necessary by the wonderful skill acquired by the professional players of first rank in 'cushion nursing'; that is, the making of an almost indefinite number of shots by getting the balls against one of the cushions. With the balls in this position such skillful players as Frank Ives, Jacob Schaefer, George Slosson, and others are able to make runs of several hundred, such is their adeptness and delicacy of touch. To guard against this, lines were drawn running parallel to and, at first, eight inches from the cushions and completely crossing the table both ways. The rules of this game provide that the players shall be permitted to make only one or a given number of shots when one or both of the object-balls are between the line and the cushion. The player is permitted to make as many carom shots as he

can when the balls are entirely outside the balk-lines, and although this space is, of course, relatively small, the more expert players frequently make runs of from 20 to 30 by extremely delicate carom playing with occasional forcing of one of the object-balls to the cushion with such accuracy as to make it return to a position from which the carom playing may be continued. But with the further development of skill among professional players, this free space was decreased by increasing the distance of the balk-line from the cushions first fourteen and then eighteen inches, while games occasionally provide for a 22-inch balk-line. Again, the restrictions of play within these lines are made more exacting as the skill of the player increases; that is to say, in many of the tournaments between professional players no shot may be counted when the balls are within the balk-lines, unless one is forced over the line.

The only play upon balls against the cushion in most tournaments between professionals is one which provides that both object-balls shall be within what is known as the 'anchor space.' These anchor spaces are rectangles about six inches long and three inches broad, drawn at the cushion line so that the balk-line will divide each into two squares. If the player is skillful enough or fortunate enough to get the two object-balls within this anchor space, he may make one shot, but he must at the same time drive one of the balls outside the space. If his skill is sufficient to make the ball or balls return to this anchor space he may continue his play; but this, as may be supposed, is an exceedingly difficult feat.

Tournaments between professional players are generally arranged with the utmost exactness as to the smallest details of play. In many cases this niceness extends even to a definite requirement as to the temperature of the room in which the contest is to take place. This, because moisture or low temperatures affect the elasticity of the ivory of which the balls are made; therefore the articles of agreement often require that the room shall be kept at a temperature of not less than 80°.

The following are some of the remarkable scores made in recent times, under the modern highly scientific developments: Straight rail—highest run for match play (3 balls, on regulation 5 × 10 table) 1531 points, Maurice Vignaux, Paris, 1880. Highest average for match play, 333⅓, by Jacob Schaefer, Chicago, 1879. Cushion caroms—highest run for tournament play, 85 points, Frank C. Ives, Boston, 1896. Highest average for tournament play, 10 (in 200 points), Jacob Schaefer, Chicago, 1887. Fourteen-inch balk-line—highest run (with 'anchor nurse' barred), 359 points, Frank C. Ives, Chicago, 1894. Highest average (with 'anchor nurse' allowed), 100, Jacob Schaefer, New York, 1893, and Frank C. Ives, Chicago, 1894. Highest average (with 'anchor nurse' barred), 63 2-10, Frank C. Ives, New York, 1894. 18-inch balk-line—highest run for tournament play, 290 points (with 5 shots allowed in 'anchor' spaces), Frank C. Ives, New York, 1896; 140 (with the 'anchor nurse' barred), Frank C. Ives, New York, 1897. Highest average for tournament play, 50 (with 5 shots allowed in 'anchor' spaces), Frank C. Ives, New York, 1896; 40 (with 'anchor nurse' barred), Jacob Schaefer, Chicago, 1898.

Pool is played with billiard-tables with fifteen numbered balls and one white unnumbered ball. This is the cue-ball. The balls are placed on the centre of the table in the form of a triangle, the apex pointed toward the head of the table. The player's object is to pocket as many numbered balls as he can, the number on each ball he pockets being scored to his credit. Pyramids is also played with fifteen red balls and one white one, the cue-ball. The balls are placed on the centre of the table in the form of a triangle, and the first player must strike them with the cue-ball with sufficient force to cause two or more object-balls to strike a cushion, or one at least to go into a pocket. The following player must distinctly call the number of the ball he intends to pocket, but he need not designate the particular pocket he intends to put it in. In Chicago pool, the fifteen balls are placed at intervals around the cushions. Other pool games, either obsolete or of less importance, are pin pool, two-pin pool, little corporal, red, white and blue, bouchon pool, Parisian pool, high number pool, and pool for 31 points. For the American game, consult: *Modern Billiards*, published by the Brunswick-Balke-Collender Company (New York, 1891); Cady, *Billiards* (New York, 1896); Thatcher, *Championship Billiards, Old and New* (Chicago, 1898); for the English game, Broadfoot, *Billiards* (London, 1896); Roberts, *The Game of Billiards* (London, 1897); for the French game, Vignaux, *Le billard* (Paris, 1889).

BILL IN EQUITY. The original process instituting an action or proceeding in a court of chancery, corresponding to a *declaration* in an action at law, a *libel* in admiralty courts, or (in England) an *allegation* in a spiritual court. It is a complaint in writing addressed to the chancellor, giving the names of the parties to the suit, a statement of the matters on which the complainant relies, the allegations which he makes, an assertion that the matters complained of are contrary to equity, and a prayer for relief. The former practice in the English Court of Chancery was to address the petition to the lord chancellor, lord keeper, or lord commissioners for the custody of the great seal, unless the seal was in the King's hands, or the chancellor was the petitioner, when it was addressed to the King himself—for, according to the theory of chancery, the plea was made to the King's conscience. Where the Crown was the suitor, complaint was by *information* (q.v.). But by the Supreme Court Judicature Act of 1874 all suits now begin by writ. Formerly the several jurisdictions of the United States followed the old chancery pleadings, but in New York and other States which have adopted codes of civil procedure the same pleadings are now established for equity as for common-law actions. Instead of the elaborate bill, the first pleading is now a complaint or petition stating the facts "constituting the cause of action," with demand for judgment. In the non-code States the old bill is retained, though generally with statutory modifications.

A bill may be either original, as when it initiates an action, or not original, as when it supplements an original bill or is brought by a third party intervening in the suit. Bills are characterized according to the nature of the remedy sought, as "bill of peace," "bill of interpleader,"

"bill of discovery," etc. See **CHANCERY**; **EQUITY**; **PROCEDURE**.

BILLINGS. A city and county-seat of Yellowstone County, Mont., 240 miles east by south of Helena; on the Yellowstone River, and on the Northern Pacific and the Burlington and Missouri River railroads (Map: Montana, E 3). It is the commercial centre for a vast stock-raising district, the exports of which consist principally of live stock and wool, the city being one of the largest inland wool markets of the United States. The wool shipments in 1901 aggregated about 14,000,000 pounds, and live stock, 1700 cars. In the vicinity are deposits of coal, marble, and limestone. The city has a public library, an opera house, a new city hall, and a fine courthouse. Population, in 1890, 836; in 1900, 3221.

BILLINGS, FRANK (1854—). An American physician, born at Highland, Iowa County, Wis. He studied at the Northwestern University Medical School (1881) and took post-graduate work in Vienna and Paris in 1885 and 1886. He was appointed professor of medicine at the Northwestern University Medical School in 1890, and professor of medicine at the Rush Medical College, Chicago, and dean of the faculty of that institution in 1898. He has published the *Year Book on Medicine* (1901), and various monographs on medical subjects in American journals.

BILLINGS, JOHN SHAW (1837—). An American surgeon and librarian. He was born in Indiana, graduated at Miami University in 1857, and at the Medical College of Ohio three years later. He then entered the surgeon-general's department of the United States Army, and during the Civil War served in the field and in hospitals until 1864, when he was transferred to the surgeon-general's office in Washington. There he became curator of the Army Medical Museum and Library and succeeded in making the latter the third largest and probably the most valuable medical library in the world. The *Index-Catalogue* of this library in 16 quarto volumes, which he prepared, is a work of the highest order. Dr. Billings was also for a number of years professor of hygiene in the University of Pennsylvania. On the consolidation, in 1896, of the Astor and Lenox libraries with the Tilden foundation into the New York Public Library, he was appointed chief librarian of the system. He is an active or an honorary member of scientific and learned societies in all parts of the world, notably the National Academy of Sciences and the Royal Medical and Chirurgical Society of London. He received the degree of LL.D. from Edinburgh in 1884, and that of D.C.L. from Oxford in 1889. Among his numerous publications are: *Principles of Ventilation and Heating* (1884); *Mortality and Vital Statistics of the United States* (1885); *National Medical Dictionary* (1889); *Description of the Johns Hopkins Hospital* (1890); and *Social Statistics of Cities* (6 vols. for the Eleventh Census). He has also contributed much to medical and general periodicals.

BILLINGS, JOSH. See **SHAW, HENRY W.**

BILLINGS, ROBERT WILLIAM (1813-74). An English antiquarian and artist, born in London. He acquired during a seven years' apprenticeship with John Britton, topographical draughtsman, a taste for and facility in the preparation of

illustrations of historic buildings. Between 1838 and 1849 he produced illustrations of several churches and cathedrals, as well as his *Architectural Antiquities of the County of Durham*. His chief work was entitled *Baronial and Ecclesiastical Antiquities of Scotland* (4 vols., 1845-52), with 240 illustrations. Under his direction the Chapel of Edinburgh Castle and the Douglas Room in Stirling Castle were restored.

BILLINGS, WILLIAM (1746-1800). The first American composer of whom any record is known. He was born in Boston, and set up as a tanner, but subsequently became a singing-master and composer of Psalm-tunes. It is probable that he is correctly regarded as the founder of American church music. Despite a meagre musical training, he evinced some talent for melody, and his collections for church choirs were widely used throughout New England. His patriotic airs, also, were popular among New England troops during the Revolutionary War. Best known of his six compilations were *The Singing-Master's Assistant* (1778), styled 'Billings's Best,' and *The Psalm-Singer's Amusement* (1781).

BILLINGSGATE (*Billing*, presumably a former proprietor of the land). A gate, wharf, and fish-market, a little below London Bridge. It was opened in 1558 as a landing-place for provisions, and in 1699 was made "a free and open market for all sorts of fish." The unpolished phraseology, native, though not peculiar, to this quarter of London, has given rise to the use of the name Billingsgate as a synonym for coarse or abusive language, such as is proverbially ascribed to fishwives.

BILLINGTON, ELIZABETH, née WEICHSEL (1768-1818). A celebrated English singer, born in London. She was the daughter of a German musician. At an early age she came forward as a performer on the piano and as a composer; and after marrying her music-master, Thomas Billington, appeared with brilliant success on the operatic stage in Dublin in 1786. Having returned to London, she was engaged at Covent Garden at the then unheard-of salary of £1000 for the season. She perfected her musical education under Sacchini in Paris, who wrote for her his opera *Inez di Castro*, while she was singing in Naples, 1794. She appeared subsequently in Venice and Rome with the greatest success. After her first husband died, in 1799, she married a Frenchman of the name of Felissent, and returned to London, 1801, where she received £4000 for six months, playing alternately at Covent Garden and Drury Lane. She retired from the stage in 1811, and died at her villa near Venice. Her private life was very stormy, and she was even accused of poisoning her first husband. To a voice of wonderful compass (of three octaves), trained in all the art of the Italian school, she added a fascinating personal beauty and grace. Consult G. F. Ferris, *Great Singers*, Vol. I. (New York, 1892).

BILLITON, bī-lē'tōn' or BLITONG, blē-tōng'. One of the Dutch East India Islands, situated between the islands of Banca (off the southeast coast of Sumatra) and Borneo. It is compact in form and covers an area of 1840 square miles, with a rough surface rising to 3000 feet, and has rich deposits of tin and other min-

erals. It forms an administrative dependency of Banca, and has a population of (1896) 41,395, of whom many are Chinese, but only about 100 are Europeans (Map: East India Islands, C 5). The chief town, Janjong-Pandang, is on the northwest coast.

BILL OF ATTAINDER (for derivation, see ATTAINDER), and **BILL OF PAINS AND PENALTIES**. Bills by which attainder or pains and penalties are inflicted by legislative enactment.

The Constitution of the United States expressly declares (Art. I., Sec. 9) that "no bill of attainder or *ex-post-facto* law shall be passed." (See ATTAINDER.)

In England such bills were formerly generally resorted to when, either from the peculiar nature of the offense, or in consequence of difficulties in the application of the ordinary laws, it was deemed necessary or expedient to inflict such punishment otherwise than through the courts of justice, as in times of public disturbance or when the offense to be punished was not a crime under existing laws. During the reign of Henry VIII., persons of the highest rank were frequently brought to the scaffold by bills of attainder, as the Earl of Surrey, the Earl of Essex, and others, who suffered for denying the King's supremacy. During other reigns, both before and after that of Henry VIII., these bills were more or less in evidence and used, until in 1870, by 33 and 34 Vict. Chapter 23, attainder was practically abolished. There were greater facilities for conviction by this penal legislation than by the ordinary judicial procedure at law; because while in the latter the strict rules of legal evidence must be observed, the injury under a bill of attainder, or of pains and penalties, was entirely in the hands of Parliament, which might dispense at its pleasure with such rules and forms of law as appeared inconvenient or unsuitable to the purpose in hand. Accordingly, in most of the cases to which we have referred, the bills were passed upon evidence which could never have been received as sufficient or even admissible in a court of law; and there are even instances where parties were attainted and punished without there being any evidence against them at all, and even without their being heard in their defense. Under the Stuarts the extraordinary mode of proceeding in Parliament was seldom resorted to, and it has been still more seldom used since the accession of the House of Hanover. In Scotland the Jacobite movement after the union with England was productive of several instances of parliamentary attainder, which, however, resulted merely in the forfeiture of the estates of the attainted parties, and these attainders were likewise unattended with the harsh, and in too many instances capital penalties, which were formerly the inevitable results of treason so discovered. The last instance of bill of attainder for treason was that of Lord Edward Fitzgerald, one of the leaders of the Irish Rebellion of 1798. In regard to bills of pains and penalties, perhaps the two most remarkable instances are those of Bishop Atterbury, in 1722, and of Queen Caroline, wife of George IV., in 1820.

The proceedings of Parliament in passing bills of attainder and of pains and penalties do not

vary from those adopted in regard to other bills. But the parties affected have generally been admitted to defend themselves by counsel and witnesses before both houses. In impeachments, the Commons are accusers and prosecutors and the House of Lords alone are judges of the crime. In passing bills of attainder, the Commons are judges of equal jurisdiction and with the same responsibilities as the Lords; and the accused can be condemned only by the joint assent of the Crown, the Lords, and the Commons. In passing bills of attainder, the bishops, contrary to the practice in capital impeachments, take part in the proceedings and vote. In parliamentary attainders, the bill sets out, by way of preamble, the facts and evidences on which it is founded, and concludes, by way of enactment, that the accused "is hereby convicted and attainted of high treason, and shall suffer the pains of death, and incur all forfeitures as a person attainted of high treason." See PARLIAMENT.

BILL OF COSTS. In England, the itemized statement of account for services rendered by a solicitor (q.v.) or attorney (q.v.) to his client. It is customary to render the items of this account in great detail, and it thereupon becomes the basis of the claim which the law gives the solicitor upon his client. Barristers (q.v.) have no legal claim for compensation, and hence are not privileged to render bills of costs.

In the United States, a bill of costs is an itemized statement of the statutory or other fixed costs of a suit, filed by the successful party, with the judgment. The bill is usually 'taxed,' i.e. verified and allowed, by the clerk of the court in which the judgment was rendered, and its amount thereupon becomes a part of the judgment. See Costs.

BILL OF CREDIT. In mercantile law, a letter of credit (q.v.); in the constitutional law of the United States, paper money. The issue of such bills of credit by the several States is expressly prohibited by the Federal Constitution.

BILL OF EXCEPTIONS. A formal statement, for the purpose of a writ of error or appeal to a court having the proper jurisdiction by way of review, of the exceptions taken, or objections raised, to the rulings or decision of the trial court upon points of law. The object of a bill of exceptions is to bring the points complained of before the proper court for review and possible reversal of the decision.

BILL OF EXCHANGE. An unconditional order in writing, addressed by one person to another, signed by the person giving it, requiring the person to whom it is addressed to pay on demand, or at a fixed or determinable future time, a sum certain in money to, or to the order of, a specified person, or to bearer. Such is now the statutory definition in Great Britain, in more than forty of her colonies, and in about twenty jurisdictions of the United States. An inland or domestic bill is one which purports to be drawn and payable within a particular State. A foreign bill is one drawn in one State upon a person in another. For this purpose, our States and Territories are deemed foreign to each other. While no set form of words is required

to constitute a bill of exchange, an inland bill is ordinarily in the following form:

\$500

Sixty days after date pay John Smith, or order, Five Hundred Dollars, value received, with interest, and charge to account of
JOHN JONES.

To JAMES LAMB, Albany, N. Y.

Accepted, James Lamb.

Foreign bills are often drawn in a set of three, numbered respectively, first, second, and third. The following is a common form of the first of such a set:

£100.

At sight of this first of Exchange (second and third unpaid) pay John Smith, or order, One Hundred Pounds, value received, with interest, and charge to account of
JOHN JONES.

To JAMES LAMB, London.

Accepted, James Lamb.

Bills of exchange are of comparatively modern origin, having been used by the Florentines in the Twelfth, by the Venetians in the Thirteenth, and introduced into England during the latter part of the Fourteenth Century. They were used in England but little until the Seventeenth Century, the first reported case in the courts of that country occurring in 1603. Originally, a bill of exchange was employed to avoid sending money from one country to another. If a London merchant, A, owed a debt in Amsterdam, he went to B in London, to whom money was owing from C in Amsterdam, paid to B the amount of the debt and received from him a bill of exchange on C directing him to pay that amount to A's creditor in Amsterdam, D, and charge the same to the drawer's account. Thus the London merchant, A, would pay his Amsterdam creditor, D, without sending any money out of the country. It will be noticed that a bill of exchange represented a trade transaction, was drawn by a creditor on his debtor, and for money paid to the drawer by the payee or by the payee's debtor. Such is still the character of a bill in France, where the nature of the value for which it is given must be expressed, and a false statement on this point avoids the instrument in the hands of any holder with notice. In Great Britain and the United States, on the other hand, a bill of exchange need not represent a trade transaction, and is frequently issued as a mere instrument of credit. The acceptor, the drawer, or an indorser may put his name on the bill, not because he has received the value named therein, but simply for the accommodation of some other party; that is, for the purpose of lending his credit to such accommodated party. In other words, bills of exchange have come to perform the functions of a paper currency.

The liability of the various parties to a bill may be stated briefly as follows: The drawee is under no obligation on a bill, until he accepts it; that is, until he formally assents to the order of the drawer. An oral acceptance was held valid at common law, and this rule obtains in some of our States; but in others, and in Great Britain, under the statutes, it must be in writing and signed by the drawee. This statutory requirement is satisfied by the drawee's signature across the face of the bill. The holder of a bill is entitled to insist that the acceptance shall be an

unqualified assent to the drawer's order. If it is qualified in any respect, as if the assent is subject to some condition, or is to the payment of a part only of the amount of the bill, the holder may refuse to take it and treat the bill as dishonored. If he does take such a qualified acceptance, he discharges the drawer and indorsers from liability on the bill, unless they assent thereto. By accepting the bill, the drawee (thereafter called the acceptor) engages absolutely to pay it; and no demand need be made on him as a condition of suing him thereon. Nor will the fact that he received no consideration for accepting the bill be a defense for him against a holder for value, for the latter has been induced to give value for the bill by the acceptor's engagement to pay. It is a good defense, however, as against any one but a holder for value, or one claiming through such holder; the rule being that every negotiable instrument is presumed to have been issued, and every contract thereon, whether of acceptor, drawer, or indorser, made for a valuable consideration; but that this presumption may be rebutted in an action brought by any one who has not paid value for the bill, or has not obtained title through a holder for value. The acceptance of a bill operates as a conclusive admission by the acceptor of the genuineness of the drawer's signature, of his capacity and authority to draw the bill, of the existence of the payee, and of his then capacity to indorse it; but it is not an admission that the body of the bill is genuine, nor that the indorsement of the payee is genuine.

The liability of the drawer and of indorsers is conditional, not absolute. The drawer admits the existence and capacity of the payee, and engages that the bill shall be accepted and paid by the drawee upon due presentment, and if it is dishonored and proceedings thereon are taken, he will pay it to the holder or to any indorser who may be compelled to take it up. Every indorser engages: that the instrument is a genuine, valid, and subsisting bill, to which he has a good title; that all prior parties were capable of contracting; that if accepted it shall be paid, or if not accepted, that it shall be accepted and paid upon due presentment, and if it is dishonored and due proceedings thereon are taken, that he will pay it to the holder, or to any indorser subsequent to himself who may be compelled to take it up.

Whether a bill must be presented for acceptance depends upon its form. If such presentment is necessary to fix the maturity of the bill, as when it is payable after sight, or if the bill stipulates that such presentment shall be made, or when the bill is made payable elsewhere than at the residence or place of business of the drawee, it must be presented for acceptance. If so presented, and acceptance is refused by the drawee, the holder, upon taking due proceedings of dishonor, has an immediate right of recourse against the drawer and indorsers, and need not present the bill thereafter for payment. If the bill is accepted, then due presentment for payment must be made, in order to fix the liability of drawer and indorsers. It is impossible, within the limits of this article, to state the various rules governing the time and manner of presentment of bills, and the proceedings of dishonor to be taken by the holder in order to secure his right of recourse against the drawer and indorsers.

For these, the reader is referred to law treatises on the subject, or to the Negotiable Instrument Law which has been enacted in a number of our States. (This statute is Chap. 612 of the Laws of New York, 1897; Chap. 74, Laws of Connecticut, 1897.) The negotiability of a bill of exchange will be dealt with in the article on NEGOTIABLE INSTRUMENTS. See NEGOTIABLE INSTRUMENTS, and the authorities there referred to.

BILL OF HEALTH. A statement by the captain and surgeon of a ship with regard to the health of the crew and passengers, which is presented to the health officer at the port of debarkation, who, after examination, decides whether or not the vessel shall be permitted to pass quarantine (q.v.). A false return is severely punished. A *clean* bill is one that reports no case of infectious disorder; a *foul* bill is one that makes it dangerous for the public health to permit the passengers to land without further precautions. A *suspected* bill (also known as a *touched* bill) is one that reports the rumored prevalence of infectious disease at the port of embarkation. A bill of health is sometimes attested by the consul at the place of sailing.

BILL OF INDEMNITY. In England, an act passed by Parliament every session for the relief of those who have unwittingly or unavoidably neglected to take the necessary oath required for the purpose of qualifying themselves to hold their respective offices. In the United States, this term is used of an act of Congress passed to legalize the action of any official who, under the stress of necessity, has exceeded his statutory authority. At the time of the yellow-fever epidemic at the South in 1853 the Secretary of War ordered the distribution of tents and rations to the sufferers, though under the law he had no power to do so; but as soon as Congress reassembled it passed an act legalizing the order. The name is also applied to a vote of money to reimburse one who has at his own risk incurred expenses on behalf of the Government or the nation.

BILL OF LADING. A written instrument issued by a common carrier, reciting that he has received certain goods, which he agrees to transport from one place or another and to deliver to a designated person or assigns, for such compensation and upon such conditions as are stated therein. Originally, bills of lading were issued only by ship-owners or carriers by water. Now, they are employed by every class of carriers.

As a receipt, the instrument may be modified and even contradicted by oral evidence, so far as the immediate parties are concerned. If, however, a third party has bought and paid for the goods referred to in the bill of lading, relying upon the truth of its statements, the carrier is estopped (see ESTOPPEL) from showing that those statements are incorrect. Whether he is so estopped when the bill of lading is issued by his agent without the receipt of any goods is a question upon which the courts are divided. It is held in England and in the United States Federal courts, as well as in some of the States, that he is not estopped. These tribunals declare that the master of a vessel, or the similar agent of a land carrier, has no authority to sign a bill of lading on his principal's behalf for goods not actually received by him, and, therefore, a ficti-

tious bill of lading does not bind his principal; that it is absolutely void. On the other hand, many American courts hold that the carrier is estopped, on the ground that when a "principal has clothed his agent with power to do an act upon the existence of some extrinsic fact, necessarily and peculiarly within the knowledge of the agent, and of the existence of which the act of executing the power is itself a representation, a third person dealing with such agent in entire good faith, pursuant to the apparent power, may rely upon the representation, and the principal is estopped from denying its truth to his prejudice."

If the bill of lading is intended to contain in itself all of the agreed terms of the contract of carriage, oral evidence cannot be given to vary or contradict the written instrument; but if it does not purport to be the whole contract, the unincorporated terms may be shown by oral evidence. When the bill of lading does contain the whole contract, the proper party to sue the carrier upon it, at common law, is the shipper or consignee, whether he is the owner of the goods or not; nor could the assignee of a bill of lading, in his own name, sue the carrier on the contract.

While the contract was not assignable at common law, the indorsement of the bill of lading could operate to transfer the title to the goods represented. This symbolical character of a bill of lading originated in the fact that while a cargo is at sea it is incapable of physical delivery. Persons could sell and deliver goods during their transit only by treating bills of lading as symbols of the goods themselves. Hence the law merchant recognizes the delivery of a bill of lading as the legal equivalent of the delivery of the goods; and this rule of the law merchant was adopted by the common law. But bills of lading are not negotiable for all purposes. A shipper can give no title to the goods represented by a bill of lading by indorsing or transferring it, unless he is their owner, or has apparent authority from their owner. Nor can a finder or a thief of a bill of lading indorsed in blank confer even upon a *bona-fide* purchaser a better title than he has. In other words, the negotiability of a bill of lading is substantially that of a bill of exchange (see **BILL OF EXCHANGE**) which is overdue; the indorser takes it subject to equities. In two respects, however, the *bona-fide* indorsee of a bill of lading has greater rights over the goods than his indorser had; he can hold them free from an unpaid vendor's right of stoppage *in transitu* (see **STOPPAGE IN TRANSITU**), and free also from a defrauded vendor's right to rescind the contract of sale and retake the goods. This semi-negotiability of a bill of lading continues until a complete delivery of possession of the goods has been made to some person having a right to claim them under it.

Bills of lading are made, as a rule, in two or more parts; a practice which enables dishonest shippers to use them as instruments of fraud, by selling the various parts to different purchasers for value. In such a case, the purchaser, to whom the transfer of one part is first made, becomes the owner of the property. Still, the carrier may safely deliver the property to the one who first presents a part of the bill of lading if he has no notice or knowledge of a claim by the holder of another part; although

the one so receiving delivery may be compelled to surrender the goods to other holders. In some States, bills of lading have been declared by statute to be negotiable, like bills of exchange. But such legislation has not transformed and cannot transform documents of title to goods into fully negotiable instruments. Consult *Scrutton, Contract of Affreightment as Expressed in Charter Parties and Bills of Lading* (4th ed., London, 1899), and the authorities referred to under the title **COMMON CARRIER**.

BILL OF MORTALITY. A list, issued weekly, of births and deaths occurring within the limits of London, the publication of which began in 1592. Such bills are now superseded by the weekly bills prepared at the Register General's office.

BILL OF PAINS AND PENALTIES. An act of the Legislature, declaring a certain act to be a crime, and imposing punishment or a disability upon such as have previously committed the act. It differs from other penal legislation in that it is retroactive in its operation, making that to be an offense against the State which was not so at the time of its commission, or imposing a penalty which the offense did not involve when committed. Strictly speaking, it comprehends the bill of attainder; but, as commonly employed, it is limited to cases in which any penalty less than death is imposed by the statute, whereas the bill of attainder always creates a capital offense. (See **ATTAINDER**.) Bills of pains and penalties are in general prohibited by the clause of the Constitution of the United States forbidding Congress and the several States from passing bills of attainder or *ex post facto* laws (Art. I., Sec. 9). But where the crime of treason, as defined in the Constitution, has been committed, Congress may, by a bill of pains and penalties, declare its punishment, so long as the attainder declared by the bill does not involve corruption of blood or forfeiture of estate beyond the life of the traitor (Art. III., Sec. 3). See **BILL OF ATTAINDER**; **TRASON**.

BILL OF PARTICULARS. A written statement of the items of the demand upon which the plaintiff founds his action or the defendant his set-off or counterclaim. In some jurisdictions it must be filed with the pleading of the party; in others, only on request of the opposite party, or in response to an order of the court. It is generally conclusive on the party furnishing it. Consult the authorities referred to under the title **PRACTICE**.

BILL OF PEACE. A bill of complaint in equity to restrain repeated attempts to litigate the same cause of action. The objects of the proceeding are to suppress useless and oppressive litigation, and to prevent a multiplicity of suits, and this procedure may accordingly be resorted to: (a) where a numerous class of persons insist upon the same legal right arising out of the same transaction; and (b) where the same individual persists in renewing repeatedly an unsuccessful action. The remedy is by injunction forbidding the prosecution of the vexatious suits. See **BILL**; **CHANCERY**; **EQUITY**; **QUITA TIME**.

BILL OF RIGHTS. An act of Parliament passed in 1689, immediately after the accession of William and Mary, and embodying the fundamental principle of political liberty as understood in England. It condemns as unconstitutional

tional certain abuses of the royal power that had characterized the reign of the preceding sovereign, James II.—the suspension of acts of Parliament by royal prerogative, the levying of taxes without consent of Parliament, the maintenance of a standing army in time of peace, interference with the administration of justice and free elections, the infliction of unusual punishments, the exaction of excessive bail, and the denial of the right of petition. It then affirms the freedom of debate in Parliament, the freedom of elections, and the freedom of petition. In France, bills of rights were frequently enacted after the revolution of 1789. The name is commonly given to the first ten amendments to the Constitution of the United States, proposed in the first Congress that met after the adoption of the Constitution itself and ratified by the necessary number of States in December, 1791. They appear to have been added in order to satisfy the objection made by many that the Constitution itself was not sufficiently specific in defining the rights of the citizen. See RIGHTS, DECLARATION AND BILL OF.

BILL OF SALE. A formal written conveyance, generally, but not necessarily, under seal, of a right to or interest in personal property. It should contain a description of the parties and property sufficient for identification; and in delivery it effects transfer of title from vendor to vendee. A bill of sale is the instrument used commonly in the sale of household furniture, the stock, fixtures, and good will of a business, and especially in the transfer of ownership of ships, which, if the ships be registered, must, under both the English and United States laws, be made by bill of sale (English Merchant Shipping Act, 1854, Sec. 55; U. S. Rev. Stats., Sec. 4170). If the property is delivered when sold or a part of the purchase-money is paid, a bill of sale is unnecessary to make a valid transfer, but is a convenient evidence of title. The instrument alone is insufficient without delivery of the property to protect the purchaser against the creditors of the seller, though under the registration laws of the United States this protection may generally be secured without transfer of possession by filing or recording the bill of sale. Bills of sale may be absolute or conditional. The latter operate as security and are generally considered chattel mortgages (q.v.) in American law. See SALE.

BILL OF SIGHT. A document signed by or on behalf of an importer of goods in England, who does not possess a sufficiently accurate knowledge of their quantity or quality to enable him to make a perfect entry of them. In this document, the importer gives the best description of the goods that is practicable. It is then presented to the collector of customs, who is authorized, upon its receipt, to have the goods landed and examined by the importer in the presence of customs officers; after which the importer must make a perfect entry within a limited period, or the goods are sold to pay duties and charges. Somewhat analogous provisions for expediting the delivery of parcels and packages are contained in Secs. 2853-2858, 2990-2997, and Chap. 371 of Laws of 1896 (29 United States Stations at Large, 263).

BILLON, bé'yón' (Fr., copper coin, base coin, OF. *billon*, mass; cf. *bullion*). An alloy of silver with copper, in which the copper pre-

dominates. Billon was formerly much used in Germany and in Austria for coins of smaller denominations, in order to avoid the bulkiness of copper.

BILLOT, bé'yô', JEAN BAPTISTE (1828—). A French general, born at Chaumeil (Corrèze). He was admitted to the military academy at Saint Cyr in 1847, was advanced to the rank of lieutenant in 1852, captain in 1854, lieutenant-colonel in 1869, and colonel in 1870. After a period of service in Mexico and Algeria he was appointed to the command of a division of the Second Army Corps (l'Armée du Rhin) upon the outbreak of the Franco-Prussian War, and participated in the battle of Spichern, and in the defense of Metz. Afterwards he became commander of the Eighteenth Army Corps, and rendered distinguished services at Baune la Rolande and Villersexel, where the French Army gained one of the few victories of the war. He was minister of war in the cabinets of Freycinet (1882-83) and Meline (1896-98).

BILLROTH, bil'rôt, THEODOR (1829-94). A German surgeon. He was born at Bergen, on the island of Rügen, and studied medicine at the universities of Griefswald, Göttingen, Berlin, and Vienna. He was the assistant of Langenbeck at Berlin, and was appointed professor of surgery at the universities of Zürich (1859) and Vienna (1867). Billroth was one of the greatest operators of modern times, and one of the foremost promoters of histology, pathology, and military surgery. His publications include the following valuable contributions to medical literature: *Die allgemeine chirurgische Pathologie und Therapie* (translated into nearly all the principal languages of Europe, as also into the Japanese, 1863, 15th ed., 1893); *Chirurgische Briefe aus den Kriegslazaretten in Weissenburg und Mannheim* (1870-72); *Ueber den Transport der im Felde Verwundeten und Kranken* (1874); *Die Krankenpflege im Haus und im Hospital* (1900).

BILNEY, bil'nî, or **BYLNEY**, THOMAS (1495?-1531). An English martyr. He was born probably at Norwich; studied at Trinity Hall, Cambridge, and in 1519 was ordained priest. After a study of Erasmus's Latin *New Testament* (1516), he denounced the scholastic doctrine of 'good works,' as well as saint and relic worship, and pilgrimages to Walsingham and Canterbury. He was arraigned before Cardinal Wolsey in 1527, and, having recanted, was absolved, but confined in the Tower until 1529. In 1531 he began field preaching in Norfolk, but was soon arraigned, condemned as a heretic, and burned at Norwich.

BILOXI, bi-lôks'î. A city in Harrison County, Miss., 60 miles southwest of Mobile, Ala.; on Biloxi Bay, extending from the Gulf of Mexico, and on the Louisville and Nashville Railroad (Map: Mississippi, H 10). A popular resort. It has a beach six miles long, fine shell-paved streets, and beautiful surroundings. A Federal building, to cost \$150,000, and improvements on the channel to secure a deep-water harbor, are projected for the immediate future. Biloxi is the centre of an extensive canning industry, including oysters, shrimp, crabs, fruits, and vegetables; and has shipyards, ice factories, and manufactures of lumber in various products. In 1890 Iberville (q.v.) established a settlement at

a point across the bay from the present city and named it Biloxi, from the Biloxi Indians. He also built near by a fort (Fort Maurepas), which was the first French fortification in this part of the country. In 1701 the settlement (now known as Old Biloxi) was abandoned because of a destructive fire, and about 1712 a permanent settlement, the first within the present limits of Mississippi, was made on the present site. For several years in the early part of the Eighteenth Century, Biloxi was the capital of the French territory in this part of North America. It was incorporated as a town in 1872 and as a city in 1896, the date of the charter now in force, which provides for a mayor, elected every two years, and a city council. Population, in 1890, 3234; in 1900, 5467. For the history of Old Biloxi (1699-1701), consult French, *Historical Collections of Louisiana*.

BILOXI. A small tribe of Indians, originally residing about Biloxi Bay, on the Gulf coast of Mississippi, whence they removed to Louisiana, probably early in the Eighteenth Century. From their geographic position and alliances it was long assumed that they were related to the Choctaws, but in 1886 Gatschet discovered a few families in Louisiana still speaking their language, and demonstrated that it is a detached dialect of the great Siouan stock.

BILSE, bil'se, BENJAMIN (1816—). A German musical conductor, born at Liegnitz. He became conductor of the orchestra in his native city and brought it to such a degree of perfection that in 1867 he could undertake to give orchestral performances in Paris during the exhibition. From 1864 to 1884 he was established at the Concerthaus, Berlin, where his popular concerts attracted large audiences. With his orchestra of seventy members he undertook several tours through Germany, Belgium, northern France, and Poland, and also visited Saint Petersburg. His repertory was very extensive.

BILSTON, bil'ston. A town of Staffordshire, England, situated on rising ground, about 2 miles southeast of Wolverhampton (Map: England, D 4). It forms a part of the parliamentary borough of Wolverhampton. It has extensive iron and coal mines, iron-smelting works, iron foundries for making machinery, besides works for manufacturing tin-plate goods, japanned and enameled wares, nails, wire, screws, and coarse pottery. Fine sand, adapted for metal-casting, is found here. The municipality owns and operates its water-works and maintains public baths and parks. Population, in 1891, about 23,500; in 1901, 24,000.

BIMA, hē'mā. See BHIMA.

BIMBASH'I. See BASHI.

BIM'BISA'RA. A king of Magadha, the modern Bihar, one of the earliest friends and protectors of the Buddha, whom he presented with the famous pleasure-park, *Veuana*. Bimbisara reigned in the Sixth Century B.C. for fifty-two years, and he was murdered by his son, Ajatashatru. According to other accounts, however, Bimbisara reigned only twenty-eight years.

BI'MELER, J. M. See BÄUMELER, JOSEPH MICHAEL.

BIMETALLISM (Lat. *bis*, twice + *metallum*, metal). The name given to a monetary system in which both gold and silver stand upon

precisely the same footing as regards mintage and legal tender. The practical difficulties which in times past have confronted the maintenance of a concurrent circulation of the two metals have led one nation after another to abandon the effort, and to adopt a system of monometallism, with gold as its basis. The historical development of coinage in modern nations has been from silver monometallism through a more or less unsatisfactory experience with bimetalism to the single gold standard.

The English monetary notation with the pound as the unit recalls the origin of English money, with a pound of silver as its basis. By successive debasements the coinage of the monetary pound parted company with the pound weight, until, in the time of Elizabeth, the pound weight of silver was coined into 62s. instead of 20s. Gold coinage had been introduced by Edward III., but a long course of experimentation, often of a most arbitrary nature, both with the silver coinage and the gold coinage, had failed to accomplish any satisfactory adjustment of their mutual relations. During this whole period silver was in theory the standard coin of the realm, and was so considered when William III., in 1699, completed the recoinage of the silver coin. His Government fixed the value of the guinea at 21s. 6d., but as this overrated gold, the silver coinage, in excellent condition from its recent passage through the mint, was rapidly exported, and the loss of the small change caused great inconvenience among the people. On the advice of Sir Isaac Newton, then master of the mint, the guinea was in 1717 declared to be equal in value to 21s. This mitigated the evil, but did not remove it. Silver could be freely minted, as before, but since its market value was higher than its legal value, it was not carried to the mint. For all larger payments gold became the exclusive medium of exchange, for there was scarcely enough silver to meet the needs of retail trade. During the course of the century the stock of silver coin was not replenished, and the money in circulation became extremely abraded. This depreciation of the coin led, in 1774, to the law that in sums of £25 and upward silver should be legal tender by weight only, and not by tale. By the coinage law of 1816 silver was reduced to the place of a token coinage. By that law, 66s. were to be coined from the pound weight of silver, though the mint price paid to individuals remained, as before, 62s. for the pound. This threw the coinage of silver in fact upon the Government, and by the coinage act of 1870 the right of individuals to take silver to the mint for coinage was abolished. By these successive steps England legalized the single gold standard, which had in fact been in operation since 1699 at least.

Other nations were slow to follow this example. By the monetary law of 1801 France contemplated the 5-franc silver piece as the standard money, but in fact established a bimetallic system. In the first half of the century silver remained the usual currency of the country; but after the discovery of gold in California and Australia and the fall of the price of gold relatively to silver, the French law favored the coinage of gold. Silver disappeared from circulation, and the lack of small change led in 1860 to the reduction of the smaller silver coins to tokens by increasing the percentage of alloy. Similar

but not uniform action by contiguous countries which used the same coin, and were accustomed to regard all francs as identical, irrespective of the heads upon the coins, led to much inconvenience, and finally, in 1865, to the Latin Monetary Union for a common basis of coinage among nations using the franc system. The 5-franc piece, then little coined, was not disturbed, but the subsequent fall in the price of silver led to such excessive and unequal coinage by the several States composing the Union, that agreements were entered into restricting, and finally abolishing, in 1877, the further coinage of the 5-franc piece. By this action, France, Belgium, Switzerland, Italy, and Greece were added to the ranks of the gold-standard nations. Germany, which had been exclusively upon a silver basis until 1871, in that year adopted the gold standard as one of the elements of the unification of the coinage following the establishment of the Empire. Indeed, her action in throwing her stock of silver in the following years upon a market which was already falling, is deemed to have been an important factor in leading the Latin Union States to abandon silver. The Scandinavian countries and Holland followed the example of their neighbors in the seventies, while Russia and Austria, then in the toils of a paper currency, were unable to take such action until the close of the century.

The United States until the outbreak of the Civil War had been legally upon a bimetallic basis. As in France, the outflow of silver following the gold discoveries of the middle of the century had led to laws making the silver fractional coins tokens of limited legal tender. In the revision of the coinage laws in 1873, when we were yet upon a paper basis, the silver dollar was dropped from the laws, and gold became the nominal standard. With the return to a metallic currency, a reaction in favor of silver set in. Various unsuccessful attempts were made to reestablish the free coinage of the silver dollar. The strength of the silver advocates was sufficient to bring about a series of compromise measures which, without removing all restrictions upon the coinage of silver, materially increased the volume of silver in the circulation of the country, and at times threatened the maintenance of the gold standard. The law of 1878 provided for the purchase of not less than two million dollars' worth of silver monthly nor more than four million dollars' worth, and the coinage of the bullion thus purchased into silver dollars of 412½ grains standard silver nine-tenths fine. Under this law nothing more than the minimum amount was purchased and coined. In some respects the law of 1890 went further in providing that the Secretary of the Treasury should purchase monthly 4,500,000 ounces of silver bullion and issue Treasury notes for the purchase price of the same. Both the silver dollars and the Treasury notes of 1890 enjoyed the full legal-tender quality. The policy of purchasing silver was abandoned in 1893. In 1896 the Presidential election hinged upon the declaration of the Democratic platform in favor of the free coinage of silver by the United States in the ratio of 16 to 1. The defeat of the Democratic candidate and subsequent adoption of the currency law in 1900 still further strengthened the gold standard legislation of the nation. These, with the cessation of silver coinage in India, and the adoption of

the gold standard by Japan, are in brief the salient features of the history of the standards among modern nations. For a more detailed account of the historical aspects of the case, the reader should consult the articles *LATIN UNION*; *MONETARY COMMISSIONS*; *MONETARY CONFERENCE*; and *MONEY*.

The arguments advanced by the advocates of the opposing systems may now be passed in review. In the first place, it should be stated that in its modern form the question of bimetallism is one of standards and not of circulation. If in earlier days the problem was to secure the concurrent circulation of gold and silver coin to meet the needs of wholesale and of retail trade, this aspect of the question is no longer important, for means have been found to insure this result without a resort to bimetallism. Almost equally irrelevant is the objection often heard to the use of silver as standard money because of its bulk and weight. This is an objection perfectly well founded, to be sure, against the circulation of silver coin, but not against silver as standard money. For silver money may and does circulate through its paper representatives, as the notes of the Bank of France or the silver certificates of the United States amply testify. In the same line of argument, the contention that bimetallism exists everywhere in fact, because wherever gold is used, silver must also be used in the monetary circulation, has no bearing upon the controversy. Only the most inexperienced in monetary affairs would attach the name bimetallism to the circulation of the two metals side by side, irrespective of the laws which govern their coinage. For it is the essence of bimetallism, as appears in our definition, not simply that both metals should be coined, but that both should be coined on precisely the same legal footing, and possess the same legal-tender qualities. They may circulate together, yet stand upon a wholly different basis. Thus, in the United States, the subsidiary silver coins are limited both in amount and in legal tender, while the silver dollars, though unlimited in legal tender, are limited in amount. Both stand obviously upon a wholly different footing from gold, which not only possesses unlimited legal tender, but which can be coined at the instance of individuals without restriction of amount. It is that element in the metallic currency which is freely expansible by law which gives the standard.

The advocates of bimetallism have laid stress upon two results which they say would follow the adoption of their system: (1) The regulation of exchanges between the various nations; (2) the attainment of a more stable standard of value. They point out that the use by some nations of gold and others of silver as the monetary standard produces a fluctuating par of exchange between gold and silver nations which impedes commerce and causes great uncertainty in their mutual relations. To the extent that uncertainty prevails as to the return when the prices attained in one country are translated into the standard of the country which has sold the goods, to that extent is trade rendered difficult. The liability to loss through exchange enhances the prices of goods sold. It is further pointed out that the varying tendencies of prices under one standard, as compared with another, acts as an unnatural impediment or stimulus to trade. If gold prices and the gold price of silver fall alike,

silver-using nations may export to gold countries without any loss, while gold countries find prices falling. Thus, if wheat falls in price in England, exporters in India suffer nothing, while exporters in the United States must be content with lower prices. A fall in the gold price of silver accompanies a fall in the prices of other commodities in gold countries, but the relation of silver to commodities remains the same, and no enhancement of general prices ensues in silver-using countries.

A more important tenet of the bimetallic creed is that such a system produces a more stable standard of value. The evils of instability in the monetary standard are thoroughly conceded by all parties. As illustrated in the fluctuating fortunes of paper money, they are patent to all. Under a metallic system, changes in the value of the standard are more gradual and less revolutionary in their effects. Yet they exist, none the less, and reveal themselves in the ups and downs of general price movements. It is only after some study that persons understand that prices and the value of the standard are reciprocals; that low prices mean a high value of money and high prices a low value of money. The economic effects of changes in the value of money must be studied in the effects of price-changes. Downward movements representing an enhanced purchasing power of money redound to the benefit of creditors and bear heavily upon debtors, who require a larger produce to fulfill their obligations. Upward movements lighten the burden of the debtor, while they shrink the purchasing power of what the creditor receives, and thus work to his injury. Such changes are not without profound effects upon the general conditions of trade and industry. Bimetallism proposes to eliminate in a large measure these evils, furnishing a more stable standard. Instability of the standard rests upon the fluctuations in the production of the metals. It is argued that by uniting in the monetary standard two metals instead of one, the fluctuation in the production will be diminished. The aggregate product is less likely to vary than is the product of each, the changes in the production of the one being offset by changes in the production of the other.

In reply to these claims and assertions, the gold monometallists have taken several positions. In the first place, some have contended that the evils which bimetallicists seek to redress are of no great consequence. In the second place, others have contended that as a plan of relief bimetallicism is out of the question because it will not work in practice. And finally, granting the possibility of bimetallicism, it is claimed that we have no guarantee that it would actually relieve the situation.

It is an extreme view that the changes in prices, which constitute the chief stay of the bimetallic argument, have no relation to the money supply. If this, however, be true, a system which, like bimetallicism, aims at working upon prices through the money supply is useless. If this extreme view has not been adopted by all monometallists, it is yet represented. Another and somewhat more moderate view of the same proposition is the claim that such changes in prices have worked far less disturbance than the bimetallicists have claimed, and that if they involve some disadvantages, they have some com-

pensations which the bimetallicist in his ardor has overlooked.

More important, and occupying a larger place in the bimetallic controversy, is the standpoint that bimetallicism will not work; that no legal enactment can so fix the relative values of silver and gold as to insure their concurrent circulation. In this view bimetallicism is not a double standard, but an alternating standard. Divergencies between the legal ratio and the market ratio being bound to occur, Gresham's Law immediately enters into operation. The more valuable metal is no longer brought to the mint, and the existing stock in the circulation is exported. Monometallists claim this to be inevitable. They tell us that law cannot fix values; that the relative value of gold and silver in the market will be fixed by commercial considerations, especially by the cost of production. Any attempt on the part of governments to interfere with the operations of these laws must be fruitless. To these considerations the bimetallicist replies by calling attention to the predominating influence of demand as a factor affecting the value of the precious metals. He points out that as the existing stock is much greater than the annual accretions, the cost of producing these cannot be the sole criterion of the value of the mass. He points out further that the demand for the use of the metals as money far outstrips any other demand. He therefore concludes that law can and does affect the value of the metals and is competent to fix the rates between them; that if the monetary demand thus created be strong enough, the commercial ratio must adjust itself to the legal ratio. Both sides of the controversy appeal to the facts of history as bearing out their contentions. On the one hand, the monometallist points to the fact that the French law of 1801 which established the legal ratio of $15\frac{1}{2}$ to 1 between gold and silver did not control the market ratio, but there was always a divergence between them, leading now to a preference for gold and now to a preference for silver in the French coinage. The bimetallicists concede that such divergence might have prevented both silver and gold being carried to the mint at the same time; that they might have determined which of the metals would be preferred for export; but they strenuously deny that they caused the export of one metal or the other. If the French law gave but an imperfect picture of the workings of the bimetallic system, it is only a proof to the advocates of the latter that the area within which it worked was too restricted. Enlarge the scope of the law by an international agreement embracing the leading commercial nations, and it would, they claim, be proof against fluctuations of ratio. Hence the agitation for a bimetallic standard has been for an international bimetallic system.

Finally, the monometallists are frequently willing, for argument's sake, to concede the practicability of bimetallicism, that they may put the further question, What would be gained? The evil to be remedied is an unstable standard. What guarantee have we that two metals would be better than one? The bimetallicists claim a compensatory action; that irregularities in the supply of one metal will outbalance those of the other. They assert that a greater stability would follow the introduction of their system from the fact that by distributing the variation over a

wider area, the full supply of both metals offering a much more extensive surface, the effect would be far less perceptible. "Imagine," says Professor Jevons, "two reservoirs of water, each subject to independent variations of supply and demand. In the absence of any connecting pipe, the level of the water in each reservoir will be subject to its own fluctuations only. But if we open a connection, the water in both will assume a certain mean level, and the effects of any excessive supply will be distributed over the whole area of both reservoirs." They point to the experiences following the discovery of gold in the middle of the century as proof. In 1846 gold was produced to the extent of \$30,000,000 and silver to that of \$32,500,000. In 1852 the figures were, for gold \$150,000,000, and for silver \$42,500,000. In other words, gold was advanced fivefold, but the combined product of gold and silver only threefold. This moderated the effect of the gold discoveries upon prices. The monometallists contest this theory and deny that it rests on a sufficient basis of historical fact. They hold that there are no inherent reasons why the combined production of gold and silver should not under a bimetallic system fluctuate quite as much as the production of gold alone.

We have endeavored to state the case between the two parties as one of pure theory. In so doing we fail to give any adequate idea of the heat of the controversy and the passions which it has aroused. To understand properly the ardor of the struggle, a brief reference to the historical setting of the discussion is perhaps desirable. The great bulk of the theoretical and controversial literature upon the subject appeared in the period between 1873 and 1898. This was a period of steadily falling prices—a period, upon the whole, of commercial depression. Trade languished, and the burden of debt grew heavier. The gold product was growing less each year, yet the general adoption of the gold standard with increased population, and an extension of the use of a money economy made a constantly increasing pressure upon the gold supply. Bimetallism seemed to promise a relief from the deadening effects of falling prices, and the industrial world lent a ready ear to its plans. It was not so much a conviction that bimetallism was right as a deep-seated feeling that the gold standard was wrong which gave such wide acceptance to its propositions. For the moment the pressure of immediate necessity has been removed. The new output of gold in the world, which brings the annual production higher than in the palmiest days of California and Australia, has induced a régime of rising prices which has cured the evils of which men complained without any radical monetary legislation such as bimetallism contemplated.

The literature of bimetallism is extensive, and no statement of references can be complete. An exhaustive bibliography on the money question was issued in 1878 as an appendix to the *American Report of the International Monetary Conference*. (Consult Horton, *The Monetary Situation*, Cincinnati, 1878.) Since that time the output has been enormous. The bimetallic theory claims the authority of Wolowski and Cernuschi in France; Malou and de Laveleye in Belgium; Mees, Vrolik, Van den Berg, and Boissevain in Holland; Seyd, Nicholson, and Foxwell in England; Arendt in Germany; Haupt in Austria;

Horton, F. A. Walker, and Andrews in the United States. On the side of the single standard are many of the older English economists—Locke, Petty, Harris; later Lord Liverpool, Tooke, Ricardo, and J. S. Mill, and, more recently, Giffen—and among American writers, Wells and Laughlin. For a clear notion of the controversy, consult: Walker, *International Bimetallism* (New York, 1896); and Giffen, *Case Against Bimetallism* (London, 1896). Other works to be commended are: Nicholson, *Money and Monetary Problems* (London, 1897); Horton, *The Silver Pound* (London, 1887); Walker, *Money* (New York, 1878) and *Money, Trade and Industry* (New York, 1879); Andrews, *An Honest Dollar* (Hartford, 1894); *Report of the Monetary Commission of the Indianapolis Convention* (Chicago, 1898); Helm, *The Joint Standard* (London, 1894); Taussig, *The Silver Situation in the United States* (New York, 1893); White, *Money and Banking* (Boston, 1896); Laughlin, *History of Bimetallism in the United States* (New York, 1897); and Price, *Money and Its Relations to Prices* (London and New York, 1896).

In official literature, the *Report of the United States Monetary Commission* (1876); the *Reports of the Monetary Conferences* (1878, 1881, and 1892); the *Reports of the Royal Commission on the Depression of Trade* (1883) and on *the Relation of Gold and Silver* (1886); the *Report of the Indian Currency Commission* (1893); and of the *Berlin Silver Commission* (1894) are important.

BINALONAN, bé'ná-lō'nán. A town of Luzon, Philippines, in the Province of Pangasinán, 27 miles east of Lingayen (Map: Luzon, D 2). It is situated in a densely wooded territory, at the junction of several high roads to the adjacent towns. Population, in 1898, 10,295.

BIÑAN, bé'nyán. A town of Luzon, Philippines, in the Province of Laguna, 41 miles west of Santa Cruz (Map: Luzon, F 9). It is situated in a great plain, near the Bay of Luzon, and is connected by high roads with Cavité and Manila, as well as with towns of the vicinity. Population, in 1898, 19,786.

BI'NARY SYSTEM. See DOUBLE STARS.

BIN - BIR - KILISSEH, bēn'bēr - kē'lē - sá' (Turk. *bin*, thousand; *bir*, one; *kilisseh*, church, from Gk. *ἐκκλησία*, *ekklēsia*). The name of extensive ruins in Karamania, Asia Minor, 20 miles north-northwest of the town of Karaman. The ruins consist chiefly of the remains of early Byzantine churches, of which four or five are in fair preservation and over thirty are in ruins. Bin-Bir-Kilisseh is supposed to be the ancient Derbe, though Hamilton identifies it with Lystra.

BINCHE, bānsh. A town of Hainaut, Belgium, on the Haine, 10 miles east-southeast of Mons (Map: Belgium, C 4). It is well built and walled, has manufactures of leather, cutlery, pottery, glass, etc., and a considerable trade in lace, paper, marble, and coal. Population, in 1890, 10,100; in 1900, 11,500.

BINDING, bīn'dīng, KARL (1841—). A German criminologist and jurist, born in Frankfurt-on-the-Main. He studied at the universities of Göttingen and Heidelberg, and in 1873 became professor of criminal law in Leipzig. Of his works on jurisprudence, *Die Normen und ihre*

Uebertretung (1872-77), in which he attempted a thorough revision of accepted theories respecting criminal law, is especially important. But one volume (1868) appeared of his *Das Burgundisch-Romanische Königreich*. In 1885 he established the *Systematisches Handbuch der deutschen Rechtswissenschaft*. Among his other publications may be mentioned *Die rechtliche Stellung des Kaisers im heutigen deutschen Reiche* (1898), and *Grundriss des deutschen Strafprozessrechts* (1899).

BINDRABAN, bin'drā-būn' (Skr. *Vraddavana*, a grove consecrated to Krishna or Vishnu), or **BRINDABAN**. A town on the Jumna, in the District of Muttra, Northwest Provinces, British India, situated 92 miles south of Delhi (Map: India, C 3). Population, 31,600. It is one of the sacred Hindu cities, and crowds of pilgrims come from all parts chiefly to do honor to Krishna. It has several superb temples and shrines, and, through the munificence of wealthy devotees, these are becoming more numerous and costly. Here, as at Benares, the immediate margin of the river is occupied by flights of steps, or ghats, extending for about a mile along the bank.

BINDWEED. See **CONVOLVULUS**.

BINET, bē'nā', ALFRED (1857—). A French psychologist, director of the laboratory of physiological psychology at the Sorbonne, Paris. He was born in Nice, July 8, 1857. He went to Paris in 1871, and, having studied law and medicine, turned his attention in 1880 to experimental and pathological psychology. He has contributed many articles to the *Revue philosophique*, the *Revue scientifique*, and *Mind*. His first book was *La psychologie du raisonnement; Recherches expérimentales par l'hypnotisme* (1886), in which he undertook to apply the method of hypnotism to psychological questions. In a similar vein was *Animal Magnetism* (Eng. trans., 1888), which he published in conjunction with Charles Féré. His other works are *Perception intérieure* (1887); *Etudes de psychologie expérimentale* (1888), comprising a section upon sexual psychology (fetichism in love), one upon the psychic life of micro-organisms (translated separately, 1889), and a third upon mental imagery; *Les alterations de la personnalité* (1892); *Introduction à la psychologie expérimentale*, in connection with Philippe, Courtier, and V. Henri (1894); *La fatigue intellectuelle*, with the collaboration of Henri (1898). Since 1895 Binet has also, together with H. Beaunis and Th. Ribot, edited *L'Année psychologique*, a yearly volume comprising original articles, a review of the progress of psychology, and an index of all publications which bear upon that science.

BINET, SATANÉ. A pen-name used by Francisque Sarcey.

BING'EN (anciently, *Bingium* or *Vincum*, capital of a Gallic tribe). A town in the Grand Duchy of Hesse, Germany, 17 miles west of Mainz, and nearly opposite Rüdeshcim (Map: Germany, B 4). It is situated in a charming country on the left bank of the Rhine, at the mouth of the Nahe, here crossed by a mediæval bridge, built on the foundation of the Roman bridge of Drusus, a name the bridge still bears. Its Gothic parish church, dating from the Fifteenth Century, contains a fine crypt of much

older date. Bingen possesses a Realschule, and a number of other educational institutions. In the vicinity of the town is the Rochusberg, with a chapel, to which annual pilgrimages are made. On the other side of the Nahe is the Rupertsberg, with the ruins of a monastery, in which Saint Hildegard resided in the Twelfth Century. Below the town is the celebrated Binger Loch, formerly a dangerous point in the navigation of the Rhine, but since 1834 rendered safe through the deepening of the channel. In the middle of the river stands the Mouse Tower, in which, according to the legend, Archbishop Hatto was devoured by mice in the year 969. Bingen's principal industries include the manufacture of starch and tobacco, and there is a large trade in wine. Population, in 1895, 8187; in 1900, 9670. Bingen was a town of the ancient Belgæ. Drusus built a castle there and threw a bridge across the Rhine, in B.C. 13. In 1281 it came under the rule of the Archbishop of Mainz. During the Thirty Years' War, it was taken in turn by the French, the Swedes, and the Imperialists. In 1689 the French burned the town and blew up the castle. From 1797 to 1814 the town belonged to France. In 1815 it became a part of Hesse.

BINGER, bān'zhā', LOUIS GUSTAVE (1856—). A French African explorer, born at Strassburg. In 1887 he started from Bammako, explored Sikaso, and then turned to Kong, which he was the first European to explore. After disproving the hitherto accepted theory that there were mountains in that region, he visited Baromo and Wagadugu (1888), and in 1889, reached Grand Bassam. By treaties, he succeeded in placing Tieba, Kong, and Bontuku under a French protectorate, and thus laid the foundation of a French Sudanese empire. He returned to West Africa in 1892, as French commissioner for the settlement of the Ashanti boundaries with England, and after serving as governor of the French territory on the Ivory Coast (1896), became director of the French colonial department in 1898. His chief publications are *Du Niger au golfe de Guinée, par le pays de Kong et de Mossi* (1891), and *Esclavage, Islamisme et Christianisme* (1895).

BINGHAM, bing'am, JOHN ARENDE (1815-1900). An American jurist and legislator. He was born at Mercer, Pa., and was educated at Franklin College, Ohio. From 1855 to 1863 he served as a representative in Congress from Ohio, and was chairman of the House board of managers in the impeachment trial of West W. Humphreys, United States district judge of Tennessee, who, in an address delivered at Nashville December 29, 1860, had advocated secession, and was consequently accused of high treason. Mr. Bingham subsequently prepared and introduced the Fourteenth Amendment to the Constitution of the United States. He conducted the prosecution of Mrs. Surratt and others charged with complicity in the plot to assassinate President Lincoln and his cabinet, and was chairman of the board of impeachment of Andrew Johnson in 1868. After serving four additional terms in Congress (1864-72), he was, in 1873, appointed United States minister to Japan, which position he held until 1885.

BINGHAM, JOSEPH (1668-1723). An English clergyman. He was educated at Oxford, was a tutor there in 1691, and somewhat later was a

rector near Winchester. Here he wrote his valuable *Antiquities* of the Christian Church (1708-1722), which has often been reprinted and translated into various languages. He was subsequently rector at Havant.

BINGHAMTON, bing'am-ton. A city and the county-seat of Broome County, N. Y., on the New York, Lake Erie and Western, the main line and branches of the Lackawanna, and the Delaware and Hudson railroads (Map: New York, E 3). It occupies an area of 10 square miles at an elevation of about 850 feet, and has a picturesque location. The Susquehanna and Chenango rivers unite within the city, and are crossed by several bridges. Among the more prominent buildings may be mentioned the Stone Opera House, courthouse, city hall, post-office, State Hospital for the Insane, city hospital, State armory, Central High School, and Susquehanna Valley and Saint Mary's homes for orphan children. Other features of interest are Ross Park, of about 100 acres, Bennett Park, the driving park, and exposition grounds. The city contains a law library of the Supreme Court and a city and school library of over 13,000 volumes. Binghamton has extensive manufacturing industries, which include cigars, spices, carriages and carriage-trimmings, wagons, sleighs, leather, boots, shoes, clothing, hats, felt, scales, time-recording clocks, motors, dynamos, electrical apparatus, steam and gas engines, furniture, glass, bottles, hoes, proprietary medicines, wood-alcohol, and envelopes. First settled in 1787, Binghamton was called Chenango Point until, in 1800, its situation was slightly changed and its present name adopted in honor of William Bingham, the proprietor of the land in the vicinity. It was incorporated as a village in 1834, and in 1867 as a city. Its charter provides for a mayor, elected biennially, who appoints the boards of fire, police, street, civil service, and school commissioners, and a city council which controls the appointments of other important officials excepting the city judge, assessors, and board of water commissioners, chosen by popular vote. The annual expenditures of the city amount to about \$520,000, the principal items of expense being \$30,000 each for the departments of fire and police, and \$130,000 for schools. The water-works, built by the city in 1867, are under municipal operation. Population, in 1890, 35,005 in 1900, 39,647. Consult: Wilkinson, *The Annals of Binghamton* (Binghamton, 1840); and Lawyer, *Binghamton, Its Settlement, Growth, and Development* (Binghamton, 1900).

BINGLEY. A town in the West Riding of Yorkshire, England, on the Aire, and the Leeds-Liverpool Canal, 15 miles west-northwest of Leeds (Map: England, E 3). It has considerable worsted, cotton, and paper manufactures. The town owns its water and gas works and maintains a free public library and baths. Population, in 1891, 17,400; in 1902, 18,500.

BINMALEY, bèn'má-lá'è. A town of Luzon, Philippines, in the Province of Pangasinan, 3 miles east of Lingayen (Map: Luzon, C 2). It is situated in a level region, on the Gulf of Lingayen. Population, in 1898, 13,787.

BIN'NACLE (earlier *bittacle*, Portug. *bitacola*, corrupted from Lat. *habitaclum*, dwelling-place, from *habitare*, to dwell). A stand for con-

taining and supporting a ship's compass and its correctors. It is made of brass or wood. The binnacle-cover is dome-shaped and fits down over the top of the binnacle, protecting the compass; it contains lamps for lighting up the compass-card at night, and has a glass plate let into the rear side through which the helmsman can see the compass and thus ascertain the direction of the ship's head.

BINNENHOF, bin'nèn-höf. See HAGUE.

BINNEY, Amos (1803-47). An American physician. He was born in Boston, Mass., October 18, 1803, and died in Rome, February 18, 1847. He was a man of wealth, a patron of artists and scientists, and an early president of the Boston Society of Natural History. He wrote *Terrestrial and Air-Breathing Mollusks of the United States* (Boston, 1847-1851; Gould's edition, 1851-59).—**BINNEY**, W. G. (born 1833), son of Amos Binney, is a conchologist of note who resides at Burlington, N. J. Besides editing his father's works in a new edition published in the *Bulletin of the Museum of Comparative Zoölogy* (Vol. IV., 1878), the latter has written *Land and Fresh-Water Shells of North America* (Smithsonian Institution, Washington, 1869), and many special papers on this subject. The collection of land and fresh-water shells of North America, and preparations of their anatomy, made by the two Binneys, are in the Museum of Comparative Zoölogy at Harvard University.

BINNEY, HORACE (1780-1875). An American lawyer. He was born in Philadelphia, graduated at Harvard in 1797, studied law in the offices of Jared Ingersoll, was admitted to the bar in 1800, and gradually acquired an extensive practice. Between 1807 and 1814 he published *Binney's Reports*, in six volumes, of the decisions of the Supreme Court of Pennsylvania. Though averse to public life, he served in the Twenty-third Congress and took a distinguished part, as an opponent to the Administration, in the debates over the removal of public deposits from the United States Bank. He then withdrew from active practice in the courts, and until 1850, when he retired altogether from the bar, confined his legal practice to the preparation of written opinions. Perhaps his most famous case was that of *Bidal vs. Girard's Executors*, which he argued before the United States Supreme Court in 1844. His argument in this case is considered to have greatly modified the old conception of the law of charities. Binney was frequently called upon to speak before public meetings, and he published addresses on the *Life and Character of Chief Justice Tilghman* (1827) and the *Life and Character of Chief Jus-*

BINNACLE.

tics Marshall (1835). He also published *A Sketch of the Life and Character of Justice Bushrod Washington* (1858); *Leaders of the Old Bar of Philadelphia* (1858); *An Inquiry Into the Formation of Washington's Farewell Address* (1858); and three pamphlets (1862-63) on *The Privilege of the Writ of Habeas Corpus Under the Constitution*, in which he strongly supported President Lincoln.

BINNEY, THOMAS (1798-1874). An English non-conformist divine, born at Newcastle-on-Tyne. He studied at the theological seminary at Wymondeley, Hertfordshire, and in 1824 became pastor of Saint James's Street Congregational Chapel, Newport, Isle of Wight. From 1829 to 1869 he was pastor of King's Weigh-House Chapel, London, and from 1869 was professor of homiletic and pastoral theology at New College, London. For forty years he was famous as a pulpit orator. He was known also as a keen controversialist, and published numerous pamphlets in discussion with representatives of the Establishment. He exerted an important influence in the enrichment of the musical services of Dissenters, and wrote considerable devotional verse, of which the hymn "Eternal Light! Eternal Light!" is most familiar. His publications include: *Is It Possible to Make the Most of Both Worlds?* (1853); *Micah, the Priest-Maker* (1867); and other works. Consult J. Stoughton, *Memorial of the Late Thomas Binney* (London, 1874).

BINOCULAR MICROSCOPE. See MICROSCOPE.

BINOCULAR TELESCOPE. A telescope with two tubes and two separate systems of lenses. See OPERA-GLASS and TELESCOPE.

BINOMIAL (Lat. *bis*, twice + *nomen*, name, thing, item). In algebra, an expression consisting of two terms connected by the sign + or -; e.g. $a + b$, $(a + b) - c$. Each term of the binomial may be a polynomial (q.v.).

BINOMIAL COEFFICIENTS. The coefficients of the various terms in the expansion of a binomial, as of $(a + b)^n$. The general form for the k th coefficient after the first, which is 1 (when n and k are integral), is the same as the combination of n things taken k at a time; i.e. $C_n, k = \frac{n(n-1) \dots (n-k+1)}{1 \cdot 2 \cdot 3 \dots k}$, symbolized as $\binom{n}{k}$.

There are certain interesting relations between these coefficients, e.g. $\binom{n}{k} = \binom{n}{n-k}$, $\binom{n}{n} = 1$, $\binom{n}{k} + \binom{n}{k+1} = \binom{n+1}{k+1}$, $1 - \binom{n}{1} + \binom{n}{2} - \binom{n}{3} + \dots + (-1)^n \binom{n}{n} = 0$.

BINOMIAL THEOREM. A general formula for raising a binomial, as $a + b$, to any power, the meaning of the word power being extended to include exponents which are not positive integers. The formula is:

$$(a + b)^n = a^n + na^{n-1}b + \frac{n(n-1)}{1 \cdot 2}a^{n-2}b^2 + \frac{n(n-1)(n-2)}{1 \cdot 2 \cdot 3}a^{n-3}b^3 + \dots + \frac{n(n-1) \dots (n-n+2)}{1 \cdot 2 \dots (n-1)}a^{n-n+1}b^{n-1} + b^n$$

where n may be any rational, irrational, imaginary, or complex number. In case n is not a

positive integer the expansion is an infinite series, which, unless convergent, is not equivalent to the given function to be expanded.

The truth of the binomial theorem for positive integral exponents has long been known to mathematicians, but Newton first extended its application and emphasized its general usefulness.

BINON'DO. A suburb of Manila (q.v.), situated on the right bank of the Pasig River.

BINTURONG, bin'tô-rông (native name). A large arboreal civet (*Arotitis binturong*), allied to the paradoxures, but representing a separate genus of the Viverridæ. It inhabits the Malay Peninsula and islands, and is $2\frac{1}{2}$ feet long in body, with a bushy tail nearly 3 feet in length and prehensile, assisting it in climbing. It passes its day asleep in a tree, and at night hunts in a slow, cautious way for animals, birds' nests, etc., and also seems to eat vegetable substances. The adult is black, but younger specimens are grizzled or yellowish. Its fur is long and harsh, and it has long, bristly brown hairs about the mouth, ears, and eyes, giving it a very strange appearance. Its nature is fierce, but it is frequently kept in captivity.

BINZ, bints, KARL (1832—). A German physician and pharmacologist, born at Bernkastel. He studied at Würzburg, Bonn, and Berlin, and in 1868 became professor at Bonn. In 1869 he founded the pharmacological institute there. His more important investigations have to do with experimental pharmacology and pathology. The action of quinia was first defined by him. His publications include: *Experimentelle Untersuchungen über das Wesen der Chininwirkung* (1868); *Das Chinin nach den neuern pharmakologischen Arbeiten* (1875); *Ueber den Traum* (1878); *Vorlesungen über Pharmakologie* (1891); and *Aether gegen den Schmerz* (1896).

BINZER, bints'er, AUGUST DANIEL VON (1793-1868). A German author. He was born at Kiel and studied law at the universities of Kiel and Jena, where he became closely identified with the *Burschenschaft*, or students' society, which was dissolved in 1819. Afterwards he taught and edited papers in various parts of Germany. He is the author of two famous songs: "Wir hatten gebauet ein stattliches Haus," written on the dissolution of the Burschenschaft, and "Stosset an," which still retain their popularity. Among the works published by him are *Venedig im Jahre 1844* (1845); *Erzählungen und Novellen*, written in collaboration with his wife and published under the pseudonym of A. T. Beer (1856). He also translated Benjamin Franklin's *Autobiography and Writings* (1829) and the *Night Thoughts*, by Edward Young.

BIO-BIO, bē'ô-bē'ô. An eastern province of Chile, bounded by Argentina on the east, the Chilean Province of Malleco on the south, and Concepcion on the west and north (Map: Chile, C 11). Area, 4158 square miles. The surface is generally mountainous and well wooded. In the lower parts the soil is mostly sandy. The chief river is Bio-Bio. There is a large trade in timber, and the western part of the province is crossed by the railway line leading from Concepcion to Angol. Population, in 1895, 88,749. The capital, Los Angeles, is situated near the railway line, and had a population in 1895 of 7868.

BIO-BIO. The largest river of Chile. It rises in the Cordilleras, and after a northwesterly course of about 220 miles, with its lower reaches along the great valley between the Andes and the Coast range, empties into the Pacific Ocean just below Concepcion (Map: Chile, C 11). It has a number of tributaries, has a width of 2 miles at its mouth, and becomes navigable at Nacimiento.

BIOGENESIS (Gk. *bios*, *bios*, life + *genesis*, origin, source). The doctrine that the series of forms which an animal passes through in developing from the egg to the adult is an epitome of the stages in the evolution of the species. This is stated briefly in the expression: Ontogeny recapitulates phylogeny. The truth of this doctrine seems to have been recognized long ago, according to Meckel (1811) by Aristotle, Halley, Harvey, Kielemeyer, Autenreith, and many other early authors. The law is often called Von Baer's, because in his great work on the development of animals (1828-37) he demonstrated its truth in detail. Louis Agassiz also laid stress on this law, although he did not accept evolution. The law is based upon observed parallelisms between ontogenetic changes and assumed evolutionary ones. Thus, at an embryonic stage, man possesses gill-slits and a two-chambered heart, like a fish; later the gill-slits close and the heart becomes reptilian. A tail like that of lower apes is present at a later stage. At birth the child grasps things with its feet, as the higher apes do, and not until several months after birth are the essentially animal instincts replaced by the human. To render the terminology of the stages of ontogeny and phylogeny more precise, and at the same time comparable, the following terms have been introduced by Alpheus Hyatt:

ONTOGENY OR DEVELOPMENT		PHYLOGENY OR EVOLUTION OF THE PHYLUM	
Stages	Stages	Stages	Dynamical Terms
Embryonic.....	Embryo or fetal	Phylembryonic.....	
Neplonic.....	Baby	Phyloneplonic.....	Epacme
Neanic.....	Adolescent	Phyloneanic.....	
Ephebic.....	Adult	Phyloephebic.....	Acme
Gerontic.....	Senile	Phylogerontic.....	Paracme

The recapitulation law remains unexplained; it does not hold in detail, but only in a rough and general way. "The embryonic record," says Balfour, "as it is usually presented to us, is both imperfect and misleading. It may be compared to an ancient manuscript with many of the sheets lost, others displaced, and with spurious passages interpolated by a later hand." See **EMBRYOLOGY**; and **GASTRÆA THEORY**.

Abiogenesis, though apparently merely the negation of 'biogenesis,' has a somewhat different meaning, the term signifying reproduction by spontaneous generation—not now accepted as a fact in any case.

BIOGEOLOGY. See **PALEONTOLOGY**; **PALEOBOTANY**; and **GEOLOGY**.

BIOGRAPHY (Gk. *bios*, *bios*, life + *graphein*, to write). A term applied to that department of literature which treats of the lives of individuals. The mode of treatment, especially in modern times, is far from uniform. In some cases biography approaches the sphere of philosophy; in others, that of history; while in the majority it assumes, to a large extent, the character of analytic or descriptive criticism. To none of these modes, theoretically considered, can

there be any valid objection; everything depends on the judiciousness of the biographer. The great points which he must keep perpetually in view are the personality and characteristics of his subject. If these are buried under a load of digressive dissertations, his book, however valuable or interesting, ceases to be a biography except in name. Such a book, for example, is Masson's *Life of Milton*. Anciently, biography was more of a mere *curriculum vitæ* than it is now; that is to say, the leading incidents of a man's life were narrated in their historical sequence, without any elaborate attempt to analyze the character from which they emanated. Like ancient history, it was possessed of a simple greatness, a stately dignity of narrative, colored here and there, but sparingly, with grave eulogy or censure. Modern biography, on the other hand, like modern history, is full of elucidations, criticisms, and disquisitions; and if wanting in the severe grace of its classic predecessors, it is much more lively, acute, and expansive.

Biographical literature has existed from an early period. The oldest historical books of the Jews abound with beautiful examples of it, such as the lives of the Patriarchs and the story of Ruth. Indeed, the mythologies of all ancient nations are but the lives of heroes and gods. Of purely biographical works, the most valuable that has come down to us from the Greeks is the *Parallel Lives* by Plutarch, written about the close of the First Century after Christ. Roman literature also possessed an admirable specimen in the *Life of Agricola* by his son-in-law, Tacitus. Besides these may be mentioned the *Lives of the Twelve Cæsars* (in Latin), by Suetonius, and *Apollonius of Tyana* (in Greek), by Philostratus, *Lives of the Sophists* (in Greek), by Philostratus, and a *Life of Plato* (in Greek), by Olympiodorus of Alexandria. Coming down to a later period we meet Saint Jerome's *Lives of the Fathers*; while biographies, more or less complete, of saints, martyrs, bishops, etc., are scattered profusely through private ecclesiastical literature. The monks of the Middle Ages employed their leisure in weaving legends that abound in superstition and absurdities. Modern biographical literature really dates from the Sixteenth and Seventeenth centuries. Among the valuable works that then appeared may be mentioned Vasari's *Lives of the Painters* (Florence, 1550); the *Acta Sanctorum* (q.v.); Tillemont's *Mémoires pour servir à l'histoire ecclésiastique des six premières siècles de l'église*, 10 vols. (Paris, 1693); Thomas Stanley's *History of Philosophy*, containing the lives, opinions, actions, and discourses of philosophers of every sect (first edition, London, 1655-62; 4th edition, with *Life*, London, 1743); Bayle's *Dictionnaire historique et critique* (Rotterdam, 1697).

In England and elsewhere, the biography of the man of letters is a late development. The men who visited the Globe Theatre never thought of writing the life of Shakespeare. To them the career of the dramatist seemed uneventful, for it was in no wise connected with the great affairs of Church and State. The signs of a new era appeared with the publication of Walton's charming *Lives* (1670), comprising Donne, Wotton, Hooker, and Herbert. This list, however, contains the name of no one who devoted himself wholly to letters. Walton's volume was followed by Wood's *Athenæ Oxonienses*

(1690-92), the lives of Oxford writers and bishops, and by Aubrey's *Minutes of Lives* (not published till 1813), containing sketches of Bacon, Milton, Hobbes, and others. These two writers, who depended largely upon anecdotes, were the forerunners of Boswell, whose *Life of Dr. Johnson* (1791) is the most famous of English biographies. Since the appearance of this work, biographical literature has increased enormously. There is no escape now for the man of letters. Among noteworthy biographies, since Boswell, are Lockhart's *Scott* (1836-38); Forster's *Dickens* (1872-74); Trevelyan's *Macaulay* (1876); Cross's *George Eliot* (1884); Tennyson, by his son (1897); and *Life and Letters of Huxley*, by his son (1901). Cross adopted the novel plan of letting George Eliot speak through her letters, chronologically arranged, and elucidated by brief remarks. This method, which does away with the fulsome praises of the biographer, is very attractive, and has, perhaps, led to a taste for the correspondence of literary men. Among notable volumes of letters of recent date are Matthew Arnold's (1895) and Stevenson's (1900). Beginning with Dr. Johnson's *Lives of the Poets* (1779-81), there is a long line of works in which biography is combined with criticism. To this class belong Macaulay's *Lives of Milton, Addison, etc.*; Carlyle's *Lives of Burns, Sterling, etc.*; Grimm's *Michael Angelo*, and many series of which the type is represented by the *English Men of Letters*, the *American Men of Letters*, and *Les grands écrivains français*. Biographical dictionaries date from the *Elucidarius Carminum et Historiarum* (Holland, 1498). But the Nineteenth Century was their flourishing period.

Among the best general dictionaries are the *Biographie universelle, ancienne et moderne*, new ed., 45 vols. (Paris, 1843-65); and the *Nouvelle biographie générale*, 46 vols. (Paris, 1852-77). The best work of the kind published in the United States is Lippincott's *Pronouncing Biographical Dictionary*, by Dr. Joseph Thomas. Most nations have biographical dictionaries confined to their own celebrities. For Germany, there is the *Allgemeine deutsche Biographie*, Bavarian Academy of Sciences (Leipzig, 1875-1900); for Austria, the *Biographisches Lexikon des Kaiserthums Oesterreich*, ed. by Wurzbach (Vienna, 1856-89); for Holland, the *Biographisch Woordenboek der Nederlanden*, ed. van der Aa (Haarlem, 1852-78); for Belgium, the *Biographie nationale de Belgique* (Brussels, 1866-95); for Sweden, *Biographical Handbook*, ed. Hofberg (Stockholm, 1876); for Russia and Spain, there are also good biographical dictionaries. England has the magnificent *Dictionary of National Biography*, 63 vols., ed. Stephen (London, 1885-1900), to which were added three supplementary volumes in 1901; and the United States, Appleton's *Cyclopædia of American Biography*, 6 vols. (New York, 1887-89), a seventh volume appearing in 1900 as a supplement, and Lamb's *Biographical Dictionary of the United States*. For contemporary biography, we have Vapereau's *Dictionnaire Universel des Contemporains, Men and Women of the Time. Who's Who* (London); and *Who's Who in America* (Chicago), revised annually. They contain only the names of persons still living.

Belonging to this department of literature is the autobiography, i.e. the life of a person

written by himself. We may cite, for their charm, the *Autobiography* of the first Lord Herbert of Cherbury; Benvenuto Cellini's *Vita da lui medesimo scritta*; Rousseau's *Confessions*; Goethe's *Dichtung und Wahrheit*; Gibbon's *Memoirs*; Franklin's *Autobiography*; Scott's *Journal*; Newman's *Apologia*; and Ruskin's *Præterita*. This form of biography often runs into fiction, as in Borrow's *Lavengro*. The interesting development of biography, of which outlines are here presented, has never been adequately treated. See *ENCYCLOPÆDIA*.

BIOLOGY (Fr. *biologie*, from Gk. *βίος*, *bios*, life + *λόγος*, *logos*, discourse). Biology is the youngest, and the most comprehensive, and the most difficult of all the sciences, and it is not strange that its spokesmen are not yet in accord as to its relation to the system of human knowledge as a whole; nor can he who reflects that human knowledge is itself a biological fact, and a constituent part of the subject-matter of biological science, be surprised that this is the case.

Opinions as to the objects and aims of biological science may be roughly divided into two classes. On the one hand, we are told that biology is resolved, in the long run, into the physics and chemistry of living matter; while we are told, on the other hand, that the problems of life, among which those of mind must be included, are so foreign to the present scope and resources of chemistry and physics that they are best treated as constituting an independent realm of science, and a distinct intellectual discipline.

CONTRASTED VIEWS AS TO THE MEANING OF BIOLOGY. Future discovery may show to us a solid basis for the opinion that all the facts of biology, including those of consciousness and reason and volition and moral obligation, are, in ultimate analysis, movements of matter in accordance with the mechanical principles which hold good throughout the inorganic universe; and every thoughtful biologist will keep this consummation in mind as eminently worthy of his best and most earnest and persistent labors. But the opinion that it has already been attained, or must in time be attained, is, at the present day, a creed, or article of faith, rather than a demonstrated fact; for no one has, as yet, manufactured a living being in a laboratory, nor can the writing of a poem, or the discovery of a law of nature, or the performance of a deed of heroic self-sacrifice, be formulated, as yet, in terms of matter and motion. Faith is not science; nor is anything more antagonistic to the inspiration of scientific discovery than the desire to discount its future progress by the declaration that what we hope some day to prove is now to be accepted as truth. On the other hand, no one who reflects upon the past progress of science should, knowingly, stand committed to any opinion that would not still be tenable, even if all the manifestations of life, including those of intellect and volition and duty, should some day be reduced to mechanics, and should prove to be new illustrations of the law and order which pervade the universe, as strictly defined as the movements of the planets in their orbits, rather than exceptions to law, and interruptions to the order of nature.

He who, in the fear that duty may prove to be no duty, right and wrong neither right nor wrong, and freedom and moral responsibility

mere illusions—he who, in fear of these evil consequences, dreads the reduction of human conduct to mechanics, may seek refuge in some corner of the realm of biology in hope that, since it has not yet been invaded by the inquisitive man of science, perhaps it never may be; but nothing could be less judicious, in view of the present condition and prospects of biology, than thus to take refuge under the shelter of ignorance. He who believes that evil consequences will follow the prevalence in biology of mechanical conceptions, is not the only advocate of opinions that the progress of biological science may, in time, render untenable. It happens, oddly enough, that certain highly esteemed thinkers, who are among the most enthusiastic advocates of a mechanical interpretation of all the facts of biology, and who claim to speak with authority upon the philosophical meaning of physical science, are also the advocates and defendants of a system of philosophy that no one could, in consistency, accept, or even consider with favor, if all the facts of biology were to be formulated in terms of matter and motion; because this system of philosophy commits its disciples to the belief that there is a 'chasm' which is 'intellectually impassable' between the facts of physics and the facts of consciousness. Herbert Spencer, for example, is inevitably led, by the premises of his system of philosophy, to believe and to teach that mind "is something without any kinship with other things; and from the sciences which discover, by introspection, the laws of this something there is *no passage* by transitional steps to the sciences which discover the laws of these other things." As we are also informed by this philosopher that, while the volume of the synthetic philosophy which is to deal with the evolution of living beings from inorganic matter is not yet written, he has handled the subject of later volumes as if the reader had this missing volume in his mind; the cautious biologist, who wishes to hold no opinion that he could not still maintain even if all the facts of biology were reduced to mechanics, may be somewhat puzzled, in lack of this missing volume, as to the frame of mind in which he is to approach the works of the author of the *Principles of Biology*.

Turning now, for the present, from the opinion that biology is the physics and chemistry of living matter, let us consider the opinion that its objects and aims and methods are so foreign to the physics and chemistry of our day that we must regard it as an independent realm of science; for there is much to be said in support of the opinion that, even if all biological facts were to be reduced to mechanics and formulated in terms of matter and motion, biology would still remain an independent science, as distinct from physics and chemistry as, for example, the shoeing of a horse is from the painting of a picture. While both these handicrafts consist in the movement of matter according to the laws of mechanics, this fact, assuredly, affords no satisfactory account of either of them; nor would the reduction to mechanics of the desires and motives and voluntary acts and rational and emotional processes which find expression in the horseshoe and the picture show that, because blacksmithing and art are both to be reduced to physics and chemistry, they are fundamentally identical. Even if the day were to come when all this had been accomplished, physics would still remain

physics, and blacksmithing and art would still be what they are.

If, like Paley, I kick a stone, I may change its position, raise its temperature, and bring about other changes which might have been predicted from a few simple data. What happens if, instead of a stone, it is a dog that I kick? In addition to certain changes that are obviously mechanical, like those in the stone, I start a new set of changes that could never be predicted from the study of the kick alone. But note this remarkable fact: Show me the dog, and I may be able to tell you what he will do. If he have short hair, a pink skin, a big occipital crest, great cheek-muscles, a long mandibular bone, a short nose with little pigment, small red eyes, and short, crooked legs, he will not act like a curly-haired dog with long silky ears, large dark eyes, a long, black, pointed nose, a bushy tail, and long legs with large feet.

What has the color of the dog's nose or the size of his feet to do with the effect of the kick? Obviously, nothing at all; but the changes in the dog which follow the kick are not its mechanical equivalent, for they might follow an unsuccessful attempt to kick just as they follow an actual blow. The color of his eyes, etc., are racial characteristics which show what his ancestry has been; how his parents and other ancestors have behaved under similar assaults. With this scientific knowledge of dogs we may conjecture, with some confidence, how this one will behave; but in order to compute his conduct with anything like accuracy, we must have still more information. If his master habitually beats and bullies him, he will not act like a dog brought up with more discretion. If he is young, and has not learned independence, and self-reliance, and distrust of strangers, he will not act like an older and wiser dog; and if eyes and limbs and teeth are failing, his conduct will be still different. If the kick awakes him from sleep, he will not act like a dog disturbed while eating; nor will a lost dog, oppressed by a sense of friendlessness, act like one whose master is near; nor one assaulted at home, like one on forbidden ground; nor one attacked while in the discharge of duty, like one detected in theft or in forbidden pleasure. The attitude of the assailant, or even such little things as the size of the pupil of his eye, or the contraction of one or another facial muscle, may tell the dog what emotions accompany the kick; and if I myself be accompanied by a dog, this third party may modify the result without any share in the assault.

What a difference between a kick against a dog and one against a stone! In one case the conditions may be stated in few words, and the result may be computed; while in the other, a book would not suffice for the statement of all the facts, and the best science of our day is powerless to formulate the result in terms of mechanics.

It may be that all the conditions which modify the result are embodied in the structure of the dog, for we have no reason to seek them anywhere else. I see no reason to doubt that, if the dog's body could be preserved without change, it might, some day in the remote future, be studied by some naturalist who would be able to tell what conduct would have followed the kick with all the certainty with which one may foresee the effect of an opened valve in a steam-engine;

but we have not yet noted the most essential characteristics of the dog's actions. They are significant. They have a meaning. They stand in judicious adjustment to the canine world. Whether he shuts his eyes, throws back his ears, and, straightening his tail, plants his teeth in my leg, or crouches at my feet with his muscles relaxed, his ears pendant, and his tail trailing, or, putting his tail between his legs, runs away howling, the reason for his conduct is not the mechanical impact of the blow, nor the pain which it causes, but the importance of escape from the further injury which may follow. The means he adopts are those which have been favorable to this result in the past history of dogs.

It is clear that the meaning of the dog's actions can never be learned by studying his body; for if the meaning which we apprehend is embodied in any structure it must be in our own rather than that of the dog. The dog no doubt knows, just as we do, that in the natural course of events the attack is a sign of a disposition to do him further harm, and that he may arrest or avert this by doing something on his own part to meet it and prepare for it; but we know, in the case of most organisms, only the response and not the consciousness of it. The important point, however, is this: The kick is a sign of something that may follow, and the responsive actions are not the mechanical equivalent of the kick; for they are directed or adjusted, either with or without consciousness and reason, to an event of which it is only the forerunner or sign. The changes in the stone are the effect of the blow, while the changes in the dog are, in some way, the result of the past history of the dog and of his ancestors; for, all through this history, violent assaults have been associated with danger of further violence. This difference is as wide as the difference between life and its absence; and the independence of biology as a science is due to its existence. It is what Herbert Spencer means by the dictum that life consists in the continuous adjustment between internal relations and external relations; and it is what Aristotle means by teaching that the essence of a living being is not what it is made of nor what it does, but why it does it.

A living being is a being that responds to the changes which go on in the world around it, for life consists in the maintenance of adjustment between the changes that go on in the external order of nature and those that take place in the living body. Life is response to the established order of external nature; for the responsive actions of living beings are such that our own reason approves them as judicious and reasonable and likely to prove beneficial. This truth has often found expression in the statement that living things use the properties of the world around them for their own good, or that of their species. The same thought may be expressed by the statement that life is the use of the natural language of signs, for each stimulus to a vital act is, in course of nature, a sign with a significance; and the act is itself a response to the significance of which, in course of nature, the stimulus is the sign.

Physical analysis resolves living beings into organs and tissues and cells and physiological units and organic compounds and molecules and atoms; and it may some day enable us to construct a living organism by the combination of the proper elements. Physiology resolves vital

activity into 'functions,' and it may some day express these functions in terms of motion; as may also the psychology which investigates the elementary constituents of mental 'faculty.' A living being is, no doubt, an organic compound, but, to the biologist, it is also something more. It is a coördinated whole; a member of a species; a part of the sum of life; and a constituent of the universe, which would cease to be what it is if nature were different. The biologist finds in it no self-sustaining power and no reality that would endure if it were abstracted from the natural world of which it is a part. Surely, this is good sense and good science. No physiologist who studies the waste and repair of living bodies, no naturalist who knows living beings in their homes, no embryologist who studies the influence of external conditions upon development, can for an instant admit that living beings are self-sufficient or self-sustaining, or that their being is in themselves. For the line we draw, for better study, between living beings and the external world, is not one that we find in nature, but one that we make for ourselves by abstraction and generalization.

The external world of a living thing is as much a part of it as its histological structure. If the environment of its body or of any cell or molecule within its body were different, neither cell nor body would be what it is; and if they had no environment they would not be at all, for neither cells nor eggs nor seeds nor desiccated rotifers exist abstractedly. A self-sufficient and self-contained living being is as fabulous as a griffin or a centaur, but no naturalist thinks for an instant that this truth casts any doubt upon the real existence of living beings. It is not the real existence, but the abstract existence of living things, that the cautious biologist must dispute.

May not the truth that biology is the physics and chemistry of living beings be true only when it is joined with the converse truth that physics and chemistry are part of biology? It is only as living beings that we care to know. If the modest biologist were to assert that the biological aspects of the physical sciences are the only basis for rational interest in these sciences, his good friends in physical and chemical laboratories would no doubt charge him with arrogance, although they must admit that the principles of science, as distinguished from the concrete sciences, are part of biology.

We cannot investigate response to the order of nature without asking what the order of nature is. What are the properties of things and of thought that convince us of its existence? What is this conviction worth? What are the methods by which knowledge of this order is acquired and perfected and extended? How far are these methods and instruments trustworthy? Are any limits to their application known, and, if so, how known? To all these questions the biologist has a peculiar right to ask answers, in addition to the right which he shares with other students of science. The inquiry into the origin of those useful properties in the employment of which life consists is the most fascinating and instructive intellectual occupation within the whole range of human inquiry, for to it knowledge itself owes its significance.

SIGNIFICANCE OF 'FITNESS' THE FOUNDATION OF BIOLOGY. The distinctive problem of biology, the

problem of fitness or adaptation, the problem to which biology owes its independence among the sciences, has been a familiar one for ages, but it was only through the demonstration, by Wallace and Darwin, that the adjustive machinery of living organisms has come about gradually, through extermination and survival, in accordance with the mechanical principle of natural selection, that the possibility of a mechanical explanation of fitness was made clear.

The discovery and demonstration of the significance of the survival of the fittest seems, to the writer, to be the foundation of scientific biology, and the greatest intellectual triumph of the human mind. It has taught us that response, or the use of one event as a means of preparing for or predicting others—that distinctive attribute of living beings which, in its higher manifestations, we know as human knowledge or science—admits of treatment by methods which do not differ in any essential or fundamental way from those that are employed in geology and astronomy and physics. It is only when we review, in the light of natural selection, the long history of Plato's question: What is science? What is it to know a thing? that we begin to comprehend the transcendent genius of Charles Darwin, and to grasp the significance of his contribution to human knowledge, and to attain to the beginnings of an adequate conception of its supreme intellectual value.

This high estimation of the value of Darwin's contribution to science does not meet the unqualified approval of all biologists; many believing that natural selection is only a minor factor in the evolution of living beings, or, at least, that we must search elsewhere for the origin of the raw material which it picks out and preserves.

We are told that since it is a merely negative process of sifting or weeding out, which does not produce, but only preserves, the fitness which exists, it does not show why there should be any fit to survive, but only how the unfit are exterminated. Without knowing why one horse is more fleet than another, or even why horses exist, breeders have increased the speed of horses by breeding from the most fleet; just as a pack of wolves may increase it in nature, by destroying, generation after generation, all the horses they can run down. If, at every stage in the ancestry of horses, there has been need for greater speed, natural selection accounts for the whole history of this characteristic of horses, and even for the first vague beginnings of locomotion in sedentary or floating animals, which may have found shelter from their enemies, or more abundant food, by those slight changes of place which may at first have been the incidental result of changes of shape.

While it is obvious that a useful quality must exist before it can be useful, and before it can survive, and while no Darwinian holds natural selection to be an ultimate explanation of anything, in the metaphysical sense of the word ultimate, all admit that horses do differ among themselves in speed, and that each may reasonably be expected to be more like its parents in speed than a horse selected at random. As no one disputes the existence of these prerequisites to improvement by selection, the declaration that nothing could come about through selection is childish.

A living being is a being that responds to the stimulus of one event in such a way as to adjust its actions to other events of which, in course of nature, the stimulus is the sign; and if all that have not thus responded have been exterminated in the struggle for existence, the adjustments of the survivors is nothing more than might have been expected. No natural law is an agent. So far as human knowledge reaches, the laws of nature are nothing more than summaries of observed facts, joined to that confidence in the continuity of nature which leads us to expect that what has come about will continue to come about under like conditions. The rational basis for confidence in the continuity of nature seems, to the writer, to be found in the truth that we have survived and are in existence. Our confidence in the validity of science, and in the real existence of order in nature, is equal to, and identical with, our confidence in our own existence. Natural selection seems to the writer to be a strictly scientific explanation of the fitness of living things, and they who assert that it is inadequate because it fails to show why beneficial response should ever follow a stimulus, and thus furnish fitness to be selected, must remember that all science is inadequate in exactly the same degree. In no case does science tell us why natural phenomena do occur in order, although it does tell us what order of events we may reasonably expect. They who challenge the sufficiency of natural selection because it does not tell us why there should be any fitness to select, must find all science equally inadequate, although the common verdict of mankind is that scientific knowledge is very adequate and sufficient for all the needs of living things in that natural universe in which we find ourselves, and of which we are constituent parts, even if it does fail to show us in nature any efficient cause for anything.

The cuckoo that lays her eggs in strange nests gets the hard and exhausting and dangerous work of incubating done for her, whether it is unconsciously, or carelessly, or with forethought that she does so. The advantage is the same, no matter who or what it is that puts the eggs into the strange nest. After the foster-brothers of the nestling cuckoo are destroyed, it profits by the exclusive attention of its two nurses, and so long as the conduct of cuckoos conduces to the welfare of the race, cuckoos will increase and multiply to continue in the same course. We find worldly wisdom in the habits of cuckoos, and the immorality of their conduct is shocking to our refined sense of right; but, so long as the eggs are laid in suitable nests and are hatched, the result may be expected to come about, even if the birds have no more share in the worldly wisdom than they have in the immorality.

The biologist is sometimes told that since he does not know the individual history of any organism in the past, and is even less able to foresee that of any that may exist in the future, he only infers the fitness of living things for their environment from their survival, and cannot logically hold the descendants accounted for by the fitness of their ancestors: but it is our confidence in the continuity of nature, and not ability to say what it was that led to the survival of any individual organism in the past, which convinces us that the fittest have survived in the past, and that they will survive in the

future, as they do now. While it is true that natural selection does not make anything, it does take away all significance from the reasons some thinkers once thought they had for believing that a living being is anything else than a natural body with a natural history. No two objects, living or dead, ever are exactly alike; and if we admit the endless diversity of nature, and the struggle for existence, natural selection is a fact. While we find it hard to discover any difference between individual house-flies, or ants, or bees, they no doubt differ among themselves in many ways; some excelling in the duration and rapidity of their flight, while others fall below the average in size of wings, or strength of muscles, or in general coördination for flight. The insects that inhabit wind-swept islands are in constant danger of destruction at sea, and those that fly most are most in danger, while those that, for any reason, fly little or not at all are safest, and live longest, and have most descendants. Kerguelen Island is said to be one of the stormiest places on the globe. There are no trees or bushes to afford shelter on the island, which is swept by almost perpetual gales. It is inhabited by several flies, by numerous beetles, and by a moth, but all are incapable of flight, and most are entirely without wings. It is often said that they have lost their wings in order to escape danger, but this is only a figure of speech. We need not know who or what has made them deficient in order to understand the facts. All that did fly have been exterminated, and there would not be any survivors if some had not been deficient in ability or in inclination to fly.

THE THEORY OF EXPERIENCE. Most of the modern critics of natural selection contend that the raw material of which it is said to stand in need is supplied by that influence of the conditions of life which we are accustomed to sum up under the general word 'experience.' They attribute to individual or to ancestral experience the origin of the adaptive actions which natural selection picks out and preserves. Our own times, like the two preceding centuries, are notable for the prevalence of 'experience philosophy'; yet there has been little reflective or philosophical study of experience in the light of modern biology, although it is clear that the biologist who asserts that experience furnishes the raw material which natural selection picks out and preserves must be prepared to give an account of experience which does not attribute it to natural selection.

Recent experiments show that when an animal is placed in such circumstances that it can, by some simple action which is well within the command of its organization, obtain some object that it likes, the way in which it acquires facility in accomplishing the desired action is very noteworthy, and strikingly the same in all the animals that have been studied. A monkey, for example, before which is placed a box that contains, in full view but out of reach, some attractive article of food, which can be obtained only by some simple but definite action, such as pulling a string, or lifting a latch, or pulling out a peg, shows no capacity for learning to perform this action through seeing it done, or by being shown how to do it. If, however, any one among the indefinite and uncoördinated and aimless movements which it makes in trying to reach the object happens to

be the proper one and to succeed, and if the time which has been consumed in irrelevant movements be noted, it is found that the adaptive movement comes a little sooner at the second trial, and that, as the experiment is repeated day after day, the interval between the beginning of effort and success grows shorter and shorter, until at last, in course of time, the monkey 'acquires' the art of lifting the latch or of pulling the string without any preceding misdirected movements. He has 'learned by experience' to perform the responsive action under the stimulus of its sensible perception, and thus to gain the desired end; but his experience has come about through the gradual extinction of the aimless and misdirected movements, and the survival of those that are definite and exact. Experiments with fishes and turtles and other animals give the same result. They learn by experience, but their experience consists in the survival of the fittest activities and the inhibition of those that are unsuccessful.

The eyes of the human infant move independently and aimlessly, and it is only after it has spent weeks in experimenting that it suppresses the vague and indefinite movements, and thus gradually and slowly acquires the useful art of coördinating compensating muscles in such a way as to move both eyes together so as to see objects single and solid, instead of flat and tremulous.

Herbert Spencer has pointed out the way in which opinion as to the limits and scope of the powers of governments over the governed has undergone slow modification with the progress of civilization, until most of the extraneous and irrelevant notions of earlier and more primitive peoples have been stripped off, leaving only that which is essential to survive and come down to modern times.

"All science," says Huxley, "starts with hypotheses—in other words, with assumptions that are unproved, while they may be, and often are, erroneous; but which are better than nothing to the seeker after order in the maze of phenomena. And the historical progress of every science depends upon the criticism of hypotheses—on the gradual stripping off, that is, of their untrue or superficial parts—until there remains only that exact verbal expression of as much as we know of the fact, and no more, which constitutes a perfect scientific theory."

It surely requires only a comprehensive view of these examples of 'experience,' drawn from the most widely separated types of vital activity, to see that they all consist in the extinction of the aberrant and the misdirected and the uncoordinated, until only that which is exact and definite survives. There is, therefore, much to urge in defense of Berkeley's contention that "the work of experience is to unravel our prejudices and mistakes, untwisting the closest connections, distinguishing things that are different, instead of confused and perplexed, giving us distinct views, gradually correcting our judgment and reducing it to a philosophical exactness." But the correction of vital activities, and their reduction to exactness by the extinction of those that are confused and perplexed, and the survival of those that are definite and distinct, is what we mean by natural selection.

If Berkeley is right, if our own experience is but conscious recognition of the universal prevalence and unceasing continuity of the selective process, what becomes of the notion that experience is an activity precedent to selection, and the source of the fitness which it picks out and preserves? In a word, what becomes of the 'philosophy of experience' which meets with so much approval from many modern men of science?

DEPENDENCE ON CONDITIONS. The discovery of natural selection has destroyed all ground for the belief that we, or any living beings, ever do anything that exhaustive knowledge of their material structure and its history may not some day lead us to expect. This is often held to be proof that all things in nature are fixed and inevitable and predetermined, and that our own belief that we control or direct our own conduct, or anything else, is a mere illusion. If we have no reason to believe that we ever do anything that exhaustive knowledge of our bodily frame and its history would not have led us to expect, we are told that our ancestry is our fate. Everything that we feel or think or do is contingent upon our structure; and if this were indeed inevitable and predetermined, we might with good reason declare that we are in the hands of fate, and can never hope to make or mar, to help or hinder. But what reason is there for thinking that proof that a thing is no more than we might have expected would show that it is fixed or fated? The writer is not so vain as to think that his opinion upon this difficult subject will have any weight. He knows well that he will be told that he has failed to grasp the real difficulty, or to understand what it is that has so long perplexed the thoughtful; for he fails to find any antagonism between mechanical interpretations of biological facts and freedom and responsibility. He cannot see, for example, how proof that he does nothing which might not have been expected from him can show that he has no true liberty. Should not he who tries to be a reasonable creature, and to do all that can be expected from him in reason, be utterly unable to see how his success can show that he has failed? How can proof that living beings never do anything that exhaustive knowledge of their structure would not give us good reason to expect show that their actions are predestined or inevitable? Proof that we are part and parcel of the cosmic process cannot tell us who or what has made us so, or that we are helpless, for there is no power, causality, or agency in a process. Processes—evolutionary or otherwise—are matters of fact. There is nothing of agency included in them. If there is agency anywhere, it is not in the selective process, nor in the evolutionary process, nor in the cosmic process, but behind them, and, logically, at least, antecedent to them and independent of them. Is it not clear that if we never discover any agency in processes, neither can we find in them any necessity or any antagonism between them and liberty?

While the progress of biology leaves no logical standing-place for him who believes a living being ever does anything that exhaustive knowledge of its machinery would not lead us to expect under given conditions, it also tells us we should not have reason to expect anything

to be as it is if these conditions had not been as they were. It is by finding out, through scientific discovery, what these conditions are that we learn how to direct and modify the course of nature.

They who fear that the extension of mechanical conceptions of biology may some time destroy their conviction that they are reasonable and rational beings, able to act wisely and foolishly, and to do right and wrong, should ask themselves, in all seriousness, whether anything could afford clearer proof that there is no discoverable limit to our ability to influence and modify the cosmic process than the artificial production of a living being would afford. If this were to be accomplished, would it not be tangible proof that they who complain that their inherited organization is their fate, mistake the bonds of ignorance for the bonds of fate? Instead of showing that our knowledge and our conduct are the necessary and inevitable effects of our structure, would it not rather show that we may hope to control and modify our structure through knowledge, when we only know enough about nature? For the blindness of ignorance science gives us a remedy; for the blindness of fate there could be none.

See ANIMAL; BROOKS, W. K.; CLASSIFICATION; DARWIN; EMBRYOLOGY; EVOLUTION; HEREDITY; DISTRIBUTION OF ANIMALS; LAMARCK; NATURAL SELECTION, and other titles in the domains of botany, paleontology, and zoölogy, under which will be found references to the literature of the various phases of biology. Consult, also, Brooks, *Foundations of Zoölogy* (New York, 1900).

BIOLOGY. This term has often been used of plants, especially in Germany, instead of ecology (q.v.), though biology in this sense usually includes the more sensational topics of ecology, such as pollination, carnivorousness, etc., rather than the broad field which is now known as ecology. The term in this sense should be discarded. See ECOLOGY.

BÍ'ON (Gk. *Βίων*) of SMYRNA. A Greek bucolic poet of the Third Century B.C., a younger contemporary and imitator of Theocritus (q.v.). Of his works there are extant seventeen short poems and his longer "Lament for Adonis" (*Ἐπιτάφιος Ἀδώνιδος*), a hymn of great beauty and tenderness, which shows many reminiscences of Theocritus's first idyl. It became itself the model for Shelley's *Adonais*. The poems are edited with Theocritus and Moschus, by Ahrens (1855); Meineke (1856); Ziegler (1868); the *Ἐπιτάφιος* with translation and explanatory introduction by Wilamowitz-Muellendorff, *Adonis* (1900). See also Smyth, *Greek Melic Poets* (New York, 1900).

BIONDO, byōn'dō, FLAVIÓ. See FLAVIÓ BIONDO.

BÍ'ONOMÍCS (Gk. *βίος*, *bios*, life + *νόμος*, *nomos*, law), or ECOLOGY. The science which deals with the relations of animals or plants to their surroundings; also called ecology, a term especially used by botanists. The science is a new one and has as yet too few adherents. Charles Darwin, Fritz Müller, and Karl Semper are the best examples of workers in this field. Some of the topics with which bionomics deal are: The relation of animals to their inorganic environment; the relation of aquatic

organisms to the chemical nature of the water, to its density, to its volume, to its temperature and currents, to light, and to gravity; the relations of land animals to the humidity and temperature of the air, to the other chemical and physical properties of the medium, to light, to gravity, and to air-currents; the relation of organisms to alternate submergence and desiccation; their relation to shelter and homes; the relation of animals to their organic environment; their relation to food, to mates, to the nutrition and care of young, or to enemies; animal communities; and the interdependence of organic species, as in parasitism and commensalism or symbiosis. Most of these topics are separately treated elsewhere. Consult Waether, *Einleitung in die Geologie*, Parts I.-II.; *Bionomie der Meeresthiere und Lebensweise der Meeresthiere*. See ECOLOGY.

BIONOMY. See PALEONTOLOGY; ECOLOGY; DISTRIBUTION OF ANIMALS; and OF PLANTS.

BIOT, bé'ô' or byô, EDOUARD CONSTANTIN (1803-50). A French writer on China. He was born in Paris, July 2, 1803, and was a son of the astronomer J. B. Biot. After a short service in railway enterprises, he devoted himself to the study of Chinese and contributed many valuable papers to the *Journal Asiatique*. He prepared a *Dictionnaire des villes et arrondissements de l'empire chinois* (1842); and he wrote *De l'abolition de l'esclavage ancien en occident* (1840), for which he received a gold medal from the Institute. He became a member of the Academy in 1847, and died March 12, 1850, his love of work having shortened his days.

BIOT, JEAN BAPTISTE (1774-1862). A distinguished French physicist and astronomer. He was born in Paris and early entered the artillery, but forsook the army for science. He was appointed a professor of mathematics at the Ecole Centrale of the Department of the Oise and in 1800 became professor of physics in the Collège de France. He was made a member of the Institute in 1803; and in 1804, at a meeting of that body called to vote in favor of establishing an empire, Biot refused to vote. With Arago he was made a member of the bureau of longitude, and (1806) sent to Spain to supervise the triangulation involved in the measuring of an arc of meridian, preparatory to the introduction of the metric system of weights and measures. He was active in geodetic work, visiting England in 1817 to make observations on an arc of meridian then being measured. Together with Arago he also made an exact determination of the force of gravity in Paris, and they were associated in a number of scientific investigations. Biot was able to demonstrate by direct experiment that the velocity of sound in solids was greater than in air, and was the founder of saccharimetry by the use of the polariscope. He made many discoveries in optics and electricity, and was a constant contributor to the scientific journals. In company with Gay Lussac, he made the first balloon ascent for the purpose of making scientific observations. His most valuable contributions to science deal with the polarization of light; and his researches connected with ancient astronomy are also very valuable. Of his numerous writings may be mentioned *Traité élémentaire d'astronomie physique*, 3 vols. (Paris, 1805); 3d ed., considerably augmented (1850), 6 vols., with vol. of plates—

translated into English; *Traité de physique*, 4 vols. (1816); *Précis de physique*, an abridgment of the former in 2 vols. (1818), often republished; *Recueil d'observations géodésiques*, etc. (1821). Biot also contributed many excellent biographies of scientific men to the *Biographie Universelle*. Among the most important of his later works are *Recherches sur plusieurs points de l'astronomie égyptienne*; *Recherches sur l'ancienne astronomie chinoise* (1840); *Mémoire sur la constitution de l'atmosphère terrestre*, in the *Connaissance des temps* (1841); *Mélanges scientifiques et littéraires* (1858); and *Etudes sur l'astronomie indienne et sur l'astronomie chinoise* (1862). See CURVES.

BIPENNIS (Lat. *bis*, twice + *penna*, wing, edge). A double-headed axe, a form of weapon found even in stone, known in Homer, and later usually attributed in use to barbarians, and especially to the Amazons.

BIPONT EDITIONS (*Bipontium* is Latin translation of Ger. *Zweibrücken*; from *bis*, twice + *pons*, bridge). A name given to a classical series of fifty volumes, begun at Zweibrücken (1770) and finished at Strassburg.

BIQUADRATIC EQUATIONS (from Lat. *bis*, twice + *quadratus*, squared). Equations of the 4th degree in one unknown quantity. A function of the 4th degree is often called a quartic. If all positive integral powers lower than the 4th are also present, the equation is called a complete biquadratic. See ALGEBRA; EQUATION.

BIR. See BIREJIK.

BIRAGO, bé-râ'gô, KARL, Baron von (1792-1845). An Austrian military engineer, born at Cascina d'Olmo, near Milan. In 1825 he invented the military bridge named after him, consisting of detachable blocks and pontoons—an invention adopted by the Austrian Army in 1828. He erected the military bridge across the Po, at Brescello (1839), which was followed, a few years later, by a similar bridge across the Danube. His system of constructing military bridges was adopted by nearly all the armies of Europe. He wrote: *Untersuchungen über die europäischen Militärbrückentrains*, etc. (1839); and *Anleitung zur Ausführung der im Felde am meisten vorkommenden Pionierarbeiten*.

BIRCH. *Betula*, a genus of plants of the natural order *Betulaceæ*. The order contains two important genera, birch and alder, the plants of which are all trees or shrubs, natives of temperate and cold regions.

The genus *Betula* is distinguished by ten to twelve stamens, and winged achenia. The common birch (*Betula alba*) has small, triangular, doubly serrated leaves. It is a very beautiful forest tree, abounding in the north of Europe and of Asia, often forming large groves by itself. In the south of Europe it is found only upon mountains of considerable elevation. It is a tree of rapid growth. In favorable situations it attains the height of 60 or even 70 feet, with a diameter of 1½ or 2 feet. In the northern, or utmost alpine limits of vegetation, it only appears as a stunted bush. The bark is smooth and silvery white, and its outermost layers are thrown off as the tree advances in age. The smaller branches are very slender and flexible, and in a particularly graceful variety called the weeping

birch (*Betula pendula* of some botanists) they are still more slender, elongated, and pendulous.

The bark and leaves of the birch are, in some northern countries, used medicinally in cases of fever and eruptions. The bark is also used for yellow dye. It is in some countries made into shoes, hats, drinking-cups, etc. In many parts of the north of Europe it is used instead of slates or shingles by the peasantry; and in Russia—the outer or white layers being subjected to distillation—there is obtained a reddish empyreumatic oil called birch oil; it yields also the birch tar, or *degutt*, which is employed in the preparation of Russia leather. The wood is in universal use in northern countries for a great variety of purposes. It is white, firm, and tough, and is employed by wheelwrights, coopers, turners, etc. It is much employed for smoking hams, herrings, etc., because of the flavor which it imparts. Much of it is made into charcoal for forges. In the highlands of Scotland, and in many other countries, the sap is used, either in a fresh or in a fermented state, as a beverage. The white birch of North America (*Betula populifolia*) very nearly resembles the common birch, but is of much less value. It is found as far south as Pennsylvania. The wood is scarcely used. The black birch, or river birch, of North America (*Betula nigra*), also sometimes called red birch, is very similar to the common birch, and produces very hard and valuable timber. It attains the height of 70 feet. The bark is of a dark color, the epidermis in the younger trees reddish. The name black birch is also given to a species that is found in the more northern parts of North America and is sometimes called the sweet birch, or cherry birch (*Betula lenta*); this also is a tree 70 feet or more in height, of which the timber is fine-grained, and valuable for making furniture and for other purposes. The bark of this species yields an essential oil identical with oil of wintergreen. Its leaves, when bruised, diffuse a sweet odor, and, when carefully dried, make an agreeable tea. The yellow birch of North America (*Betula lutea*) is a tree 70 to 80 feet high, destitute of branches for 30 to 40 feet, and remarkable for its large leaves, which are 3 to 5 inches long, as well as for the brilliant golden yellow color of the epidermis. It is found in Nova Scotia, New Brunswick, Maine, etc. Its timber is used in ship-building. The young saplings of all these American species are much employed for making hoops for casks. The paper birch (*Betula papyrifera*) is found in the northern parts of North America. It attains the height of 70 feet. The bark of the young trees is of a brilliant whiteness, and capable of division into very thin sheets, which have been used as a substitute for paper. It is used by the Indians for canoes, boxes, buckets, baskets, etc. The wood is used for the same purposes as that of the common birch. The mountainous districts of India produce several species of *Betula*. Thin, delicate strips of the bark of the *Betula utilis* are used for lining the tubes of hookahs. They were formerly used as writing-paper. *Betula alnoides*, a native of the mountains of Nepal, is a tree 50 to 60 feet high, covered with branches from the base, and of an oval form. Its wood is strong and durable. The dwarf birch (*Betula nana*) is a mere bushy shrub, seldom more than 2 or 3 feet high, and generally much less. It has orbicular crenate

leaves. It is a native of the northern regions of the globe, and is found in some parts of the highlands of Scotland. It is interesting because of its uses to the Laplanders and other inhabitants of very northern regions, to whom it supplies their chief fuel, and the material with which they stuff their beds. Its seeds are the food of the ptarmigan, on which the Laplanders depend in a considerable degree.

Fossil forms of birch are found in the Cretaceous rocks of Greenland and in the Tertiaries of Europe and North America.

BIRCH, HARVEY. A fine, resourceful character in *The Spy*, a novel of the American Revolution by Cooper.

BIRCH, SAMUEL (1813-85). An English antiquarian, Keeper of the Oriental Antiquities in the British Museum. He was born in London, November 3, 1813, the grandson of Samuel Birch, Lord Mayor of London in 1814, and the son of the Rev. Samuel Birch, rector of Saint Mary's, Woolnoth, London. He received his education at the Merchant Tailors' School, and in 1832 entered the service of the Commissioners of Public Records. In 1836, he accepted an appointment as an assistant at the British Museum, and in 1844 became Assistant Keeper of Antiquities in that institution. In 1861 he was advanced to the position of Keeper of Oriental, British, and Mediæval Antiquities. When, in 1866, these departments were divided, Birch was made Keeper of the Oriental Department. He died December 27, 1885.

Birch was a man of varied attainments. During his connection with the British Museum, he devoted much attention to classical and British antiquities, and to numismatics. Among his works on these subjects are his *Catalogue of Greek and Etruscan Vases in the British Museum*, published in 1851 with the collaboration of Mr. Newton, and his *History of Ancient Pottery* (2 vols.), published in 1858. He also wrote a number of papers for the *Numismatic Chronicle* and for *Archæologia*. In early life he was a zealous student of Chinese, and in later years he wrote some translations from that language. Among these, his *Chinese Widow*, published in 1862, is well known. He was also proficient in other Oriental languages, but it is upon his work as an Egyptologist that Birch's reputation chiefly rests. As early as 1838 he published his *Explanation of the Hieroglyphics on the Coffin of Mycerinus*, and some of the most important Egyptological publications of the British Museum were issued under his editorial supervision. Among these are: *Select Papyri in the Hieratic Character* (1841-60); *Inscriptions in the Hieratic and Demotic Character* (1868); *The Rhind Papyri* (1866); and *Facsimile of an Egyptian Hieratic Papyrus* (1876). In 1867 Birch enriched Bunsen's work, *Egypt's Place in Universal History*, by the addition of a valuable volume (Vol. V.) containing the first Egyptian dictionary since that of Champollion, and the first translation of the Book of the Dead; and in 1878 he edited the revised edition of Wilkinson's *Manners and Customs of the Ancient Egyptians*. Birch was a most prolific writer, especially upon Egyptological subjects, and his articles in *Proceedings of the Society of Literature*, *Revue archéologique*, *Zeitschrift für ägyptische Sprache*, and other periodicals, are very numerous. He was one of the founders of *Records of the Past* (1873 ff.),

and many of his translations of Egyptian texts appeared in this series. He was also one of the founders of the Society of Biblical Archæology, and was a frequent contributor to the *Transactions* and to the *Proceedings* of the Society. For his untiring industry, and his boldness in exploring untried fields of research, Birch's reputation as an Egyptologist stands deservedly high. The best sketch of his life and work is to be found in *Transactions of the Society of Biblical Archæology*, Vol. IX. (London, 1893).

BIRCH, THOMAS (1705-66). An English historian, born at Clerkenwell. He took orders in the Church of England in 1731, was in Essex in 1732, and in 1734 became chaplain to the Earl of Kilmarnock, who was beheaded in 1746. He was then (1746) appointed rector of Saint Margaret Pattens, London, and in 1752 was one of the secretaries of the Royal Society, a history of which he published (4 vols., 1756-57). His first literary undertaking was *The General Dictionary, Historical and Critical* (10 vols., 1734-41), founded on Bayle's celebrated work. He next edited the State papers of Thurloe, secretary to Oliver Cromwell (7 vols., 1742). Among his other works are *Life of the Hon. Robert Boyle*, (1744); *Inquiry into the Share which King Charles I. Had in the Transactions of the Earl of Glamorgan* (1747); *Historical View of the Negotiation Between the Courts of England, France, and Brussels, 1592 to 1617* (1749); *Life of Tiltonson* (1752); *Memoirs of the Reign of Queen Elizabeth* (2 vols., 1754), and he edited the works of Sir Walter Raleigh, Bacon, and others.

BIRCH, THOMAS (1779-1851). An American artist. He was born in London, England, but removed to the United States in 1793, and about 1800 began painting portraits in Philadelphia. In 1807 he visited the Cape of Delaware, and thereafter turned his attention to marine painting, in which he showed much skill. During the War of 1812 he painted a series of pictures of naval battles. His paintings of the engagements between the *United States* and the *Macedonian* and between the *Constitution* and *Guerriere* are in the Joseph Harrison collection of Philadelphia. Three of his marine views are in the Clag-horn collection.

BIRCH-PFEIFFER, BĚRK'pfif'ēr, CHARLOTTE (1800-68). A German actress and playwright, born in Stuttgart. She made her debut in Munich at the age of 13, and played with great success in Berlin, Vienna, Hamburg, Saint Petersburg, Pesth, Amsterdam, and other places. In 1825 she married Dr. Christian Birch of Copenhagen. She managed the theatre in Zürich from 1837 to 1843, and then, after visiting professionally most of the cities in Germany, made an engagement with the Royal Theatre in Berlin, which continued until her death. Her plays, although of no high artistic merit, showed true dramatic talent, and a thorough knowledge of stage effects, and met with popular success throughout Germany. Most of her plays were dramatizations of popular novels. The following were especially successful: *Pfefferrösel*; *Hinko*; *Die Günstlinge*, probably her best; *Der Glöckner von Notre Dame*, after Victor Hugo; *Die Frau in Weiss*, after W. Collins, and *Die Waise von Lowood*, after Charlotte Brontë's *Jane Eyre*. A complete edition of her writings was published in 1862.

BIRD (origin obscure). Birds are warm-blooded vertebrate animals clothed with feathers, and normally capable of flight. They comprise the class *Aves*. They have existed since early Mesozoic times, exhibit an interesting evolution within very compact and well-defined limits, dwell in every part of the globe, are exceedingly diverse in size, form, ability, and appearance, adapted to every sort of climate and food, show mental qualities of a high order, are of great importance in their economic relations with man, and in most cases are beautiful in outline and color and possessed of melodious voices.

THE BIRD'S PLACE IN NATURE. Birds are classified between the reptiles, regarded as inferior to them, and the mammals, regarded as superior in general organization. Birds differ from mammals, broadly, in being clothed with feathers instead of hairs, and in the absence of milk-glands, and by sundry differences in anatomy and methods of existence, such as the hatching externally of eggs, and the devotion of the fore limbs to flight. They differ from reptiles in having a covering of feathers instead of scales; a complete double circulation of warm blood; no more than three digits in the manus, long legs, etc.

Affinity with Reptiles.—The differences last noted are, however, of much less importance than those which separate them from mammals, and the structural resemblance is so close that some anatomists, notably Huxley, have included reptiles and birds in a single group, the Sauropsida, comparable to Fishes or Mammals, and completing, with them, the three divisions of the Vertebrata. This grouping was founded upon the fact that birds and reptiles were alike in being oviparous or ovoviviparous; in having a cloaca; in the incompleteness of the diaphragm, and of a corpus callosum in the brain; in having only one occipital condyle; in the presence of a movable quadrate bone and other peculiarities of the skull; and in the fact that the ankle-joint is between two sets of tarsal bones. The close relationship thus implied has been confirmed by the disclosures of paleontology, which show that birds have a reptilian ancestry, and are an offshoot of the same stock as modern reptiles.

Development of the Class.—For details of the geological evidence of the origin and evolution of birds, the reader is referred to the articles **BIRD**, **FOSSIL**, and **EVOLUTION**. It will suffice here to sum up the matter as Prof. A. Newton, following Fürbringer, does in his *Dictionary of Birds* (London, 1893-96). Birds, since they spring from reptiles, must have begun with toothed forms of small or moderate size, with long tails and four lizard-like feet, having well-formed claws, while their bodies were clothed with a very primitive sort of down. To them succeeded forms wherein down developed into feathers, and the fore and hind limbs differed in build—the former becoming organs of prehension (as is still the case in some young birds), and the latter the chief instruments of progression. Then followed a dinosaur-like transformation of the pelvis and legs, and a gradual coalescence of the ankle-bones, enabling birds more and more to walk erect. These early reptilian birds were flightless and terrestrial, or at most climbed trees. "Among those which possessed this habit, the befeathering (which as yet had, like the hair of mammals, served only for

warmth) presumably entered upon a higher step, the feathers becoming larger on certain parts of the body, particularly on the fore limbs and tail, so as to begin to act as a parachute, and allow of a safe gliding descent from a height. By successive increase in the stiffness and size of the feathers, and corresponding modification and strengthening of the skeleton and muscles, the possibility of incipient but real flight was afforded." Thus far this explanation of primitive bird-formation is theoretical; but at this point comes confirmatory evidence in the fossil remains of *Archæopteryx* (q.v.)—an actual bird with real feathers and apparently considerable power of flight, that lived at the beginning of Secondary or Mesozoic time. "The faculty of flight, thus acquired, went on improving. The remiges grew stronger and stronger . . . and in proportion as the fore limbs specialized into highly developed wings . . . the tail shortened and was consolidated, the posterior vertebrae becoming united as a pygostyle. Thus originated . . . the higher or better 'Birds of Flight.' This type was established in the Cretaceous *Ichthyornis*, and includes the vast majority of existing birds commonly grouped as *Carinatae* (i.e. with a keeled breastbone—not *Ratitæ*); but these only in later times developed their various higher modifications, which were rendered possible by the saving of material and weight." It is important, however, to bear in mind that all birds did not reach the highest degree of faculty in flight. "Many stopped, as it were, half way," to continue Newton's summary of Fürbringer's conclusions, "when a retrogression of the power already attained took place; or, if the power were reached, it could not be maintained—an easy life and absence of rivalry inducing an increased bulk of the body, until the utmost exertion of muscular strength could no longer sustain it in the air. Thus when this retrograde movement began, occasion was afforded for the dwindling away of the volant power, and hence arose the different types which are commonly grouped as *Ratitæ* (*ostriches*, etc.)."

EXTERNAL FEATURES. Though a strictly scientific arrangement might call for the more basal internal structure to be first considered, it suits present purposes better to give first an account of the exterior—the plumage and epidermal appendages so characteristic of birds.

Plumage.—Feathers are horny products of the epidermal cells of the skin, but very different from mammalian hairs or reptilian scales. Scales, in the herpetological sense, are pieces of the skin itself, originating as folds of the cuticle; and hairs arise from involution pockets in the skin; whereas feathers are produced from papillæ of the cuticle. They grow so as to form a coat over the whole body, called plumage. (For the structure and characteristics of a feather considered alone, see **FEATHER**; for the peculiarities of their growth in 'tracts,' see **PRETYLOSIS**; and for the periodical loss and renewal of plumage, see **MOLTING**.) The origin of plumage can only be surmised. It may well have been that chance variation which marked the earliest divergence from a reptilian stock toward the bird type. It has been conjectured that the primitive plumage was in the form of down, and the probability of this is shown in the fact that at present infant birds are first clothed

with down alone. In a large class of birds, mostly of low organization, this down is assumed before the embryo leaves the egg; such are called *Dasyptædes*, and as most of them are sufficiently advanced to begin at once to run about and pick up a living without parental help, they are said to be *pre-cocial*, and their parents classed as *Præcoces*. Among the higher birds, as a rule, however, the young are quite naked when hatched, and are termed *Gymnopædes* (or *Psilopædes*), and these birds are spoken of as *altricial* (*Altrices*), because they must feed and care for the young.

Origin and Service of Plumage.—The first and essential service of the feathers is as a coat, protecting the body against cold and atmospheric changes. In the view of Prof. O. C. Marsh, who did more than any one else to collect and reason upon the facts of the origin and development of birds, the acquirement and gradual increase of the feather coat was accompanied by a steadily augmented warmth of blood, and a proportional increase in its activity. The greater activity would result in a more perfect circulation, and this in a steady improvement of general bodily ability and power. If this view be correct, to the acquirement of plumage may be attributed the high degree of development attained in modern birds as a class. The second great service of plumage is its development, on wings and tail, into an instrument of flight. (For the phenomena of flying, see **FLIGHT**.)

Wings and Their Functions.—Wings, externally viewed, are formed of large quill or flight feathers (*remiges*), which grow from the posterior margin of the arms and hands in a plane (when outstretched) horizontal with the long axis of the body; they overlies one another at the outer edge so as to slide much beneath one another when the wing is closed, form an *aéroplane* when distended and quiet, and a series of oars when the bird moves. It is believed that in the development of the wings (*Gadow, Proceedings Zoological Society of London*, 1888, page 665) and powers of flight in birds, those feathers nearest the body were the first to become serviceable; but now the most important *remiges* are those near the outer margin of the wing. These form a set (usually ten, but in some groups nine, and in a few cases eleven), which spring from the bones of the hand and are called *primaries*; they are long and comparatively narrow, and the shaft is near to the anterior margin. Inside these, springing from the ulna, is a set of lesser and more equally proportioned quills called *secondaries*, or better, *cubitals*; these are variable in number, the humming-bird having only six, while the albatross has forty. The fleshy parts of the wing are covered with rows of feathers called *coverts*, which gradually diminish into the general 'scapular' plumage upon and overlying the shoulder. Wing-feathers vary in length, strength, and shape, according to the mode of life and power of flight in different birds; and there is consequently great variety among birds in respect to the relative size, shape, and power of the wings themselves. The extreme of length, both absolutely and relatively, is found among the oceanic birds, whose lives may be said to be spent upon the wing. The albatross and the condor have wings two and one-half times the total length of the body, reaching an alar expanse of between 11 and 12 feet in large

specimens, and nearly the same proportions hold for other pelagic wanderers, as the tropic-birds; while in such birds as swifts and hummers the wing may largely exceed the body-length. Such wings belong to birds which range over vast spaces of ocean, or remain poised for long periods in the upper air, as do the vultures and diurnal hawks, or that feed upon flying insects, and so have need of extraordinary sustaining power, endurance, and ability for occasional extreme speed and agility. Such wings are always slender, and sabre-like in outline, when extended, the primaries being usually much longer than the secondaries, narrow and curved, but very strong and far overlapped; those of the diurnal birds of prey are peculiarly narrowed, or 'whittled away' on the inner vane toward the tip. From this extreme, wings grade down in shape to the 'round' or 'short' type characterizing the terrestrial and arboreal birds generally, or those which seek their food in limited areas of quiet water. Here the wing may be considerably shorter than the body, and its feathers broad, the primaries little, if at all, exceeding the secondaries in length—all broadly and evenly vaned, so that the breadth of the wing approaches its length. Such are adapted to quick starting and short, agile 'fitting' flights, rather than to prolonged sustentation or swift darting; yet they do not lack power, for many short-winged birds make journeys of hundreds of miles without resting (see *MIGRATION*), and others are capable of extremely swift motion; but none of them can soar, as do sea-birds and birds of prey, nor equal these in volant grace. All these, moreover, trust for safety rather to hiding than to fleeing from danger.

Degeneration of Wings and Flight-Power.—There is, then, a close relation between the form of wings and the habits of their owner, so far as these involve flight. Hence it might be expected that birds which, for any reason, diminished or were prevented the use of their wings would find these gradually reduced in utility. This, as a matter of fact, has happened. As has already been intimated, there is every probability that the ratite birds (ostriches, cassowaries, and various forms recently extinct) began to be affected in this feature early in the history of the class, and that their present flightless and almost wingless condition, now most extreme in the apteryx (see *KIRI*), is due to degeneration of these organs, following the acquirement of cursorial habits in treeless regions. The same result came about differently in another direction, where the penguins, developing by untoward circumstances of competition in the Antarctic region, and forced to get their food wholly from the sea, have had their wings utterly metamorphosed from flight-organs into swimming-organs. The related auks of the Arctic regions have continued to find use for their wings, and have retained them in fair condition; but these include an example of how this kind of degeneration of an organ may come about in a species whose home is so restricted and peculiar (perhaps in freedom from natural enemies) that little or no call is made for exercise of the wings—such circumstances as might surround a bird or breed of birds on any of many small and nearly barren islands. The great auk or gare-fowl (*Plautus impennis*), although somewhat more free than in the case supposed, seems to have degenerated

to its wingless condition in such a way; and another, more pertinent example is the weka (q.v.) of Tristan d'Acunha, which, otherwise little different from a gallinule, is entirely flightless. Several other instances might be adduced; and the fact that the dodo, dinornis, and other extinct flightless birds were inhabitants of islands, strengthens the thesis. See *FLIGHTLESS BIRDS*.

Secondary Uses of Wings.—Wings have other uses than for flight. They seem to have been organs for climbing before they were organs for flying, and immature birds of several sorts (see *HOACTZIN*) still use them in scrambling about branches or through the reeds or over rough ground. They enable many water-birds to dive and swim, by motions under water analogous to flying. They form hiding-places and shelters for the young. "As a hen gathereth her chickens under her wings," was an expression chosen in Holy Writ to enforce the idea of supreme protection. Spread above the nest, they shed rain and hot sunshine from the eggs or tender fledglings. They serve as weapons also, for many birds strike with them very effectively, as our barnyard turkeys show; and in certain forms, as the jacana, chaha (see *SCREAMER*), and the spur-winged goose, the outer edge of the wing is furnished with one or more spurs which are highly effective as weapons. As a means of expression of the emotions, especially in the nuptial season, wings are utilized in many ways by these highly emotional animals. They are curiously developed, and are fluttered, elevated or spread, or beaten against the body or upon the air, or clapped together over the back, to make drumming or crackling sounds indicative of excitement, and serving as signals or challenges. In some cases certain parts of the wings are modified, as is the case in the snipe (q.v.), where some of the uttermost primaries are shaped so as to make a distinctively audible noise in flight (when desired) known as bleating; and still more strangely in the case of certain manakins. In color, wings are likely to be plain—at least so far as the quill-feathers are concerned. The proudly displayed wing-colors of the sun-bittern (see *Plate of BUSTARDS*) is one of a few exceptions. Ordinarily there are bars of white, and in the case of the ducks a brilliant metallic 'speculum,' and the linings of wings are often more beautiful than the outside. Frequently, however, there are present other sexual characters, more or less transitory, in the form of elongated plumes, as in the argus pheasant, the standard-wing (see *Plate of NIGHTJARS*), and some of the birds of paradise (q.v.). These belong to the male alone, and may or may not be permanent. Their explanation and history comes under the domain of 'sexual selection' (see *NATURAL SELECTION*). Lastly, wings seem to offer the privacy and darkness grateful to tired nature, for a bird desiring to sleep usually 'tucks its head under its wing.'

The Tail.—The tail, like the wings, presents great variety as to form and serves sundry purposes. It may be invisible, as in the apteryx, a downy tuft, as in the dodo, very short, broad and stiff, or very long, flexible and narrow, plain and simple or highly ornate. Like the wings, it is composed of large quill-feathers called rectrices, the insertion of which is concealed by under and upper coverts, either of which may

sometimes be transformed into highly ornamental plumes. The tail-feathers grow in pairs, the reason for which arrangement is shown by *Archæopteryx*, where each vertebra of the lizard-like tail supported one on each side. The reduction of this long caudal skeleton to a pygostyle, and the consequent crowding of the feathers upon a short base, seems to have produced the modern fan-shaped tail. "The normal number of rectrices is 6 pairs, but a few birds possess 10 or 11; several 9, 8, or 7; many only 5, and *Crotophaga* (anis) only 4—the diminution being brought about by the suppression of the outer pair or pairs." The main purpose of the tail, which is capable of much movement, is to assist the bird to balance, check, and guide itself. There seems, however, to be no relation between the size and shape of the tail and the character of the wings, though its shape is pretty constant within each order. Thus most of the sea-birds, water-fowl, waders, and game-birds have short, compact, inconspicuous tails, until we come to the pheasants, where they are likely to be exceedingly long and showy. The pigeons and their allies have broad tails, and those of the birds of prey are stout and square. The picarian families are mostly possessed of tails, which are long, or strikingly colored, as notably in the trogons and some cuckoos, or marked with peculiarities of form as in the motmots, or are the subject of special ornamentation as among the humming-birds. In the great tribe of *Passeres* the utmost variety exists, the magnificent lyre-bird (see Plate of *LYRE-BIRD*, etc.) coming next to the bob-tailed pittas; and here, among the short-tailed finches, warblers, and thrushes, are found birds capable of such caudal displays as those of the paradise-birds, sunbirds, some jays, etc. This shows that the essential service of the tail in flight may be performed by an appendage of almost any shape, and that the conspicuous, flexible, and somewhat unimportant nature of the organ has caused it to be influenced by natural (and especially by sexual) selection in an usual degree as a means of displaying sexual ornamentation and emotion. This is the explanation of the possession by male pheasants of their magnificent trains, of the gorgeous array spread by the peacock (though here it is really the tail-coverts), which he rattles nervously, as if to call attention to the show; of the symmetrical beauty of the lyre-bird's tail; and of the amazing caudal ornaments of birds of paradise. (See Plates of *PEACOCKS*; *LYRE-BIRDS*; *BIRDS OF PARADISE*.) "The motmot," remarks F. M. Chapman (see *MOTMOT*, for interesting details), "gesticulates with its tail in a remarkable manner, swinging it from side to side, so that it suggests the pendulum of a clock, or sweeping it about in circles with a movement which reminds one of a band-master flourishing his baton. We shall find in other species, also, that the tail, more than any other organ, is used to express emotion. Recall its twitching and wagging: how it is nervously spread or 'jetted,' showing the white outer feathers, as in the meadow-lark. The tail may be also expressive of disposition. Compare the drooped tail of a pensive fly-catcher with the uplifted member of an inquisitive wren."

Crests, Combs, etc.—Crests in very great variety, usually able to be elevated or depressed at the will of the bird, and ornamental plumes or

tufts of feathers, such as the aigrets (see *AIGRET*) of herons, and the 'tassels' hanging from the turkey's breast, are developments of the plumage that might properly be discussed here; but the limitations of space compel a reference instead to the biographies of the various birds that exhibit them. The beak and head-appendages, such as combs, wattles, carunculated ceres, 'helmets,' etc., are, however, dermal growths, which require mention; as also will the coverings of the feet.

The Beak.—The beak, bill, or neb of a bird is formed of two horny sheaths, overlying bony supports, and forming the mouth and food-getting organ of a bird. It consists of two *mandibles*, an upper and a lower, into which the foremost bones of the skull are produced, all appearance of lips being lost. It is not furnished with proper teeth, although rudiments of them have been observed in the embryos of some parrots; and the marginal laminae with which the bills of many water-fowl are furnished partake of the same character, being secreted by distinct pulps. The resemblance of these marginal laminae to teeth is particularly marked in the merganser (q.v.). The bills of birds differ much, according to their different habits, and particularly according to the kind of food on which they are destined to live, and the manner in which they are to seek it. In birds of prey, the beak is strong; the upper mandible arched or hooked, and very sharp; the edges sharp, often notched, and the whole beak adapted for seizing animals, and tearing and cutting to pieces their flesh. A powerful, short, hooked beak, sharp-edged and notched, indicates the greatest courage and adaptation to preying on living animals. The beak of the vulture is longer and weaker than that of the eagle or falcon. In birds which feed on insects and vegetable substances, the hooked form of the beak is less common, though well marked in parrots; those birds which catch insects on the wing, such as the nightjars, swifts, etc., are remarkable for the deep division of the beak, and their consequently wide gape, and an analogous provision to facilitate the taking of prey is to be observed in herons, kingfishers, and other fishing birds; but the object is attained in their case by the elongation of the beak, whereas birds which catch insects on the wing have the beak very short. Birds which feed chiefly on seeds have the beak short and strong, for bruising them; while the beak of insectivorous birds is comparatively slender.

Many aquatic birds have broad, comparatively soft and sensitive bills, with laminae on the inner margin for straining the mud from which much of their food is to be extracted; other birds, as snipes, avocets, etc., seeking their food also in mud, have slender bills of remarkable sensibility. As the varieties of form roughly distinguished the larger and more obvious of the groups of birds, the bill was made the standard for the early classifications, giving such group-names as *Dentirostres*, *Conirostres*, etc., no longer of scientific value. The modifications of form are very numerous, and the peculiarities of the bills of toucans, hornbills, spoonbills, crossbills, parrots, humming-birds, etc., are very interesting, and intimately connected with habits. Some of the modifications, however, are sexual and transitory, such as the knob on the beak of the pelican, and the deciduous parts of that of

the puffin. At the base of the upper mandible, a portion of the beak is covered with a membrane, called the *cere* (Lat. *cera*, wax, from the waxy appearance which it presents in some falcons, etc.), which in many birds is naked, in others is feathered, and frequently is covered with hairs or bristles. The nostrils are situated in the upper mandible, usually in the *cere*, but in some birds they are comparatively far forward, and in some, as puffins, they are very small and placed so near the edge of the mandible as not to be easily detected. They are more or less open, or covered with membrane, or protected by hairs or feathers. Besides their principal use for seizing and dividing or triturating food, the bills of birds are employed in a variety of functions, as dressing or preening the feathers, constructing nests, etc. They are also the principal instruments used by birds in their combats.

The Feet.—The feet of birds vary considerably, according to their mode of life. In some the claws are strong and hooked, in others short, straight, and weak; in some the toes are all separate, in others more or less connected; in birds especially adapted for swimming they are generally *webbed* or united by a membrane; in other swimming birds, however, a membrane extends only along the sides of each toe. A large group of birds, including woodpeckers, parrots, etc., have two toes before, opposed by two behind, the foot being thus particularly adapted to grasping irregular surfaces and facilitating climbing. These distinctions were seized upon by the early ornithologists as a means of classification, which gave us such obsolete group-names as *Scansores*, *Rasores*, etc., which only partly coincide with the more scientific groupings now accepted. In most birds the tibia is feathered to the heel-joint; in some, however, and particularly in *waders*, the lower part of it is bare; the shank and toes are generally destitute of feathers, and are covered with scaly skin, and the arrangement of these scales has been much studied. "The most primitive form of the horny covering of the feet," according to Stejneger, "seems to be its division into uniform hexagonal scales, and is called reticulate; the next stage is when some of these scales fuse together forming what are termed scuta, or scutella; . . . still further specialization is indicated by the tarsal scuta fusing into a continuous covering, which, in its extreme development, embraces both the front and the back of the tarsus, as in some of the higher groups of passerine birds; such a tarsus is said to be 'booted.'" Feet, like beaks, have certain accessory or changeable parts; thus in the grouse family there is a seasonal molting of the sheaths of the claws. The most important appendage, however, is the spur or series of spurs, which arm the 'heels' of certain gallinaaceous cock birds, and form serviceable weapons among this class, whose beaks are ill adapted to use as weapons, so that they strike with feet and wings in their combats. The extraordinary development of the legs and feet in ratite birds will be found described under *MOA*, *OSTRICH*, and similar titles.

Oil-Gland.—The skin of birds has no sudoriferous nor sebaceous glands, but on the rump at the base of the tail (on the 'pope's nose') is a bilobed gland containing oily matter, which is present in all birds except the *Ratitæ*, bustards, and a few others. This secretion seems useful

only for cleaning the plumage, and the bird squeezes a little out upon its beak before preening its feathers. In the oil-bird the secretion is excessive, and that of the hoopoe has a very disagreeable odor.

INTERNAL STRUCTURE. Skeleton.—The theory and facts of ancestry related above are enforced by comparative anatomy, which finds in the structure of birds a close resemblance to the internal structure of reptiles. Birds, nevertheless, possess distinctive anatomical features fully entitling them to rank as a separate class. In general form the body is spindle-shaped, tapering forward from the shoulders to the head, with the feathers sloping backward, and again diminishing toward the tail; this is adaptive to progress through the thin media of air and water inhabited by birds; and the weight is thrown forward, securing proper balance for the normally horizontal position. In order to secure this there is a concentration of muscles and other organs in the region below the point of suspension of the wings. Not only are the fleshy portions of the legs mainly confined to the upper portions of these limbs, but the muscles which elevate the wings are actually placed on the under instead of the upper surface of the body.

Though the neck is sometimes much prolonged, the body is very compact and rigid. The backbone consists of vertebræ having (typically) saddle-shaped, articular facets, and many processes and ligaments which lock them firmly together; moreover, the vertebræ of the back generally become ankylosed or firmly united together by cementing bone, the solidity thus acquired being for the support of the ribs, and these also are proportionately stronger than is usual in mammals; each of them is provided in the middle with a flattened bony process, directed obliquely backward to the next rib, so that they support one another, and they often become ossified with the sternum, giving unusual rigidity and strength to the thoracic framework. The hinder part of the spine is consolidated with the pelvis, and the tail, primitively long, has become shortened into a few small movable vertebræ terminating in a short and generally much elevated bone, consisting of ankylosed vertebræ, called the *pygostyle*, or *plowshare bone*.

In contrast to the general stiffness of the vertebral column in the trunk, it is remarkable for great flexibility in the neck, enabling a bird to make ready use of its bill, or to bring its head into such positions as suit the adjustment of the centre of gravity in flying, standing, etc.; there are also certain peculiar ligamentous bands, by which birds can retain the neck in the customary S-curve without muscular exertion. The first (atlas) and second (axis) vertebræ are modified to form an articulation with the head, which is completed by a single globular condyle (as in reptiles), forming a sort of pivot, and enabling the head to be turned around with a freedom and to an extent impossible to the mammalia; and the fact that it is formed almost wholly by the basioccipital bone constitutes a fundamental distinction between birds and the reptiles on one side and the mammals on the other.

The Skull.—The skull is formed of bones corresponding with those of man; but they can be distinguished only when the bird is very young, soon becoming consolidated together. The brain-case "is more arched and spacious, and is larger,

in proportion to the face, than in any reptilia" except pterodactyls. The jaws are much elongated, so as to form the bill, the outward shape of which, however, formed by the horny sheath, may be very different from that of its bony supports, in adaptation to habits of use. The upper mandible is formed anteriorly and mainly of the premaxillæ and posteriorly by the paired maxillaries and other bones, varying greatly in relative position and importance, and in many birds movable, so that the upper jaw is capable of a certain amount of up and down motion as on a hinge. These and other elements form a palate, the varying bony arrangement of which has been used with disputed success as a basis for general classification in ornithology. The lower jaw is formed of several elements now fused solidly together; and it is connected with the skull by the quadrates and other lesser bones and by a series of elastic cartilages permitting extreme movability and large expansion of the gape.

BONES OF THE SKULL OF A FOWL.

Legs.—The limbs of birds conform to the vertebrate type, with certain modifications, which are least in the hinder pair. They are attached to the 'pelvic arch,' which in birds consists of some solidified sacral and coccygeal vertebrae and the paired pelvic bones (ilium, ischium, and os pubis), which latter meet to form a cup in which

rests the head of the femur. When one considers how far behind the centre of gravity of a bird's body the hip-joint is placed, and how it must sustain the whole weight of the body under

TARSAL ENVELOPES.

1. Booted. 2. Scutellate. 3. Reticulate. 4. Reticulate-scutellate.

unfavorable circumstances, as well as provide for the leverage of the muscles of the thigh, the necessity for this consolidation, breadth, and massiveness will be perceived. The thigh is short, and concealed within the body; the next division, often mistaken for the thigh, is the leg, strictly so called, or *tibia* and *fibula*, which ends at what is really the ankle-joint, although popularly regarded as the knee; and beneath this is the shank commonly called the *tarsus*, which in some birds is very long, serving as a part not of the foot, but of the leg, and formed by a compound bone, composed of the united metatarsal bones, with the upper end of which four tarsal bones are fused. Thus the ankle-joint is not between the tarsus and metatarsus, but between two series of tarsal bones. The tibia is therefore properly a tibiotarsus, and the so-called tarsus is really a tarsometatarsus. The feet are divided into toes, which are four in number, three before and one behind, differing from each other in length and in the number of joints or phalanges of which they are composed, the hallux, which is directed backward, being in general comparatively short, and consisting of two joints only. No fifth toe is known, and the hallux (first toe) is absent in the Struthionies, which have lost also the second, while the fourth is diminished, throwing the work almost alone upon the third, or middle toe.

Wings and Shoulder-Girdle.—The anterior limbs or wings of a bird are the fore limbs of other vertebrates modified for the purposes of flight. They were attached to the shoulder-girdle or pectoral arch of the skeleton, which in this class is of extraordinary strength and importance. It consists of the thoracic case formed by the dorsal vertebrae, the true ribs and the breast-bones (sternum), which are connected by ligaments and ossifications. All the bones of birds are dense and hard. The sternum is remarkably large and strong, serving for the attachment of the muscles which depress the wings. It generally exhibits a projecting ridge, or keel, along the middle, which is proportionately largest in birds of most powerful flight or swimming ability, and is wanting only in the flightless birds (see above). This plate ossifies only as the bird matures, being in early life a cartilage, the flexibility of which may easily be felt in young fowls, affording housekeepers a test for alleged 'spring' chickens. The variations in form of the sternum are of considerable taxonomic significance. Outside and attached to this case

on each side, at a point as high and forward of the centre of gravity as feasible; is the framework of the shoulder-joint, braced against the tremendous leverage of the wings: it consists of the scapula, or shoulder-blade, a coracoid and a clavicle, the junction of which forms a cup in which rests the head of the humerus. The scapula is a more or less sabre-shaped bone placed above the ribs, and lying parallel to the spine imbedded in muscles and firmly attached (sometimes fused) at the forward extremity to the head of the coracoid. The coracoid is a pillar-like bone which serves as the main support of the shoulder, "for while at one extremity it sustains the wing, at the opposite end it is firmly united to the front of the sternum. A third brace is afforded by the combined clavicles, which curve downward and backward from the shoulder-joint, imbedded in muscles, and unite under the neck, and just in advance of the sternum, to form the furculum (fork), which we know as the 'wish-bone', and the English call 'merry-thought.'" See *FOLK-LORE*.

The wing-bones are homologous with those of the arm in other vertebrates, but have become modified in both form and relative position to adapt them to the requirements of flight. "The fore limb of a bird, when in a state of rest," says Huxley, "exhibits a great change of position if it be compared with that of an ordinary reptile; and the change is of a character similar to, but in some respects greater than, that which the arm of a man presents, when compared with the fore limb of a quadruped mammal. The humerus lies parallel with the axis of the body, its proper ventral surface looking outward. The forearm is in a position midway between pronation and supination, and the manus is bent back upon the ulnar side of the forearm, in a position not of flexion, but of adduction."

The humerus is usually short as compared with the radius and ulna (the latter is more curved and stouter than the former) which together form the forearm and main stretch of the visible wing; these remain separate, and at their outer extremities articulate with the two small bones of the wrist (carpus) which alone remain free. The other, distal, carpal bones "fuse in the embryo with the proximal end of the three first metacarpals, and all trace of their originally separate existence disappears." The metacarpus consists of three bones (I., II., III.), which are more or less flattened and fused. The first bears the pollex or 'thumb' (whence springs, in some birds, the bastard wing or alula), and the second the index finger, which is long, straight, and has two, or sometimes three, phalanges. These bones complete the wing, except that a few species have a rudimentary third finger. Archaeopteryx, however, had three well-developed fingers, all armed with claws; and in embryo ostriches a claw sometimes appears on the third finger. Such is the bony framework of the wings, operated by muscles of immense power (the pectoral muscles are said to make about one-fourteenth of the weight of the whole body in birds of prey, and one-eleventh in a wild goose); but their usefulness depends upon the external furniture of feathers, heretofore described, which forms the expanse necessary for buoyancy and flight (see below).

MUSCULAR SYSTEM. The muscles of birds conform, in general, with the vertebrate type, though the homologies, especially about the fore limbs, are sometimes obscure. For these homologies, Newton's review in Bronn's *Thier-Reich* (Vögel, pp. 9-325) is complete, and is epitomized in the former's *Dictionary of Birds*, pp. 602-620. Specified arrangements of muscles and tendons, especially the plantar tendons, have been much experimented with as a basis of classification, but the results have not proved of great value, when taken alone. Only a few general considerations need be presented here. The muscular system of birds is characterized by an extraordinary strength in those parts concerned with activity and endurance, and has certain interesting automatic functions. Thus the vast pectoral muscles attached by a broad fleshy base to the sternum and narrowing to a complicated tendinous attachment to the wing-bones, are mainly two, forming the thick whitish 'breast' of edible fowls; they depress the wing—the effective movement in flight. An elastic band in front of the wing passes from the head of the humerus to the carpal joint; when the wing is extended it is stretched about three times its ordinary length, and its natural contraction enables the bird to keep the wing closed without effort. As it lies just beneath the skin, it is easily cut, and as such a severance prevents the wing from being firmly extended, it offers the best method of rendering captive birds incapable of flight; to disable one wing is quite enough. See *MUSCULAR SYSTEM, EVOLUTION OF*.

"In the hind limb of most birds there is a singular extensor muscle, which arises from the pubis, ends in a tendon which passes to the outer side of the knee-joint, and terminates in the leg by uniting with the flexor digitorum perforatus. The result of this arrangement is, that the toes are flexed whenever the leg is bent upon the thigh, and, consequently, the roosting bird is held fast upon his perch by the weight of his own body." (Huxley, *Anatomy of Vertebrated Animals*, New York, 1878.)

VISCERAL SYSTEM. The digestive apparatus of birds resembles that of mammals; exhibiting, however, various modifications, according to the different kinds of food—some birds feeding on flesh, others on fish, others exclusively on insects, others on seeds, others more indiscriminately on a variety of animal and vegetable substances. Few birds masticate their food in any degree; upon being swallowed, it enters the crop or *craue*, an enlargement of the œsophagus situated just before the breast-bone, where it is moistened by saliva and partly digested, so that its contents, easily regurgitated, form a suitable food for nestlings in some families, as, notably, the pigeons. The crop is wanting in the ostrich, and also generally in birds that feed on fish, and is of greatest size in those of which the food consists of seeds or grain. It is generally single, and on one side of the gullet; sometimes, as in pigeons, it is double. A second dilatation of the œsophagus, called the *proventriculus*, is generally largest in those birds in which the crop is wanting or small; and in this the food is further softened and chemically treated. The third and principal stomach is the *gizzard* (q.v.), which in birds of prey, fish-eating birds, etc., is a mere membranous sac, but in birds which feed on grain or seeds is very thick and muscular,

so that it acts as a sort of mill, and with extraordinary power. In these birds, also, the grinding down of the contents of the gizzard is assisted by the small rough pebbles or grains of sand constantly swallowed, as is well exemplified in domestic fowls. The liver and pancreas are usually large, as also are the kidneys; but there is no urinary bladder, and the urine, which contains very little water, is at once poured into the *cloaca*, an enlargement of the terminal portion of the intestine. The intestine varies greatly in capacity and length, being 'short' in all purely frugivorous and insectivorous birds, and 'long' in those which live upon fishes, carrion, grain, and grass; its walls differ in structure from the mammalian and agree with the reptilian type. The diaphragm is incomplete and differently arranged from that of mammals. See ALIMENTARY SYSTEM, EVOLUTION OF.

Food.—The amount of food required to sustain the high temperature and great bodily activity of birds is excessive, when compared with that required by other animals of proportionate size; and young, growing birds tax the food-getting abilities of their parents to the utmost. Many facts might be quoted in support of this, such as that of Aughey's confined plovers, which ate an average of 200 locusts and similar large insects each day; fledglings habitually consume more than their own weight of food between sunrise and sunset—sometimes twice as much. Adult birds eat almost continuously, and digestion is extremely rapid, the process being completed in from one to two hours in small birds. This ability for enormous consumption makes the birds of vast value to man in the reduction of insect pests; it also limits the time birds may fast, so that unless they can fly with very great rapidity, long journeys cannot be undertaken, and the fact that most birds are able to make great speed is probably an achievement of natural selection related to this very characteristic. On the other hand, birds show considerable ability to adopt a new diet, and adapt themselves to it healthfully. The writings of Dr. F. E. L. Beal, Prof. S. A. Forbes, and others, published in the documents of the United States Department of Agriculture, and by the governments of Illinois and other States, contain much information on this subject.

Respiration in Birds is rapid and copious, and the pulmonary system includes not only a pair of rather large lungs, but a system of 'air-sacs,' by which air is distributed throughout the body. These air-sacs are of two kinds. One consists of membranous expansions of the lungs, which lie among the tissues in the form of inflatable bags controlled by muscles, so that they can be emptied and filled at the will of the bird; they occur in all parts of the body and penetrate beneath the skin and inside many bones, but in varying amount. It is popularly believed that all bird-bones are hollow, but this is far from true. "Generally, the skeleton is most pneumatic in large birds that fly well, like vultures, storks, swans, and pelicans; less so in small birds, and least in heavy or little-flying water-birds. However, there are many exceptions. While, for instance, most of the bones of many *Passeres*, of swifts, divers, rails, the kiwi, and of terns, are solid, and air-cells are restricted chiefly to the cranium, many parts of the skeleton of the large *Ratitæ* are very pneu-

matic. The greatest development of pneumatic cells exists in the screamers and hornbills, in which even the fingers and toes, in fact, any part of the skeleton, are hollow. . . . It is well known that a bird which has its humerus shattered by shot can for some time breathe, although its beak and nostrils be tightly closed, and thus be submitted to unnecessary, excruciating pain. Compression of the thorax and abdomen suffocates a wounded bird better than strangulation." See RESPIRATORY SYSTEM, EVOLUTION OF; ANIMAL HEAT.

The functions of these air-sacs are not very evident. They serve to ventilate the rather incontractable lungs, and from them issues the air which inflates the 'drums' in the neck of the prairie chicken, the gular pouches of the adjutant stork, the 'horn' of the bell-bird (q.v.), and that extraordinary swelling of the throat which marks excitement in the pectoral sand-piper (see Colored Plate of SHORE-BIRDS). These inflations are characteristics of male birds only, and appear only in the spring. The air-sacs also assist in furnishing a continuous current of air enabling some singing birds to maintain a long strain of melody, such as the nightingales.

Arterial Circulation.—Conformably with this copious aëration, and the habits of activity, the circulation of the blood in birds is rapid, the heart beating 120 times a minute at rest, and nearly doubling this rate at the first stroke of the wings; and its temperature (from 100° to 112° F.) is considerably higher than in mammals. The heart resembles that of the mammalia in its form and structure; but the right ventricle, instead of a mere membranous valve, is furnished with a strong muscle to impel the blood with greater force into the lungs; and the carotid arteries are peculiar. During incubation there is a congestion of blood in the enormously dilated vessels of the abdominal wall, forming the 'brood-organ.' The red corpuscles are, on the average, twice as large as those of man, and elongated, as in reptiles, rather than round, as in most mammals. See CIRCULATORY SYSTEM, EVOLUTION OF.

Reproductive System.—Birds are distinctly male and female, cock and hen. The females possess a pair of ovaries (of which only the left one is functional as a rule) situated in the 'small of the back' at the front end of the kidney. The ovary consists of a grape-like cluster of germinal eggs, which during the breeding season exhibit all stages of size and ripeness, but in winter are reabsorbed, so that the determination of sex by dissection at that season is difficult. The ripe egg passes down tubular passages (oviducts) in which it receives, in certain 'uterine' expansions, its coverings of albumen and shell, to the right side of the rectum, and thence is voided in a more or less advanced state of development, which is completed by incubation or its equivalent. The testes of the male are a pair of glands, situated as are the ovaries, from which the spermatic ducts lead to the cloaca. (See Egg and EMBRYOLOGY.) All birds lay eggs, some only one, others as many as twenty, the number seeming to depend upon the average chances of reaching sexual maturity possessed by each species. With rare exceptions, these eggs are cared for by the parents, and all birds of higher organization prepare receptacles (nests) for them, and furnish by brooding the continuous

warmth necessary to their hatching—a process which requires from two to six weeks according to size and other factors. This necessity has developed a body of instincts, habits, and mental and structural characteristics, which include the most striking, significant, and interesting facts of bird life and history. See NIDIFICATION.

NERVOUS SYSTEM. The nervous system of birds is highly developed, but presents few salient differences from the vertebrate type. There is a perceptible improvement of the brain over that of reptiles, more especially in the increased, proportional development of the cerebral hemispheres; but the surface-convolutions and other features that play so important a part in the

ment of this sense in birds; yet a certain amount of discrimination is undoubtedly exercised by them, apart from the guidance of touch and smell. Odors affect birds also, but to a less degree probably than is frequent among even reptiles, not to say mammals; and it is probable that even the carrion-eating species depend little upon their sense of smell in guiding them even to odoriferous food. Birds owe less to the sense of touch than many other creatures, for they have few tactile organs, the bristles about their beaks having other purposes, mainly. The bills of some mud-hunting species, however, are specialized in this direction (see DUCK and SNIFE). In respect to hearing, birds are well endowed, having the internal apparatus of the ear (see EAB) highly perfected, and exposed to the vibrations of the air through a cartilaginous meatus with a fairly wide opening. One function of the ears of birds, as well as of other creatures, seems to be to inform the animal as to its relations with space, balance, direction, etc. Whether or not this is to be regarded as a sense, is undecided. There is no external ear, the nearest approach being in the nocturnal owls (where the organ presents other peculiarities—see OWL), though the so-called 'ears' of some of those birds are merely tufts of feathers which have nothing to do with audition. Moreover, this faculty in birds extends beyond mere quick perception of sounds to 'the power of distinguishing or understanding' pitch, notes and melodies, or music; and it has been an important factor in the development of bird-singing.

The vocal performances of birds are one of their foremost and most pleasing characteristics; yet of only a few, in the most highly organized classes, can it be said that they sing. Even in the order called 'singers' (Oscines), many make little melody, though, like the crow, they may utter a long list of significant notes—a real language, which is developed among birds generally to a degree realized by few. The vocal mecha-

brains of the higher mammals are absent or merely indicated. In this, and in the way the cerebral nerves originate, the brain remains nearly reptilian. The sympathetic system is highly developed, as would be expected in creatures of such activity and sensitiveness. See NERVOUS SYSTEM, EVOLUTION OF.

The Senses of Birds, as a whole, equal those of most mammals, and in some directions are superior to those of other animals. Taste is, perhaps, feeblest, the horny nature of the jaws and the character of the food not favoring the develop-

ANATOMY OF BIRDS.

ANATOMY OF BIRDS

For Description see Article Birds.

nism of this class is not in the larynx, but at the lower or pectoral end of the windpipe, in an organ called the syrinx, which consists of several stretched and vibratory membranes, tracheal rings and controlling muscles. This complicated organ, peculiar to birds, presents almost unlimited modifications, and is quite unlike the arrangement of laryngeal vocal cords in mammals, for the tongue has nothing to do with a bird's speech or music. (See Plate, Figs. 7, 8, 14.) For further consideration of the singing birds, see VOICE.

The Eyes of Birds are large, clear, highly perfected in structure, and, in many species, endowed with a power of vision which is beyond anything known elsewhere. The way in which vultures descend upon carrion from a height where they are invisible to us, or sea-birds swoop down upon fishes, or fly-catchers dart long distances upon insects so small we can barely perceive them at close range, are examples of their sharp-sightedness, with which is combined remarkable ability in rapidly changing the focus, as must be necessary to a bird darting swiftly upon prey it must keep constantly in view. There are no movable eyelids, but in place of them a nictitating membrane is frequently drawn over the eyeball to clean and lubricate it, or shield it from a glare. The owls and other nocturnal birds have great power of contractility

not only in the pupil, but in the whole case of the eye. See EYE.

STRUCTURE OF THE EYE.

A 'Sense' of Direction.—The so-called 'sixth sense' of orientation or direction, that is, the power of instinctively knowing and maintaining a course of flight through the air independent of

TOPOGRAPHY OF A BIRD.

A.—General Plumage: 1, forehead (frons); 2, lore; 3, crest; 4, crown (vertex); 5, eye; 6, hindhead (occiput); 7, nape (nucha); 8, hindneck (cervix); 9, interscapular region; 10, back proper (dorsum), including 11; 11, rump (uropygium); 12, lesser tail-coverts; 13, tail; 14, under tail-coverts (crissum); 15, leg (see C); 16, abdomen; 17, side of body; 18, breast (pectus); 19, primaries; 20, secondaries or cubitals; 21, tertiaries or greater coverts; 22, coverts; 23, alula, or bastard wing; 24, throat, the lower half of which is called 'jugulum'; 25, ear-coverts (auriculars); 26, cheek or malar region; 27, chin (mentum); 28, beak (see B); 29, nostril.

B.—Parts of the Beak and Face: 1, culmen (ridge of upper mandible); 2, apex, tip, or hook; 3, tooth on cutting edge of upper mandible; 4, junction (gonys) of ramal of lower mandible; 5, cere; 6, nostril; 7, left lore; 8, corner of mouth (commissure); 9, chin (mentum).

C.—Parts of the Leg: 1, Thigh (tibiotarsus); 2, tarsus (metatarsus); 3, first or hind toe (hallux); 4, second or inner toe; 5, third or middle toe; 6, fourth or outer toe.

guidance of landmarks, is manifested by birds in a most surprising way; for no other explanation (little as we understand it) seems to account for their ability to cross vast spaces of ocean straight toward small islands or restricted areas of coasts, as some birds habitually do in their migrations. See *MIGRATION*.

GENERAL CONSIDERATIONS. Many aspects of bird-life properly belonging to a treatise more extended than this need only be indicated here, because they are elsewhere discussed with reasonable fullness. Thus their classification is outlined under *ORNITHOLOGY*. The distribution of birds on the globe, where, in spite of their powers of flight, most groups and species are strictly bounded in their range, is sketched under *DISTRIBUTION OF ANIMALS*. The seasonal movements that characterize most birds outside the tropics, leading them to make more or less extended journeys, along the customary routes, northward in the spring and southward again in the fall, will be found explained under *MIGRATION*. The singing of birds, which forms so conspicuous and enjoyable a feature of their life, is discussed in the article *VOICE*, and their nest architecture, eggs, care of young, and domestic traits, are treated under *NIDIFICATION*; *EGG*; etc.; while their peculiar colors, ornaments, weapons, economic value, and habits in general, are portrayed in the biographies to be looked for under the names of various species and groups, and in such articles as *AGRICULTURE*; *EVOLUTION*; *FALCONRY*; *FOWL*; and the like. Birds have also taken a part in the history of mankind's mental and religious development, as appears in the articles *AUGURIES*; *AUSPICE*; and *FOLKLORE*. Finally, many species have been exterminated, directly or indirectly, since mankind came upon the earth, an account of which will be found under *EXTINCT ANIMALS*.

See also *Proceedings of the United States National Museum*, and those of the Zoölogical Society of London, since 1870.

BIRD, FOSSIL. Fossil remains that could be referred to birds were among the later acquisitions of paleontologists. The first were mistakenly so considered, and consisted of the famous 'bird-tracks' discovered in the 'brown-stone' rocks of the Connecticut River by Hitchcock, about 1835, and extensively studied by him. These footprints may possibly, in a few instances, be traces of primitive animals properly called birds, but so far as known all are impressions made upon mud by dinosaurs and similar amphibians or reptiles of the Triassic Age. (See DINOSAUR; LABYRINTHODONT, etc.). More recently true birds have been found fossil from the Jurassic Age onward, but their remains are everywhere comparatively scarce, due mainly to the easy destructibility of their bodies. The earliest to be identified proved to be also the earliest in time, and consisted of the remains in the Jurassic slates of Bavaria of *Archæopteryx*, whose characteristics are fully described under *ARCHÆOPTERYX*. This seems to have been a true feather-clothed bird, with well-formed wings, but a long lizard-like tail, beset on each side with a row of horizontal quill-feathers, and a heron-like beak studded with teeth. These characteristics are so radically different from those of all other birds that the *archæopteryx* is classified in a subclass of itself termed *Archæornithes*; all other birds, fossil and recent, forming another subclass, *Neornithes* or *Eornithes*. A long gap in geological time separates the period of the *archæopteryx* from the next earliest fossil birds known, which belong to the upper, or more recent, part of the Cretaceous Age. These formations in Europe and India, but especially in the western United States, have yielded varied remains of large birds, which, because all have teeth in the beak, have been called *Odontornithes* or *Odontolæxæ*. All are still of a low type of organization, showing many points of genetic affinity with reptiles, but far advanced beyond *Archæopteryx*; and all were aquatic and fish-

eating. They approximate, indeed, so closely to the ordinary carinate birds of the present time that they are included with them in a single subclass, as above noted, of which, say Parker and Haswell, "they will constitute a separate series characterized by the possession of teeth and . . . that the two halves of the lower jaw remain completely separate in front, instead of having a solid bony union. Of these toothed birds the one type is known as *Ichthyornis*, and comprises somewhat gull-like birds characterized by having a numerous series of teeth implanted in distinct sockets, and also by the vertebræ or joints of the back articulating with one another by means of cup-like surfaces (instead of saddle-shaped). . . . It is quite within the bounds of possibility that these birds may be ancestral types of the modern gulls. With *Hesperornis* (q.v.) we are confronted with a totally different type, in which the teeth were implanted in an open groove, while the wings were rudimentary and the keel of the breast-bone was wanting, although the vertebræ resembled those of existing birds. In general organization, *Hesperornis*, indeed, approximated very closely to the modern divers. . . . That it was thoroughly aquatic in its habits is self-evident; while it may . . . be regarded as a specialized and flightless offshoot from the ancestral stock of the modern divers." The discovery and elucidation of these Cretaceous toothed birds was made chiefly by Prof. O. C. Marsh, of Yale University, between 1870 and 1880, and his novelties included a large number of skeletons or fragments which have been referred to various genera, and are preserved in the Yale Museum at New Haven. "They afford a most valuable contribution in favor of the doctrine of evolution, approximating more and more, as we descend in the geological scale, to reptiles, from which it may be confidently stated the avian class has originated."

With the closing of the Cretaceous Period, toothed birds seem to have disappeared, for bird-fossils from the early formation of Tertiary age lack them, and in general approach closely to modern types. Few of these fossils have been found in North America, but Europe and South America have supplied many genera and species of various groups, increasing in numbers as we rise in the geologic scale. Among the oldest (Eocene) were certain gigantic forms, characterized by long, powerful legs and small and apparently useless wings, but especially by "the enormous and ponderous sturture of the skull, which is quite unlike that of any recent bird, and seems out of all proportion to the limbs, gigantic as are some of the leg-bones." These have been combined into a group (*Stereornithes*) including many species, chiefly of the genera *Brontornis* and *Phororhacos*, from the Miocene of Patagonia: "*Brontornis*, for example," according to Lucas, "had leg-bones larger than those of an ox: . . . while the great *Phororhacos*, one of his contemporaries, was not only nearly as large, but quite unique in build. Imagine a bird seven or eight feet in height, from the sole of his big, sharp-clawed feet to the top of his huge head, poise this head on a neck as thick as that of a horse, arm it with a beak as sharp as an ice-pick and almost as formidable, and you have a fair idea of this feathered giant of the ancient pampas." The skull equaled in size that of a large horse, but whether this great equipment

was used for carnivorous purposes can only be conjectured. The general affinity of these huge birds seems to be with the herons; and with them have been classed Gastornis and certain other large forms of contemporary time in Europe and North America, whose habits are supposed to be those of cursorial birds of prey. Other birds of the early Tertiary Age represented the Steganopodes (q.v.), or were similar to gulls, penguins, cranes, kingfishers, game-birds, and many other modern types. The rocks and caves of the Paris Basin, and of central France, and the Eocene beds of Wyoming, have been particularly fruitful in ornitholites. The Miocene and Pliocene eras furnish still more fossil forms, among which a large number of genera still exist, showing how early birds arrived at the perfection of their form and adaptation. Lydekker tells us that by far the greater portion of the remains of birds from the still higher Pleistocene rocks seem to be generically if not specifically identical with those now inhabiting the district in which they occur, though their range at that time may have been different from its present extent. To this period, immediately precedent to that in which we live, belong such recently existing races as the moa, epiornis, dinornis, etc., but they are treated elsewhere.

See also for further references and particulars BIRDS; EXTINCT ANIMALS; ARCHÆOPTERYX; HESPERORNIS; MOA, etc.

BIRD, ARTHUR (1856—). An American musician, born in Cambridge, Mass. After studying in Berlin, he went to Canada, but in 1886 he became a resident of Berlin. His compositions comprise a Symphony; three suites for orchestra; a serenade for wind instruments; *Puppentänze*, and various other compositions for the piano; the comic opera *Daphne* (New York, 1897); and the ballet *Rübezahl*.

BIRD, EDWARD (1772-1819). An English artist. He was born at Wolverhampton, and was first apprenticed to a maker of japanware. At the expiration of his term he refused all offers to continue in the decoration of tea-trays and began to paint pictures. He aided himself by becoming a drawing-master in Bristol. His "Good News," sent to the Royal Academy in 1809, made him at once popular. Afterwards he received influential patronage, and in 1814 was appointed painter to Princess Charlotte. In 1815 he was elected a Royal Academician. His genre pictures are deemed the best of his work, though "The Field of Chevy Chase the Day After the Battle" is looked upon by some as a masterpiece. The "Surrender of Calais" is also a picture of importance. His style resembled that of Wilkie. He is best remembered by "The Blacksmith Shop," "The Village Politicians," "The Country Auction," and "The Young Recruit." He left uncompleted "The Embarkation of Louis XVIII. for France." He was buried with great honors in Bristol Cathedral.

BIRD, FREDERIC MAYER (1838—). An American clergyman, educator, and hymnologist, born in Philadelphia, Pa. He graduated at the University of Pennsylvania in 1857 and the Union Theological Seminary in 1860, and from 1860 to 1867 was a Lutheran minister. In 1868 he took orders in the Protestant Episcopal Church, and from 1870 to 1874 was rector at Spottswood, N. J. From 1881 to 1886 he was professor of psychology, Christian evidences, and rhetoric at Lehigh University, and from 1893 to 1898 was editor of *Lippincott's Magazine*. He edited *Charles Wesley Seen in His Finer and Less Familiar Poems* (1867); *The Lutheran Ministerium* (rev. ed., 1868; with Dr. B. M. Smucker); and *Songs of the Spirit* (1871; with Bishop Odenheimer), and has written much on hymnology, in which he is considered one of the foremost American authorities. He also published *The Story of Our Christianity* (1893).

BIRD, ISABELLA. See BISHOP, ISABELLA BIRD.

BIRD, ROBERT MONTGOMERY (1803-54). An American novelist. He was educated as a physician, but practiced little. Turning his attention to literature, he composed three tragedies, *The Gladiator*, *Oraloosa*, and *The Broker of Bogota*. The first suited the dramatic talent of Edwin Forrest and was one of his favorite impersonations. It still yields declamations for schoolboys. Bird's first novel, *Calavar*, appeared in 1834, and was followed by *The Infidel* (1835). Both of these were historical romances with Mexico as their scene and the Spanish Conquest as their background. Then followed *The Hawks of Hawk Hollow*; *Sheppard Lee*; and *Nick of the Woods* (1837). The last is his most popular and important work, the scene being laid in Kentucky near the close of the Revolutionary War, and its motive being the fear and hatred inspired in the backwoodsman by the red man. In other words, Bird sought to counteract the effects of Cooper's idealization of Indian character. Less important books—*Peter Pilgrim* (1838) and *Robin Day* (1839)—followed; then Bird practically retired from literary work, although he did some editing shortly before his death. His literary life was passed mainly in Philadelphia. He was a careful writer, and attained considerable popularity in his day.

BIRD-CAGE WALK. The name of a walk in Saint James's Park, London. There were, in the reign of the Stuarts, aviaries in that section, whence the name.

BIRD-CATCHING. See TRAPPING.

BIRD-CHERRY. A term applied in Great Britain and Europe to *Prunus padus*, a tree bearing its fruits in racemes, and in other respects being a close counterpart of the American choke-cherry (*Prunus Virginiana*). In America the term bird-cherry is reserved for *Prunus Pennsylvanica*, the wild red cherry, also known as pigeon or pin-cherry. *Prunus Pennsylvanica* is of little economic importance, being sparingly cultivated for ornamental purposes; it is occasionally used as a stock for the orchard cherry, and its fruit is used in making cough mixtures.

BIRDE, bērd, or BYRD, WILLIAM (1540-1623). An English ecclesiastical composer. He was educated at Edward VI.'s Chapel, was appointed organist in Lincoln Cathedral in 1563, and twelve years afterwards organist to Queen

Elizabeth. He published numerous compositions exhibiting great musical learning, and contributed many pieces to Queen Elizabeth's *Virginal Book*; but his fame rests on the canon *Non nobis Domine*, which amid all changes in musical taste, has retained its popularity. His other works include *Psalmes, Sonets, and Songs of Sadnes and Pietie* (1588); *Songs of Sundrie Natures*, etc. (2d ed., 1610); *The Nadualia* (1607), and three masses.

BIRD IN A CAGE, THE. The title of a play by Shirley, licensed as *The Beauties*. The bird is the luckless Prynnne, author of the *Histriomastix*, and the cage is the Tower of London.

BIRD ISLAND. One of the smaller of the Hawaiian Islands (q.v.).

BIRD-LICE, AND OTHER BIRD-PARASITES. See FLEA; LOUSE; MITE; TICK, etc.

BIRD-LIME. See TRAPPING.

BIRD OF PARADISE. A member of an Australasian family of passerine birds, remarkable for ornamental plumes, and so called in free translation of their native name in the Moluccas, meaning 'birds of the gods,' which Buffon transformed into *manucode*. They first became known to Europe by specimens brought by the returning ship of Magellan's expedition in 1522; but their skins had previously circulated in trade in India, Persia, and among the Arabs, being worn in the headdress of the Janizaries early in the Sixteenth Century; and they soon began to be imported into Spain and Portugal. In preparing for market the skins (mainly or altogether those of the great bird of paradise) the islanders cut off the legs and sometimes the wings, leaving in place of the latter simply the tufts of orange plumes that spring from beneath them. Thus, although Antonio Pigafetta, in his account of the Magellan voyages, had described them pretty accurately as living birds of ordinary structure, many fables were woven around these mutilated skins, and burdened literature for many years, as may be seen by a reference to Aldrovandus and his followers; and a monument remains in the present specific name of the most prominent form, *Paradisæa apoda*—the 'footless.' It is a curious circumstance that although first, and for a long time, only known from the Moluccas (where the species sent by the ruler as a present to the King of Portugal was not rediscovered until lately), the paradise birds are most numerous and varied elsewhere, especially in New Guinea and the neighboring islands (particularly Aru) and along the northern margin of Australia; many, however, are confined to limited areas, as a single small island. There are about fifty species forming a part of a family (*Paradisæidæ*), which is closely related to the crows, and which also contains the Australian rifle-birds and bower-birds (q.v.).

Birds of paradise vary in size from that of a crow to that of a sparrow, and spend their lives and make their nests—which, as a rule, are of very simple construction—in the forest tree-tops. All of them are lively and active, running and hanging about the branches with the clinging agility of woodpeckers, as well as in graceful perching attitudes, and all are more or less gregarious and migratory, moving around, or passing back and forth between certain islands, with changing seasons in search of food. Their food consists largely of various fruits; but insects,

snails, and other things are eaten, this group sharing the omnivorous appetites of the crows and jays. Females and young form little flocks which act together, but the males are less often seen, though betraying their presence by loud, harsh cries. The plumage of all is remarkably soft and velvety, and pleasing tints everywhere prevail; but there is a constant and great dissimilarity between the sexes, the females and young being dressed in quiet colors, and having none of the eccentric and gorgeous plumage which renders the males so conspicuous, and which, if worn by the hens, would betray their presence on the nest and lead to the extermination of the species by its natural enemies, such as monkeys, arboreal birds, and beasts of prey. The marvellous ornamentation of the males seems to have been developed wholly by rivalry in attracting the admiration of the females; and in the courting season assemblages of these magnificent beaus take place upon certain trees, where they display their beauties in a sort of matrimonial mart which the Papuans call dancing parties. "A dozen or twenty full-plumaged male birds," says Wallace, "assemble together, raise up their wings, stretch out their necks, and elevate their exquisite plumes, keeping them in a continual vibration. Between whiles they fly across from branch to branch in a state of great excitement, so that the whole tree is filled with waving plumes in every variety of attitude and motion."

This family, therefore, naturally plays a very important part in the evidence adduced by Darwin, Wallace, and other evolutionists, in support of the theory of sexual selection as a means of developing certain specific and group characteristics. It is at the time of these assemblages at dawn, when the birds are too much engrossed with their 'dancing' to be cautious, that the natives secrete themselves in the tree-tops and silently shoot them down with blunt-headed arrows; and this and other means have been practiced so assiduously to supply the demand for the plumes by milliners that several species are now nearly exterminated. The skins are roughly prepared and cured by smoke, so that they lose a good deal of their brilliancy and delicacy of texture. Few species have been caught alive, or, at any rate, have lived to be carried to Europe, and none probably have ever reached America. Some endure confinement well enough in the tropics, and exhibit in their cages an amusing solicitude to keep their trailing finery in perfect order.

It is impossible, in a brief article, to describe the bewildering variety and splendor of these astonishing birds, three of which are shown in the accompanying colored plate. The plumage of the males is characterized not only by great brightness, but by a glossy, velvety appearance, a metallic lustre, and a singularly beautiful play of colors. Tufts of feathers generally grow from the shoulders and these, in some of the kinds, are prolonged so as to cover wings; in the great emerald bird of paradise (*Paradisæa apoda*), the prolongation of these shoulder-tufts is so great that they extend far beyond the body, and even far beyond the tail. They constitute the magnificent part of the well-known bird-of-paradise plumes, many of which, however, are derived from other related species, as *Paradisæa minor*, illustrated in the plate; they can be erected so as to seem to fall in a shower over the whole

bird. A peculiarity of many species is the presence of very long feathers, which consist almost wholly of the central shaft, with little or no vanes, and which curl and glisten like pliant wires. The twelve-wired *Seleucidés nigricans* of New Guinea is a remarkable example of this; here they spring from the flanks, but they may be produced from the tail, wings, or head. The figure of the six-shafted bird of paradise (*Parotia sefilata*) in the plate is another example. Its plumes may be raised and lowered as the bird wills, and D'Alberty gives a long account of how one magnificently burnished male of this kind displayed all his glittering armature, one day, in a forest glade, for the delectation of admiring companions. Among the smallest of all is the third species illustrated, the king bird of paradise (*Cincinurus regius*). It measures only about six and one-half inches in length, and the prevailing colors are velvety red, with the erectile, fan-like plumes on the sides purplish, tipped with green, and the under parts white, separated from the red throat by a green gorget. Those who wish to acquaint themselves further with these splendid birds, of which Thoreau said: "Nature made them pure feathers to show what she could do in that line," should examine the colored life-size plates in Elliott's *Monograph* of the family, and in Lesson's earlier monograph, entitled *Histoire naturelle des Oiseaux de Paradis et des Epimaques* (Paris, 1835); also the plates of the *Voyage of the Marchesa*, and the writings of A. R. Wallace, especially his *Malay Archipelago* (New York, 1869), of Dr. Guillemard, D'Alberty, Salvadori, Hunstein, and other European explorers of the Papuan Archipelago. A somewhat extended popular account will be found in the *Royal Natural History*, Vol. III., pp. 329-40, with several illustrations.

BIRD OF PASSAGE. See MIGRATION.

BIRD OF PREY. Any of the predaceous, flesh-eating birds, called in the older classifications Rapaces, Raptores, Accipitres, etc., considered as a group from the point of view of habits rather than of structure. They have been regarded usually as an order divisible into two uncertain groups—Nocturnal and Diurnal—the former including the owls, and the latter the eagles, falcons, buzzard-hawks, vultures, etc. Ornithologically they are held by most modern systemists to include the three orders Striges (owls), Pandiones (ospreys), and Accipitres, the last embracing all the diurnal falconine and vulturine families, together with the aberrant form Gypogeranus. See SECRETARY-BIRD.

Characteristics.—Agreeing in subsisting by the chase and seizure of living animals, or upon dead flesh which must be torn apart, all of this large group present an organization which combines great power with special tools adapted to their habits. Most of them are masters of the power of flight, the great vultures soaring out of human sight, and the falcons having astonishing dash and quickness. Their wits are alert, and their senses are keen, their eyesight being the most highly developed, perhaps, in the whole animal kingdom. In size they vary from the condor, one of the greatest of all birds, to the finch-falcon or pigmy owl, scarcely larger than a sparrow. They are widespread, but far more numerous in warm climates than in cold, few dwelling near the Arctic zone; and while many

are migratory, the most of them are permanent residents of the districts they inhabit. Their plumage, as a rule, is plain, black, white, reddish browns, and yellowish tints predominating; nor are crests or ornamental feathers common among them. The female is usually somewhat larger than the male—a fact due, no doubt, to the circumstance that she labors more continuously than her partner in providing food for her young and in defending her home. All the birds of prey are monogamous, and the larger ones are believed to pair for life. Certain nesting-sites are resorted to for many generations in succession by eagles, vultures, fish-hawks, etc., the nest being annually refitted for occupancy. The nesting-sites are very various, ranging from the ledge of a lofty crag, or a tall tree-top, to bushes, the ground, or even holes in the ground. The eggs of the owls are always white, but those of other families are usually blotched with color, and they are commonly few in number. "The period of incubation is longer than in most other aerial birds, and the young at first are covered with down, are quite helpless, and for an unusually long time are entirely dependent on the parents." In all species the many indigestible substances, as hair, scales, bones, etc., swallowed, are later ejected from the stomach in pellets called 'castings.'

Predaceous Equipment.—The birds of prey have acquired an equipment of beak and claws entirely suitable for their work. The beak is large, strong, terminates in a sharp hook, and the edges of the mandible are sharp and more or less serrated, forming an excellent piercing, tearing, and cutting instrument. The base of the upper mandible is sheathed in a membrane, bare of feathers, and often bright yellow in color, through which the nostrils open, and which is called the cere; no other birds have a similar beak except the parrots, which otherwise are very different from this group. In the vultures, not only the base of the beak, but the whole head is naked, in adaptation to their carrion-eating habits, involving the constant smearing of the head with filth prejudicial to feather-growth. (See VULTURE.) Instruments for seizing their prey (which includes fish), holding it or carrying it away, are provided in the feet, which are flexible, very strong, and armed with long, sharply pointed and powerful claws, giving a lacerating, catlike grasp, which ordinarily no force available to the victim is able to break. In carrion-feeders, however, the feet exhibit little of this power, and the talons are comparatively short and blunt, for they are not called upon to seize and hold a struggling victim. Most of these birds live many years. See illustrations under ACCIPITRES and BIRD.

BIRLIOGRAPHY. Consult: books mentioned under BIRDS; Fisher, *Hawks and Owls of the United States* (Department of Agriculture, Washington, 1893). See BUZZARD; EAGLE; FALCON; HAWK; OWL; VULTURE; with the accompanying plates; and the names of particular birds of prey.

BIRDS, THE. The title of a comedy by Aristophanes (q.v.).

BIRD'SALL, WILLIAM W. (1854—). An American educator, born at Richmond, Ind. He graduated at Earlham College (Richmond, Ind.), in 1873, and from 1885 to 1893 was instructor in mathematics at the Friends' Central School,

BIRDS'EYE LIME/STONE. A limestone at the base of the Trenton series in New York State, so called from the white 'eyes,' cross-sections of crystallized corals of the genus *Tetradium*, that appear on the surface of the stone. The rock is usually dove-colored, fine-grained limestone, which has in some cases, where free from the 'eyes,' been used for a secondary grade of lithographic stone. The maximum thickness of the formation is thirty feet, and it is exposed on the flanks of the Adirondack Mountains of New York, and has been doubtfully recognized in Kentucky. Its characteristic fossil in New York is *Bathyurus extans*, a trilobite. The name 'Birdseye Limestone' has been replaced by the geographic term 'Lowville Limestone,' which refers to the town of Lowville, N. Y., in the vicinity of which the formation is well developed. See ORDOVICIAN.

BIRD'S-FOOT (*Ornithopus*). A genus of plants of the natural order Leguminosæ, sub-order Papilionaceæ, deriving both its popular and its botanical name from the resemblance of the curved pods to birds' claws. The leaves are pinnate, with a terminal leaflet. One species, *Ornithopus perpusillus*, is a native of Great Britain, growing on dry, sandy, or gravelly soils—a small plant of little importance, the flowers of which are white, triated with red. *Ornithopus sativus* is an important forage plant. See SERADELLA.

BIRD'S-FOOT CLOVER. See LOTUS.

BIRDS' NESTS. See NIDIFICATION.

BIRDS' NESTS, EDIBLE. See SWIFT.

BIRDS OF AMERICA, THE. A monumental work by John James Audubon (1827-30), published at a cost of \$100,000 and sold at \$1000 a copy.

BIRDS OF PASSAGE. Five collections of poems, or 'Flights,' by H. W. Longfellow (1863-1878).

BIRD-SPIDER, or BIRD-CATCHING SPIDER. A name given to some of the largest spiders, belonging to the family Theraphosidæ. Most of them are natives of tropical and subtropical America. The best known is *Mygale* or *Avicularia avicularia* of Brazil, known there as *aranha caranjuejira*, or 'crab-spider.' It is nearly two inches long, very hairy, and almost entirely black; its feet, when stretched out, occupy a surface of nearly a foot in diameter. The hooks of its mandibles are strong, conical, and very black. This great spider forms a tube-shaped burrow in sandy soil, widening toward the mouth, sometimes 18 inches deep, and lined with a fine white semi-transparent silken tissue, like muslin, at the bottom of which the silken nidus of eggs is loosely placed. Here the females sit peering out of the trumpet-shaped entrance most of the time, day and night. They are timid, gentle in disposition, and do not bite their captors. No debris is ever found about their burrows to indicate their food. In fact, their prey is not known, nor their manner of taking it, which apparently is never by searching for it or chasing. "We must confess," says the eminent specialist, the Rev. F. O. P. Cambridge (*Proc. Zool. Soc. of London*, 1896, p. 717), "that we do not know the

staple diet. . . . Though I was out night after night, and though I watched, on several occasions, the whole night through, the tunnels of twenty and upward of the sand-burrowing 'mygale,' yet not once could I detect a spider in the act of seizing her prey or even venturing beyond the entrance of her burrow."

BIRD-TICK. See FOREST-FLY.

BIRD WOOD, Sir GEORGE CHRISTOPHER MOLESWORTH (1832—). An English physician and botanist, born in Belgaum, Bombay. He studied at the University of Edinburgh, and was in 1854 appointed to the medical staff of the Bombay Establishment of the East India Company. From 1857 to 1869 he was connected with the Grant Medical College of Bombay as professor successively of anatomy and physiology, and botany and materia medica. He was also chiefly instrumental in establishing in Bombay the Victoria and Albert Museum and the Victoria Gardens. In 1871-99 he was special assistant in the revenue, statistics, and commerce department of the India Office. He was a learned student of Indian botany. He published in 1862 a *Catalogue of the Economic Vegetable Products of the Bombay Presidency* (1868), and identified the frankincense-tree (*Transactions of the Linnæan Society*, Vol. XXVII.). His other works include: *The Industrial Arts of India* (1888); *The Aryan Flora and Fauna* (in Max Müller's *Biography of Words*, 1888); *Report on the Cultivation of Spanish Chestnuts* (1892); and *The First Letter-Book of the (English) East India Company* (1895).

BIREJIK, bē'rā-jäk', or **BIR**, bār (anciently, *Birtha*, fortress, stronghold). A town of Asiatic Turkey, in the Vilayet of Aleppo, on the east bank of the Euphrates, at the head of navigation (Map: Turkey in Asia, H 4). The town is surrounded by a strong wall flanked with towers; its streets are narrow but clean; it has several mosques with tall minarets, a caravansary, a bazar, and a ruined citadel and castle. Travelers and caravans from Aleppo to Diarbekr, Bagdad, Persia, etc., cross the Euphrates at this point. Population (estimated), 8000. Bir, which signifies 'well,' is the prefix of several smaller towns in Arabia.

BIRET'TA. See COSTUME, ECCLESIASTICAL.

BIRGE, bîrj, EDWARD ASAHËL (1851—). An American naturalist. He was born in Troy, N. Y., and was educated at Williams College and at Harvard University. He was appointed professor of natural history and zoölogy at the University of Wisconsin in 1879; dean of the College of Letters and Science in 1891, and was acting president of the university from 1900 to 1901. In 1894 he became director of the Geological and Natural History Survey of Wisconsin. He has written numerous papers on zoölogy, and has edited the revision of Prof. James Orton's *Comparative Zoölogy* (1882).

BIRGE, HENRY WARNER (1825-88). An American soldier, born in Hartford, Conn. At the opening of the Civil War he organized the first State regiment of three-years troops—the Fourth Connecticut Volunteers—in which he was appointed major. After service in Maryland and Virginia, he was commissioned colonel of the Thirteenth Connecticut infantry regiment in 1861, and in 1862 was placed in command of the

defenses of New Orleans. In December of the latter year he was appointed to the command of a brigade, which he retained through the first Red River campaign and at the siege of Port Hudson. He was raised to the rank of brigadier-general in September, 1863, served in the second Red River expedition, and subsequently commanded at Baton Rouge. In 1864 he was assigned to the command of the second division of the Nineteenth Corps. He participated in the battles of General Sheridan's campaign in the Shenandoah Valley, and in February and March, 1865, was appointed to the command of the defenses of Savannah. In the same year he resigned, with rank of brevet major-general of volunteers.

BIRGER DE BIELBO, bër'gër dâ bys'l'bô (?-1266). Regent of Sweden (1250-66), during the minority of his son, Waldemar, the successor of Eric XI. During his regency he passed many beneficent laws; brought over to Christianity the inhabitants of Tavastehus, Finland, whose incursions had frequently desolated Sweden; increased the Swedish possessions in Finland; founded the city of Stockholm; and established important commercial relations with Lübeck and Hamburg.

BIR'GIT, BIRGIT'TA. See BRIDGET.

BIRGIT'TINES. See BRIGITTINES.

BIRKBECK, bër'k'bëk, GEORGE (1776-1841). An English physician and educational reformer, born at Settle, Yorkshire. He studied medicine at the universities of Edinburgh and London. At the age of 23 he was appointed professor of philosophy at the Andersonian University, Glasgow, where in 1800 he introduced a course of lectures to workmen. This 'mechanics' class' evolved, in 1823, into the Glasgow Mechanics' Institution, which is believed to have been the first institution of its kind. This was followed in 1824 by the London Mechanics' Institution, also organized by Dr. Birkbeck, and subsequently named in his honor. The success of these educational establishments paved the way for the present system of popular scientific education in England.

BIRKDALE, bër'k'dâl. A manufacturing town and railway junction in Lancashire, England, 1½ miles southwest of Southport. Population, in 1891, 12,400; in 1901, 14,200.

BIRKENFELD, bër'ken-fëlt (Ger. *Birke*, birch + *Feld*, field; refers to its rich forests). A German principality belonging politically to the Duchy of Oldenburg, but forming an enclave in the Prussian Rheinland adjoining the districts of Coblenz and Treves (Map: Germany, B 4). Its area is about 192 square miles. The principality belongs to the region of the Hochwald and Idar Wald, and its surface is hilly and covered for a large part with forests. The area devoted to agriculture is very limited, and the domestic supply of agricultural products generally falls short of the demand. The chief industry is the polishing of agates, which gives work to about 8000 men. The administration of the principality is vested in a board, consisting of a president and two assistants, responsible to the ministry of Oldenburg, and a council of fifteen members. The population was 42,248 in 1895 and 43,320 in 1900. About 80 per cent. of the population is

Protestant. The capital, Birkenfeld, had a population of 2229 in 1900.

BIRKENHEAD, bër'k'en-hëd. A seaport town and Parliamentary borough in Cheshire, England; situated opposite Liverpool, on the left bank of the Mersey (Map: England, C 3). It includes the townships of Claughton, Oxtan, Tranmere, and part of Higher Bebington. The growth of the town has been very rapid since the opening of its first great dock in 1847; its floating and dry docks now cover an area of over 165 acres. They are, with those of Liverpool, under the management of the Mersey Docks and Harbor Board. (See LIVERPOOL.) The streets of the town are regularly laid out, and the buildings, as a rule, substantial. Among the notable buildings are the handsome town-hall, the merchants' hall, and the market-hall. The educational institutions include Saint Aidan's Theological College, a school of science and art, and a public library. Birkenhead has for some years been celebrated for its extensive ship-building yards, some of the largest iron ships afloat having been built there. The notorious Confederate cruiser *Alabama* was built by the Messrs. Laird, to whose enterprise, more than that of any other firm, the town owes its present importance. In the neighborhood of the docks are the Canada works for the construction of gigantic bridges; the Britannia machinery-works, and others. Birkenhead has a number of street railway lines, which are owned by the corporation, but leased to private companies. Birkenhead is connected with Liverpool by a ferry once owned by the Priory of Birkenhead, now by the town, and by the Mersey Tunnel, opened in 1886. Birkenhead was incorporated in 1877 and sends one member to Parliament. The town's affairs are administered by a mayor, a municipal council of forty-two and a board of aldermen of thirteen members. (See GREAT BRITAIN, paragraph on *Local Government*.) The town owns its water-works, which net an annual profit of about \$26,000. It also owns its gas-works and an electric-light plant, the former netting annually about \$73,000, the latter involving a slight deficit. Refuse is for the most part burned in destructors; the sewage is discharged into the sea. The town maintains public baths, markets, a slaughter-house, and a cemetery. There are three fine municipal parks. Population, in 1891, 99,857; in 1901, 110,926.

BIRMAH, bër'mâ. See BURMA.

BIRMINGHAM, bër'ming-am (either AS. *Bermaring*, *Beorming*, a proper name + *hām*, home; or 'home on the hill by the heath,' from AS. *brōm*, broom + *wych*, descent + *hām*, home). The chief seat of the British for metallic manufactures, and the leading hardware centre of the world (Map: England, E 4). It stands near the centre of England, in the northwest of Warwickshire, with suburbs extending into Staffordshire and Worcestershire, 112 miles northwest of London. It has the status of a city, a civic county, and a Parliamentary and municipal borough. It is built on the eastern slopes of three hills at the confluence of the Rea and the Tame, with a gravelly foundation overlying clay and new red sandstone, and is one of the best-drained towns in England. The older part of the city is crowded with workshops and warehouses; but the modern portion is well built, and possessed of architectural beauty. Among the finer build-

ings are the post-office, the corporation buildings, the town-hall, the exchange, the rooms of the Royal Society of Artists, the borough jail, and the splendid Central Railway Station, covering $12\frac{3}{4}$ acres. The chief ecclesiastical edifices are the Anglican churches of Saint Martin and Saint Chad, and the Baptist Wyclif Chapel of Saint Chad, and the Baptist Wyclif Chapel of Fourteenth-Century Gothic. The central part of Birmingham, the worst overcrowded section before 1876, has been vastly improved since then, and has become the best part of the city. This was accomplished by the municipality condemning the district and purchasing it for some \$8,000,000. A considerable income is derived from the leases, and in 1951 the city will come into possession of all the buildings erected on its land. Besides nine parks, of which the chief are Aston Park on the northeast, Cannon Hill Park on the south, and Botanical Gardens, seven gardens and recreation-grounds are distributed over the city.

Birmingham has been at the head of the large progressive cities of England in the work of modernizing its institutions. In 1875 it reorganized its health department, which set itself to work eradicating insanitary conditions. One of the first tasks was the providing of a pure water-supply. Some 3000 polluted wells were closed, to prevent the spreading of zymotic diseases. That, combined with the condemnation of insanitary houses, the increase of disinfecting facilities, and a rigorous inspection of food-supplies, helped to reduce the average death-rate from 26 per 1000 to less than 20. In the insanitary districts the reduction was from 60 and more per 1000 to 25.

With the same purpose in view the city improved its sewage system by providing a modern system of sewage and garbage collection combined with a sewage-farm; it erected baths and wash-houses, hospitals, asylums, special artisans' dwellings, etc. Most of Birmingham's municipal undertakings date back to 1874-75, when Mr. Joseph Chamberlain, as mayor of the town, inaugurated the new era. At that time, also, Birmingham bought out the water company at a cost of more than \$6,000,000. Since then great extensions and improvements have been carried out, and a new supply obtained from Mid-Wales, 80 miles from the city, for which more than \$30,000,000 was appropriated. The gas-works were acquired by the city in 1875 for \$10,000,000. The price of gas was reduced about 33 per cent., which did not prevent the city from getting a net income of more than \$150,000, after allowing for interest charges and sinking-fund payments. In 1899 the supply of electricity was also municipalized. Free libraries in Birmingham date back to 1860. They consist of a Reference Library, Central Circulating Library, and nine branch libraries. The city owns the markets and slaughter-houses, which yield a considerable net income, in addition to facilitating the inspection of the food-supply of the city. It also owns its street railways, which are operated by private companies, paying a high rental to the city.

As an industrial centre, especially one in which production on a small scale is carried on to a considerable extent, Birmingham is taking great pains to provide all the facilities for technical education that can be obtained. In 1896 a municipal technical school was erected at a cost of nearly \$500,000. The school is attended by nearly 3000 pupils, who are charged a small

fee for tuition. In addition to that, the Midland Institute and Mason College provide similar facilities. The well-known Queen's College is connected with the London University. The city maintains also a school of art, with branches in several of the board schools. The art gallery and museum, also maintained by the municipality, form an integral part of the art school. The elementary schools are under the control of the school board. The charitable institutions, maintained by endowments, legacies, and donations, comprise the General and Queen's hospitals, children's hospital, general dispensary, asylums for lunatics, for the blind, deaf and dumb, sanatorium, and almshouses.

Birmingham is the largest manufacturing town in England after Manchester. It became very early the seat of iron manufactures on account of its proximity to a forest and extensive iron-mines. Its principal industry at present is the manufacture of iron and steel products. Its manufactures comprise steam and gas engines, electric motors, hydraulic presses, railway cars, guns, machinery. In addition there are glass-works, chemical-works, breweries, etc. Female workers are generally employed in the lighter trades.

Birmingham returns seven members to Parliament. (For the government of Birmingham see ENGLAND, under *Local Government*.) It is the seat of an American consulate, and the see of a Roman Catholic bishop. Like most of the great industrial cities, Birmingham increased rapidly in population during the Nineteenth Century. In 1801 it had 60,000 inhabitants; in 1901, 522,200; an increase of 770 per cent. in a century, and of 21.5 per cent. in the last decade (1891, 430,000).

HISTORY. Birmingham was an old town of the Anglo-Saxons (Beormings Ham). After the Conquest, it was ruled by the De Birmingham family till 1527. In mediæval times it was a thriving commercial and industrial place. During the Civil War it was staunchly Puritan, and supplied the armies of Parliament with arms. Prince Rupert burned it in 1643. Its great commercial importance dates from the Seventeenth Century, when the restoration of Charles II. brought from France a fashionable rage for metal ornaments, and Birmingham supplied the demand with unexampled vigor. In the latter part of the Seventeenth Century the Birmingham smiths began to manufacture swords and guns. Its hardware manufactories as early as 1727 are said to have supported 50,000 persons. The earliest attempts at cotton-spinning by rollers were made in 1736. The opening of the coal and iron fields of Lancashire added greatly to its prosperity, so that in 1745 it was one of the principal inland towns of England. By 1761 its manufactures were known throughout the world. Toward the end of the Eighteenth Century it was a centre of Liberal agitation, being the home of Dr. Priestley. The Reform and Chartist movements had powerful support in the town.

1861); Timmins, *The Resources, Products, and Industrial History of Birmingham and the Midland Hardware District* (London, 1866); Shaw, *Municipal Government in Great Britain* (New York, 1895).

BIRMINGHAM. A city and the county-seat of Jefferson County, Ala., and an important manufacturing centre, 97 miles northwest of Montgomery; on the Central Railroad of Georgia, the Louisville and Nashville, the Southern, the Alabama Great Southern, and the Kansas City, Memphis and Birmingham railroads (Map: Alabama, C 2). Birmingham was laid out in June, 1871, by the Elyton Land Company, and in the following December, with a population of less than 1000, it was chartered as a city. It did not progress rapidly until the end of 1880, when the great natural resources of the vicinity began to be developed, and, owing to its situation in a region rich in iron, coal, and limestone, it has become one of the most important and prosperous cities in the South. The chief industry is the manufacture of iron and steel in various forms. Besides pig-iron furnaces, foundries, engine and boiler works, machine-shops, and car-wheel works, it has cotton-factories, packing-houses, cottonseed-oil mills, and extensive iron and coal mining and lumber interests. Birmingham has three parks of great beauty—Capitol, East Lake, and Lakeview parks—an opera-house, and several fine buildings, prominent among which are the Jefferson Theatre, the Jefferson County courthouse, the Union passenger-station, 600 feet long and 200 feet wide, and Saint Vincent Hospital, completed in 1900, at a cost of \$250,000. About five miles northeast of the city, at East Lake, is Howard College (Baptist), organized in 1841. Birmingham is governed under a charter of 1898-99, which provides for a mayor, elected biennially, and a city council, which confirms the mayor's nominations to the board of education. The police commission, of seven members, is elected on the general ticket with other officials. The city expends about \$300,000 yearly, the main items being: Police department, \$35,000; fire department, \$45,000; and schools, \$30,000, exclusive of \$20,000 devoted by the State and county. Population, in 1880, 3086; in 1890, 26,178; in 1900, 38,415.

BIRMINGHAM FESTIVAL, THE. A periodical musical festival begun in Birmingham, England, in 1768, and given every three years. At one time the programme was made up largely from Handel, and at all times the character of the music has been of the highest order. The custom is in a measure a commemoration of the founding of Dr. Ash's hospital in the town in 1766, and the proceeds are given to the perpetuation of this institution.

BIRNAM, bër'nəm. A hill 1324 feet high, in the east of Perthshire, Scotland, near Dunkeld, 12 miles northwest of Perth, commanding a fine view of the valley of the Tay (Map: Scotland, E 3). It was formerly covered by part of an ancient royal forest, which Shakespeare has immortalized in his tragedy of *Macbeth*.

BIRNBAUMER WALD, bër'n'bou-mër vält (Ger. *Birnbaum*, pear-tree + *Wald*, wood, forest; a translation of the Latin *ad pirum*, at the pear-tree.) A highland of Carniola, near the river Frigidus, northeast of Triest. Theodosius won

a victory over Arbogast and Eugenius there in 394.

BIRNEY, bër'ni, DAVID BELL (1825-04). An American soldier, the son of James G. Birney. He was born in Huntsville, Ala., graduated at Andover, studied law in Cincinnati, and practiced for several years in Philadelphia. He entered the Federal Army as lieutenant-colonel in the Twenty-third Pennsylvania Infantry, in April, 1861; was raised to the rank of brigadier-general of volunteers in February, 1862; served with great gallantry in the Peninsular campaign, distinguishing himself particularly at Yorktown and Williamsburg, and afterwards took a conspicuous part in the second battle of Bull Run, and in the battles of Fredericksburg and Chancellorsville. In May, 1863, he became a major-general of volunteers, and during part of the battle of Gettysburg commanded the Third Army Corps. From May to June, 1864, he commanded a division under Hancock, and rendered efficient services in the battles of the Wilderness and Spottsylvania; and after July of this year he was in command of the Tenth Corps of the Army of the James. He died on October 18, 1864, in Philadelphia, of a fever contracted during this last campaign. Consult Vol. IV. of the *United Service Magazine* (New York, 1865).

BIRNEY, JAMES GILLESPIE (1792-1857). An American reformer, leader of the conservative Abolitionists during the anti-slavery struggle. He was born in Danville, Ky., studied at Transylvania University, and graduated at Princeton in 1810. He then studied law under Alexander J. Dallas in Philadelphia, began practice in Danville in 1814, and was elected to the State Legislature two years later. In 1818 he removed to a plantation in the vicinity of Huntsville, Ala., and in the following year served in the Alabama Legislature. He resumed his law practice in Huntsville in 1823, was elected prosecuting attorney there, and soon became the most successful practitioner in northern Alabama, but turned his attention more and more to the study of the slavery question, and in 1832-33 acted as agent of the Colonization Society (q.v.) for the district embracing Tennessee, Alabama, Mississippi, Louisiana, and Arkansas. In November, 1833, he returned to Danville, Ky., where he freed his own slaves, and devoted himself with zeal and energy to the cause of gradual emancipation, though he soon became a convert to immediatism. He organized the Kentucky Anti-Slavery Society in 1835, and in the same year planned an anti-slavery paper; but, as he was unable to find a publisher in Kentucky, he removed to Cincinnati, Ohio, where, on January 1, 1836, he issued the first number of *The Philanthropist*. During the next few years his press was several times destroyed by mobs, and he himself was repeatedly threatened with personal violence and death; but in spite of opposition his paper rapidly attained a wide circulation and exerted a powerful influence among those who, like himself, believed in abolition, but opposed the radicalism of Garrison and his followers. (See GARRISON, WILLIAM LLOYD.) Both as an editor and as a speaker, though firm and unflinching in his advocacy of what he believed to be right, he upheld the Constitution, opposed all violence and fanaticism, and was uniformly courteous, tolerant, and fair. He spent much of his time in

making speeches throughout the North, especially before the legislatures of the various States, and in 1837 was elected secretary of the American Anti-Slavery Society. In this capacity he conducted the correspondence of the Society, employed its lecturers, and prepared its reports; and, in addition, he continued to make frequent addresses before legislatures and large public assemblies. He soon came to be regarded everywhere as the leader of the 'Constitutional' Abolitionists; that is, of the Abolitionists who opposed all revolutionary measures, fought against secession, and endeavored to effect their desired reforms through the ordinary machinery of government; and both in 1840 and in 1844 he was the unanimous candidate of the Liberty Party (q.v.) for the Presidency, receiving 7069 votes in the first election and 62,263 in the second. He was disabled by a fall from his horse in 1845, and passed the last twelve years of his life in retirement as an invalid, first in Bay City, Mich., and afterwards in Eagleswood, N. J. Besides numerous brief articles for the press, his chief writings were his *Letter on Colonization* (1834); *American Churches the Bulwarks of American Slavery* (1840); *Speeches in England* (1840); and *Examination of the Decision of the United States Supreme Court in the Case of Strader et al. vs. Graham* (1850). Consult the excellent biography by his son, William Birney, *James G. Birney and His Times* (New York, 1890).

BIRNEY, WILLIAM (1819—). An American soldier and lawyer, the son of James G. Birney. He was born near Huntsville, Ala.; was educated at Yale College and in Europe; took an active part in the Revolution of 1848 in France, and for two years was professor of English literature in the college at Bourges. He entered the Federal Army at the outbreak of the Civil War, was elected captain; attained the rank of brigadier-general of volunteers in May, 1863, and from then until the close of the war was in command of a division. In 1863-64 he served as one of the three superintendents charged with the enlistment of colored troops, and in this capacity organized seven regiments. He served with conspicuous gallantry in the battles of Second Bull Run, Chantilly, Fredericksburg, and Chancellorsville; received the brevet rank of major-general of volunteers in March, 1865, "for gallant and meritorious services during the war," and resigned in August of the same year. After the war he lived for a time in Florida, but in 1874 removed to Washington and became a practicing attorney. Among his publications are the excellent *Life and Times of James G. Birney* (1890) and *A Plea for Intellectual and Spiritual Liberty*.

BIRON, *Fr. pron. bé'rôn'*. (1) A light-headed, light-tongued lord in the suite of the King of Navarre, in Shakespeare's *Love's Labor's Lost*. (2) A character in the tragedy *The Fatal Marriage*, by Southerne; the husband of Isabella, and much-wronged brother of Carlos. The rôle was among the earliest of the younger Macready.

BIRON, CONSPIRACY AND TRAGEDY OF CHARLES, DUKE OF. The name of two tragedies, really two parts of a single theme, founded on the career of the French conspirator of the title. Performed in London in 1605 and 1608, they were prohibited at the instance of the French Ambassador, and three actors were arrested.

BIRON, bé'rôn', ARMAND DE GONTAULT (1524-92). A French soldier. He became grand master of artillery in 1569, and was in command at the siege of Rochelle, and in Guienne. After the assassination of Henry III., who had appointed him marshal in 1577, he was among the first to declare for Henry IV. He brought a part of Normandy under subjection, and dissuaded Henry from going into England; distinguished himself in the battles of Arques and Ivry against the League, and was killed by a cannon-shot at the siege of Epernay.

BIRON, CHARLES DE GONTAULT, Duke de (1562-1602). A French soldier, son of Armand, under whose command he served with distinction in the campaigns against the League, acquiring renown and the surname of 'Fulmen Gallie,' or 'Thunderbolt of France.' He was made admiral of France by Henry IV. in 1592, and marshal in 1594; became governor of Burgundy in 1595, and was created duke and peer of France in 1598. He was a man of great intrepidity, but was fickle and treacherous. He was sent to England in 1601 to announce the marriage of Henry with Maria de' Medici, but about the same time he was condemned by the Parliament for treasonable negotiations with Spain and Savoy, aiming at the overthrow of the Bourbon dynasty, the dismemberment of the kingdom into provincial States, and his own elevation to the sovereignty of Burgundy. Induced to come to Paris, he was apprehended and beheaded in the Bastille.

BIRON, bé'rôn, ERNEST JOHN, Duke of Courland (1690-1772). A Russian statesman. He was the son of a landed proprietor of the name of Bühren. Through Bestuzheff-Ryumin, who befriended him, he obtained the favor of Anna Ivanovna, who was called to the Russian throne in 1730. The Council of the Empire attempted to secure from her an aristocratic constitution, but she crushed remorselessly the powerful nobility, notably the Dolgorukis and the Galitsins, and made her lover, Biron, who had adopted this French name in place of that of Bühren, her chamberlain and practical ruler of the Empire. Rambaud describes him "as a large, handsome man, uneducated, loving only his horses; a superb lackey, morally as evil and vindictive as his mistress." His enemies and rivals were swept out of the way, while the poor people were ground down by taxation. The Russians have described this reign as the *Bironovachina* and the 'German yoke.' He is said to have caused over a thousand executions, while the number of persons exiled by him to Siberia is estimated at from twenty to forty thousand. His revengeful severity is said to have exceeded that of his unscrupulous mistress. As an administrator, however, he showed considerable ability, and maintained order in the Empire. The Duchy of Couron, in which Biron was born, was then in dispute between Poland and Russia. Anna conferred the duchy upon Biron, and Russian armies were employed to place on the Polish throne Augustus III., Elector of Saxony, who had promised the investiture of Courland for Biron. The Emperor Charles VI., subordinating everything to his Pragmatic Sanction, readily countenanced these violent acts, and the King of Prussia was bought by certain territorial concessions. In 1737, therefore, the nobles of Courland were obliged to

confirm Anna's appointment, and in 1739 the investiture took place at Warsaw by authority of the Polish King and Senate. The Empress died in October, 1740, and Biron, under her will, assumed the regency in the name of the infant Emperor Ivan VI. Field-Marshal Münnich, who during the past reign had supported Biron, but who saw that he was to receive slight recognition now, set on foot a conspiracy, the result of which was the exile of Biron to Pelim, in Siberia. A second palace revolution occurred soon after, and the new Empress, Elizabeth Petrovna, banished Münnich and permitted Biron to take up his residence at Yaroslav. After Elizabeth's death, his duchy was restored to him by Catherine II. He died September 28, 1772.

II. and III. (Moscow, 1873-77) and *Les antiquités russes* (Moscow, 1884); Halem, *Lebensbeschreibung des russischen General-Feldmarschalls Münnich* (Oldenburg, 1803).

BIRB, bër. See PARSONSTOWN.

BIR-BELL, AUGUSTINE (1850—). An English chancery barrister, best known as an essayist, born at Wavertree (near Liverpool). He graduated in 1872 at Trinity Hall, Cambridge, and in 1875 was admitted to the bar of the Inner Temple. In 1889, 1892, and 1895 he was returned to Parliament as a Liberal for West Fife, and in 1896 was appointed professor of law in University College, London. By his first volume, *Obiter Dicta* (1884), he achieved forthwith a unique place among modern English essayists. His power of analysis, his wit—often epigrammatic—his positive opinions, and his urbanity, combine to form a style whose easy art has evoked the word 'birrelling.' He is also known as an interesting occasional lecturer on literary subjects. His publications include, further: *Obiter Dicta, Second Series* (1887); a *Life of Charlotte Brontë* (1887 in Great Writers Series); *Men, Women, and Books* (1894); *Lectures on the Duties and Liabilities of Trustees* (1896); an edition (1897) of *Boswell's Life of Johnson*; *Sir Frank Lockwood* (1898); and *Seven Lectures on the Law and History of Copyright in Books* (1899), and *Collected Essays* (1900).

BIET, bërt, THEODOR (1852—). A German classical philologist. He was born in Hamburg, March 22, 1852, became professor at Marburg, and is author of numerous monographs of a philological and historical character, among which is *Das antike Buchwesen in seinen Verhältnissen zur Litteratur* (1882).

BIETH (AS. *beorð*, *gebyrd*, from *beran*, to bear; cf. Ger. *Geburt*, birth). At law birth does not take place until the complete separation of the child from its mother and the setting up of its independent system of circulation. The old notion that the child must be heard to cry in order to gain the status of a living person was never a part of the common law. Even before birth a child is for many purposes regarded as a living person, and may, accordingly, inherit real property or acquire a vested interest under a will or grant of lands. The latter result has been secured by statute in England, and generally in the United States. (See POSTHUMOUS CHILD.)

At common law the killing of an unborn child was not murder, but it has been made so, generally of the grade of manslaughter, by modern statutes. See ABORTION.

In England and many of our States there are elaborate provisions by statute for the compulsory public registration of births. These provisions apply to all children born alive, whether legitimate or illegitimate, but not to such as are stillborn.

CONCEALMENT OF BIRTH is a statutory offense, created in England by 21 Jas. I. c. 27 (1624). That statute provided that if any woman who was delivered of a child which would be a bastard if born alive endeavored to conceal the birth by burying, drowning, or the like, she should suffer death, unless she could prove by at least one witness that the child was born dead. Even Blackstone was forced to admit that this law "savored pretty strongly of severity," and it has been modified from time to time. At present the English statute provides that any person who endeavors to conceal the birth of a child by any secret disposition of its dead body, whether it died before, at, or after its birth, is guilty of a misdemeanor. While the statutes of our States on this subject differ in some respects, most of them are characterized by the milder spirit of the modern English acts. Consult the authorities referred to under MEDICAL JURISPRUDENCE; CRIMINAL LAW.

BIRTHS, REGISTRATION OF. The first nation to provide for the public registration of births was England. Church registers had long been kept, but in 1837 a registrar-general's office was established. The registration, however, was voluntary until 1876. The Continental countries soon adopted the system, and made it complete and effective. In England the still-births are not included in the returns, but are recorded separately. On the Continent they are included. As they form 2 or 3 per cent. of the total, this should be remembered in comparing returns.

It is a matter of great regret that no comprehensive plan is adopted in the United States. Massachusetts was the first State to undertake registration, and many other States have followed. The returns are far from complete.

The birth-rate is expressed by the ratio of births to 1000 of population. Russia is supposed to have a rate of 49 per 1000. Hungary, with 44, is the highest for countries having registration. Germany has 38; England and Wales, 34; France, about 24. The census of 1890 estimated that in the United States the rate among immigrants was 38.29; native parents, 26.35; negroes, 29.07; the total average being 26.68. In all civilized lands about 1050 boys are born to 1000 girls.

The birth-rate is influenced by social and economic conditions, war, famine, abundance, etc. In all countries the rate decreases among the well-to-do. The city makes its influence felt in a decreasing rate. (See ILLIGITIMACY.) The physiological and social laws governing the birth-rate are as yet but little understood.

Consult: Richard Mayo-Smith, *Statistics and Sociology* (New York, 1895); for England, the reports of the Registrar-General; for Germany, *Jahrbuch der deutschen Städte*; for France, *Levasseur, La population française*, 3 vols. (Paris, 1889-92); for Austria-Hungary, *Ungarisches sta-*

tistisches Jahrbuch und Oesterreichisches statistisches Handbuch; for Italy, *Annuario statistico*.

BIRTHMARK. See *NÆVUS*.

BIRTHMARK, THE. A story in Hawthorne's *Mosses from an Old Manse*.

BIRTHRIGHT. A preference in inheritance accorded by law to an heir according to the order of his birth. Such preference may be exclusive, as in the English rule of primogeniture (q.v.), which gives the entire real estate to the eldest male heir, and in the singular custom of borough English (q.v.), under which it goes to the youngest son; or it may be proportional, only giving the eldest son, or the youngest, as the case may be, a larger share in the estate than is appropriated to the other heirs. It is in this latter sense that we must understand the term as employed in early Hebrew history; and this has, perhaps, been its usual form. The right, in one or another of these forms, prevailed in all stages of primitive society, though with advancing civilization it has gradually given place to the more equitable principle of an equal division of the property among all the heirs of a given class. Its survival in England is probably due quite as much to the conservative temper of the English people as to the existence of social conditions which tend to perpetuate it. Almost everywhere else, on the Continent of Europe as well as in the United States and the colonies of Great Britain, it has completely disappeared. See *HEIR*; *INHERITANCE*.

BIRTHWOOT. See *ARISTOLOCHIA*.

BIS (Lat., twice). In music, a term which denotes that the passage over which it is placed is to be played twice, or repeated. Such passages generally have a slur or bow over them, and the word 'bis' written below it, thus: *Bis*.

BISAYA, bê-zā'yā. See *VISAYA*.

BISCACHA, bis-kā'chá. See *VIZCACHA*.

BIS'CAY (Sp. *Biscaya*, *Vizcaya*, a Spanish province named after the *Basques*), *BAY OF* (the Roman *Sinus Aquitanicus* or *Gallicus Oceanus*, and the French *Golfe de Gascogne*). A portion of the Atlantic Ocean sweeping in along the northern shores of the Spanish Peninsula in an almost straight line from Cape Ortegal to Saint Jean de Luz, at the western foot of the Pyrenees, and thence curving along the west shores of France northward to the western extremity of Brittany and northwestward to the island of Ouessant. Its extreme width and length are about 400 miles each. The whole of the south coast is bold and rocky, in some places rising to a height of several hundred feet, and broken by inlets, some of which form safe and commodious harbors. From the mouth of the Adour to the Gironde, the shore presents a totally different aspect, being low and sandy, with numerous lagoons, the embouchures of these two rivers forming the only harbors. For 200 miles north of the Gironde the coast is still low, but marshy instead of sandy, and from the peninsula of Quiberon westward it is moderately elevated and rocky in some places. The rivers falling into the bay on the Spanish shores are unimportant. On the coast of France it receives, through the rivers Loire, Charente, Garonne (the estuary of which is called the Gironde), and Adour, the waters of about one-half the surface of the whole country. Its chief ports are Gijón, Santander,

Bilbao, San Sebastian, and Pasajes in Spain; and Bayonne, Bordeaux, Rochefort, La Rochelle, Nantes, and Lorient in France. Its chief islands—which are all situated north of the Gironde—are Belle-Ile, Ré, Noirmoutier, and Oléron. Navigation is rendered difficult and dangerous by the prevalence of northwest winds, and by the existence of the violent Rennel's current. The depth of the bay ranges from 100 feet or less along the shore to more than 10,000 feet in the central part. The height to which the tides rise is hardly exceeded anywhere.

BISCEGLIE, bê-shā'lyā (anciently, Lat. *Vigilia*). A city in south Italy, on the Adriatic, 21 miles northwest of Bari. The harbor admits vessels of small burden only. The principal buildings are the cathedral, two churches, dating from the Twelfth Century, a dilapidated Norman castle, and the palaces of the old families. In the country, which produces excellent wine and currants, there are many magnificent villas. During the Crusades Bisceglie was famous for the hospital founded by Bohemond for pilgrims, of which some ruins still exist (Map: Italy, L 6). Population, in 1881, 24,000; in 1901, 30,385.

BISCHOF, bish'ōf (Ger., bishop), *KARL-GUSTAV CHRISTOPH* (1792-1870). A German chemist and geologist. He was born in Nuremberg, and in 1822 became professor of chemistry and mineralogy at Bonn. He obtained the prize of the Scientific Society of Holland for his treatise on internal terrestrial heat, and published in England, in connection with it, *Researches on the Internal Heat of the Globe* (London, 1841), which was followed by a number of papers on connected geological subjects. The results of his researches (1837-40) on inflammable gases in coal-mines, and on safety-lamps, appeared in the *Edinburgh New Philosophical Journal* and other periodicals. His chief work, *Lehrbuch der Chemischen und physikalischen Geologie* (3d ed., Bonn, 1863-66), is an important contribution to the study of the physical and chemical problems of geology.

BISCHOF, MARIE. See *BRANDT, MARIANNE*.

BISCHOFF, JOSEPH EDUARD KONRAD; pen-name, Konrad von Bolanden (1828—). A German novelist. He was born at Niedergailbach and after studying at the Catholic Theological Seminary at Munich was ordained a priest at Speyer in 1852. Afterwards he retired from the ministry to devote his entire attention to literary work. His publications consist of historical novels and romances attacking the Reformation, the political and literary movements of the Eighteenth Century, and the progress of contemporary science. His best-known works are: *Franz von Sickingen* (1859); *Historische Novellen über Friedrich II. von Preussen und seine Zeit* (1872); *Angela* (1872); *Gustav Adolf* (1867-70); *Die Bartholomäusnacht* (1879); *Die Sozialdemokraten und ihre Väter* (1894); *Deutsche Kulturbilder* (1893-94); and *Otto der Grosse* (1898). His complete works appeared in 1871. Consult Keiter, "Konrad von Bolanden," in *Unsere Zeit*, Vol. I. (Leipzig, 1876).

BISCHOFF, THEODOR LUDWIG WILHELM (1807-82). A German anatomist and physiologist. He was born in Hanover, and became professor of anatomy at Heidelberg in 1836. From Heidelberg he removed, in 1844, to the University

of Giessen, and in 1855 to that of Munich. He devoted himself especially to embryology, to which he made many contributions. His *Entwicklungsgeschichte des Kanincheneies* (1843) received the prize from the Berlin Academy. Of his numerous writings in Müller's *Archiv*, and published separately, may be singled out the *Beweis der von der Begattung unabhängigen periodischen Reifung und Loslösung der Eier der Säugetiere und des Menschen* (Giessen, 1844), in which he establishes the important doctrine of the periodic ripening and detachment of the ova in mammalia and man, independently of generation. Being called upon in 1850, together with Liebig, to give his opinion in the famous Gürlitz trial (q.v.), which involved the question of the possibility of spontaneous combustion, he took occasion to publish a dissertation on the subject, *Ueber die Selbstverbrennung* (demonstrating the impossibility of spontaneous combustion), which appeared in Henke's *Zeitschrift für die Staatsarzneikunde* (1850).

BISCUIT (for older E. *bisket*; Fr. *biscuit*, twice-baked, from *bis*, twice + *cuire*, to bake; cf. Ger. *Zweiback*). A kind of hard, dry bread baked in small, thin cakes. In the United States this kind of bread is usually called crackers, the name biscuits being applied to small, round, soft cakes made from dough, raised with yeast or soda, sometimes shortened with lard, etc. Biscuits or crackers are usually made of flour, water or milk, and salt, to which are added, for special varieties of biscuits, sugar, spices, butter, eggs, dried fruits, prepared meats, etc. The varieties of biscuits now made are very numerous, but practically the same mode of procedure is adopted in making them all. The ingredients are first mixed by machine to form a dough, and this dough is mechanically kneaded, rolled out thin, and cut into squares or disks, which are carried through the ovens on traveling frames or belts, and baked in about fifteen minutes. The baked biscuits are next dried for several days, and finally packed in one of a variety of forms for shipment. (See BREAD.) For *Meat Biscuit*, see RATIONS, paragraph on *Campaign Rations*.

BISCUIT. A term applied in pottery to porcelain and other earthenware after the first firing, and before it has received the glaze and embellishments. (See PORCELAIN and POTTERY.) In this condition the ware is very porous, and allows water very slowly to percolate through its pores.

BISCUITROOT. See QUAMASH.

BISEETA, bé-zér'tá. A mediæval term for the classical Utica, in Africa, used by Ariosto in his *Orlando Furioso* for the capital of King Agramant.

BISHARIN, bē'shā-rēn' (Ar. plur. of *Bish-ari*). The designation of a group of tribes living between the Red Sea, the Nile, and Abyssinia. Properly they form the northern division of the Beja, while the southern members of the group are called Iladendoa. The Bisharin are nomadic herdsmen, and are nominally Mohammedans. Those living near the borders of Egypt have the reputation of being sturdy beggars. They present physically a fine Caucasian type, and they speak a highly developed Hamitic language, of which there are grammars by Almkvist (Upsala, 1881-85) and Reinisch (Vienna, 1893). For an

account of the Bisharin, consult Munzinger, *Ost-afrikanische Studien* (Schaffhausen, 1864).

BISHOP. The title of the highest order of clergy in the Christian Church. The name is in the Saxon *biscop*, and comes from the Greek *ἐπίσκοπος*, *episkopos*, an overseer, from *ἐπί*, *epi*, upon + *σκοπεῖν*, *skopein*, to watch. The Athenians used to send officers called *ἐπίσκοποι*, *episkopoi*, to their subject States. The word was adopted by the Romans, and Cicero speaks of himself as an *episcopus* in Campania; it was also applied by them to the officers who inspected the provision-markets. There are two theories as to the functions of a bishop in the primitive Church, which may be described as the Episcopalian and the Presbyterian theories. The question between them is whether the episcopate is necessary to the very existence of a church or only to its orderly regulation; in other words, to its *esse* or to its *bene esse*.

According to the former, the first bishops in the Church of Christ were His apostles; "for the office whereunto Matthias was chosen is termed (Acts i. 20) *episcopé*—i.e. an episcopal office, which being spoken expressly of one, agreeth no less unto them all; and therefore Saint Cyprian, speaking generally of them all, calls them bishops." The form of government at first established by the Apostles was that the laity or people should be subject to a college of ecclesiastical persons appointed for that purpose in every city. These, in their writings, they term sometimes 'presbyters,' sometimes 'bishops.' Thus Saint Paul to the elders at Ephesus says: "Take heed to the flock over which the Holy Ghost hath made you *overseers*"—i.e. bishops. This explains the Presbyterian view of the office. But as the Apostles could not themselves be present in all churches, and as in a short time strifes and contentions arose, they appointed, after the order began at Jerusalem, some one president or governor over the rest, who had his authority established a long time before that settled difference of name took place whereby such alone were called bishops; and therefore, in the Book of Revelation, we find that they are entitled 'angels.' Saint Irenæus, martyred about the beginning of the Third Century, says: "We are unable to number up them who by the Apostles were made bishops." In Rome, he tells us, they appointed Linus; and in Smyrna, Polycarp. Saint Ignatius witnesses that they made Evodius Bishop of Antioch. Saint Jerome says: "All bishops are the Apostles' successors"; and Saint Cyprian terms bishops "*præpositos qui apostolis vicaria ordinatione succedunt*" (presidents who succeed to the Apostles by vicarious ordination). Hooker says, in his usual judicious manner: "Such as deny apostles to have any successors at all in the office of their apostleship, may hold that opinion without contradiction to this of ours, if they will explain themselves in declaring what truly and properly apostleship is. In some things, every presbyter, in some things only bishops, in some things neither the one nor the other, are the Apostles' successors." And he adds, what fairly states the Episcopal theory on this subject: "The Apostles have now their true successors, if not in the largeness, surely in the kind of that episcopal function whereby they had power to sit as spiritual ordinary judges, both over laity and over clergy, where churches Christian were established." We find, also, that

throughout those cities where the Apostles did plant Christianity, history has noted a succession of pastors in the seat of *one*, not of many; and the first one in every rank we find to have been, if not some apostle, yet some apostle's disciple. By Epiphanius, the bishops of Jerusalem are reckoned down from Saint James to his own time; and Tertullian, writing in the Second Century, has the following: "Let them show the beginnings of their churches, let them recite their bishops one by one, each in such sort succeeding other that the first bishop of them have had for his author and predecessor some apostle, or at least some apostolical person who persevered with the Apostles; for so apostolical churches are wont to bring forth the evidence of their estates." The judgment of the Church of England, as to the primitive existence of bishops, is to be found in the preface to the ordination service, drawn up in the reign of Edward VI., where it is said: "It is evident unto all men diligently reading the Holy Scripture and ancient authors, that from the Apostles' time there have been these orders of ministers in Christ's Church—bishops, priests, and deacons." Saint Thomas Aquinas, however, distinguishes technically by saying that "the episcopate is not an order, but a dignity within an order." Accordingly, in the Roman Catholic Church, while ordination has always been performed by bishops, some other functions usually considered episcopal are at times delegated to priests; thus confirmation is occasionally administered by priests—with oil, however, blessed by a bishop.

According to the other, or Presbyterian theory of bishops, the origin and general history of the institution are thus sketched. In the earliest churches no traces of a hierarchy, it is affirmed, are to be found. The superintendents or directors appointed over the first churches by the Apostles or chosen by the members of the congregations, were unquestionably styled indifferently presbyters or bishops—the former title being borrowed from the Jewish synagogue, the superintendent or director of which was called the elder (Gr. *presbyteros*); the latter (*episcopus*) being familiar to the heathen converts as the title of a civil office corresponding in function to that of a Christian pastor. But this original equality did not last long. As new churches multiplied, those formed round the original church, though each having its own bishop or presbyter, remained in confederacy; and in the meetings of the pastors to regulate the common affairs one must of necessity preside, most likely determined by age, superior piety, or other qualification. From this simple circumstance, as is indicated by Clemens Alexandrinus in the beginning of the Third Century, sprang the habit of looking upon one of the bishops as superior to the others; and this superiority, at first personal and accidental, soon came naturally to be regarded as attached to the bishop of a particular congregation. In his case the word bishop came to signify an overseer of pastors rather than an overseer of people. The monarchical form of State government favored this tendency, and converted the president of a presbytery into the privileged superintendent of his brother pastors. The assumption was resisted by the presbyters at first, but from the middle of the Fifth Century episcopacy, or the domination of bishops, continued to gain the

upper hand over presbyterianism, or equality of all pastors.

In the Third Century bishops appear still dependent on the advice of their presbyters and the consent of the people, and shared with the former the office of teaching and the cure of souls. As yet their exclusive privileges or functions were limited to confirmation, ordination of ministers, consecration of sacred things, settlement of secular differences among Christians, and management of the revenues of the Church. But the tendency to subordination and unity did not rest here. Among the bishops, at first all equal, those of the larger and more important cities began gradually to acquire a superiority over those of inferior cities. When Christianity was made the religion of the Roman Empire, the bishops became more and more monarchical, and put themselves on the footing of ecclesiastical princes. The chief cities of the larger civil provinces rose to be seats of extensive dioceses, the bishops of these assuming the distinctive titles of *patriarch*, *metropolitan*, *papa*—titles of courtesy that had long been applied to all bishops; while the less important provinces, with their capitals and bishops, became subordinate. Among these provincial bishops, again, three, from obvious causes, acquired a prominence that cast all the rest into the background—namely, Alexandria, Constantinople, and Rome. The beginnings of the ascendancy of the Roman Pontiff, whatever may be thought of its claim to divine institution, are indisputably discernible as early as the end of the Second Century.

In the Roman Catholic Church the episcopal office is the foundation of the whole system. Christ's Apostles are held to have transferred their functions to the episcopacy as a body. Every bishop, therefore, exercises within his own diocese, first, the *jus magisterii*—i.e. the right of maintaining and propagating the orthodox faith; and second, the *jus ordinis*, or regulation of the sacred and mysterious rites of the priestly office, some of which are transferred to the inferior clergy, as *jura communia*, while others remain the privileges of the bishop (*jura propria*). Among episcopal prerogatives, in addition to those already mentioned as assigned to them in the Third and Fourth centuries, are anointing of kings, consecration of abbots, etc. They have also the management of the Church property in their respective dioceses, and the oversight of all ecclesiastical institutions. They are appointed by the Pope. In the United States, the clergy of the diocese who are entitled to share this function send to Rome a list of three names in order of preference, designating them as *dignissimus*, *dignior*, and *dignus*; a similar list is submitted by the other bishops of the province. The Pope may be guided by these recommendations and nominate one of these men, or he may set the lists aside altogether and make his own selection. In some European and South American countries, as a result of past compromises or concordats, the head of the State is allowed to nominate, subject, of course, to Papal confirmation. The consecration takes place normally at the hands of three bishops, this number having been required from post-Apostolic times, though a single consecrator would suffice for validity. After the elaborate ceremonies of consecration, the new bishop takes his place upon his throne, and gives his blessing to the people committed to

his oversight. (For the duties of the special vestments worn by Roman Catholic bishops, see *COSTUME, ECCLESIASTICAL*.) In case of the incapacity through age or infirmity of a diocesan prelate, an assistant or coadjutor bishop is appointed, who bears the title of some extinct see in *partibus infidelium*, it being contrary to ancient usage to consecrate a bishop with a roving commission. See *TITULAR*.

In the Greek Church the office of bishop is essentially the same, though the powers of the incumbent are somewhat more restricted. Greek bishops are practically always chosen from the monastic orders, and generally from the archimandrites or abbots of those orders.

The episcopal office in its essentials has practically disappeared from the Protestant communities of the Continent of Europe, although the title has been retained in Sweden, Norway, and Denmark. The bishops of the two former countries, while they are, from the ecclesiastical standpoint, no more than the superintendents of other Lutheran churches, have retained some of their ancient prerogatives, such as seats in Parliament, and still use the mitre, pallium, and crosier. In Germany the title has occasionally appeared in modern times among the Protestant churches, having been conferred, for example, by Frederick I. and Frederick William III.

In no other Protestant country have the prerogatives and revenues and functions of bishops remained so little impaired as in England, where the Reformation was guided by the King's own hands, and, being propagated from above downward, was effected in a very conservative spirit. Episcopacy was abolished by law under the Commonwealth; but at the Restoration the bishops were also restored, being connected closely in the thought of the time with monarchy, on James I.'s principle of "no bishop, no king," and have since retained their position in Church and State. The mode of election and confirmation is the same in the cases of bishops and archbishops, for each archbishop is also a diocesan prelate. They are elected by the chapter of each cathedral church by virtue of a license from the Crown; this is the theory, but actually the bishops of the Church of England are appointed by the Crown on the advice of the Prime Minister, since no chapter ventures to disregard the nomination which accompanies the *congé d'élire*. In early Christendom the laity used to take part in the election; but from the tumults that arose, the different sovereigns of Europe took the appointment, in some degree, into their own hands by reserving to themselves the right of confirming these elections, and of granting investiture to the temporalities which now began to be annexed to these dignities. This right was acknowledged as belonging to Charlemagne by Pope Adrian I., A.D. 773, and the Council of the Lateran. The right of appointing to bishoprics is said to have been in the Crown of England even in Saxon times. But when, by length of time, the custom of electing by the clergy only was fully established, the Popes began to object to the usual method of granting these investitures, which was *per annulum et baculum*—i.e. by the prince delivering to the prelate a ring and pastoral staff or crosier. In the Eleventh Century Pope Gregory VII. published a bull of excommunication against all princes who should dare to confer investitures. There were long and

eager contests occasioned by this Papal claim, but at length the matter was compromised, the Emperor Henry V. agreeing to confer investitures for the future *per sceptrum*, while the kings of France and England consented to receive only the homage for the temporalities, instead of investing them by the ring and crosier, the Pope keeping in his hands the power of confirmation and consecration. This concession was obtained from Henry I. of England; but King John, to obtain the Pope's protection against his barons, gave up, by a charter to all monasteries and cathedrals, the free right of electing their prelates. This grant was confirmed in Magna Charta, and was again confirmed by Statute 25 Edward III. But by Statute 25 Henry VIII. the ancient right of nomination was in effect restored to the Crown. The sovereign, on the vacancy being notified, sends to the dean and chapter a letter missive, or *congé d'élire*, containing the name of the person to be elected; and if they do not elect in the manner appointed by the act, or if the archbishop or bishop appointed for the purpose refuse to confirm, invest, and consecrate the bishop-elect, the recusants incur the penalty of a *præmunire* (q.v.). A bishop cannot be *deposed*, as it is supposed that the order itself cannot absolutely be taken from him; he may, however, be *deprived*, as was done to the Bishop of Clogher in 1822; he may also resign his see; and he may be removed from one see to another, which is called *translation*; but this practice is now less frequent than it used to be. The Dean and Chapter of Canterbury claim it as an ancient right of that church that every bishop of the province is to be consecrated in it, or the archbishop to receive from them a license to consecrate elsewhere; and it is said that a long succession of licenses to that purpose are regularly entered in the registry of that church. Bishops, upon their election, become peers of the realm, and are summoned to Parliament as well as the other nobles; but the right under which they sit there, whether in respect of their baronies, or by usage and custom, is a matter of uncertainty. It appears, however, that the bishops sat in the Witenagemote, under the Saxon monarchs, as spiritual persons; for they were not barons until William the Conqueror turned their possessions into baronies, and subjected them to the tenure of knights' service. The bishops created by Henry VIII.—viz., Bristol, Gloucester, Chester, Oxford, and Peterborough, as also some lately created bishops—sit in Parliament, though they do not hold their lands by baronial tenure. The bishops withdraw from the House (under protest, however) when any capital charge is to be decided. The bishops sit in Parliament next to the Archbishop of York: first, London; second, Durham; third, Winchester; and then the rest in the order of the foundation of their sees. In respect of their persons, bishops are not peers with the nobility; and in case of alleged crimes they are tried by a jury in the same manner as commoners, as was the case with Cranmer and Fisher. When a see is vacant, the archbishop of the province is guardian of the spiritualities; but he cannot as such consecrate or ordain or present to vacant benefices. The sovereign has custody of the lay revenues during a vacancy. Queen Elizabeth kept the See of Ely vacant nineteen years.

Including the two metropolitans, there are thirty-five diocesan bishops in England, most of

them bearing the titles of pre-Reformation sees. They are Canterbury, York, London, Durham, Winchester, Bangor, Rochester, Exeter, Peterborough, Saint David's, Worcester, Chichester, Lichfield, Ely, Oxford, Saint Asaph, Manchester, Hereford, Chester, Landaff, Lincoln, Salisbury, Bath and Wells, Carlisle, Gloucester, Bristol, Ripon, Norwich, Sodor and Man, Truro, Saint Albans, Liverpool, Newcastle, Southwell, and Wakefield. There is also a constantly increasing number of suffragan or assistant bishops—at present twenty-four—who bear territorial titles, but have no independent jurisdiction and no seats in Parliament. The Episcopal Church of Scotland has seven bishops, and that of Ireland two archbishops and eleven bishops. The first colonial bishopric of the Anglican communion was that of Nova Scotia, founded in 1787; but the Nineteenth Century saw a prodigious increase in their numbers. There are now 23 in British North America, 8 in the West Indies, 10 in India and Ceylon, 16 in Australia, 7 in New Zealand, and 24 under the direct jurisdiction of the Archbishop of Canterbury, mostly in non-Christian lands. There are now 229 bishops in the Anglican communion.

In the Protestant Episcopal Church of the United States, the functions of the bishops, in religious matters, are similar to those of English prelates. In political affairs they have, of course, no official power. They are chosen to office by the convention of clerical and lay deputies of the diocese over which they are to preside, except in the case of missionary bishops, who are nominated by the House of Bishops and elected by the House of Clerical and Lay Deputies. There are at present eighty-nine in the House of Bishops.

In England, under the Archbishop of Westminster as primate, there are fifteen Roman Catholic bishops. The hierarchy here was restored in 1850, and in 1878 in Scotland, where there are two archbishops and four bishops. The assumption of territorial titles by Roman Catholic bishops in England and Scotland was made illegal by the Ecclesiastical Titles Act of 1851; but the law, passed in a moment of great popular excitement, has always been a dead letter. In Ireland there are four Catholic archbishops and twenty-six bishops. In the United States the Church has fourteen archbishops, with the Archbishop of Baltimore as primate, and seventy other diocesan bishops, besides three vicars apostolic.

In the Methodist Episcopal Church, the bishops are elected by the General Conference. Their duties are those included in a general superintendence of the whole Church. Authority is vested in them all, and its administration distributed among them by mutual agreement. They preside over meetings of the annual conferences, ordain ministers, and appoint them to their fields of labor. There are 18 in the Northern branch and 10 in the Southern Church. They have no dioceses and are all itinerant. The Reformed Episcopal Church has 8 bishops, and the African Methodist Episcopal Church 7. Other Protestant bodies in the United States have adopted the episcopal form of government, among them the United Brethren in Christ and the Evangelical Association. See ARCHBISHOP; APOSTOLIC SUCCESSION.

For the discussion of the theory, consult: Lightfoot, *Saint Paul's Epistle to the Philippians* (London, 1868); Baur, *Das Christenthum und die christliche Kirche der ersten drei Jahrhunderte* (Tübingen, 1853); Hatch, *Organization of the Early Christian Churches* (London, 1881); Wordsworth, *Theophilus Anglicanus* (London, 1843); Döllinger, *The First Age of the Church* (Eng. tr. Oxenham, London, 1866); Moberly, *Ministerial Priesthood* (London, 1898); Reville, *Les origines de l'épiscopat* (Paris, 1894).

BISHOP. A beverage best known in England, composed of red wine (claret, Burgundy, etc.) poured warm or cold upon ripe bitter oranges, sugared and spiced to taste, and drunk either hot or cold. The oranges should be carefully selected, and the white part between the peel and pulp thrown away. If white wine be used, the beverage is called *cardinal*; and with Tokay it becomes *pope*. 'Bishop' was known under other names in Germany during the Middle Ages, having been imported into that country from France and Italy; its present name seems to have been bestowed during the Seventeenth Century.

BISHOP, ANNA RIVIÈRE (1814-84). An English operatic singer, born in London. She was the wife of the composer Sir Henry Rowley Bishop. Her first appearance was in 1837, and she soon became widely known in Europe and America. In 1839 she sang in the principal cities of the Continent. She returned to England in 1846, and in the following year came to America and became an exceedingly popular singer in the United States, Canada, and Mexico. She married Martin Schultz, a New York merchant, in 1858. In 1866 she sang in Manila and China. She lost her voice in 1868 and retired from the stage.

BISHOP, Sir HENRY ROWLEY (1786-1855). An eminent English composer of music. He was born in London. His principal musical instructor was Signor Francesco Bianchi, an opera composer settled in London. In 1806 Bishop was appointed composer of ballet music at the opera. The opera *Circassian Bride* (1809) won a triumph at Covent Garden, and a long list of works for the stage followed. His most popular operatic compositions were *Guy Mannering*; *The Slave*; *The Miller and His Men*; *Maid Marian*; *Native Land*; *The Virgin of the Sun*—all remarkable for their flowing melodies, animated style, and true musical power. From 1810 to 1824 he was director of the music at Covent Garden Theatre. One of the first directors of the Philharmonic Society, he for many years conducted the concerts of ancient music. He arranged several volumes of the *National Melodies*, and succeeded Sir John Stevenson as arranger of the airs selected by Moore for his *Melodies*. Bishop composed the familiar music to John Howard Payne's *Home, Sweet Home*. In 1839 he received the degree of bachelor of music from the University of Oxford, and in 1841 was elected Reid professor of music in the University of Edinburgh. In 1842 he was knighted. He resigned his Edinburgh chair in 1843, and in 1848 was elected professor of music in the University of Oxford.

BISHOP, ISABELLA BIRD (1832—). An English traveler and author. She was born in Yorkshire, England, October 15, 1832, the daughter of Rev. Edward Bird. She began traveling in

North America at an early age, and later spent thirteen years in Asia, showing skill, courage, and tact. Married to John Bishop, M.D., in 1881, and widowed in 1886, she continued her travels, lectures, and writing. In 1892 she was elected a Fellow of the Royal Geographical Society. Her nine volumes of travel (many of which first appeared under her maiden name, Bird) on North America, Hawaii, Japan, the Malay Peninsula, Persia, Kurdistan, Tibet, Korea, Siberia, China, and Morocco, show great ability. In 1901 she went on a philanthropic mission to India. Among the best-known of her books are *Korea and Her Neighbors* (1898) and *The Yangtze Valley and Beyond* (1900).

BISHOP, SETH SCOTT (1852—). An American physician, born at Fond du Lac, Wis. He graduated in 1876 at Northwestern University (Evanston, Ill.), and subsequently was appointed professor of otology at the Chicago Post-Graduate Medical School and Hospital and professor of diseases of the nose, throat, and ear at the Illinois Medical College. He became an editor of *The Laryngoscope*, and published a work on *Diseases of the Ear, Nose, and Throat, and Their Accessory Cavities*.

BISHOP, WILLIAM HENRY (1847—). An American novelist and graduate of Yale University, 1867. The best-known of his novels and sketches are: *Detmold* (1879); *The House of a Merchant Prince* (1882); *Choy Susan and Other Stories* (1884); *Fish and Men in the Maine Island* (1885); *The Golden Justice* (1887); *The Brownstone Boy and Other Queer People* (1888); *A House Hunter in Europe* (1893); *Writing to Rosina* (1894). *Old Mexico and Her Lost Provinces* (1883) is a book of travel.

BISHOP-AUCKLAND. A town in the county of Durham, England, 9 miles southwest of the city of Durham, on an eminence near the confluence of the Wear and Gaunless (Map: England, E 2). There is a fine town hall, dating from 1863. The chief building of interest, however, is the palace of the Bishop of Durham, a large pile covering some five acres in the midst of a park. The principal industries of the town are cotton manufactures, and in the neighborhood are several collieries. Population, in 1891, 10,500; in 1901, 12,000.

BISHOP BLOU'GRAM'S APOLOGY. A fine dramatic monologue by Robert Browning, in which, among other significant points made, it is held that the vitality of faith is conditioned on healthy doubt.

BISHOPS' BOOK. A primer of doctrine and instruction, compiled by a commission of bishops and ministers of the English Church, in 1537, and known also as *The Institution of a Christian Man*. It contains an exposition of the Apostles' Creed, the Seven Sacraments, the Ten Commandments, the Lord's Prayer, and the doctrines of justification and purgatory. It is contained in *Formularies of Faith Put forth by Authority during the Reign of Henry VIII.* (Oxford, 1823). Consult Hardwick, *Reformation* (London, 1856).

BISH'OPSGATE. A quaint London street, so called from a gate of that name, which once stood in the north wall of the city, and which was destroyed in 1812.

BISKRA, or BISKARA, bēs'kā-rā (named after the tribe *Biskri*). A town and commune

in the Department of Constantine, Algeria, on the south side of the Aures Mountains, 117 miles southwest of Constantine by rail. It is the most important military post of the district, and formerly had a large caravan trade between the Sahara and the Tell (Map: Africa, E 1). Biskra is situated in the midst of a highly fertile oasis, rich in date-palms and olives. The climate is the warmest in Algeria, the summer temperature rising often above 120° F.; in winter, however, the freezing-point is not infrequently reached. The town has broad streets, with substantial houses, a fort, barracks, caravanserai, and hospital. Burnous and carpets are manufactured, and iron, limestone, and saltpeter are mined in the neighborhood. The Zaba of the Romans, it was an important town under the Moors, but declined after the plague of 1863, by which 71,000 inhabitants perished. In 1844 it was taken by the French, with whom it has become a favorite health resort. Population (commune), in 1891, 7166; in 1896, 8417.

BISMARCK, biz'märk. The capital of North Dakota, and county-seat of Burleigh County, on the Missouri River, and on the Northern Pacific Railroad (Map: North Dakota, E 3). It has an attractive situation on the east bank of the river, which is here crossed by a magnificent bridge of steel and iron, 50 feet above high water, and contains a fine court-house, several Federal institutions, the State penitentiary, the State Library, and Saint Alexius's Hospital. The capitol, completed in 1894 at a cost of half a million dollars, is the most prominent building. The city controls a very extensive river trade, the principal articles of commerce being coal, with which the surrounding region is underlaid, grain, hides, etc. The industrial establishments include grain-elevators, a large flouring-mill, brewery, etc. Lewis and Clark spent the winter of 1804-05 on or near the site of Bismarck, which was permanently settled in 1873 and incorporated shortly afterwards. In 1883 it was made the capital of Dakota Territory, and in 1889 was chosen as the State capital of North Dakota. The government, under a general State law of 1900, is vested in a mayor, elected every two years, who has important appointive powers in municipal offices, and a city council. Population, in 1890, 2186; in 1900, 3319.

BISMARCK, biz'märk, Ger. pron. bēs'märk, FRIEDRICH WILHELM, Count (1783-1860). A German soldier and military author. He was born at Windheim, Westphalia, and was a member of the Rhenish branch of the Schönhäusen line of the Bismarck family. He served with Hanoverian, and afterwards with Nassau regiments, and in 1804 became a member of the English German Corps. Compelled to resign from the English service because of a duel, he entered the calvary service of Württemberg, at that time in alliance with France. He greatly distinguished himself in the campaigns against Austria (1809) and Russia (1812). After the battle of Leipzig he was employed in various diplomatic missions in the service of Württemberg. He was a prolific writer, especially on cavalry tactics, and a great admirer of Napoleon, whose later campaigns he describes in the work entitled *Aufzeichnungen* (1846). Among his other publications are the following: *Vorlesungen über die Taktik der Reiterei* (1826); *Reiterbib-*

liothek, 6 vols. (1825-31); *Ideentaktik der Reiterei* (1829).

BISMARCK ARCHIPELAGO, är'ki-pél'a-gó (so renamed in honor of Bismarck). A group of islands in the Pacific Ocean, situated about 56 miles east of New Guinea, and extending from latitude 2° to 6° 30' S., and longitude 148° to 155° E. (Map: Australasia, G 3). Its area is estimated at 20,000 square miles, and it comprises the islands of New Pomerania (New Britain), New Mecklenburg (New Ireland), New Laurenburg (Duke of York Islands), New Hanover, Admiralty, Anchorite, Commerson, Hermit, and a few others. The chief articles of export are copper and trepang. The annual imports and exports are valued at about a quarter of a million dollars each. The population is estimated at 188,000, and consists chiefly of Papuans. The group was declared a German protectorate in 1884 and placed under the control of the German New Guinea Company. Consult: Verbeek, "Die Entdeckung des Bismarck-archipels," in *Beiträge zur Kolonialpolitik und Kolonialwirtschaft* (Berlin, 1899-1900); Thilenius, "Geologische Notizen aus dem Bismarck-archipel," in Vol. LXXVIII., *Globus* (Brunswick, 1900).

BISMARCK-BOHLEN, bēs'märk-bō'len, FRIEDRICH ALEXANDER, Count (1818-94). A Prussian soldier. He was born on the family estate at Karlsburg. From 1846 to 1848 he was the official military attaché and companion of Prince Frederick Charles at the University of Bonn. In 1864 he was raised to the rank of major-general, in which capacity he served in the Austro-Prussian War. Upon the conclusion of that campaign he was appointed Governor of Hanover (1866). He was commandant of Berlin in 1868, and Governor-General of Alsace-Lorraine during the Franco-Prussian War, upon the conclusion of which he was appointed adjutant-general to Emperor William.

BISMARCK BROWN. See COAL-TAR COLORS.

BISMARCK-SCHÖNHAUSEN, bēs'märk shēn'hau-zen, HERBERT NIKOLAUS VON, Prince (1849—). A German statesman, eldest son of Prince Otto von Bismarck. He was born in Berlin, and studied at the universities of Bonn and Berlin. He fought in the Franco-Prussian War, was wounded at Mars-la-Tour, and was appointed an officer September 2, 1870. In 1873 he entered the Foreign Office, and served at Bern and Vienna, acting subsequently as private secretary to his father from 1877 to 1881. In 1882 he was appointed counselor of legation at London, and in 1884 he was sent in a similar capacity to Saint Petersburg, whence he was in the same year transferred as Ambassador to The Hague. He became Under Secretary of State in 1885, and Secretary of State in 1886. After the resignation of his father (March 20, 1890) he retired from the diplomatic service and withdrew to his estate at Schönhausen. He was elected to the Reichstag in 1893 and 1898 as a member of the Conservative party, of which body he had also been a member from 1881 to 1886. The treaty of 1885 between Germany and England, relative to the colonial boundary question, was negotiated by him. He also presided at the Samoan Conference held in Berlin in 1889. By his marriage with the Countess Marguerite Hoyos (June 21,

1892), he had two sons and two daughters. His political speeches have been published by Penzler under the title *Politische Reden* (1899).

BISMARCK-SCHÖNHAUSEN, KARL OTTO EDUARD LEOPOLD VON, Prince (1815-98). First Chancellor of the German Empire. He was born April 1, 1815, at the family manor of Schönhausen, in the District of Magdeburg, Prussia. He was one of the six children of Karl Wilhelm Ferdinand von Bismarck, a captain of the Royal Body Guard of Prussia. His mother was the daughter of Herr Menken, a high official in the Prussian civil service. The family traced its lineage back directly for five centuries, and many of its members had held high positions in the military service of Brandenburg and Prussia and at Court. In 1832-33 Bismarck studied jurisprudence and political science at Göttingen, where he made the acquaintance of John Lothrop Motley, the American historian, an acquaintance which ripened into the strong friendship of later years. He studied for three semesters in Berlin, was admitted to the bar in 1835 and was referendary in Aix-la-Chapelle and Potsdam in 1836-37. In the latter city and in Greifswald he served his term in the army as lieutenant in the Life Guards. In Greifswald, too, he familiarized himself with the science of agriculture. On July 28, 1847, he married Johanna von Puttkamer, and in the same year entered the first General Diet of Prussia, where he became known as an able and aggressive champion of ultra-conservative measures. In 1849 he was elected to the Second Chamber of the Prussian Diet, called into existence by the revolutionary outbreak of 1848, and as a member of that body and of the Erfurt Parliament (1850) he advocated an increase in the powers of the monarchy and the consolidation of the German people through the joint action of Prussia and Austria. At the same time he combated the Erfurt and Frankfort plans of union. In this early part of his career Bismarck gave little indication, except in his strenuous advocacy of Prussia's leadership, of the aims toward which his later activity was to be directed.

After holding the position of Prussian secretary of legation at Frankfort-on-the-Main, Bismarck was appointed, in 1851, Prussian Ambassador to the Germanic Diet at Frankfort. He had now apparently become convinced of the need of constitutional concessions in order to unite the German people, and of the inherent antagonism between the interests of Austria and the cause of German unity; for he adopted a more liberal programme and assumed that attitude of hostility to Austrian pretensions which he maintained so consistently and successfully. He was so outspoken in his opposition to Austria that it was deemed prudent, in 1859, on the eve of the Franco-Italian War against Austria, to transfer him to Saint Petersburg. There he labored effectively to strengthen the friendly relations between Russia and Prussia, and gained the highest esteem of Alexander II. When, on the death of Frederick William IV., January 2, 1861, William I. succeeded to the Prussian throne, Bismarck was transferred from Saint Petersburg to Paris, and in September, 1862, was called to the post of head of the Prussian Cabinet and Minister of Foreign Affairs. The King was then faced by a Diet which was in stubborn opposition to an army bill, but he

found in Bismarck a minister daring enough to govern without a budget and without Parliamentary majority. In this manner began the lifelong alliance between King William and his great minister. Bismarck now entered upon his life-work, the unification of Germany under Prussian leadership, and the placing of the new Germany in the forefront of European nations. In pursuance of this object, he developed a thoroughly consistent and often ruthless policy, and carried it out without hesitation. Speaking to the Budget Commission of the Prussian Diet, September 30, 1862, he said:

"Our blood is too hot; we are fond of bearing an armor too large for our small body. Germany does not look to Prussia for liberalism, but for power. Let Bavaria, Württemberg, Baden, indulge in liberal ideas; no one will assign them the rôle destined for Prussia. Prussia must consolidate its might and nurse it for the favorable moment. Prussia's boundaries as determined by the Congress of Vienna are not conducive to its welfare as a sovereign State. Not by speeches and resolutions of majorities are the mighty problems of the age to be solved—that was the mistake of 1848 and 1849—but by blood and iron."

This much misunderstood statement, so characteristic of Bismarck, concisely summarizes the subsequent development of German history. Its full significance is elucidated by Bismarck in his *Autobiography*. Bismarck disliked war, but he saw no way of bringing the jealous German States together except through war. He regarded it as indispensable to drive Austria, as an essentially non-German and anti-national State, out of the Confederation, and he utilized the Schleswig-Holstein affair (see SCHLESWIG-HOLSTEIN) to antagonize Austria and finally to force an issue between that power and Prussia. At the same time he made Prussia the champion of the demand for a national German Parliament based on popular suffrage. This seemed so at variance with his earlier political course that Germany found it difficult to believe in his sincerity. Nevertheless, it was entirely consistent with the development of his character and opinions. He gained Austria over to his views in the Schleswig-Holstein matter, and with her co-operation entered upon the war against Denmark (1864). He won the confidence of Italy, formed an alliance between that State and Prussia, and when the Schleswig-Holstein controversy came to a crisis in the Germanic Diet, Prussia was ready for action. On June 1, 1866, Austria referred the settlement of the question to the Diet, and on June 10 Bismarck addressed to the German courts a letter setting forth Prussia's national policy. The following day Austria moved in the Diet for federal execution against Prussia, and the tie vote was decided in the affirmative, whereupon the representative of Prussia presented his Government's plan for a new national organization, declared the Confederation dissolved by its own action, and withdrew. Prussia at once invaded the German States that adhered to Austria, while the main Prussian Army was pushed into Austrian territory. The brief and brilliant campaign (see GERMANY and SEVEN WEEKS' WAR) secured the first object in Bismarck's programme. The Peace of Prague excluded Austria from the German Confederation, which was reorganized under a permanent

Prussian presidency as the North German Confederation. It was still necessary to bring the South German States into the Union, to prick the bubble of Napoleon III.'s self-assumed leadership in European affairs, and to establish a more satisfactory western boundary for Germany by making the Rhine a truly German river. Bismarck forced an issue with France with the same relentlessness and the same certainty of result that had characterized the contest with Austria. The mistakes of the French diplomacy (see BENEDETTI) were utilized to the full, and France was goaded into a war to which she was wholly unequal. (See FRANCO-GERMAN WAR.) Throughout the war Bismarck was at the side of his sovereign, evincing in the course of the peace negotiations extraordinary determination and executive capacity. When on the 18th of January, 1871, King William of Prussia at Versailles accepted the title of Emperor of the new German Empire, Bismarck's policy had been vindicated. Before this his triumph had been won by constant contention against the centrifugal tendencies of the old Germany and in spite of the steadfast hostility of a large section of the German people. Now he became a popular idol. On April 16 the text of the Imperial Constitution was promulgated, and Bismarck, now created a prince, became the first chancellor of the new Empire. His next task was that of organizing the internal affairs of Germany upon the new basis, and of developing an Imperial policy worthy of a power of the first rank.

There is no ministerial responsibility under the Imperial Constitution of Germany, nor is the parliamentary opposition organized as it is in the United States and England. Bismarck never came to believe in the wisdom of popular majorities or control by a partisan Parliament. He saw the necessity of a popular basis for a strong government, but he believed above all in a strong executive. And the necessity of German unity was always uppermost in his mind. The promulgation of the doctrine of Papal infallibility by the Vatican Council of 1870 was odious to him as tending to weaken the loyalty of the German Catholics. In no sense intolerant of religions as such, he was opposed to any political religious organizations within the State, and he maintained this position both as Prussian Minister and as Imperial Chancellor. In January, 1873, he caused the introduction into the Prussian Diet of certain laws to regulate the relations of Church and State. Thus was brought on the six-years' struggle with the Clericals, known as the *Kulturkampf* (q.v.), in which Bismarck made the great mistake of his career, carrying his measures so far that in the inevitable reaction he was forced to acknowledge a virtual defeat. Bismarck's position seems to have been simply that of defending the authority of the State against outside interference. In 1874, replying to a Catholic attack in the Prussian Diet, Bismarck stated his principles clearly, acknowledging his duty to respect the dogmas of the Catholic Church merely as dogmas, and adding: "If the doctrine of infallibility be so interpreted as to lead to the establishment of an ecclesiastical *imperium in imperio*; if it lead to the nullification of the laws of this country because unapproved by the Vatican, I am naturally driven to assert the legitimate supremacy of the State. We Protestants are under

OTTO VON BISMARCK

the conviction that the kingdom of Prussia ought not to be ruled by the Pope, and we demand that you, the Ultramontane section of the Roman Catholics, respect our convictions as we do yours." The controversy led to an attempt upon Bismarck's life by a mechanic named Kullmann, in 1874. Finally, however, Ultramontane resistance drove Bismarck into an attitude of intolerance which proved untenable. Personally he had passed through four stages in his religious views, having arrived through rationalism, skepticism, and conventional Christianity at a profound religious conviction, with a firm faith in God and immortality. He was tolerant because he cared little for creeds and outward forms.

An equally difficult problem confronted Bismarck in the growing power of the Socialists. Two attempts on the life of the Emperor in 1878, by avowed Socialists, enabled the Chancellor to overcome the scruples of the Liberals in the Reichstag, and to secure the passage of special laws for the suppression of socialistic agitation. The *Kulturkampf* had brought Bismarck into alliance with the National Liberals; his conservative tendencies broke this alliance, and he came to an understanding with the Conservatives and Catholics. Now that he had suppressed the political activity of the Socialists for the time being, Bismarck very characteristically gave his attention to checking the movement by making many features of the Socialist programme his own, and he initiated a policy of paternalism, which was considered not far removed from State Socialism in some of its aspects. The most notable of the laws passed to placate the working classes were the sickness, accident, and old-age insurance acts of 1883-1889.

With the industrial and commercial development of the Empire, the time seemed ripe for expansion beyond the seas, and in 1884 Bismarck entered upon his colonial policy, at first half-heartedly. In a speech before the Reichstag, June 26, 1884, he declared his opposition to forced colonization, and his willingness to support only such a colonial policy as grew out of the need of protecting German subjects in foreign lands. He favored leaving the management of affairs largely to chartered trading companies, and added: "It is not our intention to found provinces, but to foster commercial enterprise." To stimulate industry and thereby to check the continuous emigration from Germany, Bismarck advocated a protective tariff. To settle the African question, as raised by the work of the International African Association, he arranged a conference at Berlin in 1884-85, which secured the recognition of the Congo Free State and laid down the lines upon which the partition of Africa has been effected. Bismarck was the author of the policy of subsidizing steamship lines from Germany to Asia, Africa, and Australasia. He never changed the conservative views on colonization that he had expressed in 1884, although circumstances forced him into action hardly consistent with those views. As early as 1865 he had advocated the Baltic and North Sea Canal, which was constructed after his retirement.

The genius of Bismarck was always most conspicuous in international affairs. He deliberately brought on three wars—with Denmark, Austria, and France—in order to further the great consummation of German unity. The

German Empire once established, the great Chancellor's policy became one of peace. He avoided entangling Germany in the Eastern Question; but when the rivals of Russia were aroused by the Treaty of San Stefano, in 1878, he asserted Germany's leadership in Europe by inviting an international congress to meet at Berlin. (See BERLIN, CONGRESS OF.) He formed the Triple Alliance to secure Germany against both France and Russia, but at the same time maintained the most friendly relations with Russia. France he did not regard as a serious competitor of Germany after 1871. His matured convictions in regard to Germany's position are set forth in his autobiography. In that work, after some observations on Russia's relations to the Eastern Question, he observed that if Russia failed to receive assurance of German neutrality, the old coalition of the Seven Years' War—the alliance, that is, of Austria, Russia, and France against Prussia—might be revived. "If Germany possesses the advantage," he said, "of having no direct interests at stake in the East, she labors on the other hand under the disadvantage of an exposed position in the heart of Europe, with an extended frontier, which has to be defended on every side, and surrounded by enemies ready to enter into alliance against her. At the same time, Germany is, perhaps, the only great Power in Europe which is not tempted by objects unattainable except through war. It is our interest to maintain peace, while our Continental neighbors, without exception, foster ambitions, either secret or officially avowed, which can be realized only by war. We must direct our policy in accordance with these facts—that is, we must do our best to prevent war, or at least to restrict it." Bismarck's largeness of view and freedom from petty enmity is shown by his efforts, as soon as Austria had been beaten at Sadowa, to establish friendly relations between that Power and Germany. A man of strong passions, he allowed no prejudice to blind him to the requirements of sound national policy.

His attachment to Emperor William I. was in every way creditable to him. After the death of the Emperor in 1888, Bismarck remained in office during the brief reign of his successor, the Emperor Frederick.

William II. had learned his statecraft in the school of Bismarck, but it was inevitable that the autocratic young Emperor should come into collision with the strong-willed minister who had been so long accustomed to the personal direction of Prussian and German affairs. Numerous quarrels finally led to the resignation of Bismarck, which occurred on March 20, 1890. He retired to Friedrichsruh. On leaving office the title of Duke of Lauenburg was bestowed upon him by the Emperor, together with one of the highest military ranks (Generaloberst of cavalry). The open estrangement between the two continued until after Bismarck's severe illness in 1893, when the Emperor made advances toward a reconciliation, which took place in form at least. Bismarck's eightieth birthday (April 1, 1895) was made the occasion of a great demonstration throughout Germany. He was visited by the Emperor and by thousands of military and political associates, and a Bismarck Museum was founded in Berlin.

So positive a force in the life of his day necessarily aroused both intense admiration and bitter

hostility. He was, beyond question, the greatest European statesman of the century, and one of the greatest statesmen of all time. His genius was of the rare constructive type, and he is justly included in the trio of creators of modern Germany, together with the Great Elector Frederick William and Frederick the Great. He had set himself a great end, the realization of a united Germany and the fullest development of the German nation; he pursued it relentlessly, and he achieved it by methods at least as unimpeachable as those applied to any similar task in history. Against his critics he could set up the worldly but weighty defense of success. He found Germany a group of jealous kingdoms and principalities, the shuttlecock of Austria and France. He left it a united nation, one of the world's great Powers, and the dominant force on the Continent of Europe. In his *Gedanken und Erinnerungen*, the work of his years of retirement, commonly though somewhat inaccurately 'led, in its English translation, "Bismarck's Autobiography," he has left a valuable epitome of his views on many points of European policy. In this and in his collected speeches, letters, and papers must be sought his *Apologia*. In private life Bismarck was a kind husband and father, a genial friend, and a considerate landlord. Physically and mentally, he was a man of surpassing power and endurance, and his capacity for work, creative or absorptive, was tremendous. Though not a scholar in the strict sense of the word, he was a man of wide information, always accessible to his ready memory. While not a finished orator, the pungency of his speech and the aptness of his quotations from history and literature always held his audience in the Reichstag. He died July 30, 1898. For his own epitaph he wrote simply, after his name and the dates of his birth and death, "a faithful German servant of the Emperor William I." He had three children—Countess Marie, born August 28, 1848; Prince Herbert, born December 28, 1849; and Count Wilhelm, born August 1, 1852, and died in 1901.

BISMARCK-SCHÖNHAUSEN, WILHELM ALBRECHT OTTO, Count von (1852-1901). A German statesman, second son of Prince Otto von Bismarck, born at Frankfort-on-the-Main. He was educated at the University of Bonn, and served in the Franco-Prussian War as an officer

of ordnance. He was attached to the Imperial Chancellery from 1878 to the fall of 1879, when he was transferred to Alsace-Lorraine as assistant to the Governor. He again served in the Imperial Chancellery from 1881 to 1884, and was later successively appointed President of the Province of Hanover (1889) and Governor of East Prussia.

BISMUTH, biz'müth (Fr. *bismuth*, Ger. *Bismuth*, *Wismuth*, of unknown origin). A metallic element, probably known to the ancients, but first described in 1450. In the native state it is found widely distributed in small quantities, generally with ores of copper, lead, etc. It is further found in combination with oxygen as *bismite*, with sulphur as *bismuthinite*, with carbonic acid as *bismutite*, and as an alloy with tellurium, called *tetradymite*. These various minerals are widely distributed; but the principal commercial source is the metallic bismuth which is found in association with other ores, in the mines of Saxony and Bohemia, and at Monroe, Conn., in the United States. The commercial metal is obtained chiefly from the reduction-works in Saxony, although a small quantity is smelted in England. The process by which the metal is obtained consists in first carefully hand-picking the ore, after which the selected pieces are roasted and the metal run off from the gangue into pots. By remelting at as low a temperature as possible, with one-tenth of its weight of nitre, a solid slag is formed by the nitre on the surface, with practically pure metal beneath. Bismuth (symbol, Bi; atomic weight, 208.5) is a brittle, grayish-white, crystalline metal of a distinctly red tinge, with a specific gravity of 0.98. It melts at 268.3° C., and boils between 1090° and 1450° C. It is a poor conductor of heat and electricity. The metal itself is used chiefly as a constituent of alloys and amalgams. With lead, tin, and cadmium it forms a fusible metal, which melts at from 16° C. to 34.5° C., according to the proportion of its constituents. These alloys, besides having a remarkably low melting-point, expand in the act of solidification, thus giving a perfect cast. Small quantities have been used in the manufacture of bell-metal. Bismuth combines with radicals to form diad, triad, and pentad salts, of which the trivalent compounds are the most stable. Its principal compound with oxygen is the trioxide, which is found native as the mineral bismite, and may be prepared artificially by igniting the bismuth subnitrate until red fumes cease to come off. It is a pale-yellow amorphous compound, used for glass and porcelain staining, as an addition to certain fluxes to prevent the production of color, and in gilding porcelain. Its most important compound is the nitrate, which may be made by dissolving metallic bismuth, or its oxide, or carbonate, in nitric acid, yielding a pearly-white powder consisting of minute scales, which is used as a flux for certain enamels, owing to the fact that it increases their fusibility, as a colorless iridescent glaze on porcelain, and as a cosmetic for softening the skin, under the names of *blanc de fard* and *blanc d'Espagne*. It is an official medicine, and was formerly termed *majestery of bismuth*, being largely used in chronic diarrhœa and cholera. Bismuth oxychloride, prepared by treating a solution of the normal nitrate with a dilute solution of common salt, yields a precipitate which is a white pearly

powder that is used as a cosmetic under the name of *pearl-white*, and also as a pigment. Bismuth citrate, bismuth carbonate, and bismuth and ammonium citrate are official medicines, and are used chiefly as astringents.

BISMUTHINITE. A bismuth trisulphide that crystallizes in the orthorhombic system. It is of a lead-gray color, and usually occurs massive with a foliated or fibrous structure, although sometimes it is found crystalline. The principal localities where this mineral occurs are various places in Cumberland, England; at Meymac, France; in Sweden; in Bolivia, South America; also in Beaver County, Utah, and in Fresno and Mono counties, Cal. It has some value as an ore of bismuth.

BISON (Lat., Gk. *blōw*, *bisōn*, wild ox; cf. OHG. *Wisunt*, *Wisant*, Ger. *Wisent*, *bison*, AS. *Wesend*, wild ox). A kind of wild cattle, characterized by massive and shaggy fore quarters. The name was applied by Pliny and subsequent Latin writers to a wild ox of Europe otherwise called *bonasus*, and probably the aurochs. More recently the term has been properly extended to the American 'buffaloes,' and erroneously to the East Indian gaurs. Zoologically, the word is the name of a bovine genus, including the aurochs (*Bison bonasus*), the American bison (*Bison Americanus*), and several extinct species of both continents.

Bisons differ from other oxen in the excessive development of their fore quarters, where the line of the back arches over the withers in a hump formed by the long dorsal spines that give attachment to the very thick and strong muscles needed to support the massive head; also in their more slender limb-bones and ribs (which number 14 instead of 13), in the breadth and convexity of the front of the skull, where the horns spring from below the top line of the forehead, and in their six, instead of four, nasal bones. "Externally, they differ in having the head heavily clothed with long, bushy hair; they also possess a heavy barb, and the fore legs are heavily fringed with coarse, long hair. The clothing-hair of the body also differs from that of representatives of the restricted genus *Bos* and most of its allies in consisting mainly of short, curled, crisp wool in place of straight hairs. . . . Their nearest ally is probably the yak." (Allen.) The females are smaller, less massive and shaggy in the fore quarters than the bulls, and with lighter horns. The two existing species will be treated of below. Three fossil species are recognized by J. A. Allen in his classic monograph, *The American Bisons* (Cambridge, 1876). One is *Bison priscus*, a very large, long-horned species, widely distributed in the Pleistocene formations of Europe. Another, named *Bison antiquus*, is found fossil in northern America, and is so closely similar that Allen thinks the two might have been local races of a then circumpolar species. Both of these are regarded by some naturalists as direct ancestors of the modern forms. The third is *Bison latifrons*, a more ancient type (yet belonging to the era preceding the present), which was of gigantic size, with horns that must have spread ten or twelve feet—three to four times that of any other species.

THE AUROCHS, *bonasus*, or *zubr*, has the general form of this type, and an old male stands about six feet high. The color is brown, much

darker in the long hair of the fore parts than in the short wool of the sides and flanks. The horns are about 18 inches long, tapering, spreading, and a little curved inward at the point, and the tail is long and heavily tufted. Once widely distributed over Continental Europe and Trans-Caucasia (avoiding the Russian steppes), it would long ago have become extinct were it not that guarded bands, numbering in 1898 about 700 individuals, have been protected in the Imperial forest preserves of Bialowicza in Lithuania, while a few hundred more roam semi-wild in the fastnesses of the Caucasus. It has never been really domesticated, though several experimental crossings have been made between it and tame cattle, the results of which have not been important. It is said to exhibit aversion to association with other cattle, and to retain its ancestral wildness and shyness with great tenacity. It moves about in small bands, which are easily provoked to anger, and become dangerous by the swiftness of their movements and the overpowering force of their weight in a charge. Its food consists of grass and brushwood, and the leaves and bark of young trees. Its cry is peculiar, "resembling a groan or grunt more than the lowing of an ox." It does not attain its full stature till after its sixth year, and lives for about thirty or forty years.

THE AMERICAN BISON, more familiarly known as the 'buffalo,' is a slightly smaller, less massive animal than the aurochs, with more slender hind quarters, a shorter tail, and somewhat shorter and more robust horns, but with a higher hump and greater shagginess about the head and shoulders. The females are greatly inferior to the males in bulk, Audubon giving the weight of an old bull as nearly 2000 pounds, while full-grown, fat females will weigh only 1200 pounds. In habits it differs broadly from the aurochs in being highly gregarious, the nature of the country permitting it to gather into enormous herds, and in being almost exclusively a grazer.

"The habitat of the bison," according to Allen, "formerly extended from the Great Slave Lake on the north, in latitude about 62°, to the north-eastern provinces of Mexico, as far south as latitude 25°. Its range in British North America extended from the Rocky Mountains on the west to the wooded highlands about 600 miles west of Hudson's Bay, or about to a line running southeastward from Great Slave Lake to the Lake of the Woods. Its range in the United States formerly embraced a considerable area west of the Rocky Mountains, its recent remains having been found in Oregon as far west as the Blue Mountains, and farther south it occupied the Great Salt Lake basin, extending westward even to the Sierra Nevada Mountains, while less than fifty years ago (i.e. until about 1830) it existed over the headwaters of the Green and Grand rivers, and other sources of the Colorado. East of the Rocky Mountains its range extended southward far beyond the Rio Grande, and eastward throughout the region drained by the Ohio River and its tributaries. Its northern limit, east of the Mississippi, was the Great Lakes, along which it extended eastward to near the eastern end of Lake Erie. It appears not to have occurred south of the Tennessee River, and only to a limited extent east of the Alleghanies,

chiefly in the upper districts of North and South Carolina."

Restriction of range and decrease in numbers quickly followed the settlement of the interior. By 1800 it had disappeared east of the Mississippi; by 1850 it had been confined to the region of the dry plains; by 1875 it had been swept away from the central plains and limited to the region of northwestern Texas and western Kansas in the south, and in the north to Montana and northward, where isolated herds survived, with rapid diminution, until 1888, when the last remnant of the southern herd was nearly extinguished in the 'Panhandle' of Texas, by the capture of the last specimens by C. J. Jones (consult Inman, *Buffalo Jones: Forty Years of Adventure*, Topeka, 1899). Small scattered bands remained a few years longer in isolated retreats, but the end of the century saw none in freedom south of the North Saskatchewan. There, the extensive and lonely forests south of Great Slave Lake are still tenanted, sparingly, by the forest-ranging, larger and darker variety known as the Wood-Buffalo (subspecies *Athabasca*), which is steadily being reduced by the Indians in spite of the efforts of Canadian officials. A few hundred also survive under legal protection in the Yellowstone National Park, on the Flathead Reservation in western Montana, and in various parks and zoölogical gardens in the United States and Europe—probably not more than 500 in all. This is the result of a century of unexampled waste of one of the most numerous, interesting, and valuable animals in the world, and it is an irretrievable national disgrace. For full particulars, consult Allen's *Monograph*, heretofore cited, and W. T. Hornaday's "Extirpation of the American Bison," in the *Annual Report of the Smithsonian Institution for 1887*.

The American bison was preëminently gregarious, and on the Western prairies and plains assembled in herds of thousands and even millions of individuals. So numerous were they that the early travelers on the plains might travel for days without losing sight of them; wagon-trains, and even the first railroad trains, were sometimes compelled to stop and wait for their passage; and the present writer has seen steamboats halted by herds swimming the Upper Missouri. These vast herds were made up of coherent bands, which had the habit of marching in files, and the paths thus made, called 'buffalo-trails,' are still traceable on the arid plains; also the circular 'wallows' where they rolled and spun in taking a dust-bath. Each band was accompanied by bulls which, when alarmed, formed a defensive circle, with lowered heads, about the cows and calves, to protect them from the attacks of the bands of wolves that followed the herds, preying upon the weaklings, or from onslaughts by a puma or a bear; the grizzly alone was able sometimes to vanquish a buffalo in single combat. During the midsummer rutting season the bulls were constantly fighting with one another also. The sexes remained together throughout the year, with the exception of an occasional solitary and morose bull. A single calf was the rule, born in spring, after a gestation of about nine months. The molting of the winter's woolly undercoat occurred early in summer, the hair coming off in great flakes; and the hide was in good condition for robes from October till May.

The buffaloes were nomadic, wandering in search of pasturage, and certain annual migratory movements took place under the influence of regional or seasonal changes in forage or weather. In such movements they swam large rivers fearlessly, and climbed mountains or made their way over rough ground with amazing agility. As a rule, however, they chose the easiest routes, and their trails were excellent guides to both travelers and engineers. One great defect in their character was their liability to panic, when the whole herd would rush headlong into a bog or over a precipice, taking no heed of the fate of those in front.

The Indians of the open interior region subsisted mainly upon the buffalo, and were able to retain their independence as long as it was numerous. The flesh was excellent beef, and was sun-dried in vast quantities for transportation; and the hides served as material for lodges, winter clothing, harness, boats (in the form of coracles on the Missouri), shields, etc. Various uses were found for the sinews, bones, and horns, while the dung or 'chips' formed the fuel of the plains. The Indians hunted it in companies, usually mounted, but sometimes on foot, or on snow-shoes, when various stratagems were employed to aid them. The simple chase on horseback was most exciting and perilous. When large amounts of meat were desired for winter stores, or for making pemmican, pounds were constructed, with guiding fences. At the entrance to the trap or inclosure a sudden pitch, natural or dug, would compel the animals to leap down, whence they could not return and could easily be slaughtered. This was feasible only in a somewhat wooded region. Another method was for a party of men to ride round and round a herd until they were crowded into a bewildered, stationary mass, and then kill them at leisure. White men at first hunted the buffalo for food, and thousands were recklessly killed for the sake of a single slice from the hump or a tongue. Their hides early became an article of commerce, and the Indians were encouraged to procure them for the traders. To this there was added, from about 1860 onward, an army of white hide-hunters, who made a business of following and ruthlessly slaughtering the animals, and succeeded so well that careful estimates show that on the average 2,000,000 hides a year were sent to market between the years 1865 and 1875. For these they received on the average no more than \$1, out of which sundry expenses must be paid. Subsequently, as the product diminished, prices rose, but never very greatly, and robes continued to sell up to 1890, in Eastern cities, for from \$15 to \$40, and the few remaining are not greatly advanced in price.

A great number of poor hides were tanned for leather, but it was porous and of no great value. The coarse fleece has been spun, and small quantities of it have been made into a soft cloth used for gloves, etc.—a service certain Indians found for it prehistorically. The early settlers in the Mississippi Valley looked upon the buffalo as likely to prove domesticable and of great service; but although easily subjugated when taken young, it has not proved docile and of practical use, nor have the hybrids frequently produced between it and domestic cattle shown such qualities as make them desirable.

Compare BUFFALO; and Plate of WILD CATTLE.

BISONS

1. AMERICAN BISON or BUFFALO (*Bison americanus*).

2. EUROPEAN BISON or AUROCHS (*Bison bonasus*).

BISPHAM, bis'pam, DAVID (1857—). An American singer, born in Philadelphia, Pa., and educated at Haverford College. He studied in Florence under Vannuccini, and in London under William Shakespeare, and in 1891 made his professional debut at the Royal English Opera, London, as the Duc de Longueville in *La Baïsoche*. Since 1892 he has sung in Italian, German, and English, as the principal barytone of the Royal Opera, Covent Garden, London. At the Metropolitan Opera-House, in New York City, he has appeared as the chief Wagnerian barytone. He has also sung much and most successfully in concerts.

BISSAGOS, bis-sā'gōz, or **BIJU'GA ISLANDS** (from a negro tribe *Bujago*, or *Bijuga*, inhabiting several of the islands). A group of small volcanic islands, off the west coast of Africa, in latitude 11° N. and longitude 16° W., opposite the mouth of the Rio Grande. About half of the islands are inhabited by negroes under the immediate dominion of native chiefs. The climate is unhealthy, but the vegetation is rich. Orange is the largest island. The chief town, Bulama, is situated on the island of the same name, and has a population of over 3700. The group forms a dependency of Portuguese Guinea (Map: Africa, C 3).

BISSAO, bis-sā'ō, or **BISSEO**, -sā'ō. The chief port of Portuguese Guinea (q.v.).

BISSCHOP, bis'kōp, CHRISTOFFEL (1828—). A Dutch painter, born at Leeuwarden (Friesland). He was a pupil of Schmidt in Delft, and of Gleyre and Comte in Paris. His works derive their material chiefly from Friesland, and are particularly successful in the treatment of interior light effects. His method is not unlike that of Rembrandt and other Seventeenth-Century Dutch masters. Among his paintings are: "The Dealer in Curiosities," "Winter in Friesland," and "The Morning Sun." He was elected to the Academy of The Hague.

BISSELL, EDWIN CONE (1832-94). An American biblical scholar. He was born at Schoharie, N. Y., March 2, 1832, and graduated at Amherst College (1855), and at Union Theological Seminary (1859). He served as a Congregational pastor at Westhampton, Mass., San Francisco, Cal., Winchester, Mass., and was a foreign missionary of the American Board of Commissioners for Foreign Missions at Innsbruck, Austria (1874-79). In 1881 he became professor of Hebrew in the Hartford Congregational Theological Seminary, whence he passed in the same capacity to the McCormick Presbyterian Theological Seminary in 1892. He died in Chicago, April 9, 1894. He was captain of Company H, Fifty-second Massachusetts Volunteer Regiment (1862-63), while still pastor of Westhampton, and stated supply at Honolulu, Oahu, 1869-70. He was a conservative biblical scholar, but not reactionary, and produced several still valuable works: *The Historic Origin of the Bible* (1873); *The Pentateuch: Its Origin and Structure; An Examination of Recent Theories* (1885); *Biblical Antiquities* (1888, 2d ed., 1892); *A Practical Introductory Hebrew Grammar* (1891); *Genesis, Printed in Colors, Showing the Original Sources from which it is Supposed to have been Compiled, with an Introduction* (1892). But his best and most original work was his volume on *The Apocrypha of the Old Testa-*

ment, with Historical Introductions; A Revised Translation, and Notes Critical and Explanatory (1880), which Dr. Schaff incorporated in his edition and translation of *Lange's Commentary*.

BISSELL, WILSON SHANNON (1847—). An American lawyer. He was born in New London, Oneida County, N. Y., graduated at Yale, studied law in Buffalo, and in 1872 began practice with a law firm to which, in the year following, Grover Cleveland was admitted. On the election of Cleveland as Governor of New York, Bissell became the senior partner of a newly organized firm, and gradually confined his legal practice to the special line of counsel for corporations. From 1893 to 1895, during Cleveland's second administration as President, Bissell was Postmaster-General of the United States.

BISSEN, HERMANN WILHELM (1798-1868). A Danish sculptor. He was born in Schleswig, October 13, 1798, and studied first in Copenhagen, where in later years (1850) he was made director of the Academy of Arts. In 1823 he took the great gold medal and was sent to Rome to work under Thorwaldsen, with whom he studied ten years. After returning to Denmark he executed a number of excellent works, among them a bust of Oersted, "Atalanta Hunting," etc. In 1841 he returned to Rome to complete for the Government eighteen statues. He has left numerous examples of his work. Among his masterpieces are the "Valkyrie," "Cupid Sharpening His Arrows," and "Moses." A frieze, 134 feet long, was burned in Copenhagen in 1884. By the will of Thorwaldsen he was commissioned to complete that master's work. Bissen died in Copenhagen March 10, 1868.

BISSEX'TILE (Lat. *bissextilis*). The old name of leap-year. In the Julian computation a day was added to February every fourth year; but instead of making it, as now, the 29th, the 24th day of the month was counted twice (*bis*), and as that day was the sixth (*sextus*) before the calends of March, it was called *bis-sextilis*. See CALENDAR; DATE.

BISTINEAU, bis'té-nō'. A lake in the north-western part of Louisiana, about 25 miles southeast of Shreveport; it is about 25 miles long and has an average width of about two miles. It receives a number of streams, mainly from the north, and discharges its water through the Red River, with which it is connected by a short river. It is navigable for river steamboats.

BIS'TORT (Lat. *bis*, twice + *tortus*, twisted; referring to its root)—*Polygonum bistorta*. A perennial plant, 1 to 1½ feet high, with a simple stem, ovate subcordate and wavy leaves, the radical leaves tapering into a long petiole, and one dense terminal cylindrical spiked raceme of flesh-colored flowers. The root is about the thickness of the little finger, blackish-brown externally, reddish within, and tortuous (whence the name bistort). The whole plant is astringent, containing much tannin. Bistort is a native of Europe and Asia. It is found in Great Britain, but is by no means common.

BISTRE, bis'tër (Fr. *bistre*, dark brown). A blackish-brown color, often made of moistened soot mixed with a little gum. Chinese ink, or India ink, has largely replaced bistre in water-colors.

BISTRITZ (Slav. *bystřa*, swift). A river rising in the Carpathian Mountains in eastern Hungary, flowing southeast through Bukovina and Moldavia, and joining the Sereth just below Bakau, after a course of about 185 miles. It is called the Golden Bistritz, on account of the auriferous character of its sands.

BISTRITZ (Hung. *Besztercze*). A royal free town of Transylvania, Kingdom of Hungary, beautifully situated on the Bistritz River (an affluent of the Szamos), in a fine valley about 74 miles northeast of Klausenburg (Map: Austria, J 3). It was formerly strongly fortified, and remains of its ancient walls and gates are still standing. Near the town are the ruins of a castle once the residence of the famous John Hunyady. Population, in 1890, 9109, mostly Germans. In 1848-49 Bistritz was the scene of fierce fighting between the Austrians and the Hungarians.

BITHOOR'. See BITHUR.

BITHUR, *bə-thōōr'*. A town of India, in the Cawnpore District, Northwest Provinces, on the right bank of the Ganges, 12 miles northwest of Cawnpore. It is particularly devoted to the worship of Brahma, has numerous pagodas and elaborate ghats, and is a favorite pilgrim resort for purposes of ablution. During the Mutiny of 1857, Bithur was the stronghold of Nana Sahib. Here Havelock more than once exacted retribution, defeating the Nana in the field, and burning his fort. Population, about 6000.

BITHYNIA, *bī-thīn'ī-ā* (Gk. *Βιθυνία*). An ancient division of Asia Minor, separated from Europe by the Propontis (Sea of Marmora) and the Thracian Bosphorus (Strait of Constantinople). It was bounded north by the Euxine, south by Galatia, Phrygia, and Mysia, and east by Paphlagonia. It contained the famous Greek colonies of Chalcedon and Heraclea; at a later period, Nicomedia, Nicæa, and Prusa were the chief cities. The inhabitants of Bithynia were supposed to be of Thracian origin. The country was subdued by Cræsus of Lydia, and later fell under the Persian dominion, though the native princes seem to have been left in power. In the confusion which followed the death of Alexander, the native dynasty secured an independent position, and in B.C. 297 Zipoites seems to have assumed the title of king. His son Nicomedes I. founded in B.C. 264 the city of Nicomedia, which became the capital. Prusa was founded about B.C. 185 by King Prusias I., and was for a time the chief city. The last king, Nicomedes III., made the Romans his heirs, and with a large addition from the Pontic kingdom, Bithynia became a province of the Republic (B.C. 74). Under Trajan, Bithynia was governed by Pliny the Younger, whose letters to the Emperor on the administration and condition of the province contain the well-known passage respecting the Christians. The Emperor Diocletian made Nicomedia his habitual residence. In 1298 Osman the Turk broke into the country, and in 1328 Prusa or Brusa, then the chief town of Bithynia, became the capital of the kingdom of the Osmanli, and in its mosque are the tombs of the earliest Sultans. Consult Ramsay, *Historical Geography of Asia Minor* (London, 1890).

BITING LICE, or **BIRD-LICE**. A group (Mallophaga) of wingless lice, which infest birds

and mammals, each of the thousand or more species, as a rule, belonging to only one kind of host, and having mandibulate mouth-parts adapted to cutting and biting, instead of suctional organs.

BITLIS, *bit-lēs'*. A town of Asiatic Turkey, capital of the vilayet and sanjak of the same name. It is situated at an elevation of 5156 feet above the level of the sea, in a deep ravine traversed by the river Bitlis, near Lake Van (Map: Turkey in Asia, K 3). Bitlis is a scattered and irregularly built place, with a large number of mosques, convents, several well-stocked bazars, a palace, and ruins of an old fortress. The chief products are cotton fabrics, arms, and silver and gold articles. It exports some raw wool and tobacco, and imports cotton for its manufactures, chiefly from Persia. It has also a very extensive trade. The import of British goods is small. The population is about 39,000, including a considerable number of Armenians. The Persians defeated Solymán the Magnificent near Bitlis in 1554.

BITONTO, *bē-tōn'tō* (anciently, Lat. *Butuntum*). A city in south Italy, 5 miles from the Adriatic, and 10 miles west of Bari (Map: Italy, L 6). It has a Romanesque cathedral, a theological seminary, an orphan asylum, and a castle. The chief trade is in salad-oil and in a wine called Zagarello. In its vicinity the Spaniards, under Count de Montemar, gained a victory over the Austrians in 1734, which gave Naples to Don Carlos. Population, in 1881, 23,812; in 1901 (commune), 30,617.

BITSCH, Fr. **BITCHE** (anciently *Bytis castrum*). A German town of Alsace-Lorraine, on the Horn, in a wild and wooded pass of the Vosges, 36 miles north-northeast of Strassburg. Its citadel, built on a precipitous and isolated rock, in the middle of the town, is well supplied with water, defended by 80 cannon, has accommodations for a garrison of 1000 men, and is considered all but impregnable. The Prussians under the Duke of Brunswick attempted to surprise it in 1793, but failed. It was also unsuccessfully besieged by the Germans in 1870. The town has manufactures of matches, watch-glasses, and porcelain. Population, in 1900, 3600 (Map: Germany, B 4).

BITTENFELD, *bit'ten-fēlt*, **HERWARTH VON**. See **HERWARTH VON BITTENFELD**.

BITTER, **KARL HERMANN** (1813-85). A Prussian statesman and writer on music. He was born at Schwedt, Province of Brandenburg, and studied law and cameralistics at Berlin and Bonn. He served as the plenipotentiary of Prussia on the Danube Commission from 1856 to 1860, was prefect of the Department of Vosges during the Franco-Prussian War, and subsequently became minister of finance (1879)—an office in which he displayed exceptional ability. He increased the indirect duties derived from the so-called tobacco monopoly and the tax on spirits and malt, introduced the 'Börsensteuer' (tax on the bourse), and concluded the commercial treaty with the city of Hamburg by which that city entered the German Customs Union. He reestablished the stability of the Prussian finances, and took a prominent part in bringing the railroads of Germany under Government control. He resigned in 1882, in consequence of differences with Bismarck. His lit-

erary activity was confined almost exclusively to works on music.

BITTER ASH. See QUASSIA.

BITTERFELD, bit'ter-felt. A town in the Prussian Province of Saxony, about 20 miles north of Leipzig, on the Mulde (Map: Prussia, E 3). It has foundries and breweries, and among its various manufactures may be mentioned organ-pipes and volatile oils. Bitterfeld was founded in the Twelfth Century by the Flemings. Population, in 1890, 9047; in 1900, 11,840.

BITTERN (OE. *bitoure*, bitter, from Fr. *butor*; origin uncertain). Any heron of the genus *Botaurus* and related genera, forming the separate sub-family *Botaurinae*. Bitterns are chiefly distinguished from herons by the long, loose plumage of the sides of the neck, which they have the power of erecting at pleasure, along with the rest of their clothing feathers, so as greatly to increase their apparent size. Bitterns also differ from herons in the greater length of their toes, the middle toe being as long as the shank; in the presence of only two pairs of powder-tracts, and in having only ten tail-feathers. They are almost all solitary birds, inhabiting reedy and marshy places, where they remain during the day, and will almost allow themselves to be trodden upon before taking wing; they feed during the night on frogs, and partly, also, on fish, lizards, water-insects, etc., and even small birds and quadrupeds. The claw of the middle toe is serrated on the inner edge, probably to aid in securing slippery prey. The common bittern of America (*Botaurus lentiginosus*) is a bird very widely diffused over the whole continent of North America. In size it varies greatly, from 2 to 3 feet in length, and with an expanse of wing up to nearly 4 feet; the bill is about 3 inches long. The feathers on the crown of the head are dull-brown, and the plumage in general of a dull tawny color, beautifully and irregularly marked and mottled with black and white. The bittern makes a rude nest of sticks, reeds, etc., in its marshy haunts, and lays four or five eggs (illustrated in the Plate of EGGS OF WATER AND GAME BIRDS). It has a peculiar bellowing cry, which has obtained for it such names as stake-driver, bull of the bog, etc., and many of its appellations in other languages, perhaps even its name bittern (*bitour*, *botur*, *botaurus*). Some naturalists used to assert that the booming cry of the bittern was produced by the bird inserting its bill into a reed or into the mud, but that notion has long since been exploded.

This bird's spring notes are, however, very remarkable, making a booming which has been aptly compared to the noise made by an old wooden pump-handle. Said Thoreau (*Journals*, June 20, 1852): "The stake-driver is at it in his favorite meadow. I followed the sound, and . . . heard some lower sounds at the beginning, like striking on a stump or stake, a dry, hard sound, and then followed the gurgling, pumping notes fit to come from a meadow. . . . It sounds more like wood-chopping or pumping because you seem to hear the echo of the stroke or the reverse motion of the pump-handle. After the warm weather has come both morning and evening you hear the bittern pumping in the fens." Watters (*Birds of Ireland*) says of the British bittern: "Remarkable, during the breeding season, for its peculiar spiral flight in the air, it is

to this it is indebted for the beautiful poetic name bestowed upon it by the Latins, 'Cheron of the Stars' or 'star-mounter,' an idea as quaint in its beauty as is the German 'Earth-spurner' for the skylark." When assailed, it fights desperately with bill and claws; and it is dangerous to approach it incautiously when wounded, as it strikes with its long, sharp bill, if possible, at the eye. The bittern of Europe (*Botaurus stellaris*) is very similar to that of America, but differs in having the crown black and in some other details of color; the eggs also are different, being greenish-brown. It is a common bird throughout Europe, Asia, and Africa. The Australian species (*Botaurus Australis*) is generally diffused throughout Australia, wherever marshes or sedgy rivers occur. In habits it closely resembles the bittern of Europe. The head and upper parts generally are purplish-brown, except the wings, which are buff, conspicuously freckled with brown; the throat, breast, and belly mottled brown and buff.

Least Bittern.—Nearly allied to the bitterns are birds of the genus *Ardetta*, commonly known as 'least bitterns.' So similar are they to *Botaurus* that they are included in that genus by many of the best ornithologists. They are much more highly colored and are only about a foot in length. They are found in North America and Europe, but are rarely seen because of their retiring habits, and the fact that they live in reedy swamps, where they are easily hidden. The most common North American species is *Ardetta exilis*.

BITTERN, BITTER LIQUID, or SALT OIL. An oily liquid, obtained in salt manufacture, left when the mother-liquor of the evaporating-pans ceases to deposit crystals of common salt. It consists principally of a strong solution of common salt, along with the chlorides of magnesium and calcium, and bromide of potassium. The bittern obtained from the salt-works of Epsom was at one time the source of the sulphate of magnesium (hence called Epsom salts). Bittern is also a valuable source of the element bromine, the extraction of which is usually effected by electrolytic methods. See SALT; BROMINE.

BITTERNUT. See HICKORY.

BITTERS. A term applied in popular speech to beverages containing alcohol and either aloes for a cathartic effect, or Angostura bark, gentian, calisaya, etc., for stimulating the appetite and digestion. Medically, bitters are mild tonic or pungent aromatic stimulants, to be used in improving digestive conditions. The 'simple bitters' include quassia, gentian, calumba eupatorium (boneset), etc.; the 'aromatic bitters' include chamomile, cascarrilla, angostura, and cimicifuga (snakeroot); the 'peculiar bitters' include wild cherry, cinchona, and picric acid.

BITTER SPAR (Ger. *Bitterspat*). A name given by the Germans to the mineral dolomite, owing to the magnesia which it contains, salts of magnesia having a bitter taste.

BITTERSWEET, DULCAMARA, or WOODY NIGHTSHADE (*Solanum dulcamara*). A plant found in hedges and thickets in most parts of Europe and in Asia, and introduced in the United States. The root is perennial; the stem climbing and shrubby, many feet in length; the leaves ovate-heart-shaped, the upper ones spear-shaped;

the flowers, purple or blue, in drooping cymes, much resembling those of its congener the potato, but much smaller, followed by ovate red berries of tempting appearance, are not unfrequently the cause of serious accident, particularly to children. The twigs are collected in autumn after the leaves are fallen. The fluid extract prepared from the twigs possesses the power of blunting to some extent sensibility to pain, and of considerably increasing the secretions of the skin, the kidneys, etc. The extract is employed in medicine chiefly as a remedy for scaly eruptions on the skin. Its principal chemical constituents are resin, gum, the alkaloid solanine, and the glucoside dulcamarin. *Celastrus scandens*, a woody vine, is also called bittersweet in the United States. See SOLANUM.

BITTER-SWEET. A poem of New England by J. G. Holland (1858).

BITTER VETCH. See OROBUS.

BITTERWOOD. A name given to certain species of the genus *Xylopia*, trees and shrubs remarkable for the bitterness of their wood, particularly the West Indian *Xylopia glabra*. Furniture made of this wood is safe from the attacks of insects. The genus *Xylopia* belongs to the natural order Anonaceæ. The fruit of some of the species, particularly *Xylopia sericea*, is highly aromatic and pungent like pepper. *Xylopia sericea* is a large tree, a native of Brazil; its bark is used for making excellent cordage.

Bitterwood is also the name of *Quassia excelsa* or *Simaruba excelsa*, a tree of the natural order Simarubaceæ, a native of Jamaica, the wood of which is used in medicine. Botanically, it is very nearly allied to the true quassia, and possesses very similar properties, containing the crystallizable bitter principle called quassin. The wood, which is intensely bitter, is a very useful stomachic and tonic; if introduced by the rectum, it acts in certain cases as an excellent anthelmintic. An infusion of bitterwood is, further, a well-known and useful fly-poison; and it appears to act as a powerful narcotic on many quadrupeds.

BITUMEN (Lat., a kind of mineral pitch). A name applied to a number of inflammable mineral substances varying in chemical composition and ranging in consistency from solid to gaseous. The bitumens consist mainly of carbon and hydrogen, but usually they contain also small amounts of sulphur, oxygen, and nitrogen. The most important substances included under the name of natural gas, naphtha, petroleum, maltha, mineral tar, asphalt, elaterite, wurtzilite, albertite, grahamite, gilsonite, ozocerite, and coal. Natural gas is composed mostly of marsh-gas, with small quantities of other hydrocarbons and of carbon oxide. Petroleum and naphtha and the solid bitumens are essentially hydrocarbon compounds, containing also subordinate amounts of sulphur, oxygen, and nitrogen, and other elements which may be regarded as impurities. The bitumens are widely distributed over the earth's surface, and occur in all the geological formations from the Silurian to the present. Their origin in most cases can be traced to the decomposition of vegetable matter, but various theories have been advanced to account for the deposits of petroleum. The several bitumens are described in special articles. See ANTHRACITE; ASPHALTIC COAL; BITUMINOUS COAL; LIGNITE;

COAL; GAS (NATURAL); NAPHTHA; PETROLEUM; ASPHALT; BITUMINOUS LIMESTONE; BITUMINOUS SHALE; ELATERITE; ALBERTITE; and GRAHAMITE.

BITUMINOUS COAL (Lat. *bituminosus*, from *bitumen*, a kind of mineral pitch, bitumen). A term applied to the varieties of coal which contain a large percentage of volatile matter. They yield, by destructive distillation, a considerable quantity of gas, easily purified, and with good illuminating qualities, and are consequently largely used for that purpose. Some varieties also cake when heated out of contact with the air, and yield a hard, porous product known as coke. See COAL; COKE.

BITUMINOUS LIMESTONE. A limestone impregnated and sometimes deeply colored with bituminous matter derived from the decomposition of animal and plant remains entombed within the mass or in its vicinity. The amount of bituminous matter or asphalt in the pores of the rock is sometimes sufficient to permit the material being used for asphalt pavements after simply powdering and heating it. Still better results are obtained by mixing it with bituminous sandstone. In the United States, bituminous limestone occurs in Indian Territory, Texas, and Utah. Much bituminous limestone is also mined in Germany, Switzerland, and France, whence large quantities of it are brought to the United States. See ASPHALT; PAVEMENT; ASPHALTIC COAL.

BITUMINOUS SANDSTONE. A sedimentary rock of siliceous character, containing more or less asphalt or bitumen. When rich in bitumen it is a valuable economic product; sometimes it is used directly as a paving material, but more often it is previously subjected to a process of refining. In the United States it is mined in California, Kentucky, and Indian Territory. The output in 1900 was 34,277 short tons, valued at \$138,892. Consult the volumes of *The Mineral Industry*, especially Vol. VIII. (New York, 1900). See BITUMEN; ASPHALT.

BITUMINOUS SHALES. Beds of shale occurring chiefly in the coal-measures, and containing such an amount of carbon and volatile matter that they are capable of being burned when mixed with but a little coal. They are indeed impure coal, with a large percentage of ash or earthy matter, which after burning retains the original form. See COAL; OIL-SHALES.

BITZIUS, bêt'sé-zōs, ALBERT (1797-1854). A Swiss author, known also by his pseudonym, *Jeremias Gotthelf*. He was born at Murten (Freiburg), studied at Göttingen, and was pastor at Lützelfüh (Bern) from 1832 until his death. His works deal with the Canton of Bern, and are written in the popular dialect. They have become classic in Switzerland, and have found a wider circulation through translations into High German. A fine edition of his complete writings appeared at Chaux-de-Fondues in 1894-96 (4 vols.). Selections are accessible under the title *Ausgewählte Erzählungen* (1888) in Reclam's *Universalsbibliothek*.

BIVOUC, biv'wāk (Fr., probably from Ger. *Beiwache*, *Beiwacht*, from *bei*, by + *Wache*, watch, guard), MILITARY. An encampment of soldiers in the open air; generally of a temporary nature. In active service, and in an enemy's country, great care must be exercised in

the choice of ground for a bivouac. It must be, as far as possible, free from being commanded by artillery fire, capable of hasty defense, offer few (if any) advantages to an enemy, and be near water facilities for men and animals. See ENCAMPMENT; CAMP, MILITARY; and CANTONMENT.

BIWA, bē'wā. A beautiful lake in the southern part of the island of Nippon, Japan (Map: Japan, E 6). It is about 36 miles long, 12 miles in width, and lies at an altitude of about 400 feet. The western shore is mountainous and the eastern is low. There are several small islets in the lake, and fish are found in abundance. Biwa is connected by several canals with the inlet of Osaka, and supplies water-power to the mills and factories in Kyoto.

BIXBY, JAMES THOMPSON (1843—). An American Unitarian minister. He was born at Barre, Mass., July 30, 1843; graduated at Harvard College and at Harvard Divinity School; entered the ministry, and has served in various places; since 1886, at Yonkers, N. Y. He was professor of the philosophy of religion in the Meadville Theological School from 1879 to 1883, when he went abroad for study and travel, and in 1885 received the degree of Ph.D. at the University of Leipzig. He is the author of *Similarities of Physical and Religious Knowledge* (1876; 2d ed. under the title, *Religion and Science as Allies*, 1889); *The Crisis in Morals; Examination of Rational Ethics in the Light of Modern Science* (1891; 2d ed. under the title, *The Ethics of Evolution*, 1900); *The New World and the New Thought* (1902).

BIXIN. See ARNOTTO.

BIXIO, bēk'sē-ō, GIBOLAMO (called *Nino*) (1821-73). An Italian patriot. He was born in Genoa, and was the brother of Jacques-Alexandre Bixio. He participated in the unsuccessful struggle of the Venetians against Austria, and after joining Garibaldi in Rome (1848), commanded the Roman troops that repulsed the first attack of the French General Oudinot (1849). He commanded one of Garibaldi's vessels during the celebrated expedition to Sicily in 1860, and after capturing Reggio and fighting in the battle of Volturno (1860) was made lieutenant-general. He served in the War of 1866, and in 1870 forced the capitulation of Civita Vecchia. In 1866 he was elected a member of the Chamber of Deputies, and in 1870 he was called to the Senate. He died while on an expedition in the East Indies. Consult: Guerzoni, *La vita de Nino Bixio* (Florence, 1875); Delvecchio, *Cenni biografici di Nino Bixio* (Genoa, 1887), and C. Martinengo, *Patrioti italiani* (Milan, 1890).

BIXIO, JACQUES-ALEXANDRE (1808-65). A French publicist and politician, born at Chiavari, then in the Department of the Apennines. He was concerned in the Revolution of 1830, and in 1848 was influential as a leader of the opposition. Under Louis Napoleon he received various political honors. His political career ended with the coup d'état of 1851. In 1831 Bixio, with Buloz, founded the *Revue des Deux Mondes*.

BIYSK, bēsk. A district town in the Government of Tomsk, Siberia, situated on the river Biy, 340 miles south of Tomsk, and 2500 miles east of Moscow (Map: Asia, H 3). It is a thriving town, carrying on a brisk trade with the Chinese and the Altai Kalmucks, exchanging hardware, printed cloth, leather, soap, tobacco, etc.,

for cattle and hides; the hides are then dressed in the tanneries of Biysk and resold to the Mongols as leather. Population, in 1897, 17,200.

BIZERTA, bī-zēr'tā, or **BENZERTA**, ben-zēr'tā (Lat. *Hippo Diarrhytus* or *Zarytus*, Gk. ἵππου Διάρρυτος, *Hippōn Zarrhytos*, from Phœnician *hippo*, a walled town + Gk. διάρρυτος, *diarrhytos*, intersected by streams). A fortified seaport of Tunis, 38 miles northwest of the capital, Tunis, at the mouth of a lagoon communicating with a deep gulf or bay of the Mediterranean (Map: Africa, near Farina, E 1). Formerly one of the best Mediterranean ports, the harbor was allowed to silt, and for centuries was useless, until the dredging and completion of breakwaters in 1894 reopened it as an important naval station for the French, who have occupied the city since 1881. It has important fisheries. The adjacent country is remarkably fertile, but its cultivation is neglected. The town is surrounded by walls, and defended by two castles, which, however, commanded by the neighboring heights, are useless against a land attack. *Hippo Diarrhytus*, or *Zarytus*, was founded by the Tyrians. Agathocles, between the years B.C. 310 and 307, fortified the place and provided it with a new harbor; and under the Romans it was a free city. Population, 8000.

BIZERTA, or **BENZERTA**, LAKES OF, the ancient *Hippōnitis Palus* and *Sisare Palus*. Two small lakes of Tunis, lying south of the town of Bizerta, whence they derive their name. They abound in fish, especially mullets, from the roes of which, *botargo*, an important article of Levantine trade, is manufactured.

BIZET, bē'zā' (ALEXANDRE CÉSAR LÉOPOLD) GEORGES (1838-75). A French operatic composer. He was the son of a singing-master in Paris, and was generally regarded as a child prodigy. At nine he entered the Conservatoire, where his masters were Marmontel in piano, Zimmermann in harmony, Benoist in organ, and his future father-in-law, Halévy, in composition. For a decade he carried off nearly all the Conservatoire prizes, and in 1857 his comic opera, *Le docteur miracle*, was awarded the palm over sixty other compositions in a competition established by Offenbach. Several months later he won the Prix de Rome, and the dream of his life was realized. He plunged into the study of the great Italian masters of Church music, at the same time broadening and deepening his mental and artistic equipment by voracious reading and constant visits to the museums and galleries in Rome. His letters of this period mirror faithfully the striking growth of the artist, and, more unusual still, the modest consciousness of this growth. While in Italy he composed the opera *Don Procopio*, discovered in 1895 among the papers of Auger; two movements of a symphony, and a comic opera, *La guzla de l'Emir*. He returned to Paris a finished composer, yet his opera *Les pêcheurs de perles*, a tale of Hindu love, was produced at the Théâtre Lyrique (1863) with no particular success. *La jolie fille de Perth*, based on Scott's novel, was more favorably received by the critics. Bizet now accepted Wagner's contentions for dramatic verity in opera without accepting his methods of attaining it. These were the years of exoticism in music, which was inaugurated by Félicien David (q.v.), and at which Bizet had already

tried his hand. *Djamilch* (1872), a one-act tragedy of unrequited love in the Orient, was brushed away by the public as too Wagnerian and untheatrical, but the author was "absolutely sure that he had found his way; he knew what he was doing." Technical mastery, Gallic deftness and delicacy of touch, emotional depth and sincerity, were all concentrated in this tale of suppressed passion amid the languorous surroundings of a Cairo harem. Unlike David, with whom Orientalism was the aim and essence of the composition, Bizet employed it only as a background, an atmosphere for universal and eternal emotions. This little masterpiece was followed in the same year by the incidental music to Daudet's drama *L'Arlésienne*. The spirit of 'fair Provence' was transmuted into tones with wonderful power. The public paid no attention to the entre-act music, performed amid the chattering usual between the acts, and yet at present the music and the drama have grown to be considered as inseparable as is Mendelssohn's music from Shakespeare's *Midsummer Night's Dream*, or Beethoven's music from Goethe's *Egmont*. The discouraged composer tempted fortune for the last time with *Carmen* (1875), based on Mérimée's novel. Another failure, and in a few months the master died at Bougival (of consumption, probably), carrying to his grave the conviction that he had created a chef-d'œuvre—an opinion in which musicians of all schools and tastes concur at present, when *Carmen* is one of the half-dozen most popular operas of the lyric stage. "Dramatic and picturesque," *Carmen* delineates in masterly style the psychology of the wayward heroine from the whimsical coquetry of the first scene to the fatalistic bravado of the tragic dénouement. The development of the choler in the weakling Don José, driven by Carmen's heartlessness to despair and murder; the purity and devotion of the lachrymose Micaëla; the pleasure-loving bull-fighter—all these once seen and heard are never forgotten. Even to the minor personages, each speaks an individual musical language.

Besides two overtures, Bizet wrote piano music and a number of songs, highly valued by connoisseurs.

Bizet was a remarkable reader of orchestral scores at sight, an erudite musician, a man of wide culture and strong artistic convictions. With all his admiration for the music-drama, he did not overburden his *Carmen* with colossal orchestration, nor did he discard the time-honored set numbers and ensembles or make use of the *leit-motif*, except 'reminiscentially.' The choice, too, of subjects for his last two works was in the direction of every-day realism, contrary to the theory that myth is the only subject for a music-drama. France undoubtedly lost in Bizet one of her greatest musicians before he had achieved what was easily within his power to achieve. Consult C. Bellaigne, "Georges Bizet," *Revue des Deux Mondes* (October 15, 1889).

BJARME, byär'me, BRYNJOLF. A pen-name once used by Henrik Ibsen (q.v.).

BJÖRCK, byörk, GUSTAV OSKAR (1860—). A Swedish painter, born in Stockholm. He attended the academy in that city, and studied in Munich, Venice, Rome, and Paris. He was made a member of the Stockholm Academy in 1889.

Although chiefly distinguished as a portrait painter, he has worked much in other fields.

BJÖRNEBORG, byër'ne-börg, or **BIORNEBORG** (Finnish *Pori*). A seaport and capital of a district in the Government of Abo Björneborg, Finland, on the eastern coast of the Gulf of Bothnia, at the mouth of Kumo, 76 miles north-northwest of Abo (Map: Russia, B 2), and 156 miles from Helsingfors. It carries on a considerable trade, exporting principally timber (especially to England) and importing rye-flour, salt, and iron. Some ship-building is done here. The larger vessels cannot approach the city, and must anchor off Refso. Population, in 1888, 10,100; in 1897, 11,600.

BJÖRNSON, byörn'son, BJÖRNSTJERNE (1832—). A Norwegian poet, dramatist, and novelist. He was born at Kvikne, December 8, 1832, the son of a parish priest. His childhood was passed in Kvikne, Romsdal, and Molde, in noble scenery rich in legendary association. He left the University of Christiania for journalism, having already, as a student, written sketches and reviews of plays, and in 1858 published his first drama, *Between the Battles*, and his first novel, *Synnöve Solbakken*, translated by Mary Howitt as *Trust and Trial* (1858). He was made director of the theatre in Bergen, and from 1860 to 1863 traveled on a Government stipend, chiefly in Italy. He has since resided in Norway, with frequent visits to Paris, Rome, and Munich. In the winter of 1880-81 he lectured in the United States. Björnson is the greatest distinctively Norwegian writer, so intensely national that the Danish critic Brandes says that "the mention of his name in a gathering of his countrymen is like running up the national flag." He is the chief novelist, probably the chief poet, and, with Ibsen, the chief dramatist of his country's history. For more than twenty years he has been a leader of the Republican Party in Norway, and has engaged actively in social and religious controversies. The change in the flag of Norway on January 1, 1901, with all that it symbolizes for independent national entity, is due to Björnson more than to any other man. The poet and the seer has proved himself also a practical politician. As was natural, this has changed the character of his literary work, which was at first purely artistic, but in the stress of controversy has tended to become didactic. The first period is distinctively lyric. His plays of this time are sagas; his narrative epics idyllic, and imbedded in them are gems of song, many widely popular and one 'national.' These were collected in *Poems and Songs* (1870), and in that year appeared his only epic, *Arnljot Gelline*, founded on an episode in the *Heimskringla*. Since then Björnson has written little verse. He had already distinguished himself in peasant novels and tales, e.g. *Arne* (1858), *A Happy Boy* (1860), and *The Fisher Maiden* (1868), primitive pastorals, genuine yet modern. The dramas of these years are based on the native sagas, the best of them, *Sigurd Slembe* and *Sigurd Jorsalfar* (1872), on the *Heimskringla*. *Mary Stuart in Scotland* (1864) is an isolated exception, as is the problem play *The Newly Wedded Pair* (1866). This latter style is characteristic of the whole drama of the second period beginning with *The Editor* (1874), and counting *A Bankruptcy* (1875), *The King* (1877), *Leonarda* (1879),

The New System (1879), *A Glove* (1883), *Beyond Our Strength* (1883), and *Geography and Love* (1885). Of these, *The King* is the most radical, and thought by its author the most important. The novels show the same evolution from *The Bridal March* (1873) through *Magnhild* (1877), *Captain Mansana* (1879), and *Dust* (1882), to the true problem novels *The Heritage of the Kurts* (*Det Flager*) (1884) and *In God's Way* (1889), the former dealing with redemption from heredity through education, the latter with bigotry and liberal thought. This brought on Björnson the imprecations of the orthodox, though its aim was to exalt and purify religion. It is Björnson's latest notable work. There are translations of Björnson's novels by Anderson, and of *Sigurd Slembe* by Payne (Boston). Consult: Brandes, *Moderne Geister* (Frankfort, 1897); Anderson, "Biographical Sketch," in *Synnöve Solbakken*, translated by Anderson (Boston, 1882); Gosse, "An Essay on the Writings of Björnson," in *Björnson, Novels* (London, 1895); Boyesen, *Essays on Scandinavian Literature* (New York, 1895).

BJÖRNSTJERNA, byörn'shär'ná, **MAGNUS FREDRIK**, Count (1779-1847). A Swedish soldier, statesman, and author. He was born in Dresden, where his father resided as secretary to the Swedish Legation. He received his education in Germany, and joined the Swedish Army in 1793. He distinguished himself in the Finnish War, and in 1813 was appointed colonel in the army that went to aid the Allies in Germany; took part in the conflicts at Grossbeeren and Dennewitz; was present at Leipzig, and concluded the formalities of capitulation with the French at Lübeck and Maestricht. Subsequently, he fought in Holstein, and in Norway, where he signed the treaty which united that country with Sweden. In 1828 he was appointed Ambassador to the Court of Great Britain, which office he held till 1846, when he returned to Stockholm, where he died. In addition to some political writings, he published *The Theogony, Philosophy, and Cosmogony of the Hindus* (Stockholm, 1843).

BLAAS, bläs, **EUGEN von** (1843—). An Italian painter. He was born in Albano, Italy, and received his education from his father, Karl von Blaas, and afterwards at the Vienna Academy. He settled in Venice, the life of which, past and present, he has depicted in his pictures. The following are among his best works: "Conversion of the Rhätians by Saint Valentine," "Faust and Marguerite in the Garden," "Cimabue and Giotto," "Scene from Decameron," "Dogaressa Going to Church," "Venetian Balcony Scene," "Bridal Procession in San Marco," "Venetian Masquerade."

BLAAS, **JULIUS von** (1846—). A painter, brother of Eugen von Blaas (q.v.). He was born in Albano, Italy, and after studying with his father, went to Rome, where he painted genre scenes from the Campagna. His "Race of Intoxicated Slavonic Peasants," which he painted in 1869, is in the Vienna Imperial Museum. He preferably depicts equestrian scenes. Other pictures by him are the following: "Fox-Hunt in the Campagna" (1877); "Market in Upper Hungary" (1885); "Horse-Fair in Bischofshofen" (1888).

BLAAS, **KARL von** (1815-94). An Austrian painter, born at Nauders in the Tyrol. He studied in Innsbruck, Venice, Florence, and Rome, and was appointed professor at the Academy of Vienna in 1850. He painted thirty-three frescoes for the Altlerchenfeld Church of that city. In 1855 he received a prize at the Paris Exposition for the picture entitled "Charlemagne Visiting a Boys' School" (Venice Museum), and in the same year he accepted a professorship at the Venice Academy. He returned to Vienna in 1866. Among his most celebrated productions are the following: "Tullia Driving Over Her Father's Body" (1832); three frescoes in the church at Föth, near Budapest; "Rape of Venetian Brides in Sixth Century" (1858; Innsbruck Museum); forty-two scenes in fresco (Vienna Arsenal); portraits of Francis Joseph and of the Queen of Spain; "Ekkehard Carrying the Duchess of Suabia Across the Threshold of the Monastery."

BLACK. In art, black is the name of the darkest color—that which, according to physical scientists, is produced by the absence or by the complete absorption of the rays of light. See **COLOR**.

BLACK, **ADAM** (1784-1839). An English publisher. With his nephew, Charles Black, he established a publishing house in Edinburgh, which began issuing the *Edinburgh Review* in 1826, and secured the copyrights of the *Encyclopædia Britannica* in 1829 and of the *Waverley Novels* in 1851. Besides managing this immense business, he was Lord Provost of Edinburgh from 1843 to 1848, and was a member of Parliament, as the successor of Macaulay, from 1856 to 1865. Consult Nicolson, *Memoirs of Adam Black* (London, 1885).

BLACK, **HUGH** (1868—). A Scotch clergyman and author, born at Rothsay. He studied at the Glasgow University, and was ordained to the Presbyterian ministry in 1891. From 1891 to 1896 he was pastor at Paisley, and in the latter year was called to Saint George's Free Church, Edinburgh. His publications comprise *Friendship* (1898), and *Culture and Restraint* (1901).

BLACK, **IVORY**. The pen-name of Thomas A. Janvier.

BLACK, **JAMES** (1823—). An American temperance agitator. He was born at Lewisburg, Pa., was educated at the academy there, and in 1846 was admitted to the bar. In 1852 he took an active part in the movement to have a law enacted for the prohibition of liquor in Pennsylvania. His efforts in this direction were constant, and led to the formation of a Prohibition Party at Chicago in 1869. In 1872 he was the first nominee of the party for President, and received 5608 votes. He was chairman of a committee appointed in 1876 to organize the National Prohibition Reform Party, and started a temperance publication society. Among his writings are: *Is There a Necessity for a Prohibition Party?* (1876); *A History of the Prohibition Party* (1880); and *The Prohibition Party* (1885).

BLACK, **JEREMIAH SULLIVAN** (1810-83). An American jurist and statesman. He was born in Somerset County, Pa.; received a common-school education, studied law, was admitted to the bar

in 1831, and soon acquired a considerable practice. He served for some time as deputy attorney-general for Somerset County, and from 1842 to 1851 was president-judge of the Sixteenth Judicial District of Pennsylvania. He was one of the Supreme Court Justices of Pennsylvania from 1851 until 1857, when he became Attorney-General of the United States in President Buchanan's Cabinet. In this capacity he protected the Government against the frauds involved in many of the famous 'California land-claims,' which grew out of alleged Mexican grants covering 19,148 square miles issued before the cession of California to the United States; and on the approach of the Civil War contended vigorously against any interpretation of the Constitution which would justify secession or would prohibit the President from suppressing insurrection or protecting Federal property against the attacks of State forces. Black replaced Cass as Secretary of State in December, 1860, and soon afterwards rendered an important service to the country by inducing Buchanan to take a firm attitude in his negotiations with the South Carolina commissioners with regard to the withdrawal of the United States troops from Fort Sumter. At the close of Buchanan's administration, Black served for a time as United States Supreme Court reporter, but resigned to devote himself to his private practice, and subsequently took part in many celebrated cases. He was counsel for President Johnson in the famous impeachment trial of 1868, but withdrew from the case after the President's answer had been filed. In 1877 he was conspicuous as one of Tilden's counsel before the Electoral Commission (q.v.), and afterwards wrote an able argument against the decision of the Commission in favor of Hayes. Besides winning a foremost place at the bar, Judge Black was known as a thorough classical scholar and a brilliant conversationalist. Soon after his death the Bar of the Supreme Court of the United States spoke of him as having been "a lawyer profoundly versed in the science of the law and worthy to be ranked with the greatest and ablest of our age and country." Consult C. F. Black, *Essays and Speeches of Jeremiah S. Black, with a Biographical Sketch* (New York, 1885).

BLACK, JOHN (1783-1855). A Scottish journalist. He was born near Dunse, where he pursued his studies, and was subsequently articled to a writer. He afterwards obtained employment as an accountant in Edinburgh, attending classes at the University, and doing some literary work. He became a reporter for the *London Morning Chronicle* in 1810, and editor in 1817. John Stuart Mill says that Black "played a really important part in the progress of English opinion for a number of years which was not properly recognized," and that he was the "first journalist who carried criticism and the spirit of reform into the details of English institutions." The institutions especially affected by this criticism were the courts and the Church, with the result that the press enjoyed a much larger measure of freedom in dealing with them. Black was a friend of James Mill, and Lords Palmerston, Melbourne, and Brougham, and was a patron of Charles Dickens, whose connection with the *Chronicle* began in 1835. He published translations of Humboldt's *Political Essay on New Spain* (1811-12); von Buch's

Travels in Norway and Lapland (1813); Berzelius's *System of Mineralogy* (1814); and Schlegel's *Lectures on Dramatic Literature* (1814).

BLACK, JOSEPH (1728-99). A Scottish chemist. He was born in Bordeaux, France, where his father was engaged in the wine-trade. Both his parents were of Scotch descent, but natives of Belfast, whither their son was sent for his education in 1740. In 1746 he entered the University of Glasgow; in 1751 he went to Edinburgh to complete his medical course, and in 1754 took his degree. His thesis on the nature of the mild and caustic alkalies and alkaline earths contained his first contribution to chemical science. In those days the transformation by heat of a mild alkali (a metallic carbonate) into the corresponding caustic alkali (an oxide, or hydroxide) was interpreted on the hypothesis that the mild alkali combines with the fiery principle called phlogiston, and thus the caustic alkali is produced. Black showed, however, that the transformation was accompanied by a loss of weight, and that during the transformation an æriform substance escaped from the mild alkali. This æriform substance he found to be different from atmospheric air, and gave it the name of *fixed air*. Thus the existence, both in the free state and in combination, of a gas different from air—namely, carbonic acid—was first clearly established by Black. Black succeeded Cullen as professor of anatomy (which branch he afterwards exchanged for medicine) and lecturer on chemistry in Glasgow. Between 1759 and 1763 he evolved that theory of 'latent heat' on which his scientific fame chiefly rests, and which formed the immediate preliminary to the next great stride in discovery by his pupil and assistant, James Watt. In 1766 Cullen was appointed to the chair of theoretical medicine in Edinburgh, and Black succeeded him in the chair of chemistry. Thenceforth he devoted himself chiefly to the elaboration of his lectures, in which he aimed at the utmost degree of perspicuity, and with perfect success. Black published: *Experiments on Magnesia, Quicklime, and Other Alkaline Substances; Observations on the More Ready Freezing of Water that Has Been Boiled; and Analysis of the Waters of Some Boiling Springs in Iceland*. His *Lectures on the Elements of Chemistry* was published after his death, by Robinson (2 vols., London, 1803). Consult Brougham, *Lives of Philosophers of the Time of George III.* (London and Glasgow, 1855).

BLACK, WILLIAM (1841-98). A British novelist. He was born in Glasgow, November 9, 1841. He studied art for a time in the Government school there, with the intention of becoming an architect; but he soon abandoned art for journalism. After some experience on the *Glasgow Weekly Citizen*, he went to London, where at first he wrote for the magazines. In 1865 he joined the staff of the *Morning Star*, becoming the next year its special war correspondent during the Prusso-Austrian War. Subsequently he was for a short period assistant editor of the *Daily News*. He died December 10, 1898. He produced thirty-odd novels, among which are: *A Daughter of Heth* (1871), which gained him his reputation; *Strange Adventures of a Phaeton* (1872); *A Princess of Thule* (1873); *Madcap Violet* (1876); *Macleod of Dare* (1878);

Three Feathers (1881); *Shandon Bells* (1883); *Judith Shakespeare* (1884); *In Far Lochaber* (1888); and *Wild Eelin* (1898). As may be observed from these titles, Black laid his scenes mostly in northern Scotland, which he knew and loved well. It was, however, his frequent practice to contrast the simple manners of his country-folk with the London Bohemia. His novels, some of which were extremely popular, show more than average workmanship. None of them quite reach the high art of the great novelists, though *A Daughter of Heth* reveals talent which almost approaches genius. Consult Sir Wemyss Reid, *William Black, Novelist: A Biography* (New York, 1902).

BLACKACRE, JERRY. A coarse bumpkin in Wycherley's *Plain Dealer*, trained to the law by a litigious mother, but cognizant only of its phrases.

BLACKACRE, WIDOW. The mother of the above. She is always involved in a lawsuit. The character is borrowed from the Countess in Racine's *Les Plaideurs*.

BLACK ACTS. Scottish Parliamentary acts dating from 1424 to 1594; so called because they were all printed in the black, or Saxon, characters. The expression 'Black Act' is also applied to an act of George I., directed against poachers who, with their faces blackened or otherwise disguised, and associated, as we are told in the preamble of the act, under the name of Blacks, appeared in Epping Forest, near Waltham, in Essex, destroyed the deer there, and committed other enormities. This act was, along with numerous other statutes, repealed in 1827, by 7 & 8 Geo. IV. c. 27.

BLACK APPLE. A name applied in Queensland and New South Wales to *Achras australis*, a tree of the natural order Sapotacæ. The tree produces an edible fruit about the size of a plum. The timber of this and several other Australian species is close-grained, hard, and easily worked, and is valuable for cabinet-work and for carving, for which it is especially suitable.

BLACK ASSIZE. A popular name commemorative of an extraordinary epidemic of jail fever which broke out at Oxford at the close of the assizes, July 6, 1577. Contemporary accounts describe it as having originated in the court-house immediately after a sentence to lose his ears was passed on Richard Jencks, a book-binder accused of sedition. It was popularly interpreted as a divine judgment on the cruelty of the sentence; but the phenomenon is satisfactorily explained by the pestilential atmosphere of the adjoining jail, then, as it was until long after, a seat of misery, filth, and disease. From the 6th of July to the 12th of August, 510 persons are said to have died in Oxford and the neighborhood of this terrible malady, among whom were the chief officials who sat at the assize, most of the jury, and many members of the university. Women, poor people, physicians, visitors, and children are said to have escaped the infection. A similar event is recorded as having taken place at Cambridge at the Lent Assizes in 1521. Consult: Holinshed, *Chronicles* (London, 1577; reprint, 6 vols., London, 1807-08); Stow, *Annales* (first edition, London, 1580; ed. Howe, London, 1631); Wood, *Athenæ Ox-*

onienses (first edition, London, 1691-92; 4th edition, ed. Bliss, Oxford, 1848).

BLACKBAND IRONSTONE. An ore of iron, found commonly in rocks of the Carboniferous system, and to a lesser extent in the Jura-Trias system, of several countries. It occurs in bands or rounded masses, and is often associated with coal, and sometimes with limestone. It is mainly a carbonate of iron, accompanied by some coaly matter and clay impurities. In the United States, blackband ores are obtained in Pennsylvania, Ohio, and Kentucky. In Europe, Scotland yields some. This ore is low in iron, as shown by the percentage composition of an Ohio ore from Tuscarawas: Silica, 26.22; phosphorus, 0.27; iron carbonate, 34.69; iron sesquioxide, 10.42; alumina, 0.70; manganese, 1.70; lime carbonate, 2.00; sulphur, 1.84. Before melting in the blast-furnace, blackband ironstone has to be roasted. It is seldom used alone. See IRON ORE.

BLACK BASS, DUCK, etc. See the substantives.

BLACK BATEMAN OF THE NORTH. See DEKKER, THOMAS.

BLACK BEETLE. A common name in England for the Oriental cockroach (see COCK-ROACH); also, rarely, for beetles of the genus *Blaps*.

BLACKBERRY (*Rubus villosus*). A term applied in America to both upright and decumbent thorny bushes bearing a fruit consisting of an aggregation of small drupes or berries, arranged about the receptacle to which they adhere, and which, when ripe, separates from the plant with the drupes and forms a part of the so-called fruit. In America, the blackberry and dewberry, or running blackberry (*Rubus Canadensis*), are indiscriminately spoken of as blackberries, while the English bramble (*Rubus fruticosus*) is also called a blackberry. In America, these fruits, with the exception of *Rubus fruticosus*, have attained a commercial status, and each year widens their range of cultivation. Although existing in a high state of development as wild plants, they attracted little attention as garden fruits until as late as 1850. Now, however, they are extensively cultivated over a wide area.

The blackberry is propagated almost exclusively from root-sprouts, suckers, and root-cuttings. New varieties are secured by planting the seed, but most of the named varieties now on the market are chance seedlings from wild or cultivated plants. The habit of growth of the blackberry renders it necessary to set the plants not closer than 3 by 8 feet for the smaller growing sorts, while 4 by 10 is not too wide for the larger kinds. The fruit is extensively used for canning, both in a commercial and domestic way; but it finds its chief market as a fresh fruit for dessert purposes. The bark of the root has tonic properties which are much prized by the country folk. A fluid extract made from blackberry-root is sometimes prescribed in cases of diarrhoea. For a discussion of the genus, see RUBUS; and for further information on the Running Blackberry, or briar, see DEWBERRY.

BLACKBERRY DISEASES. See RASPBERRY.

BLACK BESS. The name of the English highwayman Turpin's mare. She is mentioned by Sam Weller, in *The Pickwick Papers*, just be-

fore he voluntarily went into Fleet Prison, in a song beginning:

"Bold Turpin vunce, on Hounslow Heath,
His bold mare Bess bestrode-er."

BLACKBIRD. Any of several different birds prevaillingly black in plumage; in America, a member of the family Icteridæ. About a dozen species dwell in the United States. They agree in the possession of a rather long and slender beak, with cutting edges, and have only nine primaries in the wing; but are distinguished from each other by size and color. The males, when in full plumage, are always more strikingly colored than the females, and generally the contrast is very great. In most of the species the female is not black at all, and the young resemble her. The largest of the American blackbirds are those known as crow-blackbirds—or,

HEAD AND FOOT OF A TYPICAL BLACKBIRD.

more properly, grackles (q.v.)—one species of which reaches a length of 18 inches, but is not so heavy as a crow. The other blackbirds are much smaller—less than a foot in length—and are distinguished from each other chiefly by color. In the eastern United States we have only the cowbird (q.v.) and the red-winged blackbird (*Agelaius phœniceus*), the former uniform lustrous black, with a brown head, and the latter jet-black, with a scarlet patch on each 'shoulder.' (See REDWING.) In the middle West, besides the Eastern species, there occurs the handsome yellow-headed blackbird (*Xanthocephalus xanthocephalus*), in which the whole head and throat is yellow, or even orange. The Pacific Coast has also the red and white shouldered blackbird (*Agelaius tricolor*), which is bluish-black, with a dark blood-red patch on the wing, bordered with pure white. All of these species, except the cowbirds, frequent marshy grounds or swamps to breed, and often gather in large flocks, the more especially during the migrations. They feed on almost everything in the insect or vegetable line; but though they sometimes damage corn-fields, they are beyond question beneficial. The nests are built on or near the ground in the swamps, among reeds or small bushes, and are composed chiefly of dried grass and reeds. The eggs are pale-blue or grayish-green, scrawled or spotted with brown.

In the Western States the lark-bunting (*Calamospiza melanocorys*) is sometimes called the white-winged blackbird, while in the East the bobolink is frequently called the skunk blackbird, on account of its peculiar markings; and in Florida and the West Indies the ani is commonly termed savanna blackbird.

In Europe the name blackbird is given to an entirely different bird, the merle, a thrush (*Merula merula*). It occurs throughout Europe, in North Africa, and in the Azores. The male is deep black, while the female and young are rusty brown. Like the other thrushes, the

merle is chiefly insectivorous, though it often eats fruit, and is a fine singer, although the notes are somewhat too loud to make it an acceptable cage-bird. See Plates of BLACKBIRDS and of EGGS OF SONG-BIRDS.

BLACK BOOK. The designation of various historical and other works, so called from the character of their type or their binding or contents. Among the more popularly known are: A university register, in which students' misdemeanors are recorded; any volume treating of necromancy or the 'black art'; and, in Great Britain, the list of habitual criminals published since 1877. The most important historical black books are: The volume formerly attributed to Gervaise of Tilbury, but now known to be the compilation of Nigel, Bishop of Ely (died 1169), giving a detailed description of the Court of Exchequer, its officers, their duties and privileges, etc., also of the revenues of the Crown; a book of admiralty statutes and ordinances of the reign of Edward III., first edited by Sir Travers Twiss (4 vols., London, 1871-76); and a series of reports compiled by order of the visitors to the English monasteries in the reign of Henry VIII. Their presentation to Parliament in 1536 was followed by the suppression of those institutions. These reports probably never formed a bound volume, although one is fabled to have been burned by order of Queen Mary. The reports still in existence are considered by recent historians to be extravagant and malicious in their statements. Consult Gairdner, editor, *Letters and Papers of the Reign of Henry VIII.* (London, 1880-86).

BLACKBREAST. Either of two American bay-birds. (1) The black-bellied plover (*Charadrius squatarola*). (2) The dunlin (*Tringa alpina*); also called blackheart.

BLACK BRUNSWICKERS, or THE DEATH'S-HEAD CORPS. A troop of hussars, organized in Germany by Frederick William, Duke of Brunswick, in May, 1809, during the Napoleonic wars. Their uniform was jet-black, and ornamented with lace in imitation of the ribs of a skeleton. Their helmets were adorned with silver skulls and crossbones, and with black horsehair tresses instead of plumes.

BLACKBUCK (so named from its blackish-brown color; AS. *bucca*, he-goat, *buc*, a male deer, OHG. *boch*, Ger. *Bock*, he-goat). The common antelope of India (*Antilope cervicapra*), which ranges over the whole of the peninsula and Assam, wherever there are open plains. A male blackbuck stands about 32 inches high at the shoulders, and will weigh, alive, about 85 pounds. The horns usually run from 16 to 20 inches in length, but may reach 28 inches. They arise close together, and are cylindrical and ringed, with an elegant spiral twist of from three to four turns. The does are hornless, as a rule.

Old males are among the handsomest of all antelopes, the contrast of the full blackish-brown of the greater part of the head, body, and outer sides of the limbs with the white of the under parts and the ring around the eye being most striking. Young bucks, and the does of all ages, are rich yellowish-brown, rendering them less conspicuous to their enemies. These pretty little antelopes are always found either in open ground, wild, grassy plains, or cultivated tracts, and go in herds, sometimes reaching hundreds,

BLACKBIRDS

6

1. BOBOLINK (*Dolichonyx oryzivorus*); male in summer plumage.
2. BOBOLINK; female.
3. YELLOW-HEADED BLACKBIRD (*Xanthocephalus xanthocephalus*).

4. COW-BIRD (*Molothrus ater*).
5. PURPLE GRACKLE (*Quiscalus quiscula*).
6. RED-WINGED BLACKBIRD (*Agelaius phoeniceus*).

or even thousands, in number. Ordinarily, however, bands containing only from ten to forty individuals are met with, led by one shining, black-coated old buck. See Plate of GAZELLES.

Sport.—They are a favorite object of sport, but in many parts of India are so protected by the prejudice of the natives as to suffer little from the gun. The literature of sport with the gun in India abounds in descriptions of black-buck hunting. The usual method is by chasing them with greyhounds. Where the plains are very sandy, this coursing is usually successful, and it affords the sportsmen who follow the dogs on horseback the exhilaration of a fine burst of speed before seeing the prey pulled down; but elsewhere, on open, hard deserts, or where plains of tough turf give the fleet little animals a good foothold and fair start, it is rare that the best of dogs can catch them. They are also chased with the cheeta and with falcons. The name is sometimes applied to the African sable antelope.

BLACK BULLY, BALLY-TREE WOOD, or SAPODILLA PLUM (*Achras sapota*). A tree peculiar to South America and the West Indies, having a durable wood that is used for ship-building, and a milky juice which is thickened by evaporation and imported as gutta-percha. The tree is extensively cultivated throughout the tropics, on account of its excellent fruit. The bark is febrifugal, and the seeds have diuretic and aperient properties.

BLACKBURN (named after the river Blackburn, from AS. *burna*, brook, stream, Ger. *Brunnen*, well, Engl. *burn*, rivulet, brook). A manufacturing town in Lancashire, England, on the Blackburn, and the Leeds and Liverpool Canal, 21 miles north-northwest of Manchester (Map: England, D 3). Among its notable public buildings are a handsome town-hall, a fine Gothic exchange, and a newly erected drapers' hall. There are two large parks—Corporation Park and Queen's Park, opened in 1887. Blackburn was incorporated in 1851, and since that date has rapidly advanced to the front rank of flourishing manufacturing towns. It has owned its water-supply since 1875. The acquisition of the gas-works followed in 1877, and in 1895 the corporation began the supplying of electricity. The street railways and suburban lines were taken over in 1899. The town also maintains public baths, markets, slaughter-houses, and cemeteries. Among its educational institutions are an ancient grammar school, founded by Queen Elizabeth in 1567; a technical school, maintained by the corporation; a public library, with which is connected a museum; and an art gallery. The town also maintains two hospitals. It has a modern and profitable sewage system, including extensive irrigation-works, precipitation plant, and two sewage farms. The great business of the town is the manufacture of cotton stuffs. There are also woolen-factories, and large establishments for the manufacture of weaving-machinery. Here James Hargreaves (q.v.), a native of the town, invented the spinning-jenny in 1767. He was driven out of the town by a mob of workmen, who feared that machinery would deprive them of their livelihood. Population, in 1891, 120,064; in 1901, 127,527.

BLACKBURN, WILLIAM MAXWELL (1828—). An American clergyman and author. He was born in Carlisle, Ind., graduated in 1850 at Han-

over College, and in 1854 at the Princeton Theological Seminary; and held pastorates in Erie, Pa., and Trenton, N. J. In 1868 he was appointed professor of biblical and ecclesiastical history in the Presbyterian Theological Seminary in Chicago, Ill. He was appointed president of the Territorial University of North Dakota in 1884, and in 1886 of Pierre University (now Huron College). He has contributed to the *Princeton Review* and other periodicals, and has published: *Exiles of Madcira* (1862); *The Rebel Prince* (1864); *The College Days of Calvin* (1866); *Ulrich Zwingli, the Patriotic Reformer* (1868); and *The Theban Legion* (1871).

BLACKBURN, FRANCIS (1782-1867). An Irish Lord Chancellor. He was born at Great Footstown, County Meath, November 11, 1728. He entered Trinity College, Dublin, in 1798, where he brilliantly distinguished himself. He studied law in Dublin and London, and was admitted to the English bar in 1805 and to the Irish bar in 1822. In 1830 he was Attorney-General for Ireland, under Earl Grey's Government. When a renewal of the Insurrection Act was necessitated by the disturbed state of Ireland, Blackburne devoted himself to the vigorous application of that measure in Limerick, and at the end of two years succeeded in restoring order. His activity against the riotous opponents of the collection of tithes, and a legal victory gained over O'Connell, antagonized that politician and his followers, and their bitter attacks led to his resignation. In the critical period of 1847-48 he presided with conspicuous ability in the prosecution of Smith O'Brien and others who were convicted of treason. In 1852 he was made Lord Chancellor, but resigned soon afterwards. In the same year he was appointed a commissioner of education, and in 1856 became Lord Justice of Appeals. He accepted the office of Chancellor for the second time in 1866; but his appointment being loudly condemned, he was induced to resign. He was for some years vice-chancellor of Dublin University, and in 1867 declined Lord Derby's offer of a baronetcy. See O'CONNELL, DANIEL, and consult E. Blackburne, *Life of Lord Chancellor Francis Blackburne* (London, 1874).

BLACKBURN, JAMES HARRY (1842—). An English chess-player. He was born in Manchester, and first became known as a chess-player in 1861. There have been few tournaments within the past thirty years in which Blackburne has not been successful, and he has won more prizes than any other player of his day. Although less fortunate in single-handed competitive contests, his achievements as a blindfolded player may be ranked with those of Paulsen and Zuckertort.

BLACKCAP. A name in England and America of various small birds which have the top of the head black. In America it is properly applied to one of the fly-catching warblers (*Sylvia pusilla*), a small olive and yellow bird, the male of which has the top of the head rich, lustrous black. It frequents swamps and low woodlands, where it is very active in search of its insect prey, and builds its nest near the ground. The black-capped titmouse, or chickadee, also frequently receives this name in the United States. See TITMOUSE.

In Europe the name is given to one of the warblers (*Curruca atricapilla*), closely allied to the nightingale, and one of the sweetest song-

ily Simuliidæ. All the insects of this family are short, small, and thick-bodied, having no simple eyes and no transverse suture in the thorax; they rarely exceed one-fourth inch in length. The larvæ of these flies are aquatic, unlike mosquitoes, living in swift-running streams. Their eggs are deposited in closely packed layers on rocks near or below the surface of the water, into which the larvæ drop when freed from the egg and become attached to plants, stones, etc., by a silken thread, or sometimes to each other, forming long floating strings; they soon pupate within silken cocoons, open at the ends so as to admit water. There may be several broods, the last producing young that hibernate in the larval stage. Hence the first emergence of imagoes (flies) is early in the spring. As summer advances the insects become excessively numerous in such favorable regions for them as the well-watered forests of northern New York, Maine, and Canada, where in hot weather they abound in such swarms as to put a stop to work in the woods, and even to cause the death of poultry and other animals which cannot escape them. In Labrador, life is practically impossible away from the seashore while the flies are in force. They suck the blood like mosquitoes, but, unlike them, are worse in sunshine, becoming dormant on cloudy days. Three or more species are known, that of the Saint Lawrence Valley (*Simulium invenustum*) being different from that of Lake Superior. To protect themselves, people build smudges and smear their faces and hands with ointments, of which the best is oil of tar, habitually used by the employes of the Hudson Bay Company. Consult, for a monograph of the group, *Bulletin No. 10*, Ent. Division, U. S. Dept. Agric. (Washington, 1898). See BUFFALO-GNAT.

BLACKFOOT (for origin of name, see below). An Algonkian tribe of the Plains, formerly roaming over the country about the head of the Missouri, from the Yellowstone northward to the North Saskatchewan and westward to the Rocky Mountains. They are now confined to reservations in Montana and the adjoining territory of British America. The name Blackfoot is said to have been given to them from the fact that when they first appeared in the Upper Missouri country their leggins were black, as a result of their traveling over the recently burned prairie. They call themselves 'plains men' or 'people of one language.' They are divided into three great subtribes: The Siksika or Blackfoot proper, Kaina or Blood, and Pikuni or Piegan, each in turn being subdivided into bands. They have also a well-developed military organization, with promotion and degrees of rank. Associated with them are the weaker tribes, Arapaho, Grosventres, and Sarsee (q.v.). Less than a century ago they were one of the strongest and most warlike tribes of the Plains, being estimated as high even as 40,000 souls. They still number over 5000, of whom about 2100 are on the Blackfoot Reserve in Montana, the others being in British America. Grinnell (*Blackfoot Lodge Tales*, 1892) has made an interesting study of their mythology.

BLACK FOREST (Ger. *Schwarzwald*; so called from the dark foliage of its fir and pine trees). A wooded mountain region in the southwestern part of Germany, occupying the southern part of Baden and the western part of Württemberg (Map: Germany, C 4). It runs

in a direction from south to north; its natural boundaries on the east are formed by the Nagold and the Neckar, while on the south and west it is bounded by the Rhine. Its length is about 100 miles, its width varies from about 38 miles in the south to about 14 miles in the north, while its entire area is estimated at about 1900 square miles. The western slope of the region falls off abruptly toward the valley of the Rhine, in contrast to the eastern slope, whose incline is very gradual. The southern, or upper part, which is the widest part of the region, contains also its greatest elevations, as the Feldberg, 4860 feet, which is the highest peak of the entire region, and sends off numerous offshoots, ranging in altitude from 3000 to 4200 feet; the Herzogenhorn, 4610 feet, the Belcher, 4600 feet, and a number of inferior elevations. Near Altbreisach, in the District of Freiburg, is situated the isolated volcanic mass of the Kaiserstuhl. The northern or lower part of the region is inferior in elevation to the southern, and is less mountainous in general appearance. Its highest peak is the Hornsgrinde, 3790 feet, and there are a number of other elevations of a little over 3000 feet. The region of the Black Forest gives rise to a number of rivers, including the Danube and Neckar, and contains a number of lakes on its eastern slope. Geologically, the region is composed of Archean granites and gneiss, which form its core; porphyry, found mostly on the sides; and sandstone, which occurs mostly in the more elevated parts and also at the base. The mineral resources of the region are of little importance, and its deposits of silver, cobalt, and copper are practically exhausted. Mineral springs, however, are abundant and include such well-known health resorts as Baden-Baden and Wildbad. The climate is on the whole healthful, although somewhat raw in the more elevated parts. In the plains agriculture and cattle-raising are pursued with more or less success, and there are some vineyards on the western slope. The region is very well wooded, and the chief occupation of the inhabitants is the production of wooden clocks, musical instruments, and other manufactures of wood, as well as watches. The Black Forest is much frequented and has a number of roads and passes, among which the Höllenthal Pass, near Neustadt, is the best known. It is crossed by a number of railway lines. Two of the passes of the Black Forest, the Kniebis and the Hölle, acquired considerable celebrity during the wars of the French Revolution. The first, situated on the borders between Baden and Württemberg, at the source of the Murg, was taken by the French in 1796 and in 1797; the Hölle is known in connection with Moreau's retreat in 1796.

The Black Forest has been made the scene of many weird and curious stories, and it is associated with a vast number of legends, folk-tales, and popular superstitions.

BLACK FRIARS. See DOMINICANS.

BLACKFRIARS THEATRE. The first regular playhouse in the District of Blackfriars. It was erected in 1596 by James Burbage, who got its site and part of its structure as a gift from Sir Thomas Cawarden's executor. Shakespeare played here in 1598 in Ben Jonson's *Every Man in His Humour*. Burbage's company, which occupied the place, was known first as the Lord Chamberlain's Company, and then as the King's Servants. The theatre was torn down in 1655.

BLACK FRIDAY. The name applied to two disastrous days in the financial history of the United States. On Friday, September 24, 1869, a panic was caused in Wall Street by the effort of Fisk and Gould to corner the gold market, gold rising to 163 1-3, and on Friday, September 19, 1873, occurred in the New York Stock Exchange the great financial crash which was followed by the widespread 'panic of 1873.' For 'Black Friday' of 1869, consult an article in *The Yale Review*, Vol. III. (New Haven, 1896).

In England the name Black Friday is given to December 6, 1745, the day on which news reached London that the Pretender had arrived at Derby; again, May 11, 1866, when the failure of Overend & Gurney (on the previous day) brought on a most disastrous financial panic. See *Julgar's Short History of Panics* (New York, 1893). Good Friday is also known as Black Friday in the Western Church, because on that day clerical vestments and altar draperies are black.

BLACK GAME, or **HEATH GAME**. See **BLACK-CHICK**.

BLACK GUARDS. A name originally applied to the scullions and lower servants of the English Court, who were clothed in black garments. Gibbon says "those who carried coals to the kitchen, rode with the pots and pans, and were in derision called the Black Guards." The title is recognized in an official proclamation of 1683, which begins, "Whereas, a sort of vicious, idle, and masterless boyes and rogues, commonly called the Black Guard, with divers other lewd and loose fellows," etc.

BLACK GUM, or **SOUB GUM**. The popular name of the *Nyssa multiflora*, the Hornpipe of New England, and Pepperidge and Tupelo of our Middle and Southern States. It grows in thick forests, has crooked branches, and is densely covered with bright-green leaves in tufts at the ends of the branches; bears flowers of greenish hue, ovoid fruits, becoming blue-black as they ripen; wood close-grained and very tough, but not durable. The timber is used for hubs of wheels and in other places where splitting is to be avoided. It is an ornamental tree in England.

BLACK HAWK (1767-1838). A celebrated chief of the Sac Indians. In 1788 he succeeded his father as head chief of the Sacs. In 1804 the Sacs and Foxes agreed, for an annuity of \$1000, to give up to the United States their lands east of the Mississippi; but Black Hawk promptly repudiated this arrangement, and in the War of 1812 took part against the Americans. The cession of the disputed territory was again provided for by treaties in 1815 and 1816, the latter being signed by Black Hawk; and in 1823 the majority of the Sacs and Foxes, under Keokuk (q.v.), moved across the Mississippi, a new treaty being signed at Prairie du Chien, on July 15, 1830. When the whites began to occupy the vacated lands, Black Hawk threatened retaliation, and by crossing the Mississippi with a small force in June, 1831, precipitated the Black Hawk War. The Indians were defeated by General Dodge, near the Wisconsin River, on July 21, 1832, and by General Atkinson, at the Bad Axe River, August 1-2, and Black Hawk surrendered on August 27. He and nine other warriors were held for a time as hostages, and after being taken to several Eastern cities, were confined in Fortress Monroe until June 8, 1833. The Sacs and Foxes

under Keokuk soon moved to a reservation near Fort Des Moines, where Black Hawk died, October 18, 1838. Consult: Patterson, *Life* (Boston, 1834); Drake, *Life* (Cincinnati, 1846). Also consult an article, "Story of the Black Hawk War," by Thwaites, in Vol. XII. of the *Collections of the Wisconsin Historical Society* (Madison, 1885—).

BLACK HAWK WAR. See **BLACK HAWK**.

BLACKHEAD. (1) A scaup-duck (q.v.). (2) A minnow (*Pimephales promelas*). (3) A minute blemish in the skin, making a dark spot; a comedo.

BLACKHEAD (so named because the disease affects the color of the head), or **ENTERO-HEPATITIS**. A malignant, contagious disease of turkeys, due to the attack of a protozoan parasite (*Amœba meleagridis*). Birds attacked by the disease show loss of appetite, weakness, and emaciation. Diarrhœa is a pronounced and constant symptom. Discolorations of the head frequently occur in the acute stages. Young birds seem to be most susceptible to the disease. Little success has attended remedial treatment of blackhead. Reliance must be placed for the most part on prevention, for which purpose roosting-places and feeding-grounds should be thoroughly disinfected by means of carbolic acid or other chemicals. Blackhead appears chiefly in July and August, and at the approach of winter. Turkeys apparently resist the disease better in warm, dry weather than in wet weather.

BLACKHEATH. An elevated, open common, and a favorite holiday resort for Londoners, in Kent, England, 5 miles southeast of London, bordering on Greenwich Park. It covers 267 acres, commands a fine view of great extent, and being a healthful tract, many villas have been built on its margin. The Roman road to Dover crosses it. Blackheath was formerly the scene of several insurrections, including those of Wat Tyler (1381) and Jack Cade (1450), and was also a noted place for highwaymen. Consult Drake, *History of Blackheath* (London, 1886).

BLACK HILLS. A name applied at various times to different sections of country lying between the Missouri River and the Rocky Mountains, but now used only to indicate a mountainous region partly in northeastern Wyoming, but principally in South Dakota (Map: South Dakota, B 5). They cover a total area of about 6000 square miles, 1893 square miles of which have been set apart by the United States Government as a forest reserve. (See **FOREST RESERVES**.) They are drained and nearly surrounded by the two main forks of the Cheyenne River (q.v.). Their altitude ranges from between 2500 and 3000 feet at their base, to the summit of Harney Peak, 7216 feet in height. The mountains were formed by a local uplift, which raised the Archæan and later formations into a concentric fold. The Black Hills district was first partly explored in 1874 by an expedition under General Custer, when gold was discovered. In 1876, after some hostilities, a treaty made with the Sioux Indians opened the country to settlement, and Deadwood, Central City, Lead City, and other towns grew up very rapidly. The Black Hills constitute one of the richest gold-mining districts in the United States. Silver, copper, tin, and iron ores also occur within their

limits, besides coal, salt, petroleum, mica, gypsum, and building-stone. About one-third of the area is covered with dense dark forests of pine, whence the name, while deciduous trees are abundant. The climate is salubrious, the soil fertile, and the hills are well adapted to grazing purposes. See SOUTH DAKOTA.

BLACK HOLE. An appellation familiarly given to a dungeon or dark cell in a prison. The name is generally associated with the horrible confinement of a party of English in an apartment called the 'Black Hole of Calcutta,' on the night of June 20, 1756. The garrison of the fort connected with the English factory at Calcutta was captured by the Nawab Siraj-ud-Daula, who caused all of the prisoners taken, 146 in number, to be confined in an apartment 20 feet square. This cell had only two small windows, obstructed by a veranda. The crush was dreadful; and after a night of excruciating agony from pressure, heat, thirst, and want of air, there were in the morning only 23 survivors. One of them, Mr. John Z. Holwell, published a narrative of their sufferings in 1758. See HINDUSTAN; also Macaulay's essay on Clive.

BLACK HORSE (a fish). The Missouri or gourd-seed sucker (*Cycleptus elongatus*), usually about two feet long, "a peculiar species with small head, elongate body, and jet-black coloration, which comes up the smaller rivers tributary to the Mississippi and Ohio in large numbers in the spring." See SUCKER.

BLACKIE, JOHN STUART (1809-95). A Scottish philologist. He was born in Glasgow in 1809, but received his early education in Aberdeen, where his father was agent for a bank. After going through the usual course of a Scotch university education—partly at Marischal College, Aberdeen, partly at Edinburgh—with a view to the Church, he went in 1829 to Germany, and studied for some time at both Göttingen and Berlin. He thus acquired a mastery of German, and an acquaintance more extensive than ordinary with the literature of that language. On his return, having abandoned the thought of entering the Church, he began the study of law, and passed as advocate at the Edinburgh bar in 1834. But he soon found the practice of the profession uncongenial, and devoted himself henceforth to literary pursuits. Among his earliest productions was his translation, into English verse, of Goethe's *Faust* (1834). He wrote also about this period numerous articles in the *Foreign Quarterly Review*, the *Westminster Blackwood*, and *Tait*, chiefly on German subjects. In 1841 he was appointed by the Crown to the chair of humanities in Marischal College, which he held until, in 1852, he was elected to the Greek chair in the University of Edinburgh. From the beginning of his professorial career he had been incessant in advocating educational reform in Scotland, and took an active part in the movement that led, in 1859, to the remodeling of the Scottish universities. During 1874-76 he advocated throughout the country, with great enthusiasm, the foundation of a Celtic chair in Edinburgh University, and was successful in raising upward of £14,000 for its endowment. Of works of a professional and philological kind may be mentioned the lectures *On the Studying and Teaching of Languages*; *On the Rhythmical Declamation of the Ancients*; *The Pronunciation*

of Greek; *Accent and Quantity* (1852). Among the most matured and scholarly of his productions is his metrical translation, with notes, of the dramas of Æschylus (1850). In 1853 he spent above three months in Athens acquiring a knowledge of the modern language; and as fruits of the visit there appeared articles on the subject in the *North British* and *Westminster* reviews. In 1866 he published *The Iliad of Homer*, translated into English verse, with commentary and introductory dissertations, in which he endeavored to present Homer to the English reader as a popular singer. He resigned his professorship in 1882 and died March 2, 1895.

Besides his works on philological and educational subjects, Blackie made excursions into other fields. In 1858 he published a treatise on *Beauty*, in refutation of Lord Jeffrey's association theory. Others of his works are *Lays and Legends of Ancient Greece, with other Poems* (1857); *Lyrical Poems* (1860); *Musa Burschi-cosa* (1869); *War Songs of the Germans, a translation* (1870); *Four Phases of Morals* (1871); *Songs of the Highlands and Islands* (1872); *Self-Culture* (1873); *Horæ Hellenicæ* (1874); *Songs of Religion and Life* (1876); *Natural History of Atheism* (1877); *Lay Sermons* (1881); *The Wisdom of Goethe* (1883); *Life of Burns* (1887); *Essays on Subjects of Moral and Social Interest* (1890).

BLACKING. A preparation employed for producing a black, glazed, shining surface on leather. There are numerous recipes for making blacking, but they all involve the use of a pigment, which is usually ivory-black, bone-black, or lampblack, mixed with a vehicle which is usually some combination of oil, vinegar, beer, molasses, water, and hydrochloric or sulphuric acids. Blacking intended for harness usually has glue, gelatin, gum arabic, or some resinous compound added to the vehicle. The fact that the addition of sulphuric acid to ivory-black and sugar produces sulphate of lime and soluble acid phosphate of lime, which makes a tenacious paste, is the foundation of many of the compositions used as blacking. The famous English blacking known as Day & Martin's consists of bone-black, sperm-oil, molasses, vinegar, and sulphuric acid. These ingredients, when mixed together in the order named, produce a thick, tenacious paste, which is liquefied by the addition of vinegar, and put into stoneware bottles. A familiar recipe for a liquid blacking is as follows: Five ounces of ivory-black; 4 ounces of treacle; $\frac{3}{4}$ ounce of sweet oil; triturate until the oil is thoroughly mixed in, then add one pint each of vinegar and beer-lees. A paste blacking which may be easily made consists of ivory-black, 4 pounds; molasses, 3 pounds; hot sperm-oil, 9 ounces; gum arabic, 1 ounce, and vinegar, 12 ounces. These ingredients are mixed together and allowed to stand for about a week, with an occasional stirring, when the blacking is ready for use. By adding more vinegar the compound may be liquefied. A well-known recipe for harness-blacking is as follows: Beeswax, 1 pound; ivory-black, $\frac{1}{4}$ pound; Prussian blue, 1 ounce; ground in 2 ounces of linseed oil; oil of turpentine, 3 ounces; copal varnish, 1 ounce; mix well together and form into cakes while warm. In founding (see FOUNDED) the name 'blacking' is given to various washes of powdered charcoal, sea-coal, or graphite with which the surfaces of

models are coated to give the casting a smooth surface and to prevent the molten metal from penetrating the same.

BLACK-JACK. The name given by miners to zinc blende, which is of black color. It was also the name applied in former times to a kind of drinking-flagon. For Black-Jack as the name of a tree, see OAK.

BLACK JACK. A nickname given, chiefly by his political opponents, to Gen. John A. Logan.

BLACK KNIGHT, THE. (1) The name of a character in the early romances, son of Oriana and Amadis of Gaul. (2) Richard Cœur de Lion was known in Scott's novel *Ivanhoe* as The Black Knight or The Black Sluggard, on account of the suit of black armor and the black shield he bore during his wanderings in England.

BLACK KNIGHT, COMPLAINT OF THE. A poem written by Lydgate, but erroneously included in some of the early editions of Chaucer.

BLACK LAW. In American history, a name applied to any one of a series of laws, passed in various border and Northern States before the Civil War, sharply discriminating against free negroes who wished to emigrate to such States and become citizens thereof. Thus, in some States, certificates of freedom were to be filed, negroes were to be rigidly excluded from the militia and from the public schools, and no negro was to testify in cases in which any white man was directly interested. More or less stringent laws were passed in Virginia, Maryland, Delaware, Mississippi, Indiana, Illinois, Iowa, Oregon, and New Mexico. Consult Wilson, *Rise and Fall of the Slave Power in America* (Boston, 1872-75).

BLACK LEAD. See GRAPHITE.

BLACKLEG (so named because the tumors affect the legs oftener than other parts of the body), **BLACK QUARTER**, or **SYMPTOMATIC ANTHRAX.** An infectious disease due to the action of *Bacterium chanvoli*. It is confined almost entirely to cattle, but cases have occurred also in sheep, goats, camels, pigs, and horses. Man is immune to it. The disease is characterized clinically by the development of tumors in the muscles of various parts of the body, producing, when stroked, a crackling sound, which serves to distinguish this disease from anthrax. After death the tumors become infiltrated with blood and serum containing gas-bubbles; and this again distinguishes blackleg from anthrax, as the tumors of the latter are not found to contain any gas. Further, in blackleg the spleen is not affected and the blood coagulates quickly, while in anthrax the spleen is much enlarged and the blood clots more slowly. Blackleg has long been known as a disease of cattle, but has, until within recent years, been generally confused with anthrax. The blackleg bacterium does not develop in the presence of free oxygen. In the blood it is slightly motile. The symptoms of blackleg are loss of appetite, debility, and great elevation of temperature. The disease runs its course very rapidly, and is fatal in nearly all cases. Cattle between the ages of six and eighteen months are most susceptible, young calves and old animals being more resistant. Fat cattle seem to be especially liable to infection. The symptoms appear suddenly within from one to three days after infection. The tumors may develop at

once or may be preceded by the symptoms of fever and trembling. A lameness of the legs is usually observed, and is due to the muscular tumors which almost always accompany the disease. The animal manifests considerable pain, and falls to the ground soon after the development of the first symptoms. The part which is most affected becomes swollen and assumes a black or blue color, which is due to the infiltration and coagulation of blood within it. The dried spores of the blackleg bacterium may be carried in hay or other dry feed, and it is quite possible that animals may be infected by eating such material. Recent investigations, however, indicate that infection most frequently takes place through wounds of the skin, mouth, or tongue, such as would be produced by various spines and the awns of grasses.

Blackleg is found in nearly all countries of the globe. In the mountains of France it is known as *mal de montagne*, in Denmark as *rashsyge*, and in Germany as *Rauschbrand*. In the United States it is most prevalent in Texas, Kansas, Nebraska, South Dakota, and Colorado.

Medical treatment of blackleg has been uniformly unsuccessful and is not to be recommended. On the other hand, preventive vaccination has given very satisfactory results. Out of 600,000 cattle vaccinated in Europe, only one-half of one per cent. subsequently died of blackleg. Equally striking results have been obtained by the Bureau of Animal Industry of the United States Department of Agriculture. This bureau has perfected a method of producing immunity against blackleg by one vaccination, requiring less time than the old method, in which two inoculations were made, with an attenuated and strong vaccine, respectively. Stockmen may now buy the vaccine and inoculate their own cattle. For further study of blackleg, consult: A. J. Murray and others, "Special Report on Diseases of Cattle," *Report of United States Department of Agriculture* (Washington, 1892); *Bureau of Animal Industry, 15th Annual Report*, p. 27; Mocard and Leclainche, *Les maladies microbiennes des animaux* (Paris, 1898).

BLACK LETTER (*Black Letter*). A name commonly given in England and America to the printing-types which on the Continent are most generally known as Gothic. The first printed books imitated every peculiarity of the contemporary manuscripts; and as printing was first practiced in Germany and the Netherlands, the first types were copies of the letters in use in those countries in the middle of the Fifteenth Century. Two sorts of letters have been employed in the writings of Western Christendom. The Gothic style dates from about the middle of the Twelfth Century; the type which imitated it, first used c.1445, spread with the art of printing into most European countries, until the classical taste reverted to the more graceful letter known as Roman, which is a revival of what is known in palæography as the Caroline minuscule, of the kind used in the Eleventh and Twelfth centuries. Aldus attempted in 1501 to supersede the Roman letters by what have been called Aldine or Venetian, but are best known as Italic characters. These can scarcely be said to have come into much more than temporary or exceptional use; but the Roman letters in no long time spread from Venice all over the west of Europe. Although thus supplanted in general

use, the Gothic or Black Letter was long retained for special purposes, such as the printing of Bibles, prayer-books, proclamations, and acts of Parliament. Characters similar to the Black Letter still continue to be used in Germany, but of late there has been a movement (based largely upon the damage to eyesight from reading the old character) in favor of a general adoption of the Roman letter. For specimens of all the types used in England in the Fifteenth Century, consult Duff, *Early English Printing* (London, 1896).

BLACK LILY. See FRITILLARY.

BLACK LIST. A list of persons either (1) against whom the compiler would warn others, or (2) with whom he refuses to have business transactions, or (3) with whom he seeks to induce others not to have business relations. An example of the first class in England is the official list of defaulters on the Stock Exchange; in the United States, the list of those against whom unsatisfied judgments are standing, or who have given chattel mortgages on stock in trade, or whose credit is poor. These and similar lists are published by mercantile agencies and others, and are considered not only valuable to the business community, but perfectly fair and lawful. And yet printing a person's name in such a list may subject the publisher to an action for libel. In order to defend successfully such an action, the publisher must prove that the statement made in the list about the plaintiff was true, or else that it was a correct transcript of a public record, or a fair and accurate report of a judicial proceeding, or that it was made upon a privileged occasion. Such a statement is privileged when it is made in answer to questions by persons having a legitimate reason for asking them; as when A, to whom B has applied for credit, inquires about B's financial condition. An example of the second class of black lists is one kept by a railroad company of persons dismissed from its employment for incompetency, discourtesy to patrons, or other cause, in order that its agents may not reëngage them. The third class is illustrated by lists, kept by manufacturers or dealers forming an association or combination for the control of a particular line of business, of those who refuse to come into the association; or by lists kept by labor unions of non-union workmen or of those employing such workmen, with a view of terrorizing the workmen or of boycotting the employers. In some States the last-mentioned form of blacklisting constitutes a statutory crime. Consult the authorities referred to under the titles LIBEL and CONSPIRACY; and Eddy, *Law of Combinations* (Chicago, 1901).

BLACKMAIL (*black* + *mail*, a small piece of money, rent, tribute, Fr. *maille*, OF. *maaille*, LLat. *medallia*, medal). A term which has three distinct significations in English law: (1) It was applied to rents received in work, grain, or baser money, as distinguished from rents received in silver or white money (*mailles blanches*). See RENT. (2) It was applied to the tribute levied by freebooters, in the four northern counties of Northumberland, Westmoreland, Cumberland, and Durham. By 43 Eliz., ch. 13, sec. 1 (1601), it was made a felony without benefit of clergy to pay or receive this tribute, or black-mail, and similar legislation was enacted in Scot-

land. The practice does not appear to have ceased until after the legislative union of Scotland and England. (3) At present it is applied both in England and the United States to the offense of attempting to extort money or property by threats of various kinds. These threats are usually to accuse a person of a crime, or to injure his person or property, or to defame him, or to impute to him some deformity or disgrace. As a rule, it is no defense that the person threatened with the accusation is guilty, nor that the attempt at extortion fails. The criminality of the offense consists in its tendency to induce a breach of the peace, and in some cases its tendency to pervert justice. By some statutes, only written threats made for the purposes of blackmail are punishable criminally. Consult the authorities referred to under CRIMINAL LAW.

BLACK MAN, THE. A name popularly used for the devil; more commonly, *The Man in Black*.

BLACK'NAB, FRANK WILSON (1854—). An American economist and educator; born at West Springfield, Pa. He was educated at the University of the Pacific (College Park, San José, Cal.), and at Johns Hopkins, where he was an instructor in history in 1887-88, and fellow in history and politics 1888-89. From 1889 to 1899 he was professor of history and sociology at the University of Kansas, and was appointed to the chair of sociology and economics there in the latter year. In 1897 he organized the graduate school of the university, and was elected its dean. He was at one time prominent in the promotion throughout the West of the university extension movement, and has spoken and written extensively on topics of history, economics, and sociology. His publications include *Spanish Colonization* (1890); *Spanish Institutions in the Southwest* (1891); *History of Higher Education in Kansas* (1900); and *Charles Robinson, the Free-State Governor of Kansas* (1900).

BLACK MONDAY. A name applied to any Monday marked by a memorable disaster. Two such days occurred within a short period of English history, and both, by a curious coincidence, were Easter Mondays. In 1351 there was a tremendous hail-storm, and many people perished from cold. Nine years later, when the army of Edward III. was lying before Paris, another severe storm cost the lives of a large number of men and horses. The impression of these calamities was so lasting that Shakespeare used the expression colloquially (*Merchant of Venice*, Act V., Scene 5).

BLACK MONKS. See AUGUSTINIANS.

BLACK'MORE, SIR RICHARD (c.1650-1729). One of the court physicians in the reigns of William III. and Anne. He is remembered as the most heavy and voluminous poetaster of his time. Besides numerous essays, Blackmore wrote at least six long epic poems: *Prince Arthur*, *Eliza*, *Alfred*, *The Redeemer*, *Nature of Man*, and *The Creation*. The last-named was pronounced by Addison to be "one of the most useful and noble productions in our English verse." It was also praised by Johnson. But few modern readers are likely to agree with these judgments. Blackmore, who appears to have been a good and well-meaning man, was ridiculed without mercy by Pope and other wits of the time. His poems are really worthless. Consult: Johnson, "Blackmore," in *Lives of the Poets* (London,

1779-1781); the *Spectator*, No. 339; and the *Dunciad*, Bk. II., 259-268 (London, 1729).

BLACKMORE, RICHARD DODDRIDGE (1825-1900). An English novelist. He was born at Longworth, Berkshire, June 7, 1825; the son of Rev. John Blackmore. Graduating from Exeter College, Oxford, in 1847, he was called to the bar five years later, and practiced as a conveyancer till his health failed. He then took up fruit-growing at Teddington, a little way up the Thames from London. He died at Teddington, January 20, 1900. He began his literary career as a poet, publishing *Poems by Melanter* (1853); *Epullia* (1854); *The Bugle of the Black Sea* (1855); *The Fate of Franklin* (1860); and a translation of Vergil's *Georgics* (complete in 1871). His first novel, *Clara Vaughn*, appeared in 1864. It was followed by *Cradock Nowell* (1866); *Lorna Doone* (1869); *The Maid of Sker* (1872); *Alice Lorraine* (1875); *Cripps the Carrier* (1876); *Erema: or, My Father's Sin* (1877); *Mary Anerley* (1880); *Christowell* (1882); *Remarkable History of Sir Thomas Upmore* (1884); *Springhaven* (1887); *Kit and Kitty* (1889); *Perlycross* (1894); *Fringilla* (1895); *Tales from the Telling-House* (1896); and *Dariel* (1897). Though Blackmore thought some of his other books better and more interesting than *Lorna Doone*, his reputation as a novelist rests almost wholly upon this romance of the Seventeenth Century. It abounds in beautiful descriptions, is elevated in tone, and is written in a rhythmic prose which is rare in our literature. It has made famous Exmoor and the neighboring district, the home of the Doones.

BLACK MOUNTAINS. A mountain group in Buncombe and Yancey counties, North Carolina, forming a spur of the Blue Ridge and a part of the Appalachian system (Map: North Carolina, B 4). They lie between the French Broad River and its main tributary, the Nolichucky, and have a northwest and southeast trend transverse to the main line of the Blue Ridge elevations. The Black Mountains are the culminating points of the Appalachian system. Mount Mitchell, the highest peak, is 6710 feet, and Guyot's Peak, Sandoz Knob, Hairy Bear, Cat-Tail Peak, Gibbe's Peak, and Mitchell's Peak are more than 6500 feet above the sea. They form the divide between the Tennessee and Catawba river basins. Their slopes are forested with evergreens, while their valleys in places contain rich soil that is well adapted for agricultural purposes. See APPALACHIANS and BLUE RIDGE.

BLACK OAK. See OAK.

BLACKPOOL (so named from a pool now drained; Irish and Gael. *poll*, hole, pit, bog, AS. *pōl*, Ger. *Pfuhl*, pool, puddle). A flourishing town and popular watering-place of Lancashire, England, on the Irish Sea, about 18 miles west-northwest of Preston. It is sometimes called the 'Brighton of the North' (Map: England, C 3). It has an excellent bathing and promenade beach, a fine esplanade, three piers, a winter garden and pavilion, an aquarium, several theatres and music-halls. The principal streets and piers are lighted by electricity. Blackpool was incorporated in 1876. Its water-supply is obtained from the Fylde water-works, managed by a board composed of representatives from Blackpool and three other towns. The town owns its gas-works,

electric-light plant, markets, slaughter-houses, and cemeteries. It also owns and operates its street railways by the overhead trolley system, and has a line connecting Blackpool with Lytham, another favorite bathing-place, and Saint Anne's-on-the-Sea. There is a technical school, and a so-called continuation school, three public libraries, and a hospital. A branch railway connecting Blackpool with the Preston and Wyre Railway affords easy access from Preston, Liverpool, Manchester, and all parts of the kingdom. Blackpool is annually visited by over 100,000 tourists. Population, in 1891, 23,846; in 1901, 47,346.

BLACKPOOL, STEPHEN. A weaver in Charles Dickens's *Hard Times*. He was wrongly suspected of Tom Gradgrind's crime of robbing the bank of £150. His love for Rachel, a 'hand' in Bounderly's mill, is one of the most touching elements in the story.

BLACK PRINCE. The name usually given in history, on account of the color of his armor, to Edward, Prince of Wales, son of Edward III. (q.v.), the victor at the battle of Poitiers. He died in 1376. His son ascended the throne in 1377, as Richard II.

BLACK-QUARTER. See BLACKLEG.

BLACK RAIN. Showers of black rain have been recorded on many occasions in Ireland, and less frequently in other portions of Europe. The blackness comes from various sources, such as the soot from city fires and especially forest fires, which is washed down by rain; black fungi or fungus-spores—such as produce smut, mildew, and rust—carried up by gusts of wind and subsequently falling with the rain. In a few special cases the spores of fungi, after being wetted by the rain, grow rapidly on the ground and produce a black coating, which has not necessarily fallen with the rain, but is often spoken of as black rain. See DUST, ATMOSPHERIC.

BLACK RIVER. A river in northern New York, rising in the southwestern part of the Adirondack region and flowing southwest, then northwest, 130 miles through Herkimer, Oneida, Lewis, and Jefferson counties to Black River Bay, at the extreme eastern end of Lake Ontario (Map: New York, E 2). Numerous falls and rapids, with great possibilities for development, furnish abundant water-power to half a dozen villages and the city of Watertown. From Lyons Falls to the mouth of the river, a distance of 72 miles, the fall is about 500 feet. Boats pass from this river just above Lyons Falls to the Erie Canal at Rome, N. Y., through the Black River Canal.

BLACK RIVER, or BIG BLACK. An affluent of White River, which, rising in Reynolds County, Mo., and flowing through Missouri, bends toward the southwest, enters Arkansas, and joins the White River a few miles above Newport, Jackson County (Map: Missouri, F 5). It is about 170 miles long, and navigable for about 100 miles, except in the dry season. Valuable timber is found along its banks, and the lower regions produce good crops of cotton.

BLACK RIVER FALLS. A city and the county-seat of Jackson County, Wis., 171 miles northwest of Milwaukee; on Black River, and on the Chicago, Saint Paul, Minneapolis and Omaha Railroad (Map: Wisconsin, C 4). It contains a public library. Falls on the Black River afford

extensive water-power, and in the vicinity are iron-mines and deposits of kaolin, which are utilized in the manufacture of firebrick. The city has also flour and lumber mills, plow and wagon and patent-medicine factories, brewery, foundry and machine-shops, and nurseries; and is the commercial centre for a large agricultural district. Population, in 1890, 2261; in 1900, 1938.

BLACK ROCK, Conn. See **BRIDGEPORT.**

BLACK ROD, USHER OF THE (so called from the staff he carried). An officer of the House of Lords. He is chief gentleman usher to the Sovereign, and belongs to the Order of the Garter. His principal duty is to summon the House of Commons to the Lords when the royal assent is given to bills, or when royal speeches are read; and to take into custody any peer guilty of breach of privilege. The office also exists in the self-governing British commonwealths of Canada, Australia, and Cape Colony.

BLACK ROOD OF SCOTLAND (*Rood*, a representation of Christ crucified, AS. *rōd*, cross, akin to OS. *rōda*, Dutch *roede*, rod). A famous relic brought to Scotland in 1070 by Margaret, wife of King Malcolm. It consisted of a piece of the true Cross, set in an ivory image of the Saviour, and was held in the highest veneration by the Scotch kings. It fell into the hands of the English during the invasion of that country by David II. in 1346.

BLACK ROT. See **GRAPE.**

BLACK SALSIFY. See **SCORZONERA.**

BLACK SATURDAY. A name given to August 4, 1621, in Scotland, because of Parliament's favorable legislation regarding Episcopacy. A fearful storm is said to have been in process during the session. The name has also been given to September 10, 1547, the day of the battle of Pinkie.

BLACK SEA (Lat. *Pontus Euxinus*, Gk. Πόντος Εὐξείνιος, *Pontos Euxeinios*, hospitable sea, originally ἄξεινος, *axeinios*, inhospitable; Turk. *kara den giz*, black sea). An inland sea lying between eastern Europe and Asia Minor, and connected with the Mediterranean by the Bosphorus, the Sea of Marmora, and the Dardanelles (Map: Europe, G 4). It is bounded on the north by European Russia; on the east by Caucasus; on the south by Asia Minor; on the west by European Turkey, Bulgaria, Rumania, and Russia. It has a length from east to west of about 750 miles, a greatest width of 380 miles, and covers an area (not including the Sea of Azov) of about 165,000 square miles. The Crimean Peninsula projects into the Black Sea from the north, forming the Sea of Azov and the Gulf of Perekop. The former is almost entirely cut off from the Black Sea, and is very shallow. The Black Sea is very deep; the floor of a great part of the central basin lies more than 6000 feet below the surface, and the greatest depths considerably exceed 7000 feet. The Black Sea receives the drainage of a large part of Central Europe through the Dnieper, Dniester, Bug, and Danube; of a considerable section of eastern Russia through the Don (which flows into the Sea of Azov); of the western Caucasus region through the Kuban and a number of smaller rivers; and of northern Asia Minor through the Tchuruk, the Yesil Irmak, the Kizil Irmak, and

the Sakaria. Tidal action is scarcely perceptible, but the sea-level rises and falls with the increase and decrease in volume of the tributary waters. There is a strong surface current setting toward the Bosphorus, and an undercurrent flowing in an opposite direction from the Aegean Sea. The latter current is heavy and saline, and to its agency is due the phenomenon that the waters of the Black Sea contain nearly 2 per cent. of salt, although constantly fed by large rivers. The Black Sea is visited by severe storms of both local and general character. On the north shore the southerly winds are most dreaded, while near the Bosphorus the so-called *boras* from the northeast are particularly violent. The climate, notwithstanding its southern position, is marked by considerable severity. In winter heavy fogs form, which obscure the sunlight and lend a dark aspect to the waters, thus partially justifying its name. The Black Sea is of great economic importance to the Russian Empire, as it furnishes an outlet for the extensive agricultural region of the south. Communication is maintained with the Caspian Sea by a railway from Baku to Batum, between which points there is also a pipe-line for the transport of petroleum. The principal ports on the Black Sea are Odessa, Poti, and Batum, in Russian territory, and Trebizond, in Turkey. There are no islands worthy of mention.

BLACK SILVER. A name given, on account of its color, to the mineral stephanite, which is a silver sulphantimonite found in Saxony, Mexico, Nevada, and elsewhere, and valued as an ore of silver.

BLACKSNAKE, or BLUE RACER. A common colubrine serpent (*Zamenis* [formerly *Bascanium*] *constrictor*), prevalent over all parts of the United States and the adjacent borders of Canada. It is slender in form, but rarely if ever exceeds 6 feet in length. The color of Eastern adults is uniform, lustrous pitch-black above and slate-color beneath, sometimes tinged with greenish white; lower jaw, chin, and sometimes edges of the upper-lip plates, white; tongue, black. Specimens from the West and Southwest exhibit a more or less bright olive-green, with the whole under surface greenish-white to bright yellow; hence the Western names 'blue racer' and 'green racer.' The young under about 18 inches long are variegated with dark blotches upon dusky olive, with light margins on the scales, especially along the sides. This is one of the most ubiquitous, numerous, and vigorous of American snakes. It is at home on the ground, where it runs with amazing swiftness; but it is also an expert climber, scaling large trees and searching their topmost branches, perhaps 100 feet above the ground, with as great ease as it explores bushes and rocks; it will leap more than its own length from tree to tree when in haste. It is also a swift and powerful swimmer, and seeks much of its food in swamps and along streams. Its food consists mainly of frogs, toads, other snakes, small mammals, birds and their young, and eggs, together with some insects. These are captured by a stealthy approach and swift stroke or chase, and more often by night than by day. It is very useful to the farmer in destroying great numbers of moles and mice, but also is the most indefatigable and successful searcher for birds' nests.

Objects of special animosity are the copper-head and rattlesnake, whose trail it follows by scenting, like a dog; and having overtaken one of these sluggish reptiles it leaps upon it, avoiding the stroke by its swiftness, catches it by the back of the neck, and wrapping itself about it, crushes, bites, and shakes the life out of it, after which it swallows it whole. "The constricting power of the blacksake," according to Cope (*Report United States National Museum*, 1898, p. 795), "is not sufficient to cause inconvenience to a man, but might seriously oppress a child. The pressure exercised by a strong individual wound around the arm is sufficient to . . . cause the muscles to ache, but it is easy to unwind the snake with the free hand and arm. The blacksake is harmless, and its bite, which it rarely inflicts, only amounts to a serious scratch. . . . It is courageous, and will sometimes attack, moving forward with the head raised one to two feet above the ground. It, however, quickly turns about and runs if the enemy preserves a bold front." Large ones are easily killed by quite small dogs, and among its enemies are all the carnivora, especially, perhaps, the skunk and badger. It is inclined to frequent a limited area continuously.

THE BLACKSNAKE.

a, top of head; b, under side; c, profile; d, face; e, arrangement of body-scales.

These serpents hide away in hollow stumps and underground dens at the approach of cold weather, where often several will entangle themselves into a ball for mutual comfort and remain torpid until spring. They breed during the summer, the female—which is larger and darker than the male—laying 15 or 20 eggs in a hollow in a sunny bank, or amid the dry dust of a decaying stump, or perhaps within an old dunghap, and remaining near until the young hatch, when she takes charge of them and defends them until they have reached a considerable size. This snake is tamable, but individuals differ in temperament and docility, some showing much intelligence and kindness, while others are irascible. Several other species of the genus belong to the Southwestern United States, Mexico, and the West Indies, and the Texan whipsnake (q.v.) is a near relation. The chain-snake is sometimes called 'mountain blacksake.' Other blackish serpents known as blacksakes include a colubrine of Jamaica (*Ocyophis ater*), the death-adders (q.v.) of Australia and Tasmania, and some others, notable for dark hues.

BLACK SNAKE-ROOT. See COHOSH.

BLACK-STONE'. A town in Worcester County, Mass., 2 miles northwest of Woonsocket, R. I.; on the Blackstone River and on the New York, New Haven and Hartford Railroad (Map: Massachusetts, D 3). It has a public library and extensive manufactures of cotton, woolen,

rubber, and felt goods. The government is administered by town-meetings held three times a year to pass on matters relating to appropriations, bridges, highways, etc. Settled about 1700, Blackstone was separated from Mendon in 1845, and named in honor of William Blackstone, the first settler on the site of Boston. Population, in 1890, 6138; in 1900, 5721. Consult *History of Worcester County* (2 vols., Boston, 1879).

BLACKSTONE, WILLIAM (?-1675). An early colonist in New England. He was the first white man to settle on the site of Boston, Mass. (1623), but sold his land in 1634 and became the first white settler within the limits of the present Rhode Island. Consult Winsor, *Memorial History*, Vol. I. (Boston, 1880).

BLACKSTONE, SIR WILLIAM (1723-80). A celebrated commentator on English law. He was the son of a silk mercer in London, and was born there July 10, 1723. At the age of 15, having obtained a scholarship from the Charterhouse School, where he was educated, he was sent to Pembroke Hall, Oxford. There he was fortunate enough to obtain a second scholarship, and remained till, in 1744, he was admitted a fellow of All Souls' College. During this period he divided his time between Oxford and London, attending the courts of law with the view of qualifying himself for his future profession. In 1746, at the age of 23, he was called to the bar, but failed to attract either notice or practice. In 1749 he was appointed recorder of Wallingford, in Berkshire; but in 1753 he went to Oxford, where he delivered a course of academic lectures upon the law of England. A few years later, a Mr. Viner, himself a legal author, having left a sum of money to endow a chair of English law in the University of Oxford, Blackstone was in 1768 appointed first Vinerian professor. The following year Blackstone returned to Westminster; and as the doctrines which he had taught as a lecturer had been such as to commend him to the notice of the Tory Government of that day, he obtained its patronage, and in 1761 was made a King's Counsel. Shortly after he was appointed principal of New Inn Hall, Oxford. Other honors followed fast, and he became successively member of Parliament, bencher of the Middle Temple, and Solicitor-General to the Queen. In 1765 Blackstone published the first volume of his lectures, and the remaining three volumes between that date and 1769. These lectures form his celebrated *Commentaries on the Laws of England*. His practice continuing to increase, he resigned, in 1766, his Oxford appointments. Four years later he was offered the solicitor-generalship, and after declining it was knighted and made a justice of the court of common pleas. The remaining years of his life were spent in the discharge of his duties as a judge. He died February 14, 1780, at the age of 57.

The fame of Blackstone rests entirely upon his *Commentaries*. His other literary works were inconsiderable, and his merits as a pleader or judge were not such as, of themselves, to have made his reputation outlive him. As a commentator he had many excellences. His style was in general clear and gracefully ornate, and his illustrations pleasing and felicitous. So long as he confined himself to exposition—to the accurate statement in scholarlike English of

what had heretofore lain buried in the cumbrous language of lawyers like Littleton—Blackstone was unsurpassed, and rendered an important service to the country. But he was ambitious of combining with this exposition the higher task of explaining the reasons for the law, as well as its merits and defects. For this survey of the law, from the legislator's point of view, he had not the requisite qualifications. His knowledge of English history was, as Hallam tells us, superficial, and his study of the philosophy of law had been imperfect. With the works, indeed, of Montesquieu and Beccaria he was acquainted; but the mode in which he quotes them shows that he had imbibed nothing of their spirit. The method followed in the *Commentaries* was as unscientific as could be imagined, and had not even the merit of originality. It was taken, with little alteration and no improvement, from Sir Matthew Hale's *Analysis of the English Law*. Possibly the haste with which the *Commentaries* must have been composed, being originally in the form of lectures, may have led to some of their imperfections. Notwithstanding its defects, the positive merits of the work—its systematic character, its comprehensiveness, the accuracy of its exposition, and the dignity and charm of its style—have made it the best-known, and in many respects the most influential treatise in English law. All subsequent commentaries, including that of Kent, have been modeled upon it, and it continued to be for a hundred years the foundation of all legal education in America. Numberless editions of the *Commentaries* have been printed, including those of Chitty, Christian, Cooley, Sharswood, and, last and best of them all, the admirable edition of Lewis published in 1898. As a century has elapsed since the *Commentaries* were composed, so many alterations are requisite to adapt them to the existing state of the law, that it may be said that their purpose has been served, and that they are now valuable chiefly as materials for history.

Consult: His Life, by Clitherow, prefixed to Blackstone's *Reports of Cases*, etc. (London, 1781); also his Life, in *The Law Magazine*, Vol. XV. (London, 1836); and his Life in *The Dictionary of National Biography*, Vol. V. (London, 1886).

BLACKSTONE EXAMINATION. See GLASGOW UNIVERSITY.

BLACK STONE OF MEC'CA. A sacred stone in the Kaaba at Mecca, of which legend tells that it was given by an angel to Abraham, and that it was originally white, but became blackened by the sins of mankind. The stone is probably a meteorite.

BLACKSTONE RIVER. A river of Massachusetts, rising near Worcester, flowing southeast through Rhode Island, and emptying into the Providence River, near Providence. In the upper part of its course the river flows through a series of small lakes and ponds. Below Pawtucket it is known as the Seekonk. It is the most important river of eastern New England south of the Merrimac, and is noted for the amount of power it furnishes, there being along its banks a succession of mills. It is about 50 miles long, and drains above Pawtucket an area of 458 square miles. It falls over 400 feet from Worcester to the sea.

BLACKTAIL. An American deer, notable for its black tail: (1) The mule-deer (q.v.). (2) The Columbian deer (*Odocoileus Columbianus*) of the coast region, from central California to Alaska. It is one-third smaller than the mule-deer, but has similar antlers. In summer it is reddish, but in winter brownish-gray, mottled with black, darkest along the spine. "Top of head chestnut and black; black stripe over the eyes, meeting on forehead; chin white, behind is a black patch; face gray; upper throat, posterior portion of under parts, and base of tail, white; rest of under parts mottled similarly to the back; chest sooty; legs dark cinnamon, inner side white; tail above black, . . . beneath, white" (Elliot). Alaskan specimens are paler. This deer exists only between the mountains and the coast, and frequents the forested foothills and valleys covered with chaparral, where it is tolerably abundant. Its habits are similar to those of the mule-deer. Consult: Farrell, in Shields's *Big Game of North America* (Chicago, 1890); Van Dyke, in *The Deer Family* (New York, 1902); and bibliography under DEER.

BLACKTHORN. See CRATÆGUS.

BLACK TIN. A name applied to tin ore ready for smelting. See TIN.

BLACK-VARNISH TREE. See MELANORRHÆA.

BLACK VOMIT. The dark matter vomited in yellow fever, usually a sign of fatal termination of the disease. It is in part coagulated blood. The fever itself is sometimes called the 'black vomit.' See YELLOW FEVER.

BLACK WAD. Native black *pyrolusite* or *wad*, so called by miners in Great Britain.

BLACKWALL. Part of Greater London. For Blackwall Tunnel, see LONDON.

BLACK WALNUT. See WALNUT.

BLACK WARRIOR (from the Choctaw name *Tuscaloosac*). (Map: Alabama, B 2). A river of Alabama, formed by the junction of several large streams in Walker County: Sipsey fork, coming in from the northwest; and Mulberry and Locust forks, from the northeast. It flows southwest, joining the Tombigbee River near Demopolis in the west central part of the State. It is navigable to Tuscaloosa, above which city it has a considerable fall and furnishes extensive water power.

BLACK WARRIOR, THE. An American merchant vessel, which, touching at Havana in February, 1854, on its way from Mobile to New York, was seized by the Cuban officials for violating the customs regulations of that port. Her cargo was confiscated, and her captain heavily fined, in spite of the protests of the American consul. The affair caused great excitement in the United States, especially in the South, and was the subject of a spirited correspondence between the American and Spanish governments. Had it not been for the strong feeling aroused throughout the North at that time by the debates over the Kansas-Nebraska Bill (q.v.), it is possible that the slave power, desirous of obtaining Cuba, would have succeeded in forcing the Administration to use this as a pretext for a war of conquest against Spain. Spain finally restored the confiscated cargo and remitted the captain's fine. For a good account of the negotiations over the *Black Warrior* incident, con-

sult Rhodes, *History of the United States from the Compromise of 1850*, Vol. II. (New York, 1893). Also, for much material on the incident, consult House Document No. 86, *Case of the Black Warrior and Other Violations of the Rights of American Citizens by Spanish Authorities* (Washington, 1854).

BLACK WATCH. A famous Highland regiment in the British Army. In 1688 the Earl of Athole was commissioned to organize a guard for the maintenance of peace in the Highlands. They were known as the *Freiceadan Dubh*, and wore a dark-colored tartan, which distinguished them from the *Saighdean Dearg*, or 'red soldiers,' as the regular troops were called. The different companies were engaged in the military police work, for which they were formed, until 1739, in which year they were regularly organized into the 42d Regiment of the Line. Their war history begins at Fontenoy, and few regiments in the British service excel them in the number and character of their battle honors. See **HIGHLANDERS**.

BLACK WATER. See **TEXAS FEVER**.

BLACKWATER. The name of several rivers and streams in Great Britain and Ireland. The most important are: (1) The Blackwater of Cork County, which rises in the west of Kerry County, flows past Millstreet, Mallow, Fermoy, Lismore, and Cappoquin, and enters the sea at Youghal Harbor (Map: Ireland, C 4). It has a course of 100 miles; is the seventh in size of the Irish rivers; abounds in salmon, and is navigable for barges for the last 15 miles of its course. (2) The Blackwater of Ulster, 50 miles long, which rises on the confines of Tyrone and Fermanagh counties, runs past Caledon and Charlemont, and falls into the southwest corner of Lough Neagh. (3) The Blackwater of Essex, England, 40 miles long, which rises in the northwest of the county, flows past Coggeshall to Maldon, where it becomes an estuary opening into the North Sea.

BLACK-WATER STATE (Nebraska). See **STATES, POPULAR NAMES OF**.

BLACKWELL, ANTOINETTE LOUISA BROWNE (1825—). An American minister and author, born at Henrietta, N. Y., and educated at Oberlin College, Ohio. In 1853 she was ordained pastor of the Congregational church at South Butler, N. Y., and discharged her parishes duties for two years, when ill health compelled her to resign. Afterwards she devoted herself to the exposition of philosophical views in literary form. Her principal works are: *Studies in General Science* (1869); *The Sexes Throughout Nature* (1875); *The Physical Basis of Immortality* (1876); and *The Philosophy of Individuality* (1893).

BLACKWELL, ELIZABETH (1821—). The first woman who ever obtained a medical diploma in the United States. She was born in Bristol, England. Circumstances induced the family to emigrate to New York, and they afterwards went to Cincinnati. Miss Blackwell in 1838, with two elder sisters, opened a boarding-school, which soon had a large attendance. She, however, chafed at the limitations which society had imposed on women. At length, in 1844, the school was given up, Miss Blackwell determining to become the medical apostle of her sex. After three years' further work as a teacher, during

which time she devoted the whole of her leisure to the study of medical and anatomical books, she went to Philadelphia, where she applied in vain for admission into the medical schools. Failing this, she entered on a course of private anatomical study and dissection and of midwifery, with Professor Allen and Dr. Warrington of Philadelphia. After strenuous efforts, she at last obtained admission to Geneva Medical College, Geneva, N. Y., in 1847. From this college she graduated with the highest honor in 1849. During the two years of her study, she conducted herself with a propriety and discretion that gained for her the esteem and respect of all her fellow-students. Her 'brilliant example,' as the president called it, had stimulated them to greater effort, and their general conduct and attainments were better than usual. Shortly after her graduation, she visited Europe, in order to prosecute further her medical studies. In Paris she was told that it would be impossible for her to gain entrance to the schools or hospitals there, unless she adopted male attire; a suggestion repugnant to her taste, and to the great object she had in view—that is, the recognition of female physicians. After much perseverance, she was at length admitted into the Maternité, and was permitted to visit other hospitals. After studying at Saint Bartholomew's Hospital, and the Woman's Hospital, London, she returned to New York in 1851, and there established herself in practice. At first difficulties were thrown in her way by the refusal of physicians to meet her in consultation; but these were overcome, and she was soon established in excellent practice. In 1852 she delivered a series of lectures to women, on health and physical development, and published a work entitled *The Laws of Life, Considered with Reference to the Physical Education of Girls*; and in 1853 established the New York Infirmary for Women and Children, which proved so successful that she was induced, in coöperation with her sister Emily, to found, in 1868, The Woman's Medical College of the New York Infirmary. In 1868 she settled in London, and became connected with the Women's Medical College there. Her published works include: *Counsels of Parents on the Moral Education of their Children in Relation to Sex* (1879); *Corruptions of Neo-Malthusianism: the Influence of Women in the Medical Profession* (1890); and *Pioneer Work in Opening the Medical Profession to Women* (1895).

BLACKWELL, THOMAS (1701-57). A scholar of some eminence, born in Aberdeen, August 4, 1701; studied Greek and philosophy in Marischal College, and took the degree of M.A. in 1718. In December, 1723, he was appointed professor of Greek in Marischal College, and in 1737 published anonymously at London an *Inquiry into the Life and Writings of Homer* (2d ed. 1746), and shortly afterwards, *Proofs of the Inquiry into Homer's Life and Writings*. In 1748 he published, also anonymously, *Letters Concerning Mythology*. The same year he was made principal of Marischal College; and at the commencement of the session 1752, on his recommendation, a new order in teaching the sciences was introduced into the college. In 1753 he published the first volume of his *Memoirs of the Court of Augustus*. The second volume appeared in 1755, and the third, left unfinished by him, was completed by John Mills in 1764. He died March 8, 1757.

BLACKWELL'S ISLAND. A narrow, rocky island in the East River, forming part of New York City, between Manhattan Island and Long Island, about $1\frac{1}{2}$ miles long by one-eighth of a mile wide (Map: New York City, G 8). It is used exclusively for the penal institutions and hospitals under charge of the city of New York. See NEW YORK CITY.

BLACKWOOD. See ACACIA; KINGWOOD.

BLACKWOOD, FREDERICK TEMPLE HAMILTON-TEMPLE (1826-1902). See DUFFERIN AND AVA, MARQUIS OF.

BLACKWOOD, WILLIAM (1776-1834). A distinguished Edinburgh publisher, the originator of *Blackwood's Magazine*. He was born in Edinburgh, November 20, 1776. After serving his apprenticeship to the bookselling business in his native city, and prosecuting his calling in Glasgow and London, he settled in Edinburgh as a bookseller—principally of old books—in 1804. On April 1, 1817, at which time he had become a publisher on his own account, he issued the first number of *Blackwood's Magazine*. The literary ability displayed in this periodical was so much in advance of the monthly magazines then existing that, after a little disappointment at first, it soon became a great success. Its remarkable popularity was sustained by the papers of John Wilson, J. G. Lockhart, James Hogg, and other writers, whom Blackwood had the liberality and tact to attract to his standard. Overwhelming its political and literary opponents, now with the most farcical humor, and now with the bitterest sarcasm—sometimes with reckless injustice—the magazine secured for itself a prodigious reputation, more particularly among the Tories, of whose political creed it has always been a resolute adherent. William Blackwood himself, who added literary tastes and acquirements to his profession of bookseller, was the chief manager of his magazine, and conducted the whole of the correspondence connected with it until his death, which took place September 16, 1834. The publishing business has been greatly extended by the descendants of the founder. Consult Oliphant, *William Blackwood and His Sons* (Edinburgh, 1897-98).

BLACKWOOD RIVER. A river in West Australia, which enters Flinders Bay, just east of Cape Leeuwin, in latitude $34^{\circ} 14'$ S. and longitude $115^{\circ} 12'$ E. (Map: Australia, B 5). It flows through the counties of Durham and Nelson, first to the west, and then to the south, traversing a district of wood and pasture. It is navigable for boats to a distance of 25 miles from the sea.

BLACKWOOD'S MAGAZINE. A famous magazine founded by the Edinburgh publisher, William Blackwood, in 1817, subsequently conducted by his son, John Blackwood, and still one of the important English periodicals in literature, philosophy, and politics.

BLADDER, URINARY (probably akin to the verb *to blow*). A bag which receives the urine in man and animals after it is secreted by the kidneys. The bladder-wall consists of three coats—a lining mucous membrane, a middle muscular coat, and an outer coat which is serous, where the organ is covered over by peritoneum and fibrous throughout the rest of its extent. The mucous membrane of the bladder is lined

with stratified squamous epithelium (see EPITHELIUM), and contains small racemose glands (see GLAND) and lymph-nodules. The muscle of the middle coat is of the involuntary type, and consists of inner and outer layers which are longitudinal, and a middle circular layer. The serous coat consists of a connective-tissue layer covered by a layer of flat endothelial cells. Where the serous coat is wanting, a fibrous layer covers the muscular coat and blends with the surrounding connective tissue.

The average capacity of the bladder is one pint. The shape of the bladder is somewhat conical, the apex being upward, and the anterior part of the base constricted at the commencement of the urethra, forming the neck of the bladder. On each side, rather below its middle, open the two ducts from the kidneys (the ureters); an imaginary line drawn between them, and from each end of this line others drawn to the neck of the bladder, form an equilateral triangle. In this space, which is called the *trigonom*, the mucous membrane is not thrown into folds, but is smooth and very sensitive; the slightest pressure upon it gives rise to a desire for micturition. Children's habits of emptying their bladders when sleeping on their backs are supposed to be due to the urine accumulating in this part, as is also the distressing pain of stone. The bladder is situated in the pelvis, in adults, behind the pubes, in front of the rectum in the male and the uterus in the female, but much higher in the young. It is kept in position by four true or membranous ligaments, and false ligaments formed of folds of the peritoneum. In the male in front of the neck of the bladder lies the prostate gland, surrounding the first part of the urethra (q.v.). Like all cavities lined by mucous membrane, the bladder is subject to catarrhal inflammation, accompanied by an increased secretion of mucus, with fermentation, rendering the urine turbid, causing a frequent and painful desire to micturate, and constitutional disturbances. The symptoms may be relieved by hot applications, along with opiates, antacids, and diuretics. If there is much mucus or blood or decomposed urine in the bladder, it may be washed out with a solution of boric acid, or of creolin, or a weak mineral acid, in some cases. If there is any known cause for this inflammation, as a stone, it must be removed.

Some persons are frequently troubled with a desire to pass water; and many in this condition never effectually empty their irritable bladders, always leaving a portion which keeps up the irritation. This condition frequently arises from the habit of retaining the urine so long as to over-distend and weaken the muscular walls of the bladder; but it may be induced by general debility, the irritation of worms, cold, or an irritating state of the urine itself, or by nervousness, as in candidates for examination, etc. The best treatment is tonics, and soothing the irritability with sedatives. When this irritability is nocturnal, it may be from the patient lying on the back, as explained above; it generally occurs in delicate children, and is more a habit than a disease.

Paralysis of the bladder may be the result of accident, or disease of the nervous centres, or over-distention. In this condition the urine accumulates and dribbles away, and must be drawn off by the catheter (q.v.). This dribbling, or in-

continence, must be distinguished from irritable bladder, as it is in nearly every case the sign of a distended bladder. *Retention* of the urine may be caused by mechanical obstacles to its exit, by paralysis, or by an absence of volitional power over the muscles. This last is termed *hysterical retention*, and is common in young girls, in persons suffering from seasickness, from nostalgia, from operation or from accident, such as a broken leg, etc. The power generally soon returns. Any long-continued difficulty in passing water is generally followed by a thickening of the walls of the bladder itself, or *hypertrophy*. The mucous membrane may form pouches in these thickened walls—a condition which is called *sacculated bladder*; cancerous diseases and tubercle may also attack this organ.

The bladder is liable to be ruptured by accident from without; as, for instance, by a blow. As this accident is usually fatal, prompt surgical aid must be secured.

BLADDER CAMPION. See **SILENE**.

BLADDERNUT (for derivation see below), *Staphylea*. A genus of plants, the type of a small natural order, *Staphyleaceæ*. (See **SPINDLE-TREE**.) Only about seven species are known, which are found in very different climates, and scattered over the world. They are mostly small trees of rather elegant appearance. The seeds contain a considerable quantity of a fixed oil, which is slightly purgative. The common bladder-nut (*Staphylea pinnata*) is a native of the east of Europe, and of temperate parts of Asia, which has been admitted into the British flora, but has in all probability been introduced as an ornamental tree. It is frequently planted in shrubberies, as is also *Staphylea trifolia*, a North American species with ternate leaves. The wood of both is firm and white, well suited for the purposes of the turner. The seeds may be eaten, but act as a mild aperient. The flower-buds are pickled as capers. The name bladder-nut has reference to the curious inflated membranous capsule, and the hard, bony 'testa' of the seed. The name *Staphylea* is from the Gk. *σταφύλη*, *staphylē*, a bunch of grapes, and has reference to the racemed flowers.

BLADDERWORM. An encysted larval tapeworm. See **HYDATID** and **TAPEWORM**.

BLADDERWORT (so named from the vesicles by means of which the flowers float above the water), *Utricularia*. A genus of plants of the natural order *Lentibulariaceæ*, containing a large number of species, the bright blossoms of which, along with those of water-lilies, etc., adorn the surface of lakes, ditches, and marshes in almost all parts of the world. They are particularly abundant within the tropics, and many are natives of Australia. In the United States are found a dozen or more species with yellow, violet, or purple flowers. Great Britain has only three species, all of which have yellow flowers. These plants are very interesting from the provision made for the expansion of their flowers above water, although the whole plant is ordinarily submerged. The stems and leaves are furnished with numerous little bladders or vesicles, which are filled with water till it is necessary that the plant should rise for the expansion of the flowers, when they become filled with air; and this, again, gives place to water after flowering is over, so that the seeds are

ripened at the bottom. The bladders, at least of *Utricularia vulgaris*, have an orifice closed by a very thin elastic valve opening inward. Aquatic insects sometimes enter them, are imprisoned, and the plant utilizes the products arising from their decay. See Plate of **BIGNONIA**, etc.

BLADENSBURG. A town in Prince George County, Md., 6 miles northeast of Washington (Map: Maryland, K 5). Here, on August 24, 1814, a British force of 5000 men, under General Ross and Admiral Cockburn, with a loss of about 500, defeated 7000 untrained Americans under General Winder, who, at the first attack, with a loss of only 76, fled in wild disorder, leaving Washington open to capture. It was formerly a noted dueling-ground; and here, in 1820, Commodore Decatur was mortally wounded by Commodore Barron. Population, in 1890, 503; in 1900, 463. Consult articles on the battle and on the Bladensburg dueling-grounds in the *Magazine of American History*, Vols. XV. and XXV. (New York, 1877-93).

BLAENAVON, blā-nā'von (Cymr., Celt. *blaene*, source + *avon*, river). A coal-mining town and railway junction in Monmouthshire, England, on the Avon, 4½ miles southwest of Abergavenny (Map: England, C 5). Population, in 1891, 11,400; in 1900, 10,900.

BLAEU, blou, **BLÆUW**, or **BLAUW**. A family of learned Dutch publishers. The founder of the firm was Willem Janszoon Blaeu (1571-1638), a mathematician, born at Alkmaar, Holland. He was a pupil in astronomy of Tycho Brahe, and secured a considerable reputation by publishing terrestrial and celestial globes, excelling in beauty and accuracy everything that had preceded them. The *Novus Atlas* (6 vols., 1634-62) is his principal work. His sons Cornelius (died 1650) and Joan (died 1673) carried on his business together until the death of Cornelius. Their *Atlas Major* (11 vols., 1662) is a splendid work, and the maps are valuable from the light they throw on local history. Two of Joan's sons carried on their father's business until about 1700. Some of their classical publications, especially *Cicero's Orations* (1699), are still highly prized. Consult Baudet, *Leven en werken van Willem J. Blaeu* (Utrecht, 1871).

BLAGOVIESHTCHENSK, blā'gō - vyēsh'-chēnsk (Russ., 'City of the Annunciation'; so named from the Church of the Annunciation). The capital of the Siberian region and Governor-Generalship of the Amur, situated on the left bank of the Amur, at its junction with the Seya, on the Manchurian frontier, and about 5000 miles east of Moscow (Map: Asia, M 3). It is one of the most prosperous and busy towns in East Siberia, and owes its prosperity chiefly to the gold-mines in the vicinity. Only a military outpost in 1856, it became in 1858 the capital of the Amur region, and is at present of considerable commercial as well as strategical importance. It was attacked by the Chinese in July, 1900. In 1868 it had but 3344 inhabitants; in 1889, 20,212, and at the census of 1897, 32,600 inhabitants.

BLAICKIE, blā'ki, WILLIAM GARDEN (1820-99). A Scottish divine and author. He was born at Aberdeen, a son of James Blaikie, an advocate, and provost of Aberdeen from 1833 to 1836. Educated at the universities of Aberdeen and Edinburgh, he was ordained minister of the

Presbyterian congregation of Drumblade in 1842, but the next year he seceded and joined the Free Church of Scotland. From 1844 to 1868 he was minister at Pilrig in Leith Walk, Edinburgh, where he took a leading part in founding and managing model dwellings for the poor. From 1868 to 1897 he was professor of pastoral theology in New College, Edinburgh. In 1892 he was chosen moderator of the General Assembly of the Free Church. He was also one of the promoters and for several years the president of the Pan-Presbyterian Alliance, which holds councils in Great Britain and America. From the University of Edinburgh he received the degree of D.D. (1864), and from the University of Aberdeen that of LL.D. (1872). He died at North Berwick. Blairie edited *The Free Church Magazine* (1849-53); *The North British Review* (1860-63); *The Sunday Magazine* (1873-74); and *The Catholic Presbyterian* (1879-83). His *Six Lectures to the Working Classes* (1849) and *Better Days for the Working People* (1863), were widely popular. His best work is *The Personal Life of David Livingstone* (1880). Among his numerous other books are: *Bible History* (1859); *Outlines of Bible Geography* (1861); *Heads and Hands in the World of Labor* (1865); *The Work of the Ministry* (1873); *Leaders in Modern Philanthropy* (1884); *Heroes of Israel* (1894); *Thomas Chalmers* (1896); and *Memoir of David Brown* (1898).

BLAINE, JAMES GILLESPIE (1830-93). An eminent American statesman and political leader. His great-grandfather was Ephraim Blaine (1741-1804), an officer on the Patriot side in the American Revolution, who served from 1778 to 1782 as Commissary-General of the Northern Department. James was born, of Scotch-Irish parentage, at Brownsville, Pa., on January 31, 1830, and was educated in the common schools and at Washington College, Pa., where he graduated in 1847. After spending several years as a teacher, first in the Western Military Institute, at Blue Lick Springs, Ky., and subsequently in the Pennsylvania Institution for the Blind in Philadelphia, he became in 1854 one of the editors of the *Kennebec (Maine) Journal*; and three years later, although retaining his home at Augusta, undertook the editorship of the *Portland Advertiser*, an influential daily. In 1858 he was elected to the Legislature by the Republicans, and remained in that body four years, during two of which he served as Speaker. In 1859 he became Chairman of the Republican State Committee—a position of leadership in local politics which he retained until 1881. His rapid rise to influence and prominence in the State made natural his election, in 1862, to Congress, where he served for seven successive terms, during three of which he was Speaker of the House of Representatives. He was a pronounced Republican and a vigorous supporter of the Administration during the war. He nevertheless opposed the issue of greenbacks, and successfully urged an important modification to the Stevens plan of reconstruction. (See RECONSTRUCTION.) As Speaker he attained unusual success, and his conduct was uniformly marked by great readiness and ability. His course in this position, however, provoked acute controversies, the effect of which was seen when the Democrats secured control of the House in 1875, and when Blaine's impassioned opposition to the in-

clusion of Jefferson Davis (q.v.) in a general amnesty, on the ground of the latter's alleged complicity in the "gigantic murders and crimes of Andersonville," was followed by a vigorous effort of the Democrats to connect him with the Pacific Railroad frauds. This culminated in the highly dramatic incident of June 5, 1876, when the accused produced in the House of Representatives the 'Mulligan Letters' (q.v.), and offered what was considered an ample vindication of his course. The incident continued for a decade to be a cause of disturbance within the Republican Party, but its immediate effect was the enhancement of Blaine's prestige, and his strong and almost successful candidacy for the Presidential nomination. Upon the seventh ballot he received 351 votes, when a combination of all his opponents upon Hayes effected his defeat. The Electoral Commission (q.v.), which was created by the two Houses to decide the contested election, was vigorously opposed by Blaine on the ground that the powers conferred upon it exceeded those of Congress itself. Having been elected to the Senate in 1876, he worked against the Bland Silver Bill, opposed the unrestricted immigration of the Chinese, and favored strongly the policy of subsidizing various industries. He continued to occupy such a position of leadership that in 1880 he was again a candidate for the Republican nomination, and became in the convention the most formidable opponent of Grant, who had already served two terms as President. The defeat of the third-term candidate appearing to a majority of the delegates to be the most important matter, and the nomination of Blaine seeming impossible without causing serious discord, the adherents of Blaine and John Sherman united on the thirty-sixth ballot in throwing the nomination to Garfield, who defeated General Hancock in the ensuing election. Upon Garfield's inauguration, Blaine became Secretary of State; but the death of the President being followed by a reorganization of the Cabinet, he resigned the position in December of the same year. After his sudden retirement from the public service he devoted his time largely to the preparation of his *Twenty Years of Congress*, the first volume of which appeared in 1884, attracted widespread attention, and for the most part met with a favorable reception.

Again, in 1884, he was a candidate for the Presidential nomination, and this time was successful, although the bitterness of opposition within the party was such that in some States, notably in New York, Connecticut, and Massachusetts, large numbers of independent Republicans voted in the ensuing election for the Democratic nominee, Grover Cleveland, whose record as Governor of New York made it possible for him, by a small plurality, to carry that pivotal State and so secure the election, after a campaign remarkable for personal abuse and bitterness. It has been claimed that the State of New York, and consequently the national election, was lost to Blaine chiefly as the result of a persistent misrepresentation of his attitude toward Roman Catholics, consequent upon an unfortunate phrase, 'Rum, Romanism, and Rebellion,' used by a Republican clergyman, the Rev. Samuel D. Burchard (q.v.), in speaking of the Democratic Party; but the effect of the phrase has doubtless been considerably exaggerated. The leisure enforced upon Blaine by his defeat made

possible the preparation of the second volume of his *Twenty Years of Congress* (1886), and of a volume of *Political Discussions* (1887).

His name was again before the Republican convention of 1888, but was early withdrawn, and upon Harrison's accession to the Presidency, Blaine was again placed in charge of the State department and was enabled to develop a line of policy proposed in 1881, but at that time reversed by his successor. Not only did he adopt a vigorous course with reference to the seal-fisheries, but his especial energy was devoted to plans for establishing close commercial relations with the South American States and for securing arrangements of reciprocity in trade with other foreign nations. He resigned in June, 1892, on the approach of the nominating convention, before which it was expected that both Blaine and Harrison might be candidates. Blaine's name was presented, but with no success. After a protracted illness, he died, January 27, 1893. Consult Gail Hamilton, *Biography of James G. Blaine* (Norwich, 1895).

BLAINVILLE, blān'vél', HENRI MARIE DUCROTAY DE. See DUCROTAY DE BLAINVILLE.

BLAIR. A city and county-seat of Washington County, Neb., 25 miles north by west of Omaha, on the Chicago and Northwestern, and the Chicago, Saint Paul, Minneapolis and Omaha railroads (Map: Nebraska, H 2). It contains a Danish college. The city is the market for the agricultural products and live stock of the vicinity. Population, in 1890, 2069; in 1900, 2970.

BLAIR, ANDREW ALEXANDER (1846—). An American chemist, born in Woodford County, Ky. He studied at the United States Naval Academy, and was made an ensign in the navy, but afterwards devoted himself to analytical chemistry, especially analysis of iron and its ores. From 1875 to 1878 he was employed in testing iron and steel for the United States Government at the Watertown Arsenal, and from 1879 to 1881 acted as chief chemist to the United States Geological Survey and the Tenth Census. At the termination of this engagement he devoted himself to the practice and improvement of the methods of technical analysis. Besides a number of original papers and reports on various special subjects of metallurgy, he wrote *The Chemical Analysis of Iron*.

BLAIR, FRANCIS PRESTON (1791-1876). An American journalist and politician, born in Abingdon, Va. He graduated at Transylvania University, Ky., in 1811, and soon afterwards became prominent in State politics. He strongly supported Henry Clay for the Presidency in 1824, but in 1828 became an enthusiastic adherent of Andrew Jackson. In 1830 he went to Washington, on Jackson's invitation, to assume the editorship of the *Globe*, which was the official organ of the Democratic Party until 1845, when President Polk forced Blair's resignation. Blair supported Van Buren in 1848 and Pierce in 1852, but afterwards joined the newly organized Republican Party, and in 1856 presided over the Pittsburg Convention. In 1860 he was an active supporter of Abraham Lincoln. In December, 1864, he made an unofficial visit to Richmond, and proposed to Jefferson Davis and others who were influential in the Confederate Government the arrangement of a peace on the basis of a

joint campaign by the Northern and Southern armies against Maximilian in Mexico. This proposal, though wholly unofficial, led to the famous peace conference of February 3, 1865, at Hampton Roads between President Lincoln and the Confederate representatives, Stephens, Hunter, and Campbell.

BLAIR, FRANCIS PRESTON, JR. (1821-75). An American lawyer, politician, and soldier, born in Lexington, Ky. He graduated at Princeton in 1841, was admitted to the bar in 1843, and removed to Saint Louis to practice law. In the Mexican War he served in the United States Army as a private. Afterwards he was editor for a time of the *Missouri Democrat*, became prominent in State politics, was a member of the Missouri Legislature from 1852 to 1856, and after 1856 served for several years in Congress as a Republican. At the outbreak of the Civil War he was the leader of the Union Party in Missouri, and by his energy, tact, and political sagacity was largely instrumental in preventing that State from joining the Confederacy. In April, 1861, he entered the Federal Army as a colonel, and before the close of the following year had risen successively to the rank of brigadier-general (August, 1862) and of major-general (November 20, 1862). He led a division under Sherman at Vicksburg in 1862-63, commanding the assault upon Chickasaw Bluffs (December 29, 1862); and in 1864 took a prominent part, as division commander and temporarily as commander of the Seventeenth Corps, in the famous march to the sea. He was nominated as Collector at Saint Louis and as Minister to Austria by President Johnson in 1866, but, owing to his views on reconstruction, the Senate refused to confirm either appointment. Afterwards he joined the Democratic Party, was its candidate for Vice-President in 1868, and from 1870 to 1873 was a member of the United States Senate. He published *The Life and Public Services of Gen. William O. Butler* (1848).

BLAIR, HENRY WILLIAM (1834—). An American politician and lawyer, born in Hampton, N. H. He received an academic education, was admitted to the bar in 1859, and was prosecuting attorney for Grafton County in 1860. During the war he was lieutenant-colonel of the Fifteenth New Hampshire Volunteers. He was a member of the New Hampshire House of Representatives in 1866; of the State Senate, from 1867 to 1868; and Republican Representative in the Forty-fourth and Forty-fifth Congresses. From 1879 to 1891 he was United States Senator. He was appointed Minister to China in 1891, but that Government declined to receive him because of a bill which he had introduced for the purpose of restricting Chinese immigration. A bill to prohibit the sale and manufacture of liquors placed him in the van of the temperance ranks. The Blair Common-School Bill, appropriating \$77,000,000 to the States in proportion to their illiteracy, was another of his measures.

BLAIR, HUGH (1718-1800). A Scottish divine and man of letters. He was born in Edinburgh, April 7, 1718. He was educated at the university of his native city, where he attracted the attention of his instructors by an *Essay on the Beautiful*. In October, 1741, he was licensed to preach by the presbytery of Edinburgh; and after occupying the churches of

Colesie in Fifeshire, Canongate Church in Edinburgh, and Lady Yester's, he was promoted in 1758 to the highest position attainable by a Scotch clergyman—one of the charges of the High Church, Edinburgh. His discourses, which display little power or originality of thought, were yet greatly admired on account of their polished style. In 1759 Blair commenced a series of lectures on Composition at the university; and three years afterwards, a new chair of rhetoric and belles-lettres, with a salary of £70 a year, being created by the Crown, Blair was made professor. He held this appointment until 1783, when he resigned; and in the same year published his *Lectures*, which obtained a reputation far beyond their merits, and one that time has by no means sanctioned. His first volume of sermons, which appeared in 1777, proved a great success. George III. showed his appreciation of them by bestowing on Blair, in 1780, a pension of £200 a year. Opinion about their merits has much changed since the date of their publication; they are now considered as moral essays rather than sermons. Blair's critical acumen was not great; he strenuously defended the authenticity of Ossian's poems. He died December 27, 1800. For his life, consult Finlayson (London, 1801), and Hill (Edinburgh, 1807).

BLAIR, JAMES (1656-1743). A Colonial clergyman and educator, the founder and first president of William and Mary College in Virginia. He was born in Scotland, graduated at the University of Edinburgh in 1673, removed to England in 1682, and in 1685 was sent to Virginia as a missionary of the Church of England. He was minister successively at Henrico City, Jamestown, and Williamsburg, and after 1689 was Commissary of Virginia, "a very weighty and creditable post," the highest ecclesiastical position, at that time, in the colony. In this capacity he did much to raise the character of the provincial clergy and to rectify many clerical abuses. In 1690, at a time when there was only "one privately endowed school and a few old field schools" in the colony, he took up the work of founding a college in Virginia, and in the same year began soliciting subscriptions for an institution which was to provide for "the Education of our Youth, a constant supply of our Ministry, and perhaps a foundation for ye Conversion of our neighboring Heathen to the Christian Faith." In 1691 he went to England, and there, in 1693, secured a charter for the College of William and Mary. On his return he worked indefatigably to secure the immediate erection of buildings, and until his death was president of the college. After 1693 Blair was also a member of the Council of Virginia, of which he was for some time president. In this capacity he had rancorous disputes with Governors Edmund Andros, Francis Nicholson, and Alexander Spotswood, and by his representations to the home Government was instrumental in securing the removal of each in turn. It has been said of Blair that he did more than any other one man for the intellectual advancement of Virginia during the Colonial period. He collaborated with Henry Hartwell and Edward Chilton in the preparation of a valuable work, entitled *The Present State of Virginia and the College* (London, 1727), probably the best extant account of Virginia in the latter part of the Seventeenth Century, and published an elaborate

series of sermons on *Our Saviour's Divine Sermons on the Mount* (1740), which have been much commended by theologians. Consult D. E. Motley, "Life of Commissary James Blair, Founder of William and Mary College," in Series 9, No. 10, of *Johns Hopkins University Studies* (Baltimore, 1901).

BLAIR, JOHN INSLEY (1802-99). An American capitalist and philanthropist. He was born in Warren County, N. J., and from 1811 to 1819 worked in a small store in Hope, N. J. Later he removed to Blairstown, became interested in the Oxford Iron Furnace in Warren County, and in 1846 was associated with the Scranton Brothers in the first attempt to manufacture iron with anthracite coal. To facilitate the transportation of the company's output, he and his associates constructed the road which subsequently became known as the Delaware, Lackawanna and Western. In later life he was connected, either as builder or director, with twenty railroads, and at one time was said to own more miles of railroad than any other man in the world. He gave Blair Hall and about \$70,000 to Princeton College, where he established a professorship; helped to rebuild Grinnell College, Iowa; gave nearly \$90,000 to Lafayette College, and about \$600,000 to the Presbyterian Academy at Blairstown, and contributed toward building over one hundred churches in the towns laid out along the lines of his railroads.

BLAIR, MONTGOMERY (1813-83). An American lawyer and politician, the son of Francis P. Blair, Sr. He was born in Franklin County, Ky., graduated at West Point in 1835, and served for several months in the first Seminole War. He then resigned from the service, studied law, was admitted to the bar in 1839, and began to practice in Saint Louis. He was for a time United States district attorney for Missouri, was mayor of Saint Louis in 1842-43, and from 1843 to 1849 was judge of the Court of Common Pleas. In 1852 he removed to Maryland, where he devoted his attention as a lawyer chiefly to important cases before the United States Supreme Court, and quickly became prominent as a Democrat in State politics. From 1855 to 1858 he was United States solicitor in the Court of Claims, and in 1857 was the counsel for the defendant in the celebrated Dred Scott Case (q.v.) and made an able argument in support of his side. Strongly disapproving of the attitude of the Democratic Party toward the repeal of the Missouri Compromise in 1854, he joined the newly organized Republican Party in 1856, and in 1860 was Chairman of the State Republican Convention. In 1861 he became a member of Lincoln's Cabinet as Postmaster-General, and in this capacity served with great ability until September, 1864, when he resigned. His term is notable in the history of the department from the fact that during it money-orders first came into use, and such improvements as free delivery in cities and the sorting of the mails on postal cars were introduced. After the war, Blair returned to the Democratic Party, and in 1876-77 was conspicuous as a supporter of Tilden in the famous Tilden-Hayes controversy.

BLAIR, ROBERT (1699-1746). A Scottish clergyman and writer. He was born in Edinburgh, was educated at the university there and in Holland, was licensed to preach in 1729, and from

1731 until his death was settled at Athelstaneford in East Lothian. Besides an elegiac poem and several paraphrases of Scripture which have been totally forgotten, he wrote the forcible but strikingly lugubrious poem of 767 lines, entitled *The Grave*, which, first published in 1743, enjoyed considerable popularity and was frequently reprinted.

BLAKE, EDWARD (1833—). A Canadian statesman. He was born in Ontario, Canada, graduated at the University of Toronto, was called to the bar in 1856, and soon rose to the first rank among chancery practitioners. In 1867 he was elected to both the Ontario and Dominion Parliaments, and in the former House became the leader of the Liberal Opposition. In 1871 he became Premier of Ontario, but soon resigned. He was Privy Councillor in 1874, and Minister of Justice in 1875. After the return of the Conservatives to power, he became the leader of the Liberal Party in 1880; was elected to the British Parliament from South Longford, Ireland, in 1892, and was appointed to the judiciary committee of the Privy Council in 1896.

BLAKE, ELI WHITNEY (1795-1886). An American inventor. He was born in New Haven, Conn., and studied law at Yale. He assisted his uncle, Eli Whitney (q.v.), in the management of the gun-factory at Whitneyville, until the death of the latter in 1825, when he succeeded to the business. In partnership with his brothers he established a factory at Westville in 1836 for the manufacture of articles of house-furnishing hardware. The most useful invention of Blake, however, is the stone-breaking machine named after him—a device now extensively used for crushing stones and other hard substances. Among the numerous papers contributed by him to scientific publications are the following: *The Flow of Waste Fluids Through an Orifice*; *The Form, Formation, and Movement of Sonorous Waves*; *Original Solution of Several Problems in Aérodynamics* (1882).

BLAKE, FRANCIS (1850—). An American inventor, born at Needham, Mass. In 1866-79 he was connected with the United States Coast Survey, and in 1878 invented the transmitter for telephone instruments, which, known under his name, has become the most extensively used throughout the world.

BLAKE, JAMES HOPWOOD (1843-1901). An English geologist and surveyor, born in London. He was educated there at King's College, and apprenticed to the civil engineer Brereton, under whose direction he was for several years engaged in railway engineering and construction in Cornwall and Southern Wales. In 1868 Blake joined the Geological Survey of Great Britain, and was commissioned to prepare large scale maps of certain portions of southern England. He surveyed parts of Somerset, Suffolk, and Norfolk, and studied the phenomena of the drift deposits of those regions. Several contributions, embracing the results of his observations on the drift and the Mesozoic formations, have been published in the *Memoirs of the Geological Survey of the United Kingdom* and in the *Geological Magazine*.

BLAKE, LILLIE DEVEREAUX (1835—). An American woman suffragist and reformer. She was born in Raleigh, N. C., and was educated in New Haven, Conn. She married, in 1855,

Frank G. Q. Unsted, a Philadelphia lawyer, who died in 1859, leaving her with two children to support. She turned her attention to literary work, her first story, *A Lonely House*, appearing in the *Atlantic Monthly*. In the next few years she completed two successful novels, *Southwold* (1859) and *Rockford* (1862). In 1866 she married Grinfill Blake, a wealthy New York merchant. She was one of the active promoters of the movement that resulted in the founding of Barnard College, and was prominent as a speaker on educational topics. She also identified herself with the woman's suffrage movement, and has delivered many addresses on the subject throughout the country. She was president of the New York State Woman's Suffrage Association from 1879 to 1890, and of the New York City Woman's Suffrage League from 1886 to 1900. She was largely instrumental in securing the passage in 1880 by the New York Legislature of the law permitting woman's suffrage in school elections, and was the author of the law providing for matrons in the police stations, passed in 1891, and of that requiring storekeepers to provide seats for saleswomen. In addition to the books mentioned, her writings include: *Fettered for Life* (1874), a novel dealing with the woman's suffrage question; *Woman's Place To-day* (1883), lectures delivered in reply to a series of Lenten sermons on "Woman," by Rev. Morgan Dix; and *A Daring Experiment* (1894).

BLAKE, ROBERT (1599-1657). An English soldier and admiral of the Commonwealth. The eldest of twelve sons of a merchant, he was born at Bridgewater, Somerset, in August, 1599. He studied at Oxford from 1615-25, taking his degree of M.A. in 1623 at Wadsworth College. When the Civil War broke out, he raised a troop in Somersetshire, and narrowly escaped hanging for prolonging the defense of Bristol, when the Governor had capitulated. Parliament subsequently appointed him lieutenant-colonel, and by his obstinate defense of Lyme with five hundred men against Prince Maurice's five thousand, he seriously damaged the reputation of that warrior, who retired in disgust. In 1644 he surprised Taunton, of which place he was made governor, and gave proof of no mean military skill by defending the place against an overwhelming force, until the town was little better than a heap of ruins, when the siege was raised. In 1649, in conjunction with two other officers of equal rank, he was appointed general of the sea, the two services, military and naval, at that time not being distinct. This was Blake's true sphere. After an exciting hide-and-seek chase of several months, in 1651 he destroyed the squadron of Prince Rupert, which had sought safety in the Tagus, and forced the Royalists to surrender Guernsey, Jersey, and the Scilly Isles. In March, 1652, he was made sole admiral of the fleet for nine months, and during this year fought four engagements with Dutch fleets under Tromp, De Ruyter, and De Witt. In the first, on May 19, the Dutch retreated under cover of darkness, with the loss of one man-of-war captured, and another sunk. In the next engagement, a squadron of 12 ships, sent to protect the herring-vessels from the attacks of Blake, were captured; and in the third, on September 28, 3 Dutch vessels were destroyed, and the rear-admiral taken. On November 29 a fleet of 80 vessels, under the command of Tromp, encountered Blake with only

40 off the Goodwin Sands. The result of the action was the loss of 6 English ships—2 captured and 4 destroyed; the rest, in a shattered condition, sought safety in the Thames. There is a story, now discredited, that Tromp tied a broom to the masthead of his vessel, and sailed through the Channel, intimating that he had swept English vessels clean out of it. If he did, his pride was short-lived, for by February, 1653, Blake was at sea again with 80 ships, and falling in with Tromp with about an equal force, was at once attacked, but after a three days' running fight, the Dutchman was forced to seek shelter in the shallow waters of Calais, with a loss of 11 men-of-war, and 30 of a fleet of merchantmen he had in convoy. The English lost only one ship, but Blake was severely wounded. On the 3d and 4th of June his coadjutors, Deane and Monk, won another victory over Tromp, and his wound alone prevented Blake from taking part in the engagement of July 31, which finally shattered the naval supremacy of Holland. In 1654 Blake was appointed by Cromwell to command an English fleet in the Mediterranean, where he soon made the British flag respected by Dutch, Spanish, and French. The Dey of Tunis refused to pay homage to it. Blake attacked his capital, burned the Turkish fleet of nine ships which lay before it, accomplished a landing, and with a body of 1000 men annihilated an army of 3000 Turks. He next sailed to Algiers and Tripoli, landed, and set free all the English who were detained as slaves. He concluded alliances favorable to England with Venice and Tuscany. In 1657 he defeated the Spaniards at Santa Cruz. This was, perhaps, one of the most daring actions in Blake's career. With a wind blowing right into the bay—which was very strongly defended—Blake dashed in, attacked and destroyed the Spanish galleons and shipping in the harbor, and, the wind fortunately changing, sailed out again with a loss of only one ship and 200 men. The Spanish loss in men and property was immense, and the terror the action inspired insured increased respect to the English flag. His health now failed; he returned to England, and died, as his ship entered the harbor of Plymouth, August 7, 1657. Cromwell honored his memory by a solemn funeral procession, and caused him to be interred in Westminster Abbey, whence his body, with those of other Revolutionary celebrities, was removed by royal command at the Restoration. Consult: Gardiner, *History of the Commonwealth and Protectorate* (New York, 1894-1901), decidedly the best account of the naval war, with full citation of the original authorities; Samuel Johnson, *Life of Blake* (London, 1792); and Dixon, *Robert Blake* (London, 1852). The principal original materials may be found in *Calendars of State Papers, Domestic* (London, 1649-57); and Thurloe, *State Papers* (London, 1742).

BLAKE, WILLIAM (1757-1827). An English engraver and poet. He was born in London November 28, 1757. In 1789 he published *Songs of Innocence*, followed in 1794 by *Songs of Experience*, Showing the Two Contrary States of the Human Soul, with about 60 etchings, remarkable for their peculiar and original manner. The poems were equally singular, but many of them exhibited true pathos. Some marginal designs for Young's *Night Thoughts*, executed by Blake, were

greatly admired by Flaxman. Blake lived in the full belief that he held converse with the spirits of the departed great—with Moses, Homer, Vergil, Dante, and Milton. He published numerous etchings, chiefly of religious and cognate subjects, among the best of which are his *Intentions to the Book of Job*, and the illustrations of Blair's *Grave*. He died (August 12, 1827) in poverty and obscurity, with the conviction that he was a martyr to poetic art. The influence of Michelangelo is traceable in his art; but the imagination which produced his bold and often curious designs was peculiarly Blake's own, while in his diction, though at times almost irrational, he was, according to Swinburne, "the single Englishman of supreme and simple poetic genius of his time," and Charles Lamb regarded him as one of the most extraordinary persons of the age. The facts of Blake's early life are recorded in a book, now rare, written by Dr. Malkin, *A Father's Memoirs of his Child* (1806). Consult: Gilchrist, *Life and Works of William Blake* (2d ed. London, 1880); Swinburne, *William Blake: A Critical Essay* (London, 1868); *Poetical Works of William Blake*, ed. W. M. Rossetti (London, 1874); and *Works*, edited with lithographs of the illustrated "Prophetic Books," and memoir and interpretation, Ellis and Yeats (London, 1893).

BLAKE, WILLIAM PHIPPS (1826—). An American scientist. He was born in New York, graduated at the Sheffield Scientific School in 1852, was mineralogist and geologist of the Pacific Railroad Exploring Expedition of 1853, and author of several of the reports. He edited the *Mining Magazine* (1859-60), and was mining engineer for the Japanese Government from 1861 to 1863, when he was appointed professor of mineralogy in the College of California, and geologist to the State board of agriculture. He was commissioner for California at the Paris Exposition of 1867; was executive commissioner for Connecticut in the Centennial Exposition, and was special agent to Vienna in 1873. He also cooperated in the Paris Expositions of 1878 and 1889, and in the Chicago Exposition of 1893. He has published *Silver Ores and Silver Mines* (1860); *Report on the Production of Precious Metals* (1867); and *Ceramic Art and Glass* (1878).

BLAKE/LOCK, RALPH ALBERT (1847—). An American landscape painter. He was born in New York, and is self-taught. The following are a few of his principal works: "Indian Girl, Uinta Tribe"; "Story of Buffalo Hunt" (1880); "Shooting the Arrow" (1880); "Indian Fisherman" (1882); "Bannock Wigwam in Peaceful Vale" (1883).

BLAKELY, blak'li, JOHNSTON (1781-1814). An American naval officer, born near Seaford, Ireland. He emigrated with his parents to the United States, graduated at the University of North Carolina in 1800, and in the same year entered the United States Navy. In 1813 he became commander of the *Wasp*, a new sloop of war, and in his first cruise captured the English sloop *Reindeer*. On another cruise he captured several prizes, and defeated the *Avon* and the *Atalanta*. Late in 1814 the *Wasp* left on a cruise, but never returned to port, and was presumably wrecked.

BLAMIRE, bla-mîr', SUSANNA (1747-94). An English poet, known as 'the Muse of Cumberland.' She was the daughter of a peasant, and passed her life in her native shire. She wrote several descriptive poems, as "Stoklewath" and "Epistle to Friends"; and many beautiful songs in the Scotch dialect, as "The Traveler's Return" and "The Waefu' Heart." Consult *Poetical Works*, with memoir by P. Maxwell (Edinburgh, 1842).

BLANC, LE, le blān (Fr., the white; see below). A town in the Department of Indre, France, beautifully situated on the Creuse, which divides the town into two parts, about 32 miles west-southwest of Châteauroux (Map: France, H 5). It is known principally for the beautiful Lake Blanc (3450 feet above sea-level), near which it is situated, so called from the reflection of the quartz lining its bottom. Le Blanc has cloth and linen-yarn mills, potteries, tanneries, vinegar-works, forges, etc., and utilizes the surplus waters of the lake to furnish power for its machinery. It is very ancient, and was frequently by the Romans. Population, in 1896, 6764.

BLANC, MONT. See MONT BLANC.

BLANC, AUGUSTE ALEXANDRE PHILIPPE CHARLES (1813-82). A French art-critic, born at Castres. He was head of the Department of Fine Arts in the Ministry of the Interior from 1848 to 1852, and again from 1871 to 1873. He became a member of the French Academy in 1876 and professor of aesthetics at the Collège de France in 1878. He is chiefly known as the editor of and contributor to the *Histoire des peintres de toutes les écoles*, 14 vols. (1849-75), for which he wrote biographies of the artists of the Dutch and French schools. This work was also published in English. He also wrote *L'Œuvre complet de Rembrandt* (1873); *Grammaire des arts du dessin* (1876), his most important work, and *Grammaire des arts décoratifs* (1881), its sequel; besides other works, and was editor of the *Gazette des Beaux-Arts*.

BLANC, JEAN JOSEPH LOUIS (1811-82). A French socialist and historian, born in Madrid, October 29, 1811. In 1820 he was placed in the college at Rhodéz; in 1830 he went to Paris and became a clerk in an attorney's office for a short time, and in 1832 became private tutor at Arras. Here he resided for two years, contributing largely, on literary and political subjects, to the *Progrès du Pas-de-Calais*. He afterwards went to Paris, where he contributed to various political papers, and where in 1839 he founded the *Revue du Progrès*, in which he first laid down some of his socialistic theories. In this journal, too, he brought out his famous treatise on socialism, the *Organisation du travail*, which in 1840 appeared in a reprint. The book obtained for its author general recognition as one of the ablest of Socialist writers, as well as wide popularity among the French *ouvriers*, who were captivated by the brilliancy of the writing, the apparent simplicity of the scheme, and the freshness of the views advocated. The book denounces the doctrine of individualism—i.e. individual and competitive efforts in labor—and advocates the absorption of the individual in a vast 'solidarity,' where "each would receive according to his needs, and contribute according to his abilities." Blanc next published (in 1841-44) a historical work, entitled *Histoire de dix ans, 1830-*

40, aimed with deadly effect against the Orleans dynasty. Louis Philippe afterwards declared that "it acted like a battering-ram against the bulwarks of loyalty in France." It owed its success partly to the exposure it gave of the scandalous jobbery and immorality of the Crown and its advisers, partly to that passionate ardor which changed the tranquillity of history into the vehemence of a pamphlet, and its academic pomp of style. This was followed by the first volume of a *Histoire de la révolution française*, in which the author's aim was to describe, from his own point of view, not only the incidents of the first Revolution, but the social history of the Eighteenth Century. In the February revolution of 1848 Blanc played an important part. His popularity with the working classes led to his being appointed a member of the Provisional Government. He was placed by the Government at the head of the great commission for discussing the problem of labor. At the same time, Marie, Minister of Public Works, began—but without Blanc's coöperation—to establish the so-called national workshops (*ateliers nationaux*), which were to bring about the realization of the socialistic principle, but which only proved the hazardous and impracticable character of Blanc's doctrines. The national workshops led to an attempt on the part of the Socialists to dissolve the National Assembly by force and to institute a provisional government at the Hôtel de Ville, May 15, 1848. Blanc's name was, in the minds of many, connected with this movement. A proposal was made to prosecute him, but it was negatived by the National Assembly. After the June insurrection, he was again accused and prosecuted for conspiracy, but he contrived to escape to London, where he resided until the fall of the Empire. During his exile he devoted himself to political and historical literature. In 1849 appeared his *Appel aux honnêtes gens*, and *Catéchisme des socialistes*; in 1850, *Pages d'histoire de la révolution de février*, and in 1851, *Plus de Girondins; la république une et indivisible*. He acted also as correspondent for several Parisian journals, and a collection of his letters from London was published under the title *Dix années de l'histoire d'Angleterre* (10 vols., Paris, 1879-81). The work which has secured him the most enduring reputation is his *History of the French Revolution*, in 12 volumes, written during his residence in England. It is characterized by extensive and original research, which has frequently enabled the author to reverse the common verdicts on historical personages, and to explode many of the extravagant stories of the stormy period of which it treats. On the fall of the Empire in 1870, Blanc returned to France, and in 1871 he was elected to the National Assembly, in which he pursued a policy of consistent radicalism without returning to his former Socialistic theories. He died at Cannes, December 6, 1882. Consult Fiaux, "Louis Blanc," in *Portraits politiques contemporains*, Vol. II. (Paris, 1883).

BLANC, blānk, LUDWIG GOTTFRIED (1781-1866). A German philologist and Dante scholar. He was born in Berlin, and after studying at the French Theological Seminary of his native city, was called to a pastorate at Halle, in 1806. In 1811 he was suspected of having taken part in a conspiracy against King Jerome of Westphalia, and was imprisoned until 1813, when he

was released by a Russian flying corps. He was professor of Romance languages at the University of Halle in 1822, and from 1838 to 1860 was one of the preachers at the cathedral of that city. Professor Blanc is known chiefly for his numerous and scholarly treatises on Dante. His most important works are his *Grammatik der italienischen Sprache* (1844), the first attempt to trace the history of the development of the forms and laws of that language; *Vocabolario Dantesco*, in French (1852); and his translation of the *Divine Comedy*, with commentary (1864). His *Handbuch des Wissenswürdigsten aus der Natur und Geschichte der Erde und ihrer Bewohner* (1867-69) also enjoyed a wide popularity.

BLANC, blān, MARIE THÉRÈSE. See BENTZON, TH.

BLANC, PAUL JOSEPH (1846—). A French painter. He was born in Paris, and studied with Bin and Cabanel, obtaining in 1867 the second prize in the competition contest for the *prix de Rome*. Among his principal works are the following: "Murder of Laius by Œdipus" (1867); "Perseus" (Luxembourg, 1870); "The Invasion" (1873); "The Vow of Clovis in the Battle of Tolbiac" (1876); "Brigand's Wife" (1878); "The Triumph of Clovis" (1881); "The Tiber" (1885).

BLANCHARD, blān'shār', AUGUSTE THOMAS MARIE (1819—). A French engraver, born in Paris. He was the pupil of his father, Auguste Jean B. M. Blanchard (1792-1849). He devoted himself to engraving modern pictures, and exhibited with success at the Universal Expositions of 1855, 1867, and 1878. He received many medals, and in 1861 the decoration of the Legion of Honor. In 1888 he was made a member of the Académie des Beaux-Arts. He is considered one of the first engravers of France.

BLANCHARD, blān'chard, EDWARD LITT LAMAN (1820-89). An English journalist and dramatist. He was born in London, and in 1831 accompanied his father, the well-known comedian, William Blanchard, to New York, where he appeared upon the stage. Returning to England, he was engaged during the rest of his life as a dramatic critic for various papers and a writer of numerous plays, farces, and pantomimes. Of the latter he composed over a hundred, which for beauty and fancy of conception have never been equaled, furnishing the Drury Lane pantomime for thirty-seven consecutive years. He was also a prolific writer of short stories, and was a staff writer at different times on the *Sunday Times*, the *Weekly Dispatch*, the *Observer*, the *London Figaro*, and the *Daily Telegraph*, his connection with the latter paper extending from 1863 until his death. He edited Thomas Dugdale's *England and Wales Delineated* (1860) and Willoughby's *Shakespeare*; and was the author of two novels, *Temple Bar* and *Man Without a Destiny*, and of several guide-books. Consult Scott and Howard (editors), *Life of E. L. L. Blanchard* (London, 1891).

BLANCHARD, blān'shār', EMILE (1820-1900). A French naturalist, born in Paris. As assistant naturalist to the museum, he was several times appointed to represent Milne-Edwards in the entomology course. He was appointed a member of the Academy of Sciences in 1862, and president of that institution in 1881. The follow-

ing are his principal works: *Histoire naturelle des insectes orthoptères, neuroptères, etc.* (1841); *Histoire des insectes, traitant de leurs mœurs et de leurs métamorphoses en général* (1845); *La zoologie agricole* (1854, et seq.); *L'Organisation du règne animal* (1851-64).

BLANCHARD, FRANÇOIS (1738-1809). A French aeronaut. In 1784 he attempted to build a balloon with wings or sails and a rudder, and in 1785 he crossed the English Channel by balloon. In the same year he used, for the first time, a parachute according to Montgolfier's ideas, and laid claim to the invention. He came to the United States in 1796, and gave many balloon exhibitions. In 1798, at Rouen, he took up sixteen persons in a single balloon and landed them safely fifteen miles away. He lost his life in 1809 during a balloon ascent. See AERONAUTICS.

BLANCHARD, blān'chard, SAMUEL LAMAN (1804-45). An English journalist and author, born at Great Yarmouth. He studied at Saint Olave's School, and became clerk to a proctor of Doctors' Commons. He subsequently wrote for a journal called *The Drama*, and was a traveling player and a proof-reader. In 1827 he was appointed secretary to the Zoölogical Society, and in 1828 published *Lyric Offerings*, a volume of verse dedicated to Charles Lamb. He was appointed acting editor of the *Monthly Magazine* in 1831, and in 1832 of the *True Sun*, a Liberal newspaper. He also edited the *Court Journal* in 1837, the *Courier* in 1837-39, *George Cruikshank's Omnibus* in 1842, and was a member of the *Examiner* staff from 1841 until his death. He numbered among his friends Douglas Jerrold, Dickens, Leigh Hunt, B. W. Procter, Browning, Cruikshank, and Bulwer-Lytton. Some of his essays were collected by Bulwer as *Sketches of Life* (1846), and his poems by Blanchard Jerrold (1876). Another collection of essays appeared in 1855 as *Corporation Characters*.

BLANCHARD, THOMAS (1788-1864). An American mechanic and inventor. Among his inventions were: a machine for making tacks, one for turning gun-barrels, a lathe for turning gun-stocks and other irregular shapes; a steam-wagon, before locomotives were used; contrivances to aid steamboats in ascending rapids, and a machine for bending large timber. He received more than 25 patents for important inventions.

BLANCHE, blānsh, AUGUST THEODOR (1811-68). A Swedish poet. He was born in Stockholm, and studied law at the University of Upsala. In literature he displayed remarkable productivity and versatility. The works by which he established his reputation were the comedies respectively entitled *Hittbarnet* (1847); *Rika Morbror* (1845); and *En tragedi i Wimmerby* (1848)—which are still considered among the ornaments of Swedish dramatic literature. His complete works, with a biographical sketch by Hedin, were published at Stockholm in 1891.

BLANCHEFLEUR, blānsh'flēr'. See FLORE ET BLANCHEFLEUR.

BLANCHE-LYON, blānch'lr'ūn (from the figure of a white lion). The title of one of the English pursuivants-at-arms. See PURSUIVANT.

BLANCHE OF CASTILE, kās-tēl' (1187-1252). The daughter of Alfonso IX. of Castile

and Eleanor, daughter of Henry II. of England. She was married May 23, 1200, according to treaty, to Louis, heir apparent to the Crown of France. After the death of her husband in 1226, she was regent during the minority of her son, Louis IX. (q.v.), and as such she had to struggle against almost continuous revolts, and succeeded in suppressing a formidable conspiracy of the nobles. She acquired Toulouse by treaty, and compelled the submission of the Duke of Brittany. Possessed of remarkable executive talent, she supervised personally all the departments of government, not excepting the army. She married her son to Margaret of Provence in 1234, and when she resigned her office two years later, she left France in a most flourishing condition. From 1248 to 1252 Blanche again acted as regent while Louis was gone on a crusade. The common people of France rebelled against the heavy taxation necessitated by the large outlays of the King on his crusading expeditions; but she put them down with a strong hand; and in spite of all these embarrassments successfully resisted the encroachments of the Church. France has seldom had so able a ruler, or one whose death was more universally lamented. She died in November, 1252. Consult: Petit-Dutaillis, *Etude sur la vie et le règne de Louis VIII.* (Paris, 1894); Berger, *Histoire de Blanche de Castille* (Paris, 1895).

BLANCHE OF DEV'AN. A character in Scott's poem, "The Lady of the Lake."

BLANCHET, blān'shā', JOSEPH GODERICK (1829—). A Canadian statesman. He was born at Saint Pierre, studied at the Quebec Seminary, and graduated at the College of Saint Anne as a physician. During the Saint Albans and Fenian raids of 1864 and 1866-70, he commanded a battalion of volunteer infantry. He was speaker of the Provincial Legislature for seven years, and mayor of the town of Lévis. On account of the law on dual representation, he resigned his seat in the Canadian Assembly, to which he had been elected in 1861, but retained his seat in the Quebec Assembly until his defeat in 1875. In politics he is a Liberal Conservative.

BLANCH FEE, or **BLANCH HOLDING** (Fr. *blanc*, white; referring to the payment in white metal, that is, silver). One of the ancient feudal tenures in the land law of Scotland, the duty payable to the superior, or lord, being in general a trifling sum expressed in silver instead of gold, or merely illusory, as a peppercorn, "if asked only," although it may happen that the duty is of greater value. Anciently, many estates in Scotland were held, both of the Crown and other superiors, by this tenure, but it now seldom appears in the grant of an original right of property. See **FEUDAL SYSTEM**; **TENURE**.

BLANCHING (Fr. *blanchir*, to make white, from *blanc*, white; cf. Eng. *blank*). A process by which gardeners arrest the formation of chlorophyll and certain secretions in plants by the exclusion of light, thus depriving the leaves of much of their color and bitterness and making them more palatable. Celery and sea-kale are familiar examples. Blanching is generally effected by heaping earth or litter about the parts to be blanched, tying heavy paper about the plant, covering with boxes or pots perforated at the top, etc. See **CHLOROPHYLL**.

BLANCO, blāq'kō, CAPE. See **CAPE BLANCO**.

BLANCO, GUZMAN. See **GUZMAN BLANCO**.

BLANCO, JOSÉ FELIX (1782-1872). A Venezuelan patriot, born at Carácas. He was ordained as a priest in 1801, but nevertheless took an active part in the movement for Venezuelan independence, and became chaplain in the Revolutionary Army. In 1818 his favorable report upon the possibilities of the campaign induced Bolívar to invade New Granada. In 1830 Blanco was made brigadier, and after the separation of Venezuela from Colombia, became, successively, Governor of Maracaibo, Minister of War (1837), and Minister of Finance (1854). The fall of Monagas forced him to retire, and he returned to the Church. The best years of his life were spent in preparation of his work, in 16 volumes, *Documentos para la historia de la vida pública del Libertador de Colombia, Perú y Bolivia*, published posthumously in Carácas in 1877.

BLAND, EDITH NESBIT (1858—). An English poet. She was born in London, August 15, 1858, and educated in London and on the Continent. She married Hubert Bland in 1879. She has published a large body of beautiful verse and several delightful children's books and stories. Her poem on the Queen (1901) was by far the best occasioned by the death of Victoria. Among her publications are *Lays and Legends* (1st series, 1886; 2d series, 1892); *Leaves of Life* (1888); *A Pomander of Verse* (1895); *In Homepun* (1896); *Songs of Love and Empire* (1897); *Grim Tales* (1893); *The Story of the Treasure-Seekers* (1899); *Pussy and Doggy Tales* (1899); *The Book of Dragons* (1900).

BLAND, RICHARD PARKS (1835-99). An American legislator, born near Hartford, Ky. He emigrated to Missouri, thence to California, and from California to Utah Territory, where in 1860 he was admitted to the bar. Having returned to Missouri, he there continued the practice of law, and in 1872 was elected as a Democrat to the National House of Representatives, in which he served until 1895, and from 1897 until his death. As a Congressman he is best known for his connection with the free-silver movement. In the Forty-third Congress he stoutly opposed the bill for the demonetization of silver, afterwards styled by him 'the crime of '73.' He voted in 1874 for the bill, vetoed by President Grant, for the increase of green-back circulation, and in 1878 introduced a bill which, as amended by the Senate and passed over the veto of President Hayes, provided for the coinage of not less than \$2,000,000 nor more than \$4,000,000 worth of silver bullion a month, and continued in force until repealed by the passage of the Sherman Law in 1890. In 1893 he was chairman of the House committee on coinage, weights, and measures, and in 1896 was indorsed by the State of Missouri as Democratic candidate for the Presidency, and received 291 votes in the National Convention at Chicago. Consult W. V. Byars, *An American Commoner: The Life and Times of R. Parks Bland* (Columbia, Mo., 1900). See **BIMETALLISM**.

BLAND, THEODORIC (1742-90). An American patriot and author. He was born in Prince George County, Va., was educated in medicine in Edinburgh, and practiced in Virginia. On the approach of the Revolution he took an active part

in the controversies with Lord Dunmore (q.v.), and attracted especial attention by a series of papers written under the pen-name 'Cassius.' He served through the Revolutionary War as a lieutenant-colonel of Virginia cavalry, and was an intimate friend and confidant of Washington. He was a member of Congress from 1789 to 1790. The *Bland Papers*, which contain valuable historical material covering the period of the Revolution, were collected and edited by Charles Campbell (Parkersburg, 1840).

BLAND'AMOUR, *SIR* (evidently *bland*, Lat. *blandus*, smooth-tongued, fawning + *amour*, Fr. *amour*, love). A bombastic knight in Spenser's *Faerie Queene*. His adventures are dealt with in the beginning of the fourth book of the poem. He is intended for the Earl of Northumberland, one of the leaders in the revolt of 1569.

BLANDIMAN. A character in the romance of *Valentine and Orson*, a Fifteenth-Century story of the Charlemagne cycle.

BLANDRATA, blân-drâ'ta, properly **BIANDRATA**, byân-drâ'ta, GROSIO (c.1515-c.90). An Italian Unitarian. He was born at Saluzzo, Piedmont. He practiced at Pavia, but, suspected of heresy, was compelled to escape to Geneva. Here his anti-Trinitarian views, which persisted despite the *Responsum ad Quæstiones G. Blandratos* (1559) of Calvin, involved him in violent controversy with the latter. From Geneva he went to Poland, and subsequently to Transylvania, where he became physician-in-ordinary to the Prince John Sigismund, whom he numbered among his converts. In both countries he was the first to introduce the doctrines of Unitarianism. In 1566 he defended his doctrines against Reformed theologians in public disputation. His most important work, the *Confessio Antitrinitaria*, was edited by Henka (1794). Consult Malcarne, *Commentario della Opere di Giorgio Blandrata* (Padua, 1814).

BLANGINI, blân-jè'nè, GIUSEPPE MARIA FELICE (1781-1841). An Italian composer. He was born in Turin, and went to Paris in 1799, where he composed romanzas, canzonettas, nocturnes, and also several operas, the most celebrated of which was entitled *Neftali*. In 1809 he was called to Cassel as *kapellmeister* to King Jerome of Westphalia, and it was here that the work to which he owes his fame, *La Fée Urgèle*, was written. He composed, in all, about eighteen operas and more than two hundred smaller compositions.

BLANKENBERGHE, blân'ken-bèrk'. A favorite seaside resort in the Province of West Flanders, Belgium, on the North Sea, 9 miles north of Bruges, and 12 miles northeast of Ostend. It has a fine beach, a paved promenade along the sand-dunes 22 yards wide and over a mile in length, handsome residences, and a casino with a concert-room to accommodate 4000 persons. Its popularity dates from 1840, and it is now visited annually by over 25,000 tourists. Permanent population, in 1899, 4297.

BLANKET (Fr. *blanchet*; originally, a kind of white woolen stuff, dimin. of *blanc*, white; cf. Eng. *blank*). A sheet of heavy woolen or partly woolen cloth, which is used for beds, for horse-coverings, and to wrap around the person. In the early years of the last century, especially from 1812 to 1815, the manufacture of blankets in the United States was confined to the produc-

tion of coarse qualities, chiefly for the military and naval forces. The War of 1812 gave a great impetus to woolen manufactures, and factories sprang up everywhere; but with the restoration of peace these enterprises met with disaster because of the superior goods that were imported at much lower prices. In 1831 a large mill for the manufacture of cotton-warp blankets for the use of slaves was erected near Pendleton, S. C. It is said that in the same year a factory was built near Buffalo, N. Y., for the manufacture of Mackinaw or Indian blankets. In 1860 the census reports stated that the manufacture of blankets was carried on in nineteen different States, and that the total output was 616,400 blankets, which were produced chiefly in Maine, Massachusetts, New Hampshire, Pennsylvania, and California. The manufacture of blankets increased largely during the Civil War and in the years immediately following, and the importations decreased proportionally. Since that time the values of the finer grades of white bed-blankets have become much reduced, and the production of the poorer qualities discontinued. In the last twenty years great advances have been made in the manufacture of blankets, and those of lighter weight, but more fleecy finish, are preferred to the heavy grades of former years. The finest grades are manufactured in California and Oregon, the best blankets costing over \$20 per pair, or more than \$2 per pound. All-wool blankets can be obtained from \$7.50 upward, while cheap blankets can be bought as low as \$2 a pair.

The best blankets are made wholly of wool, but those of medium or inferior qualities are formed of cotton warp and woolen filling threads, the aim of the manufacturer being to raise the fibres of the woolen yarn into a loose, soft mat on the face of the blanket so as to hide the threads below. Extraordinarily fine woolen blankets are made in Mysore in India, some of which, it is said, are so delicate that, though 18 feet long, they can be rolled inside a hollow bamboo. Such fancy blankets cost about \$150. The blankets made by the Navaho (q.v.) Indians of northern Arizona and New Mexico are much sought after where durability and warmth are desired. The Navahos occupy a reservation of 8,000,000 acres in northern Arizona and New Mexico; they are the most civilized of the Indian tribes, and number about 16,000. They possess about 1,000,000 sheep, which they raise for their wool to make into blankets. The wool which comes from their flocks is rudely carded and spun on a spindle resembling a boy's top. The loom consists of two horizontal beams, one hung above the other and the warp stretched between. The shuttle is a stick. The colors most used are black, red, blue, and yellow; the patterns are geometrical designs. The value of a Navaho blanket depends upon its weight. The average weight is twenty pounds, and the value in 1900 was from \$1 to \$2 per pound. They were much sought after by emigrants to the Klondike. Blankets are also made by other Indian tribes of the Southwest, and specimens are shown in the accompanying colored plate.

BLANK VERSE (refers to absence of rhyme; probably from *blank*, lacking a part necessary for completeness, as e.g. in 'blank' cartridges, containing powder but no ball). Verse without rhyme. The typical line contains five feet, or

measures, each measure having two syllables. A stress of the voice, varying in degree, comes regularly on the second syllable in each measure, though this stress is frequently thrown back upon the first syllable. Still greater ease of movement is attained by an extra syllable at the end of a line or before the cæsure. Any measure may also contain three syllables, and measures occur in which there is only one syllable. This structure may be illustrated by *Macbeth*:

This cæ | tle háth | a pléas | ant séat; | the af |
Nimby | and swéet | ly ré | comménds | itself |
Uáto | our gén | tleséus | æs. | This guést | of sém | mer, etc.

Again:

The mál | titú | dínoús séas | incár | nadíne.

The classical productions of the Greek and Roman poets—at least such of them as have come down to us—are composed without rhyme; and, accordingly, when the passion for imitating classical models set in, rhyme came to be looked upon as an invention of Gothic barbarism, and attempts were made in several countries to shake it off. The first specimen of blank verse in English is a translation of the second and fourth books of Vergil's *Æneid*, by the Earl of Surrey, who was executed in 1547; but it had been used by Italian and Spanish writers as early as about the beginning of that century. Surrey derived it from Italy. First employed in the drama by Sackville in *Gorboduc* (1561), it was perfected by Marlowe and Shakespeare. It has since continued dominant in our poetic drama, if we except the effort made by Dryden and others, after the Restoration, to return to rhymed plays. But in other kinds of poetry, it was not till the appearance of *Paradise Lost* (1667) that it could be said to have taken root; and even then the want of rhymes was felt, as the poet expected it would be. Many poets have since followed Milton's example; and English narrative, didactic, and descriptive poetry is partly in blank verse, partly in rhymed couplets. Of recent poets, Tennyson and Browning have written the best blank verse. In Italian and Spanish it never became popular, and still less in French. But under the influence of the English example, it was introduced into Germany by Lessing and others. Consult: Mayor, *Chapters on English Metre* (London, 1886, revised ed., 1901); and J. Schipper, *Englische Metrik*, Part II. (Bonn, 1888). See RHYME.

BLANQUI, blán'ké', JÉRÔME ADOLPHE (1798-1854). A French economist. He was born in Nice, November 28, 1798. After 1814 he pursued his studies in Paris, where, under the influence of J. B. Say, he turned to political economy. Upon Say's recommendation, he was appointed in 1825 professor of history and of industrial economy in the Commercial School in Paris. On the death of Say he was appointed professor of industrial economy in the Conservatoire des Arts et Métiers, and was one of the editors of the *Dictionnaire de l'industrie manufacturière, commerciale et agricole*. At the instance of the Academy of Moral and Political Sciences he prepared studies of economic conditions in Corsica, Algeria, and in England. He died in Paris on January 28, 1854. His principal works are: *Résumé de l'histoire du commerce et de l'industrie* (Paris, 1826); *Précis élémentaire d'économie politique, précédé d'une introduction historique, et suivi d'une biographie des économistes*, etc. (1826); and, most important of all, the *Histoire de*

l'économie politique en Europe, depuis les anciens jusqu'à nos jours suivie d'une bibliographie raisonnée des principaux ouvrages d'économie politique (4th ed., 1860).

BLANQUI, LOUIS AUGUSTE (1805-81). A French revolutionist and a member of the Paris Commune. He was a brother of Jérôme Adolphe Blanqui (q.v.), and was born at Puget-Théniers, in the Department of Alpes-Maritimes, February 7, 1805. While studying law and medicine in Paris, he became closely identified with the Revolutionary movement, and took an active part in the disturbances which led to the overthrow of Charles X. He became one of the most prominent leaders of the Parisian proletariat and an irreconcilable enemy of the bourgeoisie government of Louis Philippe. With Barbès (q.v.) he was the instigator of the insurrection of May 12, 1839, and as a result was condemned to death, the sentence being commuted, however, to imprisonment for life. The February Revolution set him free. He was one of the leaders of the mob which, on May 15, 1848, attempted to storm the hall of the National Assembly, and was condemned to ten years' imprisonment. Liberated in 1859, he lived in London for some time, and returning to Paris in 1861, speedily succeeded in incurring a sentence of four years' imprisonment as an instigator to riot. In 1871 he took part in the insurrection which led to the establishment of the Paris Commune, and became subsequently a member of the Communal Government. After the taking of Paris by the troops from Versailles, Blanqui was sentenced to transportation to New Caledonia; but in consideration of his infirmities, the aged man was sent to prison instead. He was pardoned in 1879, and died January 1, 1881. With Armand Barbès, whose coadjutor he was in the events of 1839 and 1848, Blanqui stands out as the type of the fanatic reformer engendered by the French Revolution and the democratic movement of the Nineteenth Century. Idealist and fighter in one, with no recognition for the limitations of actuality, he was but a lineal descendant of the men of 1793, who attempted to regenerate the world through terror. The sincerity of his beliefs was attested by nearly half a lifetime spent in prison. Blanqui was the author of a scientific work entitled *L'éternité dans les astres* (1872). His writings on economic subjects were published in 1885, under the title of *Critique sociale*. The name Blanquistes is now borne by the radical wing of the Socialist Party in France.

BLANQUILLO, blán-kel'yó (Sp., whitish, dimin. of blanco, white). A fish of the family Latilidæ (see TILE-FISH), which inhabit warm seas. A common species in southern California is the yellow-tail (q.v.), but the name is most specifically applied to the reddish *Caulolatilus chrysops* of the Gulf of Mexico.

BLANTYRE'. The chief town of the British Central Africa Protectorate (q.v.).

BLARNEY (Irish *blairne*, a little field, from Gael. *blair*, *blar*, a plain). A village in Ireland, four miles from Cork, having a castle built in 1449, by Cormac McCarthy. Near the castle are the 'Groves of Blarney,' and on the summit of the castle-tower is the Blarney Stone, the kissing of which is said to endow one with the gift of coaxing, wheedling, and flattering. The true stone, however, is one set into a wall, where it

can be kissed only by a person held over the parapet. The name has given a noun, a verb, and a participle to the English language.

BLARNEY, LADY. A woman of bad character in *The Vicar of Wakefield*, introduced to the Primroses by Thornhill to aid in the seduction of Olivia.

BLÄSER, blē'zēr, GUSTAV (1813-74). A German sculptor. He was born in Düsseldorf, and in 1833 entered the studio of Rauch, with whom he remained for eleven years. In 1845 he went to Rome, whence he was called to Berlin to design one of the eight marble groups adorning the *Schlossbrücke*, a task in which he was eminently successful. The group executed by him, and entitled "Minerva Leading a Youthful Warrior into Battle," is considered the best of the series. His subsequent works include: "Saint Matthew, the Apostle," a statue of colossal proportions (church at Helsingfors); "The Prophet Daniel" (Royal Castle, Berlin); "Borussia" (New Museum, Berlin); the equestrian statue of Frederick William IV. (Rhine Bridge, Cologne); "Hospitality" (National Gallery, Berlin); and busts of Emperor William I., the Empress of Russia, von Alvensleben, von der Heydt, Alexander von Humboldt, Rauch, Abraham Lincoln (Washington), and many others.

BLASHFIELD, EDWIN HOWLAND (1848—). An American painter. He was born in New York City, December 15, 1848. He studied in Paris under Bonnat. It is for decorative work on a large scale that he is chiefly noted. Among his paintings in public buildings may be mentioned a dome in the Manufactures Building at the Columbian Exposition, and a decoration for the Appellate Court of New York. He has also decorated ceilings in private houses. For several successive years he was represented at the Paris Salon and also at the Royal Academy. Among his paintings are "Christmas Bells" and "The Angel with the Flaming Sword." One of his most important works is the decoration of the dome of the Congressional Library in Washington.

BLASIUS, or BLAISE. A saint and martyr of the Roman Catholic Church. He was Bishop of Sebaste, in Cappadocia, when Licinius began a bloody persecution of the Christians. Blasius left the town, and concealed himself in an unknown chasm in the rocks, but his abode was discovered by the prefect, Agricola, while out hunting. The saint was conveyed to Sebaste, and as he steadfastly refused to deny Christ and worship the heathen gods, he was first scored with iron combs and then beheaded (316). At one period his worship must have been widely diffused, judging from the extent of territory over which his relics were scattered. The wool-combers claim him as their patron, for the singular reason that he was tortured, among other instruments, with a wool-comb. The practice of invoking Saint Blasius in cases of sore throat is said to have originated in the circumstance that, when young, he saved the only son of a rich widow from being choked by a fish-bone. Saint Blasius's day is the 3d of February.

BLASIUS, blā'zē-us', LE DOCTEUR. One of the many pseudonyms of Paschal Grousset.

BLASNAVAC, or BLASNAVATZ, bläs'nā-vāts, MILIVOYE PETROVITCH (1826-73). A Serbian soldier and statesman. He was born at Blas-

nava (District of Kraguyevatz), and studied in Berlin in 1848. Upon the outbreak of the Hungarian Revolution (1848), he joined the volunteer corps of General Knitchanin against the Hungarians, and commanded the Serbian artillery until the close of the war. After the accession of Prince Michael Obrenovitch to the throne of Serbia, Blasnavac was appointed colonel (1862) and Minister of War (1865), in which capacity he created a national militia of 80,000 men. After the assassination of Prince Michael (June 10, 1868), he proclaimed Milan as Prince of Serbia, and maintained the public order. He was a member of the Regency during the minority of Prince Milan, and upon the accession of the latter to the throne (August 22, 1872) was appointed president of the Ministry.

BLASPHEMY (Gk. *βλασφημία*, *blasphēmía*, 'speech or word of evil omen'). As a criminal offense at common law, blasphemy consists in maliciously reviling God or the Christian religion. As a sin, it was punishable by the ecclesiastical courts of England; and even in the United States, where such courts are not a part of the machinery of government, it still may subject the blasphemer to expulsion from a church or religious society.

Two reasons are assigned by the courts for treating blasphemy as a crime: (1) It tends to produce a breach of the peace by leading to violent altercations between the blasphemer and those who are shocked and outraged by his language. (2) Christianity is a part of the common law, and therefore blasphemy tends to subvert the law and to destroy the very foundation of civil society. Because of its offensiveness to the majority of virtuous people, and because it is considered injurious to the tender morals of the young, it is often spoken of by judges as a public nuisance, and when it is written or printed, it is deemed a libel (q.v.).

Formerly, any attack upon Christianity or any argument against its fundamental doctrines, as those were understood by the Established Church, amounted to the crime of blasphemy; but a different view now prevails both in England and in the United States. It is the manner rather than the matter of the publication that renders it blasphemous. Lord Chief Justice Coleridge declared in 1833, in one of the few modern cases on this subject, that "if the decencies of controversy are observed, even the fundamentals of religion may be attacked without a person being guilty of blasphemous libel." Similar views had been expressed still earlier by Chancellor Kent in New York and Chief Justice Shaw in Massachusetts. The latter had defined the crime as "a willful and malicious attempt to lessen men's reverence of God," and the former had defined it as consisting "in maliciously reviling God and religion." In line with these opinions is the following statement from a decision of the Supreme Court of Pennsylvania: "No author or printer, who fairly and conscientiously promulgates opinions with whose truths he is impressed, for the benefit of others, is answerable as a criminal. Audacious and mischievous intention is, in such a case, the broad boundary between right and wrong; it is to be collected from the offensive levity, scurrilous and opprobrious language, and other circumstances, whether the act was malicious." A sober, serious, and reverent statement of one's honest opin-

ions, however heretical, is not at present criminally blasphemous. Undoubtedly, the provisions in the Federal and State Constitutions, guaranteeing religious freedom and securing the liberty of speech and the press, have helped to modify the judicial conception of this crime.

While blasphemy is still a crime in England and in most of the United States, prosecutions for the offense have become very rare. Though always punishable, it is seldom punished. In some of the United States it has ceased to be a crime. Such seems to be the case in New York.

See Stephen, *History of the Criminal Law of England* (London, 1883); also the *Encyclopædia of the Laws of England*, Vol. II., page 172 (London); Bishop, *New Commentaries on the Criminal Law* (Chicago, 1892); and the *New York Penal Code*, Chapter 676, Laws of 1882, § 2.

BLASS, bläs, **FRIEDRICH WILHELM** (1843—). A German classical philologist, born at Osnabrück, Hanover. He was professor in the University of Kiel from 1881 to 1892, and joined the faculty of the University of Halle in 1892. His works include: *Die attische Beredsamkeit* (3 vols., 2d ed., 1887-98); *Die Aussprache des Griechischen* (3d ed., 1888); *Plutarch, Tiberius, und Gaius Gracchus* (1875); *Grammatik der neutestamentlichen Sprache* (1896); *Philology of the Gospels* (1898). He also edited the orations of Æschines, Andocides, Antiphon, Demosthenes, Dinarchus, Hyperides, Isocrates, and Lycurgus; *Bacchylidis Carmina* (1898); *Acta Apostolorum* (1894-96); *Evangelium Lucae* (1897); Aristotle's *Ἀθηναίων Πολιτεία* (2d ed., 1895); revised Kühner's *Grammatik der griechischen Sprache* (I. 1, 2, 1890-92); and is a frequent contributor to philological journals.

BLAST-FURNACE. See **IRON AND STEEL**.

BLASTING (AS. *blæst*, OHG. *blast*, a blowing; cf. OHG. *blāsan*, breathe, snort, Ger. *blasen*, to blow, Engl. *blaze*, to spread a report, just like the slang *blow*). The process of breaking up rock, ores, and other fracturable material by means of explosives. It is extensively employed in engineering works generally, and in quarrying and mining operations particularly. Previous to 1613 the means of loosening and breaking up rock in these operations were the hammer, chisel, and wedge, and the process of fire-setting, which consisted in heating the rock surface by building wood-fires against it and then quickly cooling it with water, the sudden contraction thus produced causing the material to spall off and crack open to a limited depth. The first attempt to blast rock by the use of an explosive is commonly credited to Martin Weigel, a mine boss at Freiberg, Saxony, and is said to have occurred in the year 1613. Whether this date is accurate or not, it is quite certain that any previous attempts at blasting were so exceptional that they did not come to the notice of the several writers on mining of that early date. Whatever may have been the date of the first attempt at blasting, however, it is certain that by 1634 to 1644 the use of gunpowder in mining operations was quite generally known in Germany. From that country the process was taken by German miners to England in 1670, and to Sweden in 1724. Until 1685 the drill-holes were stopped with wooden plugs, but in that year clay-tamping was employed in Saxony. In 1791 sand-tamping was first used. Hand-drilling with cone and

crown drills was used until 1759, when the modern chisel-edge drill was introduced. In 1829 Moses Shaw, of New York, first fired blasts by electricity, and in 1831 Bickford, an Englishman, invented the match or fuse now known by his name. (See **FUSE**.) In 1849 Mr. J. J. Couch, of Philadelphia, Pa., invented the first power percussion drills. (See **DRILLS**.) In 1863 nitroglycerin, and in 1867 dynamite, were first used as explosives in blasting operations. See **EXPLOSIVES**.

Modern blasting operations may be divided into three classes: (1) small-shot blasting, in which comparatively small volumes of rock are moved at a single blast; (2) blasting by mines, in which large masses of rock are broken up by a single heavy blast; and (3) surface-blasting, in which the explosive is placed on or against, or simply near to, the rock to be broken up, and which is possible only with very high explosives. Small-shot blasting is employed in the great majority of quarrying, mining, and engineering operations. It consists in piercing the rock with a comparatively small number of drill-holes from 1¼ inches to 3 inches in diameter and from 18 inches to several feet in depth; charging these holes with explosives, generally blasting-powder or dynamite, with the proper fuse or electric-wire connections; tamping the space above the explosive with earth, sand, clay, or water, and finally firing these charges by means of a time-fuse or wires from an electric battery or magneto-machine. The relative location of the drill-holes, their size and depth, and the amount of explosive used vary according to the object which it is sought to accomplish by the blast. Where the purpose is merely to break up the rock in the most efficient manner for its removal, as in excavating a foundation, the holes will be placed quite close together and heavily charged, so as to shatter the rock thoroughly. In quarrying, where the object is to loosen the rock in large and regularly shaped masses, the holes are arranged in rows and lightly charged, so that the explosion will split the rock along approximately definite lines without shattering it. In tunnel-work, the object is to take out a cylindrical mass of rock the size of the tunnel cross-section. This is usually accomplished by drilling and firing a small number of converging holes so as to take out a cone-shaped or wedge-shaped centre core, and then to enlarge this opening by drilling and blasting successive rings of holes surrounding this centre opening. In excavating a canal through rock, a row of holes is usually drilled transversely across the canal so as to throw down and break up a slice or section of rock extending from one side of the channel to the other. See **TUNNELS**; **QUARRYING**; and **CANALS**.

Blasting by mines is employed when great ledges of rock have to be removed at one operation, or where a large quantity of broken stone is required. Mining is usually accomplished by sinking vertical shafts into the top of a cliff, or by driving similar shafts horizontally into its face, or by a combination of the two methods. The methods of blasting by mines will be better explained by describing a number of typical blasts of this sort than by a general discussion of processes. In the work of removing the rock-obstruction of the Danube River known as the 'Iron Gates' a vertical cliff, Greben Point, was

removed by a succession of notable mine-blasts. The largest of these blasts was made in May, 1894. A tunnel 3×4 feet in cross-section and 80 feet long was driven into the face of the cliff and enlarged at its inner end into a $6 \times 6 \times 6$ -foot chamber. This chamber was filled with 12 tons of second-grade dynamite, the tunnel packed with loose rock, and closed with a brick masonry wall. The firing of the blast removed about 78,000 cubic yards of rock. To break down the face of a quarry at South Bethlehem, N. Y., in 1880, 50 vertical holes 30 feet deep and 7 feet apart were driven near the edge of the cliff, and charged with 40 pounds of dynamite each. This blast displaced between 20,000 and 25,000 tons of rock. In a similar blast at Crarae Quarry in Argyllshire, Scotland, in 1886, a blast of 14,000 pounds of powder dislodged 60,000 tons of granite rock. To secure a large quantity of rock for building a dam near Teller, Colo., a granite mound known as Vesuvius Butte was blown up on December 18, 1899. A horizontal tunnel, with several angles to prevent the blowing out of the blast, was driven into the side of the butte near its bottom until the inner end was about at the centre of the butte. From the end of this tunnel a horizontal tunnel 70 feet long was driven to the right and to the left, so that the whole excavation formed a T-shaped tunnel. The ends of the cross-arm of the T were packed with some 32,000 pounds of black powder and the remaining space filled with rock and earth. The main tunnel was also packed with earth, with green timber bulkheads placed at each angle. This blast was fired by electricity, and its explosion opened up a crater 72 feet deep and 150 feet in diameter, and broke up 110,000 cubic yards of rock. By far the largest blast ever made was fired in connection with the removal of Hell Gate Rock in the East River at New York in 1876. This rock had an area of about 9 acres, and to remove it 24 longitudinal and 46 transverse galleries or tunnels, with their faces pierced with 12,561 holes 3 inches in diameter and 9 feet deep, were excavated in its interior. Into each drill-hole was inserted a rack-a-rock cartridge, and then a dynamite cartridge, in all 240,399 pounds of rack-a-rock and 42,331 pounds of dynamite, and then water was admitted to the mine. The blast was fired by electricity, and removed 270,717 cubic yards of rock, while about 80,000 cubic yards of rock had been taken out in excavating the galleries.

Surface blasting is possible only with high explosives, such as nitroglycerin, dynamite, or guncotton, which explode by detonation so suddenly that the shock is transmitted with shattering effect to the rock with which it is in contact. Gunpowder, when fired in an unconfined space, explodes so slowly that its force is expended through the air without producing any effective local shock. Surface blasting has been extensively used in removing reefs and similar obstructions to navigation in Long Island Sound. Small-shot submarine blasting is frequently used for similar work, and the method is well illustrated by the following typical example. In removing a submarine ledge in Oswego (N. Y.) Harbor in 1893, a drill-scow $82 \times 26 \times 0\frac{1}{2}$ feet was employed, along one side of which was a track carrying two movable drill-frames. Each drill-frame carried a percussion drill operated by steam, the drill-rod of which descended down the

side of the scow. The holes were drilled 5 feet apart in rows of 14 holes to a depth of from 4 feet to 7 feet, and charged with 2×18 -inch dynamite cartridges, weighing $2\frac{3}{4}$ pounds, and containing 75 per cent. dynamite. The entire 14 holes were fired by electricity in one blast.

In charging the drill-holes with explosives for blasting, the method now in use is to employ the explosive in the form of cylindrical cartridges. Formerly, and more particularly in case gunpowder was used, the explosive was placed in the hole in powdered form. All high explosives are now fired by electricity, several holes being fired simultaneously. As each hole is charged, a detonator or cap with two wires attached is inserted in the top of the cartridge. The first wire of the first hole runs to the battery, as does the last wire, the other wire being used to connect several holes with each other. When the first and last wires are secured to the poles of the firing-battery or frictional electric machine and the current passed through them, the detonators or caps in the cartridges are exploded by the current, and in turn cause the explosion of the cartridge. Where a time-fuse is used, the end of this fuse is inserted into the detonator, which is itself inserted into the top of the cartridge; the outer end of the fuse is then lighted and the fire follows the fuse until the detonator is reached and exploded, thus causing the explosion of the cartridge. For a comprehensive discussion of blasting operations, consult: Drinker, *Tunneling, Explosive Compounds and Rock Drills* (New York, 1874); for a more concise description, in Prelini, *Tunneling* (New York, 1901). See EXPLOSIVES.

BLASTOIDEA. See PENTREMITES.

BLATANT BEAST, THE (archaic *blate*, to babble, prate; cf. Engl. *bleat*, the cry of sheep). Spenser's personification of slander, in the *Faerie Queene*. It is temporarily muzzled by Artegall, and Calidore afterwards seeks its death.

BLATCHFORD, SAMUEL (1820-93). An American jurist. He was born in New York City, graduated at Columbia in 1837, and was admitted to the bar in 1842. In 1845 he went to Auburn and joined William H. Seward and Christopher Morgan as a law partner, but returned to New York in 1854, and was appointed district judge of the United States Court for the Southern District of New York in 1867, and circuit judge for the Second Circuit in 1878. In 1882 President Arthur appointed him an associate judge of the United States Supreme Court.

BLATCHLEY, WILLIS STANLEY (1859—). An American naturalist and geologist, born at North Madison, Conn. He graduated at Indiana State University in 1887; was a member of Scoville's scientific expedition to Mexico (1891), of the Arkansas Geological Survey (1889-90), and of the United States Fish Commission (1893). In 1894 he became State Geologist of Indiana. The following are some of his publications: *Gleanings from Nature* (1899); "How Plants and Animals Spend the Winter," in *Popular Science Monthly* (New York, 1897); "Some Indiana Acrididae," in *Canadian Entomology* (London, 1891); "Locustidae and Blattidae of Indiana," in *Proceedings of the Indiana Academy of Science* (Brookville, Ind., 1892); and numerous contributions as editor of Vols. XX-XXV. of the *Annual Reports, Department of Geology and*

Natural Resources of Indiana (Indianapolis, 1895-1900).

BLATHWAYT, WILLIAM (c.1649-1717). An English statesman. He was born at Saint Martins-in-the-Fields. He accompanied James II. and his army to Salisbury in the capacity of Secretary of War, in November, 1688, and seems to have conducted nearly all the affairs of the army. Owing to his linguistic attainments he became a favorite with William III., whom he accompanied on his campaign in Flanders. He was a member of Parliament almost uninterruptedly from 1685 to 1710.

BLATTIDÆ (Lat. *blatta*, cockroach, moth). A family of cursorial Orthoptera, including the ordinary cockroach. The Blattidæ are the oldest known insects, being found as fossils in the Middle Silurian of France. See COCKROACH.

BLAUBOK, blou'bök, or BLUEBUCK (Dutch *blauwbok*, blue buck). A large hippotragine antelope (*Hippotragus niger*) of South Africa, distinguished by its glaucous hue. Its long, stout horns sweep back from its forehead in a sabre-like curve, and are effective weapons. Closely related are the magnificent, jet-black sable antelope (*Hippotragus niger*), the equine antelope (*Hippotragus equinus*), and Baker's antelope (*Hippotragus Bakeri*) (q.v.). All have been growing rare, and it is feared that since 1900 the blaubok has been extinct.

BLAUREE, blou'rër, or **BLARER**, AMBROSUS (1492-1564). A German religious reformer. He was born at Constance, and studied at the University of Tübingen. In 1515 he entered the Benedictine monastery at Alpirsbach, where he afterwards became prior. In consequence of his advocacy of the doctrines of Luther, however, he was deposed in 1521. He then became a Protestant preacher at Constance, and was sent to regulate the ecclesiastical affairs at Memmingen (1528) and Ulm (1531). In 1534 Duke Ulrich summoned him to Württemberg, where, during a period of four years, he introduced the principles of the Reformation into the Church, his sphere of activity embracing 62 towns and 450 villages. In consequence of his leaning toward Zwingli, however, he was, at the instigation of the extreme Lutherans, dismissed from his office. Afterwards he expounded the new doctrine in Isny, Lindau, and Augsburg. In addition to numerous letters, which are valuable as historical documents, he left a number of writings bearing upon the Reformation. For his biography, consult: Keim (Stuttgart, 1860); Pressel (Elberfeld, 1861).

BLAUVELT, blou'vêlt, LILLIAN (c.1870—). An American singer, born in Brooklyn, N. Y. She early appeared as a violinist, subsequently studied vocal music with Bouhy in Paris, and appeared at the Théâtre de la Monnaie, Brussels, in *Faust* and other operas. Afterwards she sang in concert and oratorio, and has continued solely in those fields. Her début in England was made in 1898 at the Queen's Hall symphony concerts. She has sung throughout Europe, in the United States, and in Canada.

BLAVATSKY, blá-vüts'ké, HELENA PETROVNA HAHN-HAHN (1831-91). A Russian traveler and theosophist, born in Yekaterinoslav, Southern Russia. She traveled widely, penetrated to Tibet, and originally dealt much in spiritism and the occult. In 1873 she came to the United

States, where, with H. S. Olcott, she in 1875 founded the Theosophical Society. In 1879, under her direction, a branch of the society was organized at Bombay, India, and the official journal, *The Theosophist*, was established. She met numerous 'adepts' in India and elsewhere, and did somewhat to popularize the content of Buddhist philosophy alike among foreigners and native Indians; but the imposture of her miraculous pretensions has been adequately demonstrated by V. S. Solovyoff in his work, *A Modern Priestess of Isis* (trans. by W. Leaf, London, 1895), and by the investigations of the Society for Psychical Research in 1884. Although but slightly acquainted with Sanskrit, she wrote voluminously on the ancient esoteric doctrines of India. The accredited text-book of her disciples is her *Isis Unveiled* (1876), which displays the subtitle, "A Master Key to the Mysteries of Ancient and Modern Science and Theology." Consult Olcott, *Old Diary Leaves* (New York, 1895). See THEOSOPHY.

BLAYDON. A coal-mining town in Durham, England, on the right bank of the Tyne, 4½ miles west of Newcastle (Map: England, E 2). Its municipal life is active; it owns its water-supply, maintains a technical school, and has fine modern public buildings. Population, in 1891, 13,200; in 1901, 19,600.

BLAZE DE BURY, bláz' de bu'rè', ANGE HENRI (1813-88). A French author. He was born in Avignon, and was a son of the author Castil Blaze. In 1830 he published his first comedy in verse, *Le Souper chez le commandeur*, the first of a series of contributions to the *Revue des Deux Mondes*, with which publication he was associated for forty years. Under the influence of the Romantics he devoted himself to the study of German literature, and in 1840 published his translation of Goethe's *Faust* (14th ed. 1880), a work which obtained a wide circulation. His other works on the German poets include *Ecrivains et poètes de l'Allemagne* (1846); *Les poésies de Goethe* (1862); *Les écrivains modernes de l'Allemagne* (1868). His wife, Madame PAULINE ROSE STEWART BLAZE DE BURY, was well known as a writer under the pseudonyms 'Arthur Dudley' and 'Maurice Flasan.' She also published, under her own name, *Voyage en Autriche, en Hongrie et en Allemagne* (1851).

BLAZONRY. See HERALDRY.

BLEACHING (AS. *blæcan*, to grow pale, Ger. *bleichen*, to whiten; cf. E. *bleak*, Ger. *bleich*, pale, AS. *blac*, *blæc*, pale, shining). The art of removing coloring matters from animal and vegetable substances, leaving the material uninjured but of a light or white color, so that, as in the case of fabrics, they may be readily dyed to some desired shade. The origin of bleaching is unknown, but the art is believed to have been practiced before the Christian Era, and the 'fine linen' mentioned in the Bible is supposed to have been bleached. It is thought to have been practiced by the ancient Babylonians, Egyptians, and other Eastern peoples, and was for the most part applied to vegetable fabrics, such as flax, hemp, and cotton, or the cloths made from them, although the bleaching of silk has long been known in China. Originally, the atmosphere and the sun's rays alone were used for bleaching, and the plan followed was to spread the cloth on a grass-field

called a *bleaching-green*. The fabric was sprinkled with water several times a day, and after several months of exposure it became white. No improvements of importance occurred until the Eighteenth Century, when Holland became the principal seat of the industry, and there the material was steeped in a solution of potash lye for several days and then in buttermilk for about a week, after which it was washed and bleached on the ground. The satisfactory results thus obtained led to the name 'Hollands' being given to the excellent fabrics bleached in that way, while a quality of linen, much in demand, which was spread on grass fields, was called 'lawn.' The next improvement was the use of dilute sulphuric acid in place of buttermilk, by which the duration of the process, formerly about eight months, was reduced to one-half that time. In 1785 the remarkable bleaching properties of chlorine were discovered by Berthollet, and its application to the bleaching of cloth soon followed. At first the chlorine was used in its gaseous state, and it was found that it destroyed color by uniting chemically with the coloring principle, thus decomposing the color; but as the chlorine also united with the hydrogen of the fibre it destroyed the fabric. Subsequently javelle-water, obtained by dissolving chlorine in dilute potassium hydroxide, was employed; but in 1799 the dry chloride of lime, or bleaching-powder, came into use, and is still largely employed, although for some purposes hydrogen peroxide is now preferred.

COTTON-BLEACHING. When yarn and thread are bleached, the process consists in boiling the material in a dilute solution of caustic alkali and washing; then steeping in a solution of bleaching-powder and washing, after which it is steeped in sulphuric acid and again washed, then heated in a soap solution with the addition of a small quantity of bluing, after which it is passed through a dumping-machine consisting of wooden rollers, containing a solution of indigo, then washed and dried again. In the case of cotton cloth or calico the process is somewhat more complicated, but consists essentially in the treatment of the material in baths of lime, lye, bleaching-powder, and sulphuric acid, with thorough washing after each step. The most recent improvement in this process has been the substitution of caustic alkali and resin soap for the lime-boil as the initial step. It should be mentioned that an electric bleaching process has been introduced, the principal feature of which is that the bleaching liquid, as hypochlorite, is obtained by passing an electric current through solutions of calcium or magnesium chloride.

LINEN-BLEACHING. The process employed for removing colors from linen is similar to that employed for cotton, although the natural impurities are greater in the flax-fibre than in the cotton. These are rendered soluble by alkaline boilings, after which the coloring matters that still remain are oxidized and destroyed by baths of hypochlorites, or bleaching-powder. It is sometimes found desirable, especially when linen cloth is bleached, to introduce a step called *grassing*, which consists in exposing the material in a field to the action of air, light, and moisture for several days. It is believed that by this method the full strength of the fibre is more completely retained. In linen-bleaching the treatment of the yarn varies slightly from the

treatment of the cloth, the latter being somewhat more extended.

WOOL-BLEACHING. The special feature in which this differs from the preceding methods is in the preliminary process, which is called *scouring*. Wool-fibre usually contains from 15 to 70 per cent. of foreign matter, consisting of dirt, and especially of fatty matters secreted by the animal, called *yolk*. This is divided into two parts: (1) 'Wool perspiration,' which is soluble in water, and consists essentially of potassium compounds of *oleic* and *stearic* acids, thus constituting an important source of potash; and (2) a compound insoluble in water and composed of cholesterolin in combination with fatty acids. The scouring process consists in dipping the loose wool on a frame into dilute alkaline solutions which form emulsions with the *yolk*, or in treating the wool to the successive action of fat solvents, such as carbon disulphide, and washing. When the wool-yarn is scoured the process is similar, although the machinery is somewhat different. Wool cloth is scoured by passing the material as an endless band through the scouring liquid, and then through a pair of squeezing rollers. Even after scouring, wool cloth retains a faint yellow tint, which is then removed by bleaching. This is accomplished by the action of sulphurous acid, which is formed by burning sulphur in a closed chamber while the scoured and washed material, still wet, is suspended on poles, or the woollen material may be immersed and moved about in a solution of sulphurous acid. After bleaching the materials are well washed, and any persistent yellow tint is neutralized by the addition of a preparation of bluing.

SILK-BLEACHING. Raw silk contains a gelatinous substance called *sericin*, or *silk glue*, which, with other calcareous and mineral matter, is removed by rinsing the silk in a warm bath of dilute hydrochloric acid, and then washing. This process, called *stripping*, is repeated until only a small portion of the gummy substance remains. The crude silk is then 'boiled off' for several hours in open boilers, after which the silk is well rinsed in a tepid solution of sodium carbonate, and finally in cold water. The crude material frequently loses as much as 30 per cent. by these operations. The bleaching process is similar to that described under *Wool-Bleaching*, and consists in exposing the wet scoured silk to the action of gaseous sulphurous acid. The use of hydrogen peroxide for bleaching silk is becoming more and more extensive. The method consists in steeping the silk in a dilute solution of hydrogen peroxide, made slightly alkaline with ammonia, until it is sufficiently bleached. The bleaching of paper-stock, as cotton and linen rags or paper, and the bleaching of straw, as well as the bleaching of animal products, as beeswax, feathers, hair, ivory, oils, and sponges, will be found described in special articles under the names of these products. Consult: J. Gardner, *Bleaching, Dyeing, and Calico-Printing* (London, 1884); and *Modern Bleaching and Finishing*, by a practical working bleacher (London, 1897). Works on dyeing usually contain special chapters on bleaching.

BLEACHING-POWDER, or CHLORIDE OF LIME. An important bleaching agent and disinfectant. The exact chemical nature of bleaching-

powder has never been definitely established, but it is generally accepted to be a mixture of calcium chloride with calcium hypochlorite. The process for its manufacture patented by Charles Macintosh, of Glasgow, in 1799, is still largely employed, and consists essentially in the absorption of chlorine by dry lime. The chlorine-gas was for this purpose originally made by heating a mixture of salt (sodium chloride), manganese dioxide, and sulphuric acid in a glass or wooden apparatus. Subsequently, however, the process was simplified by heating hydrochloric acid, a by-product of the manufacture of soda, with manganese dioxide. The lime used is ordinary limestone calcined in any convenient kiln, and then slacked with water. It is spread on the floor of a stone or leaden chamber, into which the chlorine-gas is introduced. The absorption is considered complete when a sample of the product is found to contain about 37 per cent. of chlorine. As thus obtained, chloride of lime is a white or grayish-brown powder with a strong, pungent odor of chlorine, which is, however, destroyed in time, the substance gradually undergoing decomposition. Besides its use as a bleaching agent, as for the removal of metallic and other colors in calico-printing, chloride of lime is considered a valuable disinfectant.

BLEAK, or **BLICK** (from the pallid color of the scales). A minnow (*Alburnus alburnus*) of the family Cyprinidae. It is about 6 inches long, and slender, resembling the dace, but darker on the back, with silvery sides and white fins. It inhabits in active shoals the streams of England and the Continent, spawning in May, and is much esteemed as food by anglers, and as a pet in the aquarium. The silvery substance beneath the scales is used for the manufacture of artificial pearls, as in several related fishes.

BLEAK HOUSE. The title of a novel by Charles Dickens (1852-53). It exposes the interminable delays in chancery. The name is that of Mr. Jarndyce's residence, which is said to have been drawn from a dreary house at Broadstairs, Kent, occupied by Dickens in summer. See **SUMMERSON**, **ESTHER**.

BLEB (allied to Engl. *blob*, *blub*). A circumscribed elevation of the superficial layers of the skin which contains fluid, usually serous in character. Blebs are really large vesicles or pustules, and occur in certain skin-diseases, as erysipelas, pemphigus, or erythema multiforma.

BLECHEN, blék'en, KARL EDUARD (1798-1840). A German landscape painter. He was born at Kottbus, and studied at the Berlin Academy. After a residence of several years in Italy, he established himself in Berlin in 1830, where he was appointed professor at the Academy of Fine Arts in 1835. Blechen was the earliest representative of the Berlin landscape school. His works include: "Villa Este;" "View near Narni;" "Villa Borghese;" "View of Naples," and "View at Tivoli."

BLEDOW, blá'dó, LUDWIG (1795-1846). A German chess-player, born in Berlin. He founded the Berlin chess-school, which flourished from 1837 to 1842, and where Heydebrand, Mayet, von der Lasa, Bilguer, and Hanstein contributed greatly to the development of the game. He established the first chess paper published in Germany (1846). His arrangement of the 100 games of the Syrian master Stamma was pub-

lished by von Oppen (Leipzig, 1865). The extensive collection of chess literature which he had accumulated during his lifetime was bought by the Royal Library in Berlin.

BLEDSE, bléd'só, ALBERT TAYLOR (1809-77). An American metaphysician and educational author. He was born in Frankfort, Ky.; graduated at West Point in 1830, and became a lieutenant of infantry, but resigned in 1832, and was professor of mathematics successively in Kenyon College, in Miami University, and in the universities of Virginia and Mississippi. During the Civil War he was Assistant Secretary of War in the Southern Confederacy. He was a frequent contributor to periodical reviews, and at the time of his death was editor of the *Southern Review* (Methodist). His published works include: *An Examination of Edwards on the Will* (1845); *Theodicy: or, Vindication of the Divine Glory* (1853); and *Philosophy of Mathematics* (1866).

BLEEDER. See **BLEEDING**.

BLEEDING (*hemorrhage*). One of the most serious accidents that can happen to an animal, and one which constitutes an anxious complication in surgical operations. As there is but a limited quantity of blood in the body (about one-tenth of the body's weight), and as the sudden escape of a large portion of it is sufficient to cause death, every one should be instructed as to the measures which experience has shown to be the most efficient for preventing a dangerous loss of blood. Bleeding may be either from a wounded artery or vein, or it may be in the form of a general oozing from a raw surface or a mucous membrane, or the blood may escape into the surrounding tissues or into a cavity like the pleura, and remain concealed.

ARTERIAL BLEEDING. This is recognized by the florid redness of the blood, and by its issuing from the cut vessel in jets. There are exceptions to this, however. When an artery has been tied, and bleeding occurs from below the ligature, the flow of blood is continuous and of a dark color. It is also dark during profound anæsthesia. If a large artery be wounded, the first gush of blood may prove fatal, but generally there are rapid and feeble pulse, frequent and irregular breathing, intense pallor; cold, moist skin, possibly nausea and vomiting, and prostration merging into unconsciousness, and the patient faints; the artery draws up within its sheath (see **ARTERY**); the blood, no longer impelled vigorously by the heart, clots between the cut end and the cellular tissue surrounding it; the inner and middle coats not only retract, but contract, and another clot forms within the arterial tube. These clots—which, with the faintness and the contraction and retraction of the artery, are termed natural *hæmostatics*—are sufficient in many cases to prevent a recurrence of the bleeding; but we must be prepared to adopt some of the many surgical or artificial means for restraining the flow of blood till adhesion (q.v.) can occur between the cut surface of the coats of the artery. The principal surgical means are: Immediate pressure, which may be applied by pressing the finger-tip on the place whence the blood is seen to flow, and may be kept up by pads secured with a bandage to the part; pressure on the artery above, or as it comes to the cut part, which requires some knowledge of anatomy, but not more than any intelligent person may

easily acquire. Thus, pressing on the inside of the arm, about midway between its front and back, will press the brachial artery (q.v.) against the bone, and arrest any bleeding from wounds of the forearm and hand. Pressure on the middle of the groin with a thumb placed crosswise will control the stream of blood in the femoral artery, so that none can escape from any wound in thigh or leg below where the pressure is made. Pressure on the course of the vessel may be very efficiently effected temporarily by tying a handkerchief round the limb above where it is injured, and then inserting a stick and twisting it sufficiently tight. This is the principle of the original tourniquet, which was invented by Morel, a French surgeon, at the siege of Besançon, in 1674. (See **TOURNIQUET**.) The objections to pressure as a means of arresting hemorrhage are, that it is very painful, that it includes the vein, and thereby engorges the limb with blood, and may cause mortification if continued for any length of time. Actual cautery, or hot iron, is occasionally useful in bleeding from a bone, or at some points where pressure or ligatures cannot be efficiently applied. It is the oldest method of stopping bleeding, and until the Eighteenth Century was much in use. If used, the iron should be at a white heat, the wound pressed for an instant, and then the iron should be held in contact with the bleeding vessel. It causes an eschar or slough, with shriveling of the artery; and if the latter be small, it effectually stops the bleeding, until the eschar drops off, when the vessel may be found still pervious at the wounded part, and the danger of bleeding be as great as at first. Ligature, or tying the artery, is a very old method of arresting hemorrhage, and certainly the best. A ligature should be applied to each extremity of the cut artery. (See **LIGATURE**.) **Acupressure** (q.v.) was introduced by the late Sir James Y. Simpson of Edinburgh, and was extensively used. It is useful in a few instances where the arteries are too brittle to permit ligation.

VENOUS BLEEDING. This is recognized by the dark color of the blood, and its continuous flow. Pressure is generally found sufficient to arrest it, and it should be applied directly over the wounded part. Ligatures are used somewhat as in the case of arterial hemorrhage. **Acupressure** is rarely used. In the case of large venous trunks, or sinuses, the vessel is packed with a gauze plug.

CAPILLARY BLEEDING. This is distinguished by oozing, with a tendency to spontaneous arrest. It is rarely dangerous, except in hemorrhage from the mucous membrane of the stomach. Water at a temperature of 116° F. will arrest it, or cold, or the actual cautery. The old styptics (as alum, tannin, cobwebs, etc.) are not used by surgeons, as they cause unclean clots, which invite sepsis and secondary hemorrhage.

PARENCHYMATOUS BLEEDING. This occurs in organs wherein small arteries empty directly into veins without intervening capillaries, as the spleen. Hot water, or cold, or dilute acetic acid may arrest it. Transfusion of blood from another person, or introduction of salt solution into the venous system of the patient, is very frequently a resort in severe hemorrhage. Some persons have a congenital tendency to bleed (the hemorrhagic diathesis); if such a one have a trifling cut, or have a tooth pulled, he bleeds perhaps to death. A prudent surgeon will not per-

form cutting operations on one of a hemorrhagic family. See **BLOOD**.

BLEEDING, or BLOODLETTING. Blood may be drawn from a vein (phlebotomy—venesection), or from an artery (arteriotomy). The veins most commonly opened for this purpose are the median basilic (see **ARM**), but those of the lower limbs are occasionally selected. The patient should be placed sitting up in bed, as he may lose a dangerous amount of blood without showing the usual premonitory symptoms if his head be kept low. The venous return should now be obstructed by a bandage, and when the veins swell, one should be selected, steadied with the left thumb, and slit obliquely with a lancet; the blood allowed to flow till the desired quantity has escaped. The surgeon's thumb should now be placed on the cut in the vein, and kept there till the bandage is removed, when a small pad of lint of figure-of-8 bandage will sufficiently prevent the bleeding, and the wound will speedily heal. Phlebotomy was at one time habitually resorted to in inflammatory diseases, and even when there was no positive disease, it was often applied periodically at particular seasons, as spring and autumn, as a hygienic precaution. It is now rarely used. Local bloodletting by means of cupping or leeches is used in certain conditions, such as pleurisy, sciatica, inflammation resulting from injury to a joint, etc.

BLEEDING HEART YARD (once belonging to the Hattons). The name of a part of London where very poor houses predominate. Why so called is not known, but there is a tradition that here the devil cast the heart of one of the Ladies Hatton after he had torn it from her body. The place is mentioned by Dickens in *Little Dorrit*.

BLEEK, bläk, **FRIEDRICH** (1793-1859). A German biblical scholar. He was born at Ahrens-bök, Holstein, July 4, 1793; educated at the University of Kiel (1812-14), and in Berlin, under de Wette, Neander, and Schleiermacher (1814-17). In 1818 he became tutor in theology in the University of Berlin. Soon afterwards he published essays on the *Origin and Composition of the Sibylline Oracles*, and on the *Authorship and Design of the Book of Daniel*, in which he attracted attention by solid learning, thorough investigation, and candor of judgment. In 1823 he became professor extraordinary; and in 1829 he accepted the chair of theology in the University of Bonn, where for thirty years he labored with constantly increasing success, due to the thoroughness of his investigations, the impartiality of his judgments, and the clearness of his methods of presentation. He died suddenly of apoplexy, Sunday, February 27, 1859, having given his regular lecture on the previous day. His defense of the genuineness of the Gospel of Saint John is regarded as one of the strongest that have yet appeared, and his critical labors on the New Testament are among the most important contributions to the maintenance of the evangelical faith that our time has produced. Translated are his *Introduction to the Old Testament* (London, 1869, 2 vols., reprinted 1875, 1 vol.), and his *Introduction to the New Testament* (Edinburgh, 1869, 2 vols.), and *Lectures on the Apocalypse* (London, 1875). His great work on the Epistle to the Hebrews (1828-40, 3 vols.) is untranslated. The Introductions just mentioned were published by his son from his notes

(Berlin, 1860 and 1862, respectively); later so edited by Wellhausen (last ed. 1893) and Mangold (latest ed. 1886) as to make him the channel of views he certainly did not stand for while he lived.

BLEEK, WILHELM HEINRICH IMMANUEL (1827-1875). A German philologist, son of the preceding. He was born in Berlin, was educated in Bonn and Berlin, and in 1855 went with Bishop Colenso to Natal. The next year he settled in Cape Town as curator of the important library of the Governor, Sir George Grey. He was distinguished for researches in the languages of Africa. His works, written chiefly in English, include *The Languages of Mozambique* (1856); the uncompleted *Comparative Grammar of South African Languages* (1862-69); and *Reynard the Fox in South Africa* (1864).

BLEFUS'CU. The name of an island representing France in Swift's satire, *Gulliver's Travels*.

BLEIBTREU, blip'troi, GERO (1828-92). A German painter. He was born at Xanten, and studied at the Düsseldorf Academy, and under Theodor Hildebrandt. He first became known through the picture entitled "Destruction of the Kiel Turner-Corps at Flensburg" (1852), which was followed by paintings descriptive of episodes of the War of Liberation, the battles of Frederick the Great, and, later, of the Prussian-Austrian campaign and the Franco-German War. In 1858 he settled in Berlin, and in 1866 accompanied the Prussian Army in the suite of Prince Frederick Charles. During the campaign of 1870 he was attached to the suite of the Crown Prince. His works have fine detail and broad conception. The following are a few of his best productions: "Battle of Grossbeeren" (1857); "Episode from Battle of Waterloo" (1858); "Battle of Königgrätz" (National Gallery, Berlin); "Surrender of Napoleon After Sedan"; "Attack of Saxon Corps at Saint Privat" (1880).

BLEIBTREU, KARL (1859—). A well-known German poet and critic, born in Berlin. He studied at the University of Berlin and in London, and was editor, between 1884 and 1890, of various periodicals, including the *Magazin für die Litteratur des In- und Auslandes*. In 1890 he assisted in founding the Deutsche Bühne at Berlin. He is prominent in the literary movement sometimes known as 'Young Germany.' In addition to several collections of verse, such as the *Lyrisches Tagebuch* (2d ed. 1885), *Lieder aus Tirol* (1885), and *Kosmische Lieder* (1890), he has written some indifferent dramas, a number of works on fiction, and a *Geschichte der englischen Litteratur* (2 vols., 1887), in which he exalts his hero, Byron, at the expense of other names prominent in English letters.

BLEICHRÖDER'S, blīk'rē-dēr. The banking house in Berlin established by Samuel Bleichröder (died in 1855) in 1803, and continued by his son, Gerson Bleichröder (1822-93), under whose management it has become one of the most important private banking institutions in Europe. The house of Bleichröder dates its larger influence from its numerous transactions carried on with the Rothschilds and the patronage of Bismarck. Its financial relations with the Prussian Government began with the large subscriptions by Gerson Bleichröder to the building of the Prussian railroads. Financial advice and assistance were

also sought from Bleichröder by the King of Prussia in 1866, and again in 1871, when the treaty of peace concluding the Franco-Prussian War was negotiated at the headquarters of the German Army at Versailles. In recognition of his services, Gerson Bleichröder was elevated to the hereditary nobility in 1872. The banking business was subsequently conducted by his sons, Hans and Georg Bleichröder.

BLEMYES, blēm'ī-ēz, or BLEMMYES (Gk. Βλέμυες, Βλέμυες). An ancient African people living in and around the Libyan Desert. In the Second Century, while Egypt was under Roman rule, they made predatory incursions into that province, and Diocletian made important concessions to them. They were powerful and troublesome as late as the Seventh Century, and old authors tell strange stories of their savage appearance and habits. It is supposed that the Ababdeh, the Bisharin, and other tribes are their descendants.

BLENCK, blēnk, EMIL (1832—). A German statistician. He was born in Magdeburg, and studied law and cameralistics in Berlin. In 1869 he became a member of the Royal Bureau of Statistics, and in 1883 director of that institution. The course reorganized by him, and designed for the education of the higher Government officials employed in the departments of statistics, has produced excellent results. Since 1882 Blenck has been the editor of all publications issued by the Prussian Department of Statistics. His independent writings include the following: *Das königliche Statistische Bureau in Berlin beim Eintritte in sein neuntes Jahrzehnt* (1885); and *Das königliche Statistische Bureau während der Jahre 1885-96* (1898).

BLENDE (Ger., from blenden, to blind, delude; see below), or SPHALERITE. A zinc sulphide that crystallizes in the isometric system, and is usually found containing sulphide of iron, which gives it a dark color, in consequence of which it is familiarly known among the Cornish miners as 'black-jack.' It occurs both massive and crystallized, and in color is black or brown, and sometimes red, yellow, or green. It is found in the Harz Mountains, in Saxony, in Cornwall, England, and with lead ores in various localities in Missouri, Wisconsin, Iowa, and Illinois, in the United States. It is a valuable ore of zinc, and when pure contains 67 per cent. of that metal. The sulphur which it contains has been used for the manufacture of sulphuric acid. The name was given to it by German miners because, while it resembled the mineral galena, it yielded no lead.

BLÉNEAU, blā'nō' (Blanoilus, Blanellus, of the Middle Ages). A village of France, situated in the Department of Yonne, about 29 miles west-southwest of Auxerre. It is celebrated as the scene of a two-days' battle between the Prince de Condé and Turenne (April 6-7, 1652). The first day Condé gained an advantage over Turenne's army in the latter's absence, but during the night Turenne arrived, and the next day he overwhelmed the Spanish troops of Condé.

BLENHEIM, blēn'hīm (Ger. Blindheim). A village of Bavaria, 23 miles north-northwest of Augsburg (Map: Bavaria, B 4). It is memorable in connection with the great victory won by Marlborough and Prince Eugene over the French and Bavarians under Tallard, Marsin, and the Elector

of Bavaria, August 13, 1704. The battle, however, did not actually take place here, but at a village in the vicinity called Höchstädt, about a mile north of the Danube, and is known to the Germans by that name. The French had massed their forces on their right and left wings, thinking the centre sufficiently protected by a narrow stream in front. Marlborough perceived the weak point in their line, and ordering an assault on the enemy's wings, to hide his real purpose, he with the mass of his army forded the stream, broke the French centre, took them in flank, and utterly destroyed the hostile army. Of 56,000 French and Bavarians, 14,000 were taken prisoners and 25,000 perished by the sword or in the Danube. The loss of the victors amounted to about 5000 killed and 8000 wounded. Near Blenheim the French defeated the Austrians, June 19, 1800.

BLEMHEIM DOG, or **MARLBOROUGH DOG**. See SPANIEL.

BLEMHEIM HOUSE. The seat of the Duke of Marlborough, erected near Oxford at the public expense in the reign of Queen Anne as a testimony of gratitude to the victor of Blenheim (q.v.). For this purpose £500,000 was voted, but that sum did not suffice for the completion of the work. The royal estate of Woodstock, in which it stands, was granted at the same time. The building was designed by Sir John Van Brugh, and is a grand monument, picturesque, in a heavy way. The length of the principal front from wing to wing is 348 feet, with advancing wings and a projecting perron brought together with insweeping curved lines toward the centre. The interior is proportionately magnificent, and the collection of paintings is one of the most valuable in Great Britain. In the grounds are a triumphal arch, and a column 130 feet high, surmounted by a statue of Marlborough. An inscription on the pedestal, written by Bolingbroke, recites the public services of the hero. The Manor of Blenheim Park embraces a circuit of about 12 miles.

BLENKER, blēk'ēr, LOUIS (1812-63). A German-American soldier, born in Worms, Germany. He was one of the leaders of the German Revolutionary party of 1848, and as commander of the Freischaren (Free Corps), took Ludwigshafen (May 10, 1846), occupied the city of Worms, and made an unsuccessful attack on Landau. When the Prussian troops entered the Palatinate, he fought in several of the engagements in Baden, but after the suppression of the revolution was compelled to flee to Switzerland, whence he emigrated to the United States. Upon the outbreak of the Civil War he organized the Eighth Regiment, New York Volunteers, of which he became colonel. For his gallantry in the first battle of Bull Run he was raised to the rank of brigadier-general of volunteers. In 1862 he commanded a division in Western Virginia, and took an active part in the battle of Cedar Keys; but soon afterwards was superseded by General Sigel. He was mustered out of service March 31, 1863, and died in October of injuries sustained while with his command at Warrenton, Va.

BLANNERHASSETT, HARMAN (1764-1831). A wealthy British emigrant to America, accidentally conspicuous through his connection with the conspiracy of Aaron Burr (q.v.) He was born in Hampshire, England; was educated

for the law at Trinity College, Dublin; married his niece, Adeline Agnew, then only 18 years of age, in 1796; and, in consequence of the social ostracism he thus brought upon himself, broke the entail upon the extensive Blennerhassett estates and emigrated to America in 1797. In the following year he bought the island later known by his name, in the Ohio, a few miles below Parkersburg, W. Va., where he built a large mansion, and amid luxurious surroundings dispensed a generous hospitality. A man of scholarly tastes, he spent much of his time in study and in the making of original experiments in the natural sciences. He was visited by Burr in 1805, and was by him involved in the ambitious schemes which, within the next two years, brought about their ruin. For his complicity in these schemes he was twice arrested, but was free from criminal prosecution after Burr's acquittal at Richmond. A large part of his extensive property, however, passed to his creditors. He was thereafter engaged as a cotton-planter, with little success, near Port Gibson, Miss.; removed to Montreal in 1819; practiced law there until 1822, when he returned to Ireland; and, after a few uneventful and unsuccessful years, died on the island of Guernsey, February 1, 1831. His wife was a woman of considerable literary talent, and published *The Deserted Isle* (1822), and *The Widow of the Rock, and Other Poems* (1824). She returned to America in 1842 and presented a claim to Congress for a reimbursement of her husband's losses at Blennerhassett Island, but she died in New York before final action could be taken. Consult: Safford, *Life of Harman Blennerhassett* (Cincinnati, 1853), and also Safford (editor), *The Blennerhassett Papers, Embodying the Private Journal of Harman Blennerhassett* (New York, 1864). An article, "The True Story of Harman Blennerhassett," by Therese Blennerhassett-Adams, in Vol. LXII. of the *Century Magazine* (New York, 1901), gives for the first time, on the authority of family papers, the real cause of Blennerhassett's emigration to America, together with some details concerning the Blennerhassett family.

BLENNORRHOEA (Gk. βλέννα, blenna, thick mucous discharge + ροία, rhoia, a flow, flux). A term applied to an unusually copious discharge from any mucous membrane. The term is now but seldom used. In discharges called blennorrhœal, a mixture of epithelial scales is shed in large quantities from the mucous membrane (mucous cells), and occasionally pus-cells. In blennorrhœa of the lachrymal sac, or what is called 'watery eye,' if the inner corner of the eye be pressed by the fingers, an opaque, milky fluid will appear between the lids, instead of the transparent tears which are present when the lachrymal apparatus is in health. After inflammation of the genito-urinary mucous membrane, a gleet discharge frequently occurs, and continues for a long period. The treatment consists in establishing a robust state of health by tonics, fresh air, and careful regimen, with astringent lotions applied directly to the mucous membrane, to lessen the secretion, and occasional caustic stimulants, as the nitrate of silver, to alter the condition of the secreting membrane. See GONORRHOEA.

BLENNY (Lat. blennius, blendius, Gk. βλέννος, blennos, from βλέννα, blenna, slime, mucus). A representative of a genus (Blennius) of spiny-

rayed fishes, remarkable for the abundance of slimy matter with which their skin is covered. Many are scaleless. The body is generally of an elongated form. They have only one dorsal fin, which, however, in many is deeply divided. They are distributed in the seas of all parts of the world. The true blennies are small fishes living in small shoals, frequenting rocky coasts, and often found in pools left dry by the tide, or even among the wet seaweeds, where they are capable of subsisting for a much longer time than that of the absence of the tide. They possess the power of using their ventral fins to aid them in moving about among rocks and seaweeds. They are hardly edible, but are much in request for the aquarium on account of their tenacity of life and their activity. They feed chiefly on small crustaceans. Many of the Blennidæ family retain their eggs within the oviduct until they are hatched, so that the young are produced alive and capable of seeking their own food. See Plate of GOBIES, BLENNIES, ETC.

BLEPH'ARITIS (from Gk. *βλέφαρον*, *blepharon*, eyelid). A chronic inflammation of the margins of the eyelids. It is very common, particularly in children, and occurs in persons who are debilitated, with poor hygienic surroundings or uncleanly habits. It is also a result of insufficient sleep, or may follow measles, chronic conjunctivitis, or exposure to dust, smoke, or wind. Very frequently it shows the presence of errors of refraction, requiring correction by eyeglasses. The superficial form is characterized by redness, itching, soreness, and swelling of the margins of the lids, with a formation of white scales between the lashes, which are loose. There is sensitiveness to light. If ulceration occurs, the lashes are glued together by yellowish crusts, which cover the ulcers. As in the other form, the lashes fall out, but in cases with ulceration they are not replaced. Ectropion (q.v.) or trichiasis (q.v.) may follow. The affection is chronic and very obstinate, but will usually yield to treatment.

BLEPH'AROPLAST' (Gk. *βλέφαρον*, *blepharon*, eyelid + *πλαστός*, *plastós*, formed, molded; referring to the cilia; see below). In plants, a name given by Webber to certain bodies occurring in connection with the formation of the male cells of one of the Cycads (*Zamia*). Homologous structures have been found in other Cycads (*Cycas*, etc.), in the Maiden-hair Tree (*Ginkgo*), and in various fern-plants. In the Cycads two blepharoplasts appear at opposite poles of the nucleus of the cell that is to produce the two male cells, and when it divides, each male cell receives a single blepharoplast. In all cases the function of the blepharoplast is the formation of cilia, by means of which the male cells may swim. Originally spherical in form, it becomes drawn out into a narrow band, which disposes itself in a spiral against the inner surface of the wall of the male cell, and from which cilia are developed which pierce the wall. The radiations which surround the blepharoplasts, and their position at opposite poles of the nucleus, have suggested that they are concerned in the formation of the spindle which precedes cell-division, but more evidence is needed before this view can be accepted. Many believe that the blepharoplast, while only a transient structure, is a genuine Centrosome (q.v.), while others contend that it is a unique organ of the cell. Ho-

mologous bodies have been described under the names 'Höcker,' 'Körnchen,' 'Nebenkern,' 'attraction sphere,' 'directive sphere,' and 'centrosome-like body.'

BLÉRÉ, blá'rá'. A town in the Department of Indre-et-Loire, France, situated on the left bank of the Cher, about 15 miles east-south-east of Tours (Map: France, G 4). Bléré is the entrepôt for most of the traffic on the Cher, and is noted for a handsome Sixteenth-Century chapel. Population, in 1896, 3269. The famous castle of Chenonceaux (q.v.) is 4 miles distant.

BLES, blés, HENRI (c.1480-1550). A notable Flemish painter, about whose life and works very little is known. He is supposed to have been born near Dinant, and to have traveled in Italy. The "Adoration of the Magi," in Dresden, is his only signed picture; but paintings are accredited to him in nearly all the galleries of Europe. His brush was prolific, and there is great variety in his subjects. With Joachim Patinot he is by some considered a founder of the Dutch school of landscape.

BLESBOK, blés'bók. A harte-beest (*Alcephalus albifrons*), "of a beautiful violet color." See HARTE-BEEST.

BLESSING OF JACOB, THE. A painting by Rembrandt (1656) in the Museum at Cassel, Germany. It is a fine conception, and a masterly delineation of the biblical account of the blessing bestowed by Jacob on Ephraim and Manasseh.

BLES'SINGTON, MARGUERITE, Countess of (1789-1849). An English leader of society and author. She was born September 1, 1789, at Knockbrit, near Clonmel, Tipperary, Ireland, where her father, Edmund Power, was settled. At the age of 15 she was married to Captain Farmer, and shortly after his death to Charles John Gardiner, Earl of Blessington. With him she took several extensive journeys on the Continent, where, as well as in London, she gathered around her all the most distinguished men of the time. In Genoa she formed an intellectual friendship with Lord Byron, and afterwards resided in Paris until the death of her husband, in 1829. He left her a good fortune, which enabled her to gratify her literary tastes. She held a little court of her own at her family mansion, Gore House, Kensington, a suburb in the West End of London. Her celebrated soirées were frequented by many of her distinguished contemporaries. Her subsequent connection with Count d'Orsay placed her in an equivocal position as regards society, and consequently, on the accession to power of Louis Napoleon, with whom both were intimate, they left England for France. She died in Paris, June 4, 1849. Besides editing *The Keepsake* for ten years and doing other miscellaneous literary work, she wrote several novels and sketches of life and scenes in France and in Italy. Her most valuable production is the *Conversations with Lord Byron* (1834), which helped to place the poet in a more favorable light before his countrymen. Consult Madden, *Life of the Countess of Blessington* (3 vols., London, 1855).

BLES'SON, JOHANN LUDWIG URBAN (1790-1861). A Prussian military writer, born in Berlin. He entered the Pioneer Corps in 1813, served in the War of Liberation as an officer of engineers, was for some time a teacher in the mili-

tary school in Berlin, and retired in 1829 with the rank of major. He wrote a number of important military works, including *Beitrag zur Geschichte des Festungskrieges in Frankreich 1815* (Berlin, 1818); *Uebersicht der Belagerungskunst* (1827); and *Uebersicht der Befestigungskunst* (Berlin, 2 parts, 1827-34).

BLICHER, blík'ér, STEEN STEENSEN (1782-1848). A Danish lyric poet and novelist, born at Vium, October 11, 1782. He translated *Ossian*, and followed this with poems and novels of little importance till he began to cultivate the field of Jutland peasant stories and legends (1826), in which he excelled among Danish writers, and ranks very high in the world's literature. He was a close and sensitive observer of the comedy and tragedy of the commonplace sphere in which his pastor's life was passed, and rendered his observations with sympathetic art and rare love of nature. He died at Spentrup, March 26, 1848. "The Snow Bells" and "Birds of Passage" are his best later poems. *The Knitting-Room*, a collection of poems and stories largely in Jutland dialect, is characteristic of his simple naïve humor. His collected tales (*Jydske Romanzer, Nationalnoveller*, etc.) appeared 1833-36 and 1882. The collection *Gamle og nye Noveller* (Copenhagen, 1861-62) contains a humorous autobiography. Blicher's *Poems* appeared in two volumes (1835-36), supplemented by two others (1870). Consult Kristensen and Lund, *Blicher's Liv og Gjerning* (Copenhagen, 1882).

BLIDA, blé-dá'. A town of Algeria, 30 miles southwest of Algiers (Map: Africa, E 1). It is beautifully situated on the borders of the fine plain of Metidja, at the base of the Atlas Mountains. The town is fortified with ramparts and towers. These fortifications command the passes of the Atlas, and serve as a starting-point and base of supplies for all expeditions going south. The streets are of modern appearance, and there are numerous mosques, churches, arcades, barracks, a military hospital, and a railway depot. The Oued-el-Kebir, through an aqueduct, yields an abundant water-supply. The exports consist of oranges, grain, cotton, tobacco, raisins, etc. Cedar and cork trees abound in the vicinity, and copper and lead mines are worked. In 1825 and in 1867 Blida was almost destroyed by earthquakes. Population, in 1891, 11,404; in 1896, 13,026.

BLIT'FIL, CAPTAIN JOHN. The name of a character in Fielding's *Tom Jones*, probably the original of Sheridan's Joseph Surface.

BLIGH, bli, WILLIAM (1754-1817). An English admiral, celebrated in connection with the mutiny of the *Bounty*. He was born, according to his statement, at Tyntan, Saint Tudy, Cornwall, 1753. It is probable, however, that he was the son of John Bligh, of Tretawne, and born at Plymouth, September 9, 1754. He entered the navy, and as sailing-master accompanied Captain Cook on his second voyage around the world. At Otaheite the bread-fruit tree was discovered, and on December 23, 1787, 'Bread-Fruit Bligh,' as he had been nicknamed, was appointed commander of the *Bounty*, with orders to sail to Otaheite or Tahiti, collect bread-fruit tree-plants, and transport them for introduction to the West India Colonies. On the way from Tahiti to Jamaica, a part of the crew mutinied, and forced the cap-

tain and eighteen men into the ship's launch, which they cast adrift, turning their own course back to Tahiti. The captain and his companions, who had very little provisions, and no sextant or map, arrived, after three months of severe hardship, at the island of Timor, a distance of 3600 nautical miles from the point where they were abandoned. To Bligh's skill and courage is due the fact that not a single life was lost. On Bligh's arrival in England, a man-of-war, under Captain Edwards, was sent, at his instance, to capture the mutineers. Some of them were seized; the rest had escaped to Pitcairn's Island (q.v.), with Fletcher Christian, the leader of the mutiny, accompanied by a number of Tahitian men and women. Their place of refuge, however, was not discovered until 1808, when an American ship accidentally touched at the island. At that time drunkenness and unbridled passion had left only one of the mutineers, John Adams, remaining, who had succeeded in instilling morals and religion in the little community there. Their fortunes form the subject of a poem by Byron, entitled *The Island of Christian and His Comrades*. Bligh was again sent out to collect bread-fruit trees and convey them to the West Indies, in which he was successful. In 1794, during the French Revolutionary War, Bligh commanded a ship of the line; but again exciting the disaffection of his men by his harshness, they mutinied and ran the ship into a French harbor. In 1797 he commanded the *Director* at Camperdown, when Admiral Duncan defeated the Dutch Admiral De Winter; the same year he distinguished himself by his fearlessness at the mutiny at the Nore. In 1801, as commander of the *Glanton* at Copenhagen, he was personally thanked by Nelson. In 1808 Bligh was appointed Governor of New South Wales; but in his prohibition of the unlimited importation of ardent spirits his conduct was so tyrannical that the military officer of the colony summarily arrested and kept him imprisoned for over two years. The officer, Major Johnson, was subsequently cashiered. Bligh, on returning to England, was made rear-admiral in 1811, and vice-admiral in 1814. He died December 7, 1817. For narrative, consult Bligh, *The Mutiny of the Bounty*, (Philadelphia, 1790).

BLIGHIA, blí't-á. See **AKEE**.

BLIGHT, blit (perhaps akin to *bleak*, pale, wan). A name applied to diseases of a number of plants, and to the parasites which cause them. The term has been very vaguely and variously used, having in fact been applied to almost every disease of plants caused by the condition of the atmosphere, or of the soil, the attacks of insects, parasitic fungi, etc. As now used by botanists, the term 'blight' is limited to attacks of parasitic fungi and bacteria. Among the numerous plants subject to blight are the apple, pear, strawberry, tomato, potato, and grape (qq.v.).

BLIGHT, AMERICAN. See **AMERICAN BLIGHT**.

BLIGHTBIRD. A small insect-eating bird (*Zosterops carulescens*) of New Zealand, so called because it frees fruit-trees of blighting insects. See **WHITE-EYE**.

BLIM'BER, CORNELIA. A character in Dickens's novel *Dombey and Son*, assistant in Dr. Blimber's (her father's) school, and afterwards the wife of Mr. Feeder, B.A., the usher.

BLIMBER, DOCTOR. The master of a private school at Brighton, to which Paul Dombey was sent, in Dickens's *Dombey and Son*. "A portly gentleman in a suit of black, with strings at his knees and stockings below them. He had a bald head, highly polished; a deep voice, and a chin so very double that it was a wonder how he managed to shave into the creases."

BLIND, EDUCATION OF THE. In every generation of children, a certain proportion, varying according to social conditions and climatic influences, are born blind, or with such defective organs of sight as to become blind. With the improvements in cleanliness and in sanitary appliances at orphan asylums and houses of refuge, blindness has decreased in the United States in recent years. Most of the blind are born of the poor, and even the few who are not so born tend to sink into the dependent class. Hence, in all civilized countries, blindness and pauperism have been synonymous terms, although many of its victims are endowed with keen sensibilities, and suffer more from their low social position than from their physical infirmity. The Nineteenth Century saw a wonderful revolution in the condition of the blind. They have emerged from a state of utter ignorance, dependence, and general wretchedness; and while many have become well-educated, independent, self-supporting citizens, the condition of all has been greatly improved. For this radical change, much credit is due to the blind themselves, for the eagerness with which they have taken advantage of the opportunities offered them, and for the brave and successful struggle to overcome the obstacles in their path. Since their infirmity cuts them off less than the deaf from social intercourse with the world at large, they are, as a rule, more cheerful and happy than the latter, while a tendency to conceit is doubtless attributable to the consciousness that they have had to contend with very great difficulties.

HISTORY OF INSTITUTIONS. The first book calling attention to the condition of the blind was published in Italy in 1646, and we find, from this time onward, an increasing interest in the subject of blindness and its effect on the human mind. Locke, Leibnitz, Condillac, Reid, and Diderot wrote upon it, and Rousseau endeavored to bring the question out of the region of abstract speculation into that of practical everyday life. Raised print had been long, though dimly, foreshadowed, and a number of blind persons had received assistance in their studies from tangible apparatus, such as raised letters and ciphering-tablets, before Valentine Haüy began his work. To him, however, belongs the honor of inventing embossed books for the blind, as well as of founding in Paris, in 1785, the first school for their instruction. The Royal Academy made a report on his work in that year, and while pointing out the features which his system had in common with the agencies previously employed by individual blind persons, declared that to him alone were due their perfection, extension, and systematization. The school for the blind aroused great interest in Paris, and Louis XVI. took Haüy into favor, bestowing several offices upon him. In the dark days of the Revolution, Haüy and his school suffered much; but he continued his work, under great difficulties and privations, educating some pupils who be-

came famous. Haüy's long, faithful, arduous, and fruitful labors in behalf of the sightless earned him the title of 'Father and Apostle of the Blind.' He published an essay on their education, and continued his work in Russia and Prussia, after he had been obliged to give it up in Paris.

England followed the lead of France by establishing in 1791 the School for the Indigent Blind in Liverpool, the object of which was to teach poor blind children to work at trades, to sing in church, and to play the organ. In 1793 Mr. David Miller, a blind man, and Rev. Dr. David Johnston founded the Royal Blind Asylum and School in Edinburgh, the main purpose of which was to train them to habits of manual labor, though in later years the directors have devoted increased attention to the intellectual development of the pupils. The Bristol Asylum for the Blind was opened in 1793, its object being to teach sightless children such handicrafts as would enable them to earn their own living. They also receive instruction in music and the English branches. The School for the Indigent Blind in London was established in 1799. Its chief object was instruction in manual labor, but a more liberal scheme of education was adopted after a time. Similar establishments were founded in Norwich, Glasgow, York, Manchester, and elsewhere. The organized efforts made in Great Britain for the relief of the blind were founded upon the idea that as a class the blind must necessarily remain at the foot of the social scale, forever dependent upon the more fortunate classes. Hence most of the British schools have never taken a high stand in their literary or musical training. The Royal Normal College and Academy of Music for the Blind was established in London, 1872, by an American, Mr. F. J. Campbell, a blind man, who had been educated and had taught at institutions for the blind in the United States, and who brought American teachers and methods to England. There are also in Great Britain societies for teaching the adult blind to read, and circulating libraries of books in raised type have been established in London, Brighton, and many provincial towns. The Association for Promoting the General Welfare of the Blind, which has been in operation for fifty years, supplies regular work to many at their own homes, and finds employment for others in its workshops.

In most of the European institutions the prevailing idea is that what is done for the blind is in the spirit of favor and charity, rather than of right and obligation. A large number of the so-called schools, especially those in Great Britain, are mere asylums, chiefly supported by annual contributions, which are made and received in the nature of alms. Even in those establishments which are endowed and supported by the governments the pupils are brought up under such influences as favor the segregation of the blind into a class by themselves, and do not inspire the desire for usefulness and self-maintenance.

At the beginning of the Nineteenth Century institutions for the blind, mainly fashioned after the model set by Haüy, were established in various parts of Europe. The Vienna Institution was founded in 1804, Dr. Klein, a blind man, being its director for about fifty years. That of Berlin was established under the superintendence

of Herr Zeune in 1806, Hatly having paved the way for it on his way to Russia. In 1808 three institutions were established—one in Amsterdam by an association of Freemasons, one in Prague by a charitable society, and one in Dresden. In 1809 Hatly put the school in Saint Petersburg in operation, and Dr. Hirzel organized that of Zürich. In 1811 the Society of the Chain, an organization similar to the Freemasons, started an institution in Copenhagen, and many others were founded soon afterwards. All the principal countries of Europe have special institutions for the instruction of the blind in the rudiments of learning, in music, and in mechanical arts. There are more than 150 of these on the Continent, many being under Government supervision or control.

In the United States of America the education of the blind rests on a different basis. As soon as their claims to a share of the benefit of common-school learning were urged, it was conceded not as a matter of charity, but as a matter of right. The most valuable distinctive feature of the American institutions is that they constitute an integral part of the educational system of the country. The right of the blind to participate in all the educational benefits provided for every child in the Commonwealth is acknowledged by the State in its sovereign capacity, and since they cannot be taught in the common schools, an express provision is made for their instruction. This policy has acted very favorably upon the blind, and has inspired them with self-respect and a worthy ambition to be independent.

The general system adopted in the American schools is as follows: (1) to give to all pupils the same sort of instruction, and to the same degree, as is given in the best public common schools; (2) to teach them the elements of vocal and instrumental music; (3) to train them in some sort of simple handicraft by which to earn a livelihood. Owing, however, to the prevailing desire of the young in America to strike out in new directions, to the general preference for brain-work rather than hand-work, and to the disadvantage at which the blind do mechanical work, comparatively few, hardly two-tenths, it is said, practice for a living the handicrafts which they have learned at the several institutions. Most of the graduates resort to various branches of the musical profession, teaching the elements of vocal and instrumental music, playing upon organs, tuning pianos, or trading in musical instruments. Some graduates take petty agencies, and with a guide go about the country peddling on their own account. Others, favored by friends, find employment in some of the establishments where hand-work combined with a certain amount of head-work is required. A few work diligently at their trade, and earn an honest and comfortable livelihood. The general condition of the graduates is affected by the prevailing feeling of compassion, which, it must be said, is often abused by the blind. Upon the whole, however, the general effort made to lift the blind out of the pauper class has had very satisfactory results. There is doubtless a greater proportion of really self-supporting blind persons in the United States than in any other country. This is owing mainly to the public institutions for their education and training, especially to the pioneer school, the Perkins Institution, on which the others are modeled to a

great extent, and to its director for forty-five years, Dr. Samuel Gridley Howe. Dr. Howe, the Hatly of America, possessed not only the humanity and inventive genius characteristic of the famous Frenchman, but also great executive ability.

The first school for the blind in the New World was founded in Boston, Mass., chiefly through the efforts of Dr. John D. Fisher, a young physician, who had visited the French school. It was incorporated by Act of Legislature March 2, 1829, as the New England Asylum for the Blind. The State granted its aid from the beginning, this being proportioned at first to the number of beneficiaries received and educated, and active work was commenced in 1831, when Howe was engaged as director. Exhibitions of the pupils were given before the Legislature at an early date, and much interest and enthusiasm were aroused. Col. Thomas H. Perkins gave his mansion in Pearl Street to the institution, which was renamed in his honor, as the Perkins Institution and Massachusetts Asylum (now School) for the Blind. The other New England States promptly took measures to secure for their blind children the advantages of instruction; but instead of erecting institutions at home, they sent their beneficiaries to the Massachusetts school.

Instruction in the literary department included not only the simple branches of a common-school education, but also some higher mathematics, astronomy, and natural philosophy. The study of languages, too, was introduced at an early date; but, of course, the main emphasis was laid on a solid English education. In addition to vocal music and instruction upon the piano and organ, the foundation for an orchestra was immediately commenced. The tuning of pianofortes, taught as a practical employment, has proved to be a lucrative one. The pianos of the public schools of Boston have been tuned and kept in repair by the blind for the past twenty-five years. Physical training, both in the gymnasium and out of doors, has always been insisted upon, and the pupils are gently stimulated to run about and play like other children. The Perkins Institution soon surpassed the European institutions, and has long been the best school of its kind in the world. A printing-press was started at an early date, and many improvements in the apparatus for the education of the blind were made. A detachment of pupils visited various parts of the country, and they were exhibited before the legislatures and people of twelve different States for the purpose of inducing them to make provision for similarly afflicted persons within their own limits. These exhibitions were so effective that "provision for the education of the blind was made in those States before the representatives of the people had time to wipe the tears from their eyes."

In 1837 Dr. Howe began the education of Laura Dewey Bridgman, a child seven years old, who had become blind, deaf, and dumb from scarlet fever at the age of two. It had been supposed up to that time that a person in Laura's condition could not be taught the use of language; and Dr. Howe's success elicited great interest, his reports detailing the progress of his pupil being translated into several European languages. His methods, which remain the standard ones, may be thus briefly stated: Upon

articles in common use, such as spoons, forks, and keys, labels were pasted, containing their names printed in raised letters. Laura felt of these carefully, and soon distinguished the difference between the crooked lines—s p o o n and k e y. Then small detached labels containing the same names were given to her, and the child, observing their similarity, laid these on the articles thus designated. The same process was repeated with all the articles she could handle. After a time the labels were cut up into their component letters and these were arranged side by side. They were then mixed in a heap, and a sign was made to her to arrange them herself. The meaning of these exercises now dawned upon her mind, and the important step was taken. Laura's education was continued until she was twenty. She learned to converse fluently in the manual alphabet, to read easily, and to write well and correctly. She studied arithmetic, algebra, geography, history, and elementary physiology. She was an expert needlewoman, could sew on the sewing-machine, and knit fine lace. With Oliver Caswell and other blind deaf-mutes, Dr. Howe began first with the manual alphabet, instead of with printed labels. The Perkins Institution has maintained as a specialty the teaching of blind deaf-mutes, Helen Keller having begun her education under the direction of this school.

The separation of the sexes was early insisted upon by Dr. Howe, on the ground that while marriage between defectives is always unfortunate, it is especially so in the case of a class so helpless as the blind. In 1868-69 the cottage or family system was introduced, the State of Massachusetts appropriating nearly \$100,000 for cottages for the girls.

The Kindergarten for the Blind, an offshoot of the parent institution, was founded in 1887 by Michael Anagnos, the son-in-law and successor of Dr. Howe, who has continued the policy of the latter, and has greatly enlarged the work of the institution. An opportunity is thus afforded for a continuous education from the earliest stage to the gates of the college, where it is thought more desirable to have the blind mingle with the seeing than to remain segregated as a class apart.

The work of educating the adult blind in their own homes was begun in Massachusetts in 1900, the Legislature appropriating a sum of money to be expended by the Perkins Institution in this way. Several teachers were employed, and the enterprise proved so successful that the State increased its appropriation the following year. Instruction is given in reading and in several branches of handicraft, suited to the sex and the physical condition of each person. The institution places at the disposal of these outdoor pupils, free of all charge, its large library of books in embossed type of four different kinds. In this manner an attempt is made to solve the problem of educating, cheering, and rendering in a measure self-supporting and independent those who become blind after the period of childhood and youth has passed.

The first thought and purpose of building up special institutions for the instruction of the blind seem to have occurred to benevolent persons in New England, New York, and Pennsylvania almost simultaneously, but without concert. The New York Institution for the Blind

was incorporated April 22, 1831, through the efforts of Dr. Samuel Akerly and Mr. Samuel Wood. On March 15, 1832, Dr. John D. Russ began the education of three pupils, and although he resigned his position in 1836, he continued to manifest much interest in the improvement of educational appliances for the blind.

The progress of the school was for some years retarded by the want of an efficient head to direct its affairs. In 1845 Mr. James F. Chamberlain was elected superintendent, and the institution entered upon an era of prosperity and advancement which has continued to this day. The excellent Pennsylvania Institution, which has grown to be among the foremost of the world, was founded in Philadelphia by the Society of Friends in 1833. Robert Vaux had for some years urged the necessity of making such a provision for the education of the blind. Julius R. Friedlander, the first principal, had had experience in European institutions for the blind, and came to Philadelphia in the hope of establishing a school for their benefit. He organized the school with great care and deliberation, gave exhibitions of the attainments of his pupils before the legislatures of Pennsylvania, Delaware, and New Jersey, and obtained appropriations for the support of beneficiaries from each of these States, and later from Maryland. The Ohio School for the Blind was established at Columbus in 1837. The Virginia school opened at Richmond in 1838, and that of Kentucky at Louisville in 1842. In 1900 there were 37 institutions in the United States, with 393 instructors and 3665 pupils, of whom 417 were in kindergartens, 1738 received instruction in vocal music, 1797 in instrumental music, and 1924 were in the industrial departments. The libraries contained 100,000 volumes. The value of buildings and grounds was \$6,500,000, and the annual expenditure was over \$1,000,000.

In Europe, Mr. Anthony Buckle, superintendent of the Yorkshire school, who died in 1900, did much for the elevation of the blind in the industrial and moral scale, as well as for their intellectual and spiritual enlightenment. The *Ecole Braille*, situated at Saint Mandé, one of the suburbs of Paris, is administered with vigor and efficiency by Monsieur A. Péphau. It is under the control of the municipal authorities and entirely supported by the city. The *Institution Nationale* of Paris, the school founded by Hatty, is liberally supported by the State, and its pupils, selected from a large number of applicants residing in all the districts of France, are, as a rule, superior in intelligence to those of other European and of American schools. The institutions for the blind of Germany do not differ from those of France in any of the fundamental principles upon which the work is conducted. They employ a class of instructors superior to those of any other country. Few of the teachers are blind, and most of them are graduates of the German universities. The Imperial institution for the blind in Vienna now occupies a fine building, situated near the Prater, and well calculated to meet all demands for the physical, mental, moral, and spiritual development of its inmates. In addition to a commodious and well-equipped gymnasium, excellent school and music rooms, and a printing-office with the necessary tools and machinery, it contains a museum, which is the best of its kind in Europe, in arrangement, classi-

fication, and proper display of its contents. It is not so rich in collections of specimens of apparatus as that of Paris. The director, Prof. Alexander Mell, is the author of the *Encyklopädisches Handbuch des Blindenwesens*—an important work on the blind and the methods and appliances employed in their instruction and training.

An international congress for the amelioration of the condition of the blind was held in Paris in connection with the Universal Exposition of 1900. Germany, England, Denmark, Sweden, Holland, Russia, Hungary, Switzerland, Italy, Portugal, the United States, Belgium, and France were represented, the two countries last named having the largest number of delegates and the controlling influence. There is an American Association of Instructors of the Blind, which meets biennially.

BOOKS. In all the branches of instruction for the blind, while oral teaching is of no small importance, aid is derived from the use of books and apparatus adapted to the sense of touch. The process of printing embossed books consists of pressing the type strongly on heavy paper, in such a way as to produce letters in relief.

The first characters adopted by Hatty in 1785 were those of the Illyrian or Slavonic alphabet, doubtless on account of their square form. Large editions of a few works were printed at great expense in his system, which gave 365 letters on 50 square inches of surface. About forty years later James Gall, a printer and publisher of Edinburgh, took up the work, being deeply impressed with the importance of putting the Bible into the hands of the blind. He printed his first book in 1827, and in 1834 published the Gospel of Saint John, the first book of the Scriptures ever printed for the blind. In 1838 he printed for the British and Foreign Bible Society the Gospel of Luke and the Acts of the Apostles. His labors extended over a period of twelve years. While at first he was obliged to contend with apathy and incredulity, much interest was eventually excited in his work in Great Britain and elsewhere. He used a modified Roman letter, choosing the lower-case alphabet in preference to capitals, whose uniformity renders them difficult to distinguish by the touch. His system gave 526 letters on 50 square inches. Meantime Dr. Howe, when beginning the work of educating the blind at the Perkins Institution, found himself seriously hampered by the fact that at that time (1832) only three embossed books in English were in existence. By dint of various improvements, such as stereotyping, using thin paper expressly prepared, and reducing the size of the letters, he succeeded in cutting down the bulk of the books one-half, and the expense of printing to one-quarter of what it had been. Thus the Boston method gave 702 letters to 50 square inches, 21 editions of books being printed in a short time. A further improvement gave 1067 letters to the same space. Dr. Howe was extremely desirous of giving the Bible to the blind, and in 1836 the entire New Testament was printed at the Perkins Institution. Numerous text-books were also issued.

The first printing in Philadelphia (in 1833-34) gave only 200 letters to 50 square inches, and was abandoned. In 1836-37 work was resumed with an improved method giving 826 letters. John Alston was the inventor of the Glasgow system which gave 891 letters, using capital letters,

however, as did the Philadelphia type. He printed the Gospel of Saint Mark in 1837, the New Testament in 1838, and the whole Bible in 1840, Dr. Howe finishing his task of issuing the Bible in 1843. Alston's type was too small to be legible, and his system did not stand the test of time. Mr. Lucas, of the Bristol Institution, invented a system of stenographic printing, with arbitrary characters and many contractions, by which he secured largeness of type and diminished the size of the book. In 1839 a society was formed to aid Lucas in printing the Bible and teaching the blind to read on his system. As this system was phonetic, it did not teach correct spelling, which is in any event difficult for the blind to master. Mr. Frere, of London, also invented a phonetic system about 1838, as well as return lines. His books are read from left to right and from right to left alternately, the letters being reversed in alternate lines.

Nearly all of the supposed improvements for facility in reading were made upon the idea that, as the majority of the blind are adults, all methods must be directed for their benefit—a theory which does not recommend itself to Americans, who consider the education of the young as of the first importance. Of these new methods only two have any prominence at the present time: Dr. Moon's complex line type and the arbitrary point character. The former uses a combination of Roman letters with arbitrary characters, reversing the lines like Frere, but not the letters. His system is read with facility owing chiefly to its large type, measuring one-fourth of an inch. It was meant for elderly blind persons and for those whose hands are roughened by manual labor. It is well adapted for these two classes, but is too unwieldy for general use. The 64 volumes of the Moon Bible can be printed in eight volumes in Roman type. It also has the disadvantage of being illegible to seeing persons. Dr. Moon has printed many books in English and in foreign languages. A society has been formed to extend his system, and the blind are taught by it in their own homes. It requires, however, special teachers.

The arbitrary point character was invented by Charles Barbier, a Frenchman, and arranged in its present form by Louis Braille, one of the blind professors at the Institution Nationale of Paris. It consists of six dots. One or more of these are placed in various positions, making 62 varieties of form. One great advantage of this character is that it can be used by the blind for writing to others in their condition. Another is that it affords an excellent method for writing and printing music. It is extensively used, and is a valuable invention. Mr. William B. Wait, the superintendent of the New York Institution for the Blind, arranged a modification of the point system, the dots of his method being placed horizontally. The friends of the point system would be glad to abolish the Roman letter altogether, whereas the advocates of the latter are glad to avail themselves of both methods, which are taught side by side in some institutions. They point out that seeing persons use three distinct methods for their educational purposes: Roman letter for reading, script letter for writing, and an arbitrary arrangement of characters for music. There would therefore seem to be no reason why the blind should not employ two:

Roman letter for reading and the point for writing and music.

Since the time of Hatty thoughtful educators have dwelt on the importance of using seeing methods as far as possible for the instruction of the blind. The point is to rescue the sightless from segregation as a class apart, and to give them as many interests as possible in common with the rest of the world. Thus, owing to the influence of Mr. Gall, the modified Roman letter was adopted by the Royal Society of Arts. In 1851 the Royal Commissioners of the Exhibition of the Works of Industry of All Nations, held in London, recommended the universal adoption of Dr. Howe's books (the Boston type). In 1872 the American Association of Instructors of the Blind passed a series of resolutions in favor of the adoption as far as practicable of seeing methods. In 1876 the London School Board, after a patient and careful examination of the arguments advanced by some of the ablest educators of the blind in England, decided to adopt the methods used by seeing children in ordinary schools. In the reports of the Perkins Institution, Dr. Howe urged constantly the minimizing in every possible way the difference between the blind and the seeing. Dr. Frank Rainey, of the Texas Institution, read before the World's Congress of the Educators of the Blind, held in Chicago in 1893, an able paper on this subject. He said, among other things: "If we use the ordinary methods, the child will think and talk like seeing persons, whereas if we use odd or extraordinary methods, it will not have the same conceptions of concrete things as we do."

A great advantage of the Roman letter over the point is that blind children can get their early training from teachers in the public school, or from their parents, under the former system, and they themselves can in turn, after they have grown up, teach seeing children, making fairly good governesses for families. The punctuation of the point system is complicated, and the omission or abrasion of one single point alters the entire letter. "Any system where frequent substitution of its characters is necessary for its perfection is essentially weak in all its parts, and is fearfully defective in that its structure depends upon position, reversion, and substitution."

The principal printing establishments in the United States are: (1) The American Printing House for the Blind at Louisville, Ky. Congress has since 1879 appropriated \$10,000 a year in support of this enterprise, the publications being distributed *pro rata* among the institutions of this country. (2) The Howe Memorial Press at the Perkins Institution, Boston, which has an endowment fund of nearly \$150,000, raised by private subscription.

The first circulating library for the blind in the United States was established at the Perkins Institution in 1882, although books had been lent to the blind free of charge before this time. Philadelphia and New York also have libraries of this sort, and departments for the blind have been instituted in the State Library of New York at Albany, and in several of the principal cities of New England.

APPARATUS. Among the early appliances for writing may be mentioned the 'string alphabet' invented by Messrs. Milne and Bain, of the Edinburgh Asylum. It consisted of knots tied

upon cord. Gall's writing-stamps, which date from 1838, were much used. Saint Clair and Gall invented processes for guiding the pencil in an ingenious but slow and tedious way. Guldberg, of Copenhagen, also invented a method of pencil-writing. The modern methods employed in the best American institutions are (1) the ordinary typewriter and (2) tablets for point-writing, according to the Braille and kindred systems. This has the great advantage of being legible by the blind themselves, but is a slow process. It is gradually replaced in advanced work by the Hall-Braille writer—an adaptation of the principles of the typewriter to the printing of point characters, made by Mr. Frank H. Hall, of the Illinois Institution for the Blind. The followers of the New York point system use a similar machine called the kaleidograph, the invention of Mr. Wait, of the New York Institution. A third process consists in writing with a pencil on a grooved sheet of cardboard or aluminium, thus forming a square handwriting. This method has the advantage of extreme simplicity and cheapness, and has been much used by the blind for many years.

For *arithmetic*, W. H. Taylor, of York, England, invented an octagonal ciphering-board, with cells into which type may be placed in different positions to represent the digits. A modification of this board was made at the Perkins Institution and manufactured by one of its graduates.

For the study of *natural history*, relief representations of animals are employed, also stuffed specimens of birds and animals. Papier-mâché models, life-size, assist the blind in the study of anatomy, while for botany these are greatly enlarged.

The early *maps* for the blind were made in Europe, on boards and by hand, the process being tedious and expensive. Dr. Howe, in 1836, invented an atlas which is thought to have been the first book of maps for the blind ever made. At the present time the blind are aided in their study of geography by wooden wall-maps in relief; dissected maps, also of wood, made at the American Printing House for the Blind, Louisville, Ky., and at the Perkins Institution in Boston; and embossed maps printed on paper by the British and Foreign Blind Association, London, and by Mr. Kunz, Illzach, Alsace.

All the *kindergarten* occupations, except drawing and painting or color work, are used with the blind children. In the kindergarten at Jamaica Plain, Mass., the following changes have been made in the ordinary appliances, to fit them for the use of the blind: The tables are marked out in inch squares by grooves instead of by lines. For the use of the gift representing surface, line, and point, frames 2 inches high and the length and breadth of the kindergarten tables have been prepared. These frames are stuffed with horse-hair, and covered with cloth stitched in inch squares with coarse silk. The cushions thus formed are placed on the tables, and the tablet rings and half rings (having been previously drilled, two holes in each) are pinned on to the cushions. Sticks large enough to have holes drilled in them are used in place of the regular kindergarten sticks, and beads one-quarter inch in diameter are used to represent the point. By pinning the forms they make to these cushions, the children are able to examine their work with their fingers without displacing it, and can thus

'see' what they have accomplished. In the use of the parquetry, the circles, squares, etc., are not pasted on plain paper, as is usual in the kindergarten, but square and oblong cards of different sizes with raised lines, forming inch squares, printed on them have been substituted.

BLIND, blĭnt, KARL (1826—). A German agitator and writer. He was born at Mannheim, and while a student at Heidelberg was imprisoned for his revolutionary activity. In 1848 he participated in the uprising in Baden, and had to flee, wounded. The next year he joined the band of liberals headed by Struve which invaded southern Germany. He was taken prisoner and sentenced to eight years' confinement. He was, however, set free by the populace and went to Karlsruhe, whence he was sent by the Provisional Government as an envoy to Paris. Expelled from France, he went to Brussels, and then (1852) to London, where he found rest. There, for many years, he kept up his political agitation through articles in many journals, and in intercourse with Garibaldi, Mazzini, Louis Blanc, and other democratic leaders; but after 1866 his writings became less revolutionary in tone, in consequence, perhaps, of the death of his stepson, who in May of that year attempted to assassinate Bismarck, and committed suicide in prison. Blind published a great number of political essays and brief articles on history, mythology, and German literature. Among his works are: *Fire-Burial Among Our German Forefathers: A Record of the Poetry and History of Teutonic Cremations*; *Ygdrasil: or, The Teutonic Tree of Existence*; and biographies of Freiligrath, Ledru Rollin, and Francis Deák. In 1897 he contributed an autobiographical sketch to the *Cornhill Magazine*, London.

BLINDAGE (from *blind*, in the sense of invisible, making invisible, as in 'blind story'). A screen to shelter troops from an enemy's fire. It may be constructed of lumber and earth, or of trees inclined against walls, or toward each other; much will depend on the available materials and ingenuity of construction. The effective defense of Ladysmith, Kimberley, and Mafeking, in the Boer War of 1899-1902, was rendered largely possible by the clever construction and use of improvised bombproofs and shelters. See **FORTIFICATION**.

BLIND BEGGAR OF AL'EXAN'DRIA, THE. See **CHAPMAN**, GEORGE.

BLIND BEGGAR'S DAUGHTER OF BETHNAL GREEN. An English ballad in two parts, of the time of Queen Elizabeth. The blind beggar has a fair daughter, Bessie, whom a knight falls in love with, and marries. At the wedding-feast the blind beggar turns out to be

Henry, son of Sir Simon de Montfort. Day, in 1659, and Knowles, in 1834, produced dramas entitled *The Blind Beggar of Bethnal Green*, founded on this poem.

BLIND FISHES (OF CAVES). See **CAVE-ANIMALS**.

BLINDNESS. Want of sight may arise from any cause within the eye intercepting the rays of light on their way to the optic nerve, or from disease, defect, or injury of the optic nerve or optic tracts, or of the visual centres in the brain. Blindness may exist from birth, or be acquired. It may be present during the day or the night, and may be permanent or transient, complete or partial. *Congenital Blindness* is due to deficient development of the nervous apparatus or to defect in the globe; to cataract (q.v.); to defect or disease of the cornea, choroid coat, optic nerve, or retina; or to tumors. *Acquired Blindness* may be due to injury of the eye or wounds of the head, or operations, or sympathetic irritation; to ophthalmia neonatorum, trachoma, diseases of the cornea, iris, choroid, or retina; to glaucoma or tumors; or to Bright's disease of the kidneys, heart disease, syphilis, disease of the brain or its meninges, or of the spinal cord; certain fevers; poisoning by lead, alcohol, or tobacco, etc. See **AMAUROSIS**; **AMBLYOPIA**; **ASTHENOPIA**; **HEMERALOPIA**; **NICTALOPIA**; **EYE, DISEASES OF THE**; and **COLOR-BLINDNESS**.

BLIND PREACHER, THE. The Rev. William Henry Milburn, for many years the Chaplain of the United States Senate.

BLIND SHELL. See **PROJECTILE**.

BLIND SPOT. A roundish oval spot in each retina, which is blind. It corresponds to the place of entry of the optic nerve. The spot is some 1.8 millimeters in width, i.e. subtends an angle of some 6° (the limits given by Helmholtz are 18° 55' and 12° 25'). That it is totally blind, whether to brightness or color, was first proved by the French physicist Mariotte in 1668, and is easily demonstrable. Its form differs somewhat in different eyes. With careful observation, it can be shown to possess certain irregular prolongations, which represent the course of the large blood-vessels that enter the eye along with the nerve.

A striking experiment may be performed as follows: Close or bandage the right eye, and with the left gaze steadily at a point upon a

BLIND SPOT OF LEFT EYE (plane-projection). Reduced from a large diagram, in which the distance from the inner edge of the point of fixation *a*, to the inner edge of the blind spot was 54.5 cm. The distance of the point of fixation from the eye in the experiment was 2.2 m.

wall or screen some 7 feet distant. Let another person seat himself directly before the wall, on your left-hand side, in such a position that his forehead is on a level with the point of gaze, and his nearer cheek some 50 centimeters distant

from it. If your gaze remains constant, his face will entirely disappear, and the wall will seem to extend continuously away from you on the left. By spreading a sheet of paper on the wall, and noting the points at which a colored pencil, moved to and fro by an experimenter, disappears and reappears, you can make an accurate map of the blind spot, including the vascular prolongations mentioned above.

This experiment raises a difficulty. You fail to see the face, and yet you see something, i.e. the unbroken color of the wall. The blind spot is thus filled out with color sensation. Now in binocular vision this result might have been expected. For the optic nerve enters the eyes on the nasal side of each retina; so that when we are using the two eyes together for purposes of visual perception, superposing (as it were) the one upon the other, and laying temporal half over nasal and nasal over temporal, the area that is blind in the one eye will correspond to an area in the other that is endowed with normal vision; the two eyes supplement each other. Further, the result would not be surprising, if it were gained in monocular vision, but under the ordinary conditions of seeing; for the eye is intrinsically a moving organ, and we instinctively turn the spot of clearest vision (see EYE) upon any object in the visual field that we wish to observe. But what of the result, in monocular vision, when we have taken especial pains to restrain the eyeball from movement?

PROJECTION OF BLIND SPOT OF RIGHT EYE.

Cc, optic axis; *ba*, area of optic nerve; *AB*, area of blind spot as projected on the screen *CAB*.

Let us look at the experimental data: (1) There seems to be no doubt that the spatial value of the blind spot, in visual perception, is entirely normal; points seen on the inner and outer edges of the spot do not approximate or run together,

as they would if the spot were wholly indifferent for purposes of space-perception. Paste nine large letters, in three vertical columns of three letters each, upon a sheet of paper. Hold the paper at such a distance and in such a position before the eye that the central letter of the square falls within the blind spot, while the surrounding eight letters are still visible. You will find that the surrounding letters still form a square for perception; whereas, if the blind spot had no spatial function, the two letters to right and left of the central would approach each other, and the whole figure would take on an hour-glass form. (2) If the surface at which we are looking is uniformly colored, the blind spot is filled out by this color. This law was demonstrated by our first experiment. It may also be proved as follows: Paste on a sheet of paper a colored ring, large enough to contain the blind spot within it. Let the ring be so wide that the spot slightly overlaps its inner edge. You see a solid disk, of the color of the ring. (3) If the surface is checkered or variously colored, there is (for practiced observers) no filling of the spot. Paste upon a sheet of paper a rectangular cross, the two vertical arms of red and the two horizontal of blue, with the four arms mitred at the centre. Hold the paper in such a way that the centre, with its two red and two blue triangles, falls at the centre of the blind spot. At first you will think that you see the two red or the two blue arms as a continuous band of red or blue; with practice, you will be able to convince yourself that at the central point of the figure you really see nothing.

The last of these three facts is intelligible enough: if the spot is blind, it stands to reason that one does not see with it. The first two facts, however, require explanation. We may (1) attempt a peripheral theory of the phenomena; that is to say, we may assume that the retinal sensations set up in the near neighborhood of the blind spot somehow 'irradiate' over the spot itself. The irradiation can hardly be thought of as physical, an irradiation of the stimulus. We must rather suppose that the local signs attaching to retinal points along the edge of the spot are extensible signs, carrying with them the sense-values and space-values of the whole blind area. When one is required to localize a pressure upon the skin of the back, one may make a mistake of as much as 5 centimeters in any direction; the local sign is extended so far in all directions. The local signs of the particular ring of retinal tissue under consideration would be similarly extended, only that the direction of their extension (toward the centre of the spot) is limited by the structure and function of the rest of the retina. If this explanation appear far-fetched, we may have recourse (2) to a central theory; that is to say, we may assume that the blind spot is filled out by 'association' or 'imagination,' by centrally aroused sensations (see SENSATION), while the periphery is and remains blind. There is no inherent difficulty in this view, and it accords well with the fact that the unpracticed observer sees the spot as filled, while the more practiced observer is aware that he does not see with it at all. We must then suppose that the local signs of the rim of the spot have taken shape under the same general laws that have conditioned visual local signs at large; and we may, perhaps,

suspect that their development has been influenced, in each eye, by the normal space-values of the corresponding area of the other eye.

BIBLIOGRAPHY. H. von Helmholtz, *Physiologische Optik* (Hamburg, 1896); Titchener, *Experimental Psychology* (New York, 1901); Wundt, *Physiologische Psychologie* (Leipzig, 1893).

BLINDSTORY. A story or other architectural horizontal division in a building, either outside or inside, which is without windows or other openings of importance. On the outside, it may consist of a blank wall or of a series of blind arcades. On the inside of churches the term is applied especially to the middle story of the nave above the side-aisles and below the clerestory (q.v.), or windowed story, of which it is the opposite in architectural terminology. It is then interchangeable with *triforium* (q.v.); and is in the form of a wide, open gallery in Byzantine, Lombard, Norman, and other Romanesque schools. In Gothic this gallery is gradually reduced until it becomes a series of false arcades.

BLIND TOM (c.1850—). A musical prodigy, a blind and almost idiotic negro, born of slave parents near Columbus, Ga., and called Thomas Bethune after his master. His musical genius attracted wide attention, and from 1861 he was frequently exhibited in New York. He was able, after a single hearing, to render even complicated music on the piano, frequently playing two melodies simultaneously. After playing, he often sprang up and applauded himself vociferously. He was difficult to manage, and his growing mental infirmity caused his final withdrawal, since which he is said to have lived in obscurity in New York.

BLINDWORM (Dan. *blindorm*; so called on account of the small size of the eyes), or **BLIND SNAKE**. A name given to certain worm-shaped, burrowing reptiles and amphibians. It applies especially to those of three groups, none of which is really blind:

(1) The serpent-like lizards of the family Anguillidae, of which the common blindworm, orvet, or slow-worm (*Anguis fragilis*) of Europe and western Asia is a type. Both the body and tail are elongated and serpent-like, and rarely more than one foot long; it possesses no external traces of appendages, but has internally a rudimentary shoulder-girdle, sternum, and pelvis, placing it intermediate between the lizards, which have four legs, and the snakes, in which all traces of limbs are lost; indeed, it has been proposed to put several snake-like lizards, with more or less degenerate legs, together with some of their allies, into one group and call them serpent-lizards (Saurophida). The eyes are bright, but small, giving rise to the belief that the animal is blind. It feeds on slugs and insects, and is perfectly harmless. It is so very timid that when startled its muscles contract violently, and the body is rendered so stiff and brittle that it is easily broken. Blindworms bring forth their young alive, and winter together in numbers under brush and leaves, or in loose, dry soil. Several genera of the same family, and presenting similar characteristics, inhabit the warmer parts of America, some of which have part or all of their limbs externally developed; the beautiful green, brown-banded, many-keeled lizard (*Gerrhonotus multicarinatus*) of California is an example.

Best known, however, is the 'glass-snake,' frequently found in the loose soil of dry fields from Illinois to Florida, and westward into Mexico. It has no feet, but by serpentine movements is able to move with considerable swiftness; and when overtaken can hardly be captured without injury, for its tail is so loosely articulated and so free of muscles that it breaks off like a bit of glass, to be quickly renewed by a new growth if the animal is not further harmed. It is yellowish-green above, with black lines. "The snout is long and pointed, the ear-pits large, the eyelids well developed, and each flank is provided with

"GLASS-SNAKE" LIZARD.

a, top of head: b, side of head.

what is ordinarily a deep groove, but which, on the animal's swallowing some large object, appears as a tract of elastic skin, the rigid skin of the body generally being incapable of expansion." It is perfectly harmless. Its technical name is *Ophisaurus ventralis*. Consult Cope, *Crocodylians, Lizards, and Snakes* (Smithsonian Institution, Washington, 1900).

(2) A family of true serpents (Typhlopidae), called 'blind snakes,' because their eyes in all cases are minute and weak, and in some are almost invisible under overlapping plates. They rank lowest among serpents, are only a few inches in length, and have rigid bodies suitable for burrowing, shaped much like those of earthworms, and with curved tails. They occur in all the warmer parts of the world, boring their way through the loose top-soil and feeding on worms, grubs, and insects; and in India sometimes appear in large numbers above ground after showers, inspiring the natives with foolish dread, for they are quite harmless. Numerous genera and species inhabit the warmer parts of America. Consult Gosse, *A Naturalist's Sojourn in Jamaica* (London, 1851).

(3) The Cæciliidae, a family of degenerate urodelous amphibians for a long time classed among reptiles. The body is vermiform and without limbs, all traces even of the pelvic and pectoral girdles having been lost. The ribs are too short to encircle the body, and the vertebrae are articulated as in fishes and lower amphibia, and not as in snakes. There are small scales in the skin, the eyes are very small, and in some species are covered entirely by the skin. There is neither tympanic membrane nor tympanic cavity. The small mouth lies on the ventral side of the conical head, and there is no tail, for the vent opens at the posterior end of the body. All these departures from the typical amphibian type are adaptive, fitting the cæcilians for their subterranean burrowing life. The young are hatched with external gills, and gill-slits, and for a time lead an aquatic life. The cæcilians inhabit warm countries and feed on earthworms and insect-larvæ; they are most abundant in South America, and Mexico and Ceylon possess several species. Sometimes they are called blindworms, but these am-

phibia should not be confused with the lizards and snakes above mentioned.

BLISS, CORNELIUS NEWTON (1833—). An American merchant and politician, born in Fall River, Mass. He was a clerk in New Orleans, and subsequently in Boston, and in 1866 was admitted a partner in the commission business of J. S. & E. Wright & Co., of the latter city. In 1881 his firm was merged into that of Bliss, Fabyan & Co., of New York. He was chairman of the Republican State committees of New York of 1887 and 1888, and treasurer of the Republican National committees of 1892, 1896, and 1900. In 1897-98 he was Secretary of the Interior in President McKinley's Cabinet.

BLISS, EDWIN MUNSELL (1848—). An American Presbyterian theologian, born in Erzerum, Turkey, a son of Isaac G. Bliss, formerly agent of the American Bible Society for the Levant. He was educated at Robert College, Constantinople (1862), and afterwards at Amherst and Yale. His extensive travels through Persia and Turkey, and his close association with foreign missions, have given him an intimate acquaintance with Eastern conditions, of which he writes in his books, *Encyclopedia of Missions* (1891); *The Turk in Armenia, Crete, and Greece* (1896); and *Concise History of Missions* (1897).

BLISS, FREDERICK JONES (1859—). An American archaeologist, born at Mount Lebanon, Syria. He graduated at Amherst College (1880), and at the Union Theological Seminary, New York (1887), but was not ordained to the ministry. After independently conducting researches in Syria, he was in 1890 associated as explorer with the Palestine Exploration Fund. He held this office until 1900, during which time he superintended the excavations at Tell-el-Hesi, on the site of Lachish (1891-93), and at Jerusalem (1894-97). During the course of these excavations he discovered the site of a city. His excavations at four places in Palestine, between 1890 and 1900, revealed much concerning pre-Christian pottery. His published works include *A Mound of Many Cities and Excavations at Jerusalem* (1894-97).

BLISS, PHILIP PAUL (1838-76). An American singer and composer. He was born at Clearfield, Pa., and studied at the Geneseo Normal Academy of Music, Geneseo, N. Y. In 1874 he became an evangelistic speaker and singer. In 1864-76 he composed a number of hymns, for which he generally wrote the words, and which had a very great popularity. These include: "Hallelujah! 'Tis Done!" "Pull for the Shore," and "Hold the Fort." He perished in the Ash-tabula (O.) railway disaster.

BLISS, PORTER CORNELIUS (1838-85). An American journalist. He was born in Erie County, N. Y., and was the son of the Rev. Asher Bliss, a missionary to the Indians. He investigated the condition of the Indian tribes in Maine, New Brunswick, and Nova Scotia, in 1860-61, and in 1861 went to Brazil as private secretary to Gen. J. W. Webb. In 1863 he explored the tract called the Gran Chaco for the Argentine Government, and in 1866 became secretary to Hon. C. A. Washburne, United States Minister to Paraguay, whom he assisted in collecting material for a *History of Paraguay*, 2 vols. (1871). At the outbreak of the war between Paraguay and Brazil, he was arrested by

President Lopez as a Brazilian spy. He was released in 1868, however, on the demand of the United States Government, and afterwards was a translator in the War Department, Washington; edited the *Washington Chronicle* (1869-70); and was secretary of legation in Mexico (1870-74). In 1879 he was the New York *Herald's* correspondent in South America.

BLISS, WILLIAM DWIGHT PORTER (1856—). An American Episcopalian clergyman. He was born in Constantinople, Turkey, and was educated at Robert College, Constantinople, Phillips Academy, Andover, Mass.; Amherst College (1878), and Hartford Theological Seminary (1882). He organized the first Christian Socialist Society in the United States, in 1889, and he is president of the National Social Reform Union. He has been editor of *The Dawn* (1889-96), of the *American Fabian* (1895-96), and of the *Encyclopedia of Social Reform* (1898), and in 1901 was editor of the publications entitled *The Social Unity* and *The Civic Councilor*.

BLISS, WILLIAM JULIAN ALBERT (1867—). An American physicist, born in Washington, D. C. He graduated at Harvard in 1888 (A.B.), and received a "proficient in electrical engineering" at Johns Hopkins in 1891. He was assistant in physics at Johns Hopkins from 1895 to 1898, and associate in physics there from 1898 to 1901, when he became collegiate professor of the same subject. His publications include a *Manual of Experiments in Physics*, in collaboration with Joseph S. Ames (1898).

BLISTER. A character in Fielding's *Old Man Taught Wisdom; or, The Virgin Unmasked*. He is in love with Lucy, and attempts to make himself agreeable by discussing his trade.

BLISTER-BEETLE. A dark-colored, elongated beetle of the family Meloidæ, so named because the dried and pulverized bodies of certain of them are used to make blister-plasters. They are also called oil-beetles (q.v.), because some species, as of Meloe, exude a disagreeable yellow fluid from the knee-joints when disturbed. In the adult stage these beetles occur on foliage and flowers, especially the goldenrod, and several kinds are destructive to the potato-plant. The food habits of the young are very different from those of the parent. These beetles illustrate a method of insect development termed hyper-metamorphosis. (See METAMORPHOSIS.) The best-known one is the cantharis, or Spanish-fly (*Lytta vesicatoria*), of southern Europe, which is bright green, and about an inch long. It is gathered from its food-plants—lilac, privet, etc.—at night, when at rest, by beating the bushes and catching the insects in a cloth, by persons who guard their faces against the acrid volatile discharges of the beetles with veils and gloves. They are killed usually by immersion in hot vinegar and water, and then dried and put into air-tight bottles. Several other species of blister-beetles are similarly used in other parts of the world.

The active principle of the blistering-flies is *cantharidine*, $C_{10}H_{12}O_4$, which possesses such powerful properties that one-hundredth of a grain placed on the lip rapidly causes the rise of small blisters. Administered internally, blistering-flies cause heat in the throat, stomach, intestines, respiratory organs, etc.; and in large doses, they give rise to inflammation of a serious na-

ture, and sufficient to cause death. Externally, they are employed as a blistering agent. There are various medicinal preparations of blistering-flies, such as *cerate of cantharides*, which contains 320 parts of cantharides to 180 parts yellow wax, 180 parts of resin, 220 parts of lard, and 150 parts of oil of turpentine; *tincture of cantharides*, procured by digesting blistering-flies in proof-spirit, etc.; but that most commonly employed is *plaster of cantharides*, or *blistering-plaster*, obtained by heating and straining 80 parts of cerate of cantharides, and melting 1000 parts of Burgundy pitch with the strained liquid. See **BLISTERS**; **MELOIDÆ** (for bibliography); and illustration on Colored Plate of **BEETLES**.

BLISTERS (akin to O. Dutch *bluyster*, blister; cf. *blast*, blow). Medicinal agents which, when applied to the skin, raise the cuticle into small vesicles filled with serous fluid. They are applied either in the form of plasters or in a fluid state, as suits the convenience of the person or part, and have for their object the establishing of a counter-irritation or diversion of morbid action from a part in which it cannot be reached by remedies, or from some organ where it may do permanent mischief, to some more superficial part of the body. The most common blister in use is made of cantharides (see **BLISTER-BEETLE**) mixed with a convenient proportion of lard and wax to form the blistering ointment of ordinary use. If applied too long it produces distressing affection of the urinary bladder, and may produce sores which are difficult to heal. Four hours are generally requisite to produce the desired effect. Mustard (*Sinapis nigra*) is frequently used, but seldom left on sufficiently long to produce blistering. Its effect may be limited by applying white of egg to the blistered surface. Croton-oil, strong liquor ammoniæ, tartar-emetic ointment, and many others, are used in practice. If the occasion for the blister passes off, the vesicles should be opened freely, and their fluid contents allowed to escape, the vesicated surface being then dressed with some cold cream or lard. But if it should appear desirable to promote a discharge from the skin, the raised cuticles may be snipped off, and the blister either applied again at intervals, or some stimulating ointment, as savine ointment, should be used. Blisters are especially useful in inflammations of serous membranes, as pleurisy, in glandular tumors, in indolent ulcers, and for the relief of muscular pain, as well as for old joint affections.

The term blisters is also commonly applied to elevations of the cuticle filled with serum or blood.

BLISTER-STEEL. See **IRON AND STEEL**.

BLITHE'DALE ROMANCE, **THE**. Hawthorne's novel on the Brook Farm experiment, which is regarded by Mr. Howells as in some respects the finest of the author's works.

BLIZZARD. A severe, blinding storm of fine dry snow, with a freezing wind. This word is popularly said to have originated in the United States, and is in fact on record there as early as 1830 or 1840; but more recent investigations have shown that it is used in analogous senses in the local dialect of Lancashire, England, where it can be traced back for several centuries and is usually spelled *blesard*. It came to be widely employed in 1880-81 in connection with the

severe storms in the Western States, and has been in almost universal use since the great storm of March, 1888, when snow fell to the depth of three feet over the Atlantic States and New England, and was drifted by gales of wind for several days into drifts of five, ten, and twenty feet deep, causing a general suspension of traffic. A similar storm occurred in eastern Virginia and Maryland in February, 1898, and one is also recorded for the neighborhood of Norfolk, Va., in the early part of the last century. The most destructive blizzards, because of the intense cold, occur in the region between Dakota and Missouri and Ohio. Similar storms of snow and wind are also frequent in Great Britain. These storms correspond very nearly to the *purga* of Siberia and the *buran* of Russia. They are due essentially to the rapid southward flow of a mass of cold air pushing outward from a large region of high barometric pressure. They have a well-defined front edge, which advances with great regularity, the rate of progress being by no means so rapid as that of the wind itself, whence we infer that the wind at the front must be rising upward and flowing over. The general rate of progress is therefore due, not to the wind as such, but to the differences of density and pressure prevailing in the atmosphere on either side of the front. On this account it has become possible for the officials of the United States Weather Bureau to forecast the advance of a blizzard with considerable accuracy, and very few cases occur in which the citizens are not abundantly forewarned.

BLIZZARD STATE, **SOUTH DAKOTA.** See **STATES**, **POPULAR NAMES OF**.

BLOAT (Icel. *blotna*, to become soft, blautr, soft, wet), **HOVEN**, or **TYMPANITES**. A condition in cattle or sheep, in which, owing to the formation of gas in the rumen, or first stomach, this organ becomes painfully distended. The trouble frequently occurs from eating too much green alfalfa, clover, or other legumes. Eating undue quantities of grain sometimes produces the same effect. Cases of bloat are most frequent among animals that are unaccustomed to grazing on green legumes. Relief may usually be attained in mild cases by administering liberal doses of cathartics. One pint of linseed-oil or a pound of Epsom salts would be a suitable dose for a cow and about one-fifth that amount for a sheep. If simple remedies fail, the breathing becomes distressed, and the animal stupid, the gas may with safety be allowed to escape by an external opening made with a canula and trochar, or with a large pocket or table knife, at a point intermediate between the last rib, the lumbar vertebra, and the prominence of the haunch.

BLOCH, blôg, **JEAN DE** (1836-1902). A Polish financier, economist, and writer on military affairs. He was born at Radom, of Jewish parents. He was administrator, under Government appointment, of the entire railway system connecting the Black Sea and the Baltic, and holder of the concessions for numerous lines. He was active in promoting an industrial movement in Poland. This he furthered by his large interests in the lumber and sugar trades, of which he became the actual head. He was constantly engaged in scientific and philanthropic enterprises among the poorer classes. He first became known to the world at large, however, as a propagandist of universal peace, partly by his articles in

French, German, and English periodicals and his war- and-peace museum at Lucerne, but more particularly through his great work published at Saint Petersburg in 1898 (7 vols.), and in abridged form translated into English by R. C. Long as *The Future of War in Its Technical, Economic, and Political Relations* (1899; in England as, *Is War Now Impossible?*). In this book the author argues that under modern conditions a war would necessarily be of such length as to result in the starvation of the contending powers, consequent revolution, and the destruction of the State; and hence that it is unlikely to be entered upon in the future.

BLOCH, KARL HEINRICH (1834-90). A Danish painter. He was born in Copenhagen, and studied at the Copenhagen Academy. From 1852 to 1865 he was in Italy, and in 1883 he was appointed a professor at the Copenhagen Academy. He first achieved a reputation for nature-studies, in particular those drawn from Jutland and Zealand, and for humorous pictures. His most important paintings, however, are historical. The list of his works includes: "Peasant's Cottage" (1858); "Roman Street Barber" (1864); "Christian II. in Prison at Sonderburg" (1871); "James of Scotland Visiting Tycho Brahe," and two large historical frescoes at the University of Copenhagen.

BLOCH, MARCUS ELIESER (1723-90). A German ichthyologist, born of poor Jewish parents in Anspach. He was permitted to grow up in ignorance, and at nineteen he had read nothing except a few useless rabbinical treatises. He then became an assistant to a Jewish surgeon in Hamburg, and learned German and Latin. He decided to study medicine, went to Berlin, and devoted himself with indefatigable zeal to anatomy and other branches of natural history. His great work is the *Allgemeine Naturgeschichte der Fische* (12 vols., Berlin, 1872-95, with 432 colored plates), long the most comprehensive work on ichthyology, and still valuable, especially for its pictures. His collection of fishes went to the Berlin Zoölogical Museum.

BLOCH, MORITZ. A Hungarian philologist and theological writer. See BALLAGI, MORITZ.

BLOCHMANN, blöc'män, KARL JUSTUS (1786-1855). A German educator, born in Reichstädt (Saxony). He studied at the University of Leipzig, and from 1809 to 1816 was an instructor in Pestalozzi's school in Yverdon, Switzerland. In 1824 he opened in Dresden the Blochmann Institute, which in 1829 was united with the Vizthum Gymnasium, and long enjoyed a very considerable fame. His method was in general similar to that of Pestalozzi, except that it placed a greater emphasis upon the orthodoxy of the time. He wrote what is perhaps the best German biography of Pestalozzi: *Heinrich Pestalozzi, Züge aus dem Bilde seines Lebens und Wirkens* (1897).

BLOCK. An instrument used in practical mechanics, and especially on board ship, for changing the direction in which a rope leads, or for gaining power at the expense of speed. It consists of a framework, or shell; one or more pulleys, or sheaves; a hook, shackle, or other means of attachment to other objects; a pin or pivot-bolt for the sheaves to revolve upon; and, generally a strap of rope or iron to which the hook or shackle is attached. Blocks are classed in sev-

eral ways according to the number of sheaves, as *single, double, treble, fourfold*, etc.; according to their design, as *snatch blocks, fiddle blocks, gin blocks, secret blocks, sister blocks, check blocks, clump blocks*, etc., and according to their use as *cat blocks, quarter blocks, clew-line blocks, topsail halliard blocks*, etc. The apparatus called a *tackle* or *purchase*, consists of two blocks and the rope (called the *fall*) which *reeves* (i.e. passes) through them. One end of the fall,

BLOCKS.

a—Double block. b—Treble block. c—Long-tackle block. d—Clew-line block. e—Snatch block.

called the *standing end*, is made fast to the *breech* (the part opposite the hook) of one of the blocks; from this the fall leads through the other block and then back through the first one; if the blocks are double, treble, fourfold, etc., the fall leads back and forth through the blocks until all the sheaves are filled. See TACKLE.

BLOCK, blök, MORITZ. A French writer on statistics and political economy. He was born in Berlin, but was naturalized in France, where he served in the Ministry of Agriculture from 1844 to 1852, and then in the Bureau of Statistics till 1862, devoting himself henceforth exclusively to authorship. Among his numerous works on agriculture in various countries of Europe, on French statistics and finances, and on socialism in Germany, the most important are: *Des charges de l'agriculture dans les divers pays de l'Europe* (1850); *Dictionnaire de l'administration française* (1892), which won for him his great reputation; *Statistique de la France* (1875); *L'Europe politique et sociale* (1893); *Petit manuel d'économie pratique* (1890), which was translated into eleven languages; and *Les progrès de la science économique depuis Adam Smith* (1890). From 1856 he edited *L'Annuaire de l'économie politique et de la statistique*, and he also published several statistical works in German.

BLOCKADE (Fr. *bloquer*, to obstruct, block; *bloc*, block). The investment of an enemy's city, port, or seacoast. It may be military, in which case the object of the operation is to reduce the invested place, or commercial, for the purpose of shutting out neutral commerce from access to the blockaded port or coast.

The right to establish a blockade rests in the general right which every belligerent power possesses of distressing its enemy and weakening the power of resistance. (See BELLIGERENT.) As such it imposes the obligation of observance upon a neutral, even though incidentally the neutral be injured by the cutting off of commercial relations. But the neutral need not employ preventive measures; nor is the breach of a blockade a municipal offense which the blockading power may require the neutral to punish. The responsibility of its maintenance belongs to the block-

ading belligerent. As a sovereign act, also, the proclamation and establishment of a blockade rests with the highest authority of a State. At the commencement of a blockade a delay is usually granted by comity to permit neutral vessels in port to sail, which during the American Civil War was fixed at fifteen days. Neutral men-of-war on diplomatic errands and ships in distress are generally allowed entry. A neutral may insist that due notice of the blockade shall be given, and that the declaration be substantiated by a suitable force at the point affected.

The rules relating to blockades are a development of the past hundred years. In 1804 Prussia, in alliance with Napoleon, had seized Hanover and declared her ports closed to England. The latter retaliated by proclaiming the coast from the Elbe to Brest under blockade. Napoleon in 1806 issued the Berlin Decree, laying the whole British coast under blockade. England followed with the Orders in Council putting a blockade on the coast from the Elbe to Italy. These were mere 'paper blockades,' as neither power could actually cover the coasts with blockading squadrons; but they served to render any neutral liable to seizure who went from an English to a Continental port, or *vice versa*. The subsequent development of commerce and the recognition of neutral rights finally led to the Declaration of Paris in 1856, which requires that a "blockade, to be binding, must be effective." The United States was not a party to this convention, but during the Civil War was the first one practically to enforce its rules. The Crimean War, the American Civil War, and the war between the United States and Spain for the liberation of Cuba, furnish the best examples of modern blockades.

Three requirements are necessary to constitute valid capture for breach of blockade: (1) *Due Notification*; (2) *An Effective Blockade*; (3) *Breach of Blockade*. (1) Notice may be given in two ways: by diplomatic announcement to neutral powers and by a warning at the blockaded port usually inscribed upon the register of the ship seeking to enter. The French rule requires both. But the diplomatic notice, after a reasonable length of time, under modern conditions of communication, implies presumptive knowledge of the blockade on the part of all ship-owners. In the Civil War, on April 19, 1861, the ports from South Carolina to Texas were proclaimed in a state of blockade, and a week later this was extended to Virginia. Since at first an effective force actually invested but a small portion of the coast, it was customary to give notice at the harbor-mouth as the ports were really closed. Thus it was little more than a paper blockade for some time. If the blockade is raised temporarily, as by the approach of an enemy's fleet or for any other cause, excepting storms, a new diplomatic notice is necessary. (2) The rule for an effective blockade was adopted to prevent the widespread inconveniences resulting from the so-called 'paper' or 'cabinet' blockade. The Declaration of Paris defines it as "maintained by a force sufficient really to prevent access to the coast of an enemy." It requires that the evasion be made a dangerous act. (3) *Breach of Blockade*.—To render a capture valid an actual attempt to break an effective blockade must appear. This may be evidenced by the ship's papers, her course, or the owner's instruc-

tions. The penalty for breach is confiscation of the ship and, unless proved innocent, the cargo also. But no punishment can be inflicted upon the crew. The doctrine of 'continuous voyages' requires that though a ship may touch at a neutral port, if her eventual destination is a blockaded one, she is liable. This rule is applied with caution.

When from peace or other causes the investment ceases, the blockade must be declared raised. See Snow, *Manual of International Law* (2d ed., Washington, 1898).

The maintenance of an effective naval blockade depends primarily upon the possession of great naval superiority by the blockading force. From the standpoint of grand strategy, the blockade of an enemy's coast is desirable if the enemy depends upon foreign countries for his munitions of war, or the materials of which they are made; or if the sea affords assistance to his land operations; or for the protection of the commerce of the nation establishing the blockade. A blockade may be desirable for the purpose of cutting off food-supplies and general imports; but its importance, based on those grounds, is frequently overestimated. For it must be understood that those countries which import a large part of their food do so because they can purchase it cheaper than they can produce it—not because the production is beyond their capacity. A blockade which would interrupt foreign supplies would stimulate domestic production and divert labor from the remunerative employments to that of agriculture. A country which depends upon the sea for its food likewise depends upon it as an outlet for its manufactures, and the financial disturbance caused by closing the foreign market to its exports is quite as likely to cause suffering and bring the nation to seek terms of peace as the threatened scarcity of food which an interval of a few months is likely to cure. The importance of maintaining a blockade depends largely upon the amount of trade interrupted. If a country has a land frontier, it is manifest that this must be controlled or the blockade will be annoying only and not vitally important. The seaport towns would suffer, but the country might continue to be but little affected.

The difficulty of maintaining a blockade is at present less than it has been at any time in the history of maritime war, notwithstanding the torpedo-boat—surface and submarine. The actual blockading force need be composed of light vessels only, in part of the large torpedo craft commonly called torpedo-boat destroyers. The heavier ships, especially at night, should lie farther out, beyond the easy range of torpedo-boat attack, but in supporting distance of the inner fleet should the enemy attempt a sortie in force. The maintenance of this condition depends upon the position of a base in the enemy's territory where coal and supplies may be taken on board, or where at least there may be found a safe anchorage and refuge for the smaller ships in case of very heavy weather. During the continuance of such weather the heavy ships can move farther in, replacing the lighter ones which have been compelled to leave station, so that the blockade is not broken.

The most perfect blockade of a long coast was that maintained by the United States Navy during the Civil War. The conditions were as

favorable as ever can be expected. The South possessed a long land frontier, but except along the Mexican border it was dominated by the United States forces. The navy held several bases in the enemy's territory, and could have had others had it been deemed necessary. As the South had almost no seagoing naval force, many of the blockading ships were lightly armed merchantmen commissioned as auxiliaries. Blockading fleets will always be largely composed of such craft if the extent of blockaded coast is great, because no nation has a sufficient number of regularly built war-ships available for such duty, and for stopping merchant vessels they are quite as good as more powerfully armed and better protected ships. If the enemy still possesses seagoing fighting ships, they must be kept in port by an adequate force of fighting ships, or they may escape and raise the blockade of ports where the enveloping fleet is weak. One of the closest blockades ever maintained was that of Santiago by the fleet under Admiral Sampson during the Spanish War. Seven of the heaviest ships in the navy lay in a semicircle about the entrance to the harbor, about two thousand yards apart, and from four to six thousand from the entrance. In addition to these were several cruisers, auxiliary yachts, and torpedo-boats. At night, auxiliary cruisers and steam-launches patrolled the entrance, which was lighted up by search-lights of one of the battle-ships. Not even a skiff could have left the harbor unobserved.

The establishment of a blockade of the enemy's coast protects a country's commerce because it prevents, or tends to prevent, the fitting out of cruisers to prey upon it. But the war against commerce—what the French call the *guerre de course*—is becoming of less and less importance. The capture of merchant vessels has never affected the result of war, and the operations of 'commerce-destroyers' are likely to be attended with difficulties. It is no longer possible for them to keep the sea for long periods, as their radius of action is limited by their coal-supply. Furthermore, merchant vessels of belligerents are likely to be transferred to neutral flags if the insurance rates rise unduly through greatly increased danger of capture. And, lastly, the tendency of modern warfare is toward increased exemption of private property from capture.

A military blockade is designed to shut off an enemy from his source or base of supplies, make him ineffective, and eventually force him to surrender through lack of food, water, ammunition, or other supplies. It is not a regular siege, in the sense that organized efforts are made to take the base by assault; neither is it necessarily accompanied by a regular bombardment, though it may be subject to such intermittently. The military blockade, from the point of international law, does not occupy so important a place as the naval operation.

BLOCK BOOKS. See PRINTING.

BLOCK COAL. A name given to certain non-coking bituminous coals of Ohio and Indiana, on account of the cube-like forms into which they break. See COAL.

BLOCKHOUSE. A temporary military fortification, usually made of logs banked with earth, and surrounded by a stockade. Its construction will depend largely on the service it is intended for, the country in which it is used,

the troops occupying it, and the material available. Blockhouses were extensively used in the American Civil War of 1861-65; for instance, to protect the long line of communications of Sherman's Army in the Atlanta campaign. The Spaniards, during the closing years of their occupation of Cuba, adopted them extensively, notably along the line of the 'Trocha.' The vastness of the theatre of operations in the British-Boer War of 1899-1902, and the extreme mobility of the Boers, compelled the British to secure all cleared country by an extensive system of blockhouses, built at intervals of from 600 to 1000 yards, and connected when possible by wire entanglements. Such defenses can be made more or less strong and defensible, depending on time and conditions. See FORTIFICATION.

BLOCK ISLAND. An island in the Atlantic, 10 miles south of the Rhode Island shore, and northeast of Long Island (Map: Rhode Island, B 6). It is about 8 miles long and from 2 to 4 miles wide, forming the town of New Shoreham, Newport County, R. I., well known as a popular summer resort. There are lighthouses on the northern and southeastern extremities. The island was named by Adrian Block, who visited it in 1614; was first settled in 1662, and was captured by French privateers in 1689. In 1720 a ship bearing emigrants from the Palatinate was wrecked here; and this, together with the occasional appearance of an *ignis fatuus* off-shore, gave rise to the legend which forms the subject of Whittier's "The Palatine" and of Dana's "The Buccaneers." Population, in 1890, 1320; in 1900, 1396. Consult Livermore, *A History of Block Island from 1614 to 1876* (Hartford, 1877).

BLOCK PRINTING. See PRINTING.

BLOCKSBERG, blöks'bërk (corrupted, in German popular speech, from *Brocksberg*; the Brocken Mountain). A name given to various mountains and hills in Germany, but preëminently to the Brocken, 3745 feet, the highest point of the Harz Mountains, and, indeed, of the north of Germany (Map: Germany, D 3). In old legend it is the favorite haunt of the witches, where they celebrate the night of the first of May, *Walpurgisnacht* (see WALPURGA), with wild orgies. Almost all mountains thus haunted have been famous as places of sacrifice in the ages of paganism. See BROCKEN.

BLOCK-SIGNAL SYSTEM. A method in use on railways to insure increased safety by keeping trains a certain distance apart, by dividing the line into blocks or sections, the entrances to which are guarded by appropriate signals for the government of the train. The blocks may be of any reasonable length, depending upon the physical characteristics of the line and the frequency with which the trains are run. On lines of heavy traffic the blocks are often only several hundred yards long, while on lines with a light traffic they may be several miles in length. The block systems used in modern railway practice are: (1) The manual; (2) the controlled manual; (3) the auto-manual; (4) the automatic, and (5) the train staff or machine. In manual blocking the signals at the entrance to each block are operated and controlled by the signalman at that station. In controlled manual-block systems the signals at the entrance of each block are controlled either electrically or mechanically by the signalman in the next station ahead, but

are operated by the signalman at the entrance to the block. In the auto-manual the signals are operated as in the manual or controlled manual systems, but are placed in the danger position automatically by the train after the rear car passes them. In the automatic system the operation of the signals is entirely automatic, generally through the agency of electricity or a combination of electricity and compressed air, and no signalmen are required. In train-staff blocking a special machine is located at the entrance to each block which contains a number of train staffs. The engine-driver receives one of these staffs upon approaching the block and until this staff is carried to the next block and inserted in the machine there, no more staffs can be taken from the first machine. The control between the two machines is maintained by electricity. With any of these systems either absolute blocking or permissive blocking may be practiced. In absolute blocking, two trains are never allowed to be in the same block at the same time. In permissive blocking, a second train may be allowed after a certain time has elapsed to enter a block before the first train has left it, the second train being compelled to run at decreased speed and observe caution.

The accompanying diagram shows a double-track railway arranged with block-signals. The blocks are the spaces between A-B, B-C, and C-D. At A, B, and C there are signal-stations, with three signals for each track. These signals are an advance signal, a distant signal, and a home signal. Should all these signals be at safety, the train passes the station into the next block, but should the home signal be at danger the train stops. The advance and distant signals are simply to show the engine-driver the condition of the home signal sufficiently in advance to permit him to slow up his train ready for a stop should it be at danger. The form of signal most commonly used is a semaphore arm pivoted to an upright post. When this arm is horizontal the signal is at danger, and when it hangs down in an inclined direction the signal is at safety. For distant signals the end of the semaphore arm is notched. Often disk signals are used instead of the semaphore arm. At night inclosed lights take the place of the semaphore arm. Formerly, a white light meant

safety, a red light danger, and a green light caution; but of late years green has been adopted for safety and red for danger, with yellow or a combinations of colors for caution. In all but the automatic systems the signals are thrown to safety (they are so arranged that they always stand at danger until pulled to the safety position) by pulling the levers resembling the reversing lever of a locomotive. These levers are located in the signalman's tower, and are connected to the signals by means of wires or rods. In the automatic system these signals are operated by the train itself; the wheels pass over track instruments or levers and set in motion certain mechanical or electrical operations, as a result of which the signals are removed.

In manual blocking, which is extensively used in England, each signalman controls the signals at his station. The code signaling between the block stations is generally done by means of electric bells. British lines also use in manual blocking an indicator giving a visual indication of the condition of the block. The block station has, for each block, an indicator connected by an electric circuit with a similar instrument at the other end of the block. On the dial of the indicator appear the words, 'line clear,' 'train on line,' and 'line closed.' By placing the hand of the indicator over any of these phrases, the instrument at the other end gives a like indication. The method of operation of the system as follows: Attention is first called on the bell, and then station A will give to station B what is called the 'be ready' signal, consisting of a certain number of strokes on the bell, varying so as to indicate the nature of the train. The man at station B, if the previous train has passed his station and he knows that the block between A and B is clear, repeats this signal. The train is then dispatched from A, the man at A gives the signal 'train on line,' the man at B acknowledges this by moving his own indicator, and, through the connection, the one at A to 'train on line,' and at once gives the 'be ready' signal to station C. As soon as the train has passed B the man at B moves his indicator, and therefore the indicator at A, to 'line clear'; and upon this being acknowledged by A the indicator is left vertical, signifying 'line closed,' and the operation has been completed so far as that particular train and particular block are concerned.

In controlled manual blocking, the manipulation of the signals at the entrance to the block is controlled electrically by the signalman at the block station in advance. In what is termed the auto-manual system there is at each block station a track circuit of at least two or three rail-lengths, which is used for automatically replacing the home signal to danger when the rear end of a train passes that signal. The locking instruments are generally placed in front of the signalman and over the levers with which they operate. Each block station has one of these instruments for each block, the two instruments at the opposite ends of a block being connected by an electric circuit. The code signaling between the stations is accomplished by bell, as in manual blocking. The mode of operation is as follows: Prior to starting a train from A, the signalman there asks B to unlock the signal at A; and when B does so A throws his signal to safety, allowing the train to proceed toward B. As the rear of the train passes the home signal at A,

that signal is thrown to danger by the local track circuit. As soon as his home signal goes to danger, A throws his lever to its normal position of danger, thereby locking it so that the signal cannot be thrown to safety again without permission from B. A drop-slide indicator or annunciator forms a part of the electric mechanism, displaying through a slotted opening on the front of the instrument-case the words 'free,' 'locked,' and 'train in block.' By a system of electric locking working in connection with the indicators, and operated in part by the train through track circuits, B is unable to clear A while there is a train in the block.

Automatic block-signals are usually operated through the agency of electricity alone or a combination of electricity and compressed air by the passage of trains into and out of the block. A track circuit is generally used for conveying the electric current to the signals. In arranging a track circuit, a battery is placed at the advance end of the block. A relay and a signal are placed at the other end. Each line of rails is connected with a pole of the battery. The current passes along the rails of one side of the track, through the relay, thence along the rails of the other side of the track, thus forming a circuit. The relay controls a local circuit, which works an electromagnet, which in the simple electric system actuates the signal, and in the electro-pneumatic system permits compressed air to operate it. Automatic block-signals are operated on two plans: (1) The 'normal safety' plan, in which the signals always show safety unless the block is obstructed; (2) the 'normal danger' plan, in which the signals always show danger at all times, except when cleared by an approaching train, which can be done only when the block is clear of trains and other obstructions. When the head end of a train enters an automatic electric block the current short-circuits, that is, takes the shortest path back to the battery, through the axles of the locomotive or car, and is thereby cut off from the relay, which then breaks the local circuit operating the signal. When the signal is passed by the rear end of the train it goes to danger. In the 'normal safety' plan, when the train passes out of the farther end of the block, the signal again goes to safety. In the 'normal danger' plan the currents are so arranged that the signal is set at danger until it is again cleared by an approaching train.

A train-staff machine consists of an iron pillar with a vertical slot through nearly its entire length, in which is a supply of staffs. The head of the machine, called the 'locking-case,' contains the electrical apparatus for manipulating the machine. Only one staff can be withdrawn at a time from the two machines governing a block; and this only with the consent of the signalman at the receiving station, who alone controls the staffs at the sending station. Another staff cannot be removed from either machine until the one already out is restored at one or the other end of the block. The following is the method of operation: Before starting a train from A toward B, the situation in the block is ascertained by means of the bell code. If the block is clear of trains and obstructions, B, when asked, unlocks A's machine. This allows A to withdraw one staff, which is given to the engineman, who, on arrival of the train at B, hands it over to the signalman there to place in his machine. As

neither of the machines governing the block can be unlocked while the engineman has his staff, it is of course impossible to furnish a staff for another train until the first staff has been returned. The train-staff system is essentially a single-track system.

The preceding paragraphs describe the typical methods of block-signaling, without describing the apparatus employed. This varies considerably, and in so many details that it can be treated clearly only in a special treatise. The actual operation of the block system dates from December, 1839, when the Great Western Railway of England began telegraphing the arrival of its trains from station to station for short distances near London. The block system was introduced into the United States by the Pennsylvania Railroad in 1876. Block-signaling is now universal in England, but it has been adopted in full or in part on only a few American railways.

BLOCK TIN. An inferior variety of tin in the form of blocks. When the metal is reduced from its ores it is first poured into molds, and the ingots thus procured are heated to incipient fusion in a reverberatory furnace, when the pure tin fuses and is withdrawn; and the less pure tin which is left behind is melted at a higher temperature, poured into molds, and called block tin. See TIN.

BLODGET, LORIN (1823-1901). An American physicist and statistician. He was born in Chautauqua County, N. Y. In 1851 he became assistant at the Smithsonian Institution in charge of matters relating to climate and atmosphere. In 1857 he issued *Climatology of the United States and of the Temperate Latitudes of the North American Continent*, a work highly praised by Humboldt. He was for several years editor of the *North American* and secretary of the Board of Trade in Philadelphia, and had charge of the statistical work in the United States Treasury. His contributions on finance, industrial progress, and kindred subjects comprise many volumes.

BLOEMAERT, bloō'märt, ABRAHAM (1564-1651). A Dutch painter and engraver, born in Gorkum. He studied under Joost de Beer in Utrecht, and Hieronymus Francken in Herentals, and was dean of the Guild of Painters in Utrecht from 1611 to 1628. He painted biblical and mythological scenes, flower-pieces, landscapes, and portraits. His works include: "Hippomenes Crowned in the Arena" (1626); "Old Man's Head" (1635); "Joseph's Second Dream;" and "Saint John Preaching in the Desert."

BLOEMEN, bloō'men, PIETER VAN (called STANDAERT) (1657-1720). A Flemish painter, born in Antwerp. He studied under Simon van Douw; spent some time in Italy, and in 1699 was appointed dean of the Guild of Saint Luke in Antwerp. His works include "Ruin with Cattle" (1710); "Halt before an Inn" (1718), and many other pictures, chiefly of military life, or landscapes.

BLOEMFONTEIN, bloōm'fōn-tin. The capital of the former Orange Free State, now the Orange River Colony, South Africa, near the Modder River, 95 miles east by south of Kimberley (Map: Orange River Colony, C 8). It is situated at an altitude of over 4450 feet, and is well built and lighted by electricity. There are a number of fine public edifices, among which the

chief are the President's house, the town-hall, and the museum. Bloemfontein contains also several educational institutions, including colleges and a theological school. Its favorable climate has made the town of importance as a health resort. A considerable trade, particularly in wool, is carried on. Population, in 1899, about 12,000. During the war between Great Britain and the South African Republics, Bloemfontein attained considerable importance as one of the chief centres of the Boer strength. After the forces of the Transvaal and the Orange Free State had been twice defeated in the neighborhood of the town, it surrendered to Lord Roberts on March 13, 1900.

BLOIS, blwa (Med. Lat. *Blesum*, *Blesis*, *Bleza*). The capital of the Department of Loir-et-Cher, France, finely situated on the slopes of a hill, on the right bank of the Loire, 35 miles southwest of Orleans (Map: France, H 4). The main street traverses a hollow, flanked by elevations, dominated respectively by the castle and the cathedral. The streets in the upper part of the town are narrow and tortuous, and the houses mean and ill built. Besides the Cathedral of Saint Louis, a structure in bastard Gothic, the most notable ecclesiastical edifice is the abbey Church of Saint Nicolas, built in 1138-1210. Blois's educational establishments comprise a college, teachers' school, two seminaries, a museum, and library. It has manufactures of wearing apparel, porcelain, and chocolate. A fine aqueduct of Roman origin, cut in the solid rock, supplies the city with water. A bridge across the Loire connects Blois with the suburb of Vienne. The most interesting edifice of the city is the old castle, situated on the highest ground. The earliest part dates from the Thirteenth Century, while the finest portion, the Francis I. wing, with its admirable staircase, ascending within a projecting pentagonal tower, adorned with exquisite carvings both outside and inside, was built in the Sixteenth Century, and is a masterpiece of the early French Renaissance. The outer as well as the inner façades are richly decorated. The castle has been the scene of many interesting historical events. Louis XII. was born in it, and under its roof Charles, Duc d'Alençon, and Margaret of Anjou were married. The courts of Francis I., Henry II., Charles IX., and Henry III. were held here occasionally, and in the castle the Duke of Guise and his brother were murdered, by order of Henry III., on December 23, 1588. Isabella, queen of Charles VI., here found a retreat; it served as a prison for Maria de' Medici; Catharine de' Medici died within its walls; and Maria Louisa held her Court here in 1814, after Paris had capitulated. Population, in 1896, 23,542. Consult Le Nail, *Le Château de Blois* (Paris, 1874).

BLOK, blók, PETRUS JOHANNES (1855—). A Dutch historian, born at Helder. He studied at Leyden, and in 1884 was made professor of history at Croningen. He later occupied the same position at the University of Leyden, and during Queen Wilhelmina's historical studies acted as her instructor. Blok's researches have been in connection with the social-political history of the Netherlands, especially during the Middle Ages. Among his works are: *Eene Hollandsche stad in de middeleeuwen* (Hague, 1883); *Eene Hollandsche stad onder de Bourgondisch-Oostenrijksche heerschappij* (Hague, 1884); *Geschiede-*

nis van het Nederlandsche Volk (Croningen, 1892), translated by Miss Ruth Putnam, as the *History of the People of the Netherlands* (New York, 1898-1902).

BLOMFIELD, blöm'fēld, CHARLES JAMES (1786-1857). Bishop of London; a learned and influential prelate of the Church of England. He was born May 29, 1786, at Bury Saint Edmund's, in Suffolk, 60 miles northeast of London, where his father was schoolmaster. Being well grounded by his father in the classics, Blomfield went to Cambridge, where he took high honors, B.A., 1808, and became fellow of Trinity College. After he had filled several curacies, the Bishop of London appointed him his chaplain, in recognition of his acknowledged philological and theological acquirements. Shortly after, he was called to the living of Saint Botolph; in 1824 he was made Bishop of Chester, and in 1828 he was promoted to the See of London, on the translation of Bishop Howley to Canterbury. Blomfield's reputation for classical scholarship rests chiefly on his editions of *Cullimachus* (London, 1815), and of several of the dramas of *Æschylus*. In connection with Rennel, he published the *Musæ Cantabrigienses*, and with Monk (1812), *Posthumous Tracts of Porson*, and in 1814 the *Adversaria Porsoni*. He also published lectures on the Gospel of John and on the Acts (1823-28, 3d ed. 1838). Blomfield was exceedingly active in the superintendence of his diocese, and was a prime mover in the agitation for the erection of new churches. Under his presidency more churches were erected in London than under any other bishop since the Reformation. He died in London, August 5, 1857. For his biography, consult Blomfield (London, 1863, 2 vols., 2d ed. 1864).

BLOMMAERT, blöm'märt, PHILIPP (1809-71). A Flemish historian and philologist. His most noted work is *History of the Belgians* (*Aloude geschiedenis der Belgen*, Ghent, 1849), urging a German policy as opposed to the French. He published also mediocre poems (1834), a Flemish translation of the *Nibelungenlied* (q.v.), and learned editions of old Flemish poems of the period from the Twelfth to the Fourteenth Century, *Oudvlaemsche gedichten* (Ghent, 1838-51), and *Theophilus* (ib. 1858).

BLOMMAERT, SAMUEL (1590-1670). A Colonial patroon. He bought from the Indians a large tract of land, extending from Cape Hellen to the mouth of the Delaware River—a tract almost the size of the present State of Delaware. The purchase was ratified by Peter Minuit and his Council at Fort Amsterdam in 1630, and is the oldest deed for land in Delaware. The other owner of the land, Samuel Godyn, with Kiliaen Van Rensselaer, De Laet, and De Vries (q.v.), formed a company to settle this tract, and a colony of thirty was started at Lewis Creek under the governorship of Gillis Hosset. In the same year twelve square miles were added to the company's land by a purchase recorded at Fort Amsterdam. The colony, which had been named Swaanendale, was after a few years destroyed by the Indians in revenge for an act of Hosset's.

BLOMSTRAND, blöm'strånd, CHRISTIAN WILHELM (1826-97). A Swedish chemist, born at Wexiö. He studied at the University of Lund, and from 1862 to 1895 was professor of

chemistry and mineralogy there. In 1861 he undertook a scientific expedition to Spitzbergen, and in the same year was elected a member of the Stockholm Academy of Sciences. He discovered manganosite, vallerite, and other minerals, wrote several valuable text-books on organic chemistry, and also published *Die Chemie der Jetztzeit vom Standpunkte der elektrotechnischen Auffassung aus Berzelius's Lehre entwickelt* (1869), and other treatises.

BLONDEL, *Fr. pron. blôn'del'*. A noted French minstrel of the Twelfth Century, called a native of Nesle, a place difficult to identify. According to tradition, Blondel was the favorite of Richard the Lion-hearted, King of England, whom he accompanied to Palestine. While returning to England Richard was imprisoned by Leopold, Duke of Austria, and Blondel, determined to find his master, wandered through Germany in disguise until he came to the Castle of Dürrenstein, which he heard contained an illustrious captive. Feeling assured that Richard was in the castle, he tried to see him, but failing, began to sing a song which he and Richard had composed. The first stanza was hardly sung before the well-known voice took up the second. The minstrel was overjoyed, and returning with all speed to England, was the means of securing Richard's ransom. Blondel's poems were published at Rheims, in 1862, by Prosper Tarbé, under the title *Les Œuvres de Blondel de Néelle* (Rheims, 1862).

BLONDEL, blôn'dél'. The name of two French architects. (1) FRANÇOIS BLONDEL (1617-86). A diplomat, littérateur, military engineer, and mathematician. He was noted for the triumphal arch of the Porte Saint Denis, in Paris (1674), as well as the Porte Saint Antoine, and became director of the new Académie de l'Architecture in 1672. He published *Cours d'architecture enseigné dans l'académie royale* (1675). (2) JACQUES FRANÇOIS BLONDEL (1705-74). An architect and engraver. He founded one of the earliest French private schools of architecture (1743), and became royal architect. He designed buildings at Metz, Strassburg, and elsewhere.

BLONDIN, blôn'dan', CHARLES EMILE GRAVELET (1824-97). A French acrobat, born at Saint-Omer. He became an exceedingly expert tight-rope walker, and attracted much attention by crossing the cataract of Niagara on a rope in 1855, 1859, and 1860. Subsequently he gave exhibitions in Europe and at the Crystal Palace, London.

BLOOD (probably akin to the verb *to blow*, to be in bloom). From the standpoint of histology, blood is usually classed as a tissue. It is developed from the middle layer, or mesoderm, of the embryo, and differs from the other tissues of the body in that its intercellular substance, the *liquor sanguinis*, or blood-plasma, is fluid instead of solid. When a drop of human blood is examined under the microscope, there are seen floating in the plasma certain formed elements. We distinguish three main forms: the red blood-cell, or corpuscle; the white blood-cell, or corpuscle; and the blood-plaques, or platelets.

THE RED BLOOD-CELLS. These are minute biconcave disks, averaging 7 to 8 micromillimeters, or about 1-3200 of an inch in their long diameter, and about one-fourth that in thickness. In adult human blood these cells are not nucleated, al-

though in the human embryo they contain nuclei. This round, discoid, non-nucleated red blood-cell is characteristic of mammals with the exception of the camel family, in which the red blood-cells are non-nucleated, but oval. In birds, reptiles, amphibians, and fishes (with the exception of Cyclostomata, which have nucleated, but round cells) the red blood-cells are oval in shape and contain nuclei. As regards size, the largest corpuscles are found in the amphibia; those of the Amphiuma being as much as 75 micromillimeters in diameter, so that they may be distinguished by the unaided eye. The following table shows the size of the red blood-cells in some of the more common mammals:

Elephant.....	.0092 millimeter
Man.....	.0079 "
Dog.....	.0071 "
Rabbit.....	.0070 "
Mouse.....	.0067 "
Horse.....	.0069 "

In normal human blood there are about 5,000,000 red blood-cells per cubic millimeter of blood. As a general rule woman's blood has somewhat fewer than man's. In different animals the number of red cells varies greatly, and the number of cells per cubic millimeter is much reduced in the lower animals, which have very large corpuscles. The redness characteristic of blood is not evident in a single corpuscle, which appears of a light straw-color. When, however, a large number of the cells are seen together, the mass appears bright-red. The red blood-corpuscles are embryologically of mesoblastic origin, beginning their life-history as nucleated cells and as such possessing amoeboid movement and reproductive powers. At birth all nuclei have been lost as well as the powers of movement and of reproduction. After birth the production of new red corpuscles is believed to occur mainly in the marrow of bones. The question as to the possibility of determining by microscopical examination whether a specimen of blood, particularly a blood-stain, is human or animal, often presents itself in trials for murder. By reference to the table given, it will be seen that the red corpuscles in a considerable number of animals so closely approximate in size those of man that a positive answer to the question is often impossible. Then the drying of the corpuscles in a clot, which has to be softened with salt solution before examination can be made, introduces an uncertainty as to whether such corpuscles preserve their normal dimensions. On the other hand, it will be noted that a differentiation between human blood and that of lower animals whose red corpuscles are oval and nucleated—for example, birds and fishes—is comparatively easy.

THE WHITE BLOOD-CELLS. These are much fewer in number than the red cells, the average being about one white cell to every four or five hundred of the red. The proportion, however, varies. They are slightly larger than the red cells, averaging about 8 to 10 micromillimeters in diameter. Their shape varies, largely from their amoeboid movement. They are nucleated, and the protoplasm of the cell-body is more or less granular. Several varieties of the white blood-cell are recognized, which may be classified as follows: (1) *Lymphocytes*, large and small, having a round nucleus surrounded by a small rim of cell-body; and (2) *Leucocytes*, which may be further subdivided into large mononuclear leucocytes, in which there is a round

or oval nucleus with considerable cell-body; transitional forms, in which the nuclei are irregular in shape; polynuclear leucocytes, in which there are several nuclei, and eosinophile leucocytes, which have in their cell-bodies large granules which stain bright red with eosin. The amoeboid movement of the white cells enables them to change their shape and to accomplish some locomotion. In this way they pass through the walls of the capillaries into the tissues, where they are known as wandering cells. (See **CONNECTIVE TISSUE**.) The blood-platelets are small, non-nucleated, round or oval bodies, about one-third the diameter of a red blood-corpuscle. They are found usually in groups and are prone to disintegration. Their function is unknown, but there is reason for believing that they are concerned in the process of coagulation when it occurs. Embryologically the white blood-cells are derived, like the red cells, from the mesoblast. In the adult, new white cells are derived by reproduction. This reproduction seems to occur largely in the lymphatic organs, especially the spleen.

THE PLASMA. The fluid portion of the blood, called the plasma, consists of water containing calcium salts, the chlorides of sodium and potassium, phosphates, albumen, and other proteid substances, as well as fatty and extractive substances. If blood escapes from the body, coagulation or clotting occurs; after standing a while, the blood separates into a contracting semi-solid mass, the clot, and a thin red fluid, the serum. The clot is composed of the red blood-corpuscles matted together with fibrin (q.v.). The process of clotting is accelerated by cold. In the body, clotting of the blood may occur in the blood-vessels, in case of an obstruction to the blood-stream or infection by bacteria; or it may occur in the neighboring tissues where a blood-vessel is ruptured. After death the blood remains fluid in the capillaries, but clots in the veins. Clots are sometimes found in the cavities of the heart. Certain diseases cause alterations in the blood. In a condition called *hæmophilia* the blood clots with difficulty, if at all (see **BLEEDING**); and persons possessing this peculiarity are liable to bleed to death from a small wound, as that left by drawing a tooth. This peculiarity is called the hemorrhagic diathesis, and it is found more often among Germans.

The color of the blood is due to the hæmoglobin (q.v.) of the red blood-corpuscles, which is the carrier of oxygen from the lungs to the different tissues. (See **RESPIRATION**.) Consult Cabot, *Clinical Examination of the Blood* (4th ed., New York, 1901).

BLOOD, CORRUPTION OF. See **ATTAINDER; FORFEITURE**.

BLOOD, EATING OF. As among other peoples of antiquity, so among the Hebrews the blood of animals was regarded as the seat and source of life, and hence the blood was forbidden as food. All animal food being originally of a sacrificial character, the prohibition against the eating of the blood, carried back by tradition to the days of Noah (Gen. ix. 4), is thus shown to be connected with sacrificial observances. See **SACRIFICE**.

BLOOD, THOMAS (1618-80). A bold and successful adventurer, commonly known as 'Colonel Blood.' He was the son of a prosperous black-

smith, and was probably born in Ireland, but the place of his birth is uncertain. In the great Irish rebellion he served with the Parliamentary Army. He visited England, married a Lancashire lady, was made a justice of the peace by Henry Cromwell, and received large assignments of land in Ireland. He was deprived of these at the Restoration, and in a spirit of reprisal associated himself with several disbanded Cromwellians who were ripe for mischief. He put himself at the head of an insurrectionary plot, which was to begin with the seizure of Dublin Castle, and of Ormond, the Lord Lieutenant. On its discovery he escaped, while his chief accomplices were seized and executed, although he made a bold attempt to rescue them. He remained in hiding, but eventually fled to Holland, where he was received with high consideration. He soon found his way back to England, to try what mischief might be brewed among the Fifth-Monarchy men. Finding no prospects of success, he repaired to Scotland, invited by the turbulent state of affairs, and was present at the fight of Pentland, November 27, 1666. On the night of December 6, 1670, the Duke of Ormond was seized in his coach in Saint James's Street by a gang of bravoos, tied on horseback behind one of them, and hurried away toward Tyburn. The timely approach of his attendants at the moment when he had succeeded in struggling with his riding companion to the ground probably saved him from hanging. The leader in this daring villainy was Blood, and so well had he contrived it that he did not even incur suspicion. His next enterprise was still more wild and dangerous. On May 9, 1671, disguised as a clergyman, and accompanied by his former accomplices, he entered the Tower with the determination to carry off the regalia of England. After almost murdering the keeper of the jewels, he succeeded in carrying off the crown under his cloak, while one of his associates bore away the orb. They were immediately pursued, however, seized, and committed to the Tower jail. But a singular turn of fortune awaited Blood. At the suggestion of Buckingham, who was accused of having hired Blood to attack the Duke of Ormond, King Charles visited the dauntless miscreant in prison, and, dreading the threat that there were hundreds of Blood's associates banded together by oath to avenge the death of any of the fraternity, pardoned him, took him to Court, restored to him his Irish estates, valued at £500 a year, and raised him so high in favor that for several years Colonel Blood was an influential medium of royal patronage. After the fall of the 'Cabal' ministry, Blood became hostile to Buckingham, and, accused of originating a scandalous charge against him, was committed to prison. He was bailed out and died in his own house in 1680. Scott introduces Blood in *Peveril of the Peak*. Consult Seecombe, *Lives of Twelve Bad Men* (New York, 1896).

BLOODBIRD. The name in southern Australia of several wax-billed finches and other small birds marked with bright red, especially the 'soldier-bird' (*Myzomela sanguinolenta*), a beautiful species of honey-eater, black, with the head, neck, breast, and back of the male rich scarlet.

BLOOD-CLAM. See **ARK-SHELL**.

BLOOD FEUD (AS. *fæhf*, from *fah*, inimical; OHG. *fēhde*, injury, enmity, Ger. *Fehde*, feud). In primitive society, the legalized right of private vengeance for crimes of violence. The institution of the feud and its regulation by law, involving, as it does, a restriction on the primary impulse of revenge, marks a great advance in the direction of a settled social order. The primitive theory of the responsibility of the family, clan, and tribe for the acts of its members tended to convert an act of private vengeance into a state of war. The developing sense of law and order restricted the right of vengeance to the immediate family, or next of kin, called the 'avenger of blood' (see AVENGER OF BLOOD) of the injured person, and limited the punishment to the person committing the crime or to those who protected him from the vengeance incurred. The right was further restricted by the doctrine of sanctuary (q.v.) and the institution of places of refuge for the manslayer fleeing from the avenger of blood (see ASYLUM; CITY OF REFUGE), and, at a later period, by the institution of the wergild (q.v.), with which the hunted criminal might purchase exemption from the vengeance due him. Ultimately the acceptance of this blood-money (q.v.) became compulsory, and the codes of early law which have come down to us are full of minute regulations fixing the amount to be paid for various crimes of violence according to the state or dignity of the victim of the crime, and specifying the persons entitled to share in the payment.

The stage of society marked by the blood feud has prevailed among most of the primitive peoples with whom we are acquainted, and it forms a part of nearly all systems of primitive law. We find marked traces of it in the Mosaic legislation, and it constitutes an important part of the law of the Teutonic communities which planted themselves on the ruins of the Roman Empire. Anglo-Saxon law is largely concerned with it, and in England it survived, nominally, at least, in the form of the wager of battle, until abolished by act of Parliament in 1819. (See BATTLE, TRIAL BY; FEUD.) Consult: Jenks, *Law and Politics in the Middle Ages*; Maine, *Ancient Law* (11th Eng. ed., London, 1887), and *Lectures on the Early History of Institutions* (6th ed., London, 1893); Pollock and Maitland, *History of English Law* (2d ed., London and Boston, 1899); and Stephen, *History of the Criminal Law of England* (London, 1883).

BLOODFLOWER (*Hæmanthus*). A genus of bulbous-rooted plants, of the natural order Amaryllidæ, embracing about 60 species, mostly natives of South Africa, some of which are among the prized ornaments of our greenhouses. They take their name from the usual color of their flowers, which form a fine head or cluster, arising from a rosette of root-leaves. The fruit is a berry, usually with three seeds. The leaves of the different species exhibit considerable diversity of form, in some almost linear, in others almost round; in some, also, they are erect, in others appressed to the ground. The bulbs of some of the finest species of bloodflower being very slow to produce offshoots, a curious method of propagating them is resorted to by gardeners, which is occasionally practiced also with other bulbous-rooted plants, by cutting them across above the middle, upon which a number of young

bulbs form around the outer edge. *Hæmanthus multiflorus*, *Hæmanthus lindeni*, and *Hæmanthus puniceus* are among the most handsome in hothouse cultivation. *Hæmanthus albiflos* has white flowers, and some of the others are grown as oddities. The inspissated juice of *Hæmanthus toxicarius*, now known as *Buphane disticha*, is used by the natives of South Africa for poisoning their arrows.

BLOODHOUND, or SLEUTH-HOUND. A variety of hound often used in tracking criminals. See HOUND.

BLOODLETTING. See BLEEDING.

BLOOD-MONEY. In early law, the compensation paid by a manslayer to the next of kin of the man slain, securing the offender and his relatives against subsequent retaliation. It was common in Scandinavian and Teutonic countries until after the introduction of Christianity. The amount of the payment was fixed by law, as well as the persons who were entitled to exact and share it. (See AVENGER OF BLOOD.) The principle was not limited to cases of manslaughter, but was ultimately extended to all crimes of violence. Certain crimes, however, by reason of their enormity or their sacrilegious character—as slaying a person in church or when sleeping—or because they involved a breach of the King's peace, were 'bootless,' i.e. incapable of commutation for money. The perpetrator of such an offense came under the King's ban, was outlawed, and abandoned to his enemies. (See BANISHMENT; OUTLAWRY.) Even in such a case, however, it is provided in one of the barbaric codes of the Middle Ages that the offender "may redeem himself from the wilderness with 40 marks when the injured party has interceded for him." See BLOOD FEUD; WERGILD, and the authorities there referred to.

BLOOD OF OUR SAVIOUR, also called ORDER OF OUR REDEEMER AND THE PRECIOUS BLOOD OF JESUS CHRIST. An order of knighthood in Mantua, instituted by Duke Vincenzo Ganzaga in 1608, on the occasion of the marriage of his son with a daughter of the Duke of Savoy. It consisted of twenty knights, the Mantuan dukes being sovereigns. The collar was embroidered with scrolls containing ingots of gold in crucibles over a fire, with the words *Domine probasti me*. To the collar was pendant an oval medallion with two angels kneeling before an altar, on which were three drops of blood, with the words *Nihil isto triste recepto*. The name originated in the belief that in Saint Andrew's Church, in Mantua, certain drops of our Saviour's blood are preserved. Consult: Laurence-Ascher, *Orders of Chivalry* (London, 1887); Wahlen, *Ordres de Chevalerie* (Brussels, 1844).

BLOOD OF SAINT JANUARIUS, jän'ü-ä'-ri-üs. See JANUARIUS, SAINT.

BLOOD-PHEASANT, fêz'ant (from the red color about the throat and breast). One of the small and beautiful Himalayan quail-like pheasants, of the genus *Ithaginis*. See PHEASANT.

BLOOD-POISONING. See PYÆMIA.

BLOOD-RAIN. A shower leaving red stains, due essentially to microscopic organisms containing red oxide of iron. The organisms consist of fungi, numerous specimens of which are carried down from the atmosphere by rain and snow.

Such organisms are often capable of imparting to snow a pink, red, or bluish tint, and sometimes exhibit the phenomenon of phosphorescence. Similarly, black rain may be caused by the presence of a black fungus. The above-mentioned low forms of plants grow, especially in torrid zones, in ponds that hold water during a short season of each year, being dried up during seasons of drought which last for several months. From these desiccated basins the fine dust and minute fungi are raised into the atmosphere by wind and carried for hundreds of miles. Decrease of temperature causes rainfall or snowfall, during which the dust-particles are carried to the earth. The gray dust, consisting principally of diatoms, being rather denser, may descend without rain. Such dust-showers have been observed to fall upon vessels in the Atlantic Ocean as far as a thousand miles west of the coast of Africa. Showers of blood-rain and dust are observed principally over the area lying east, west, and north of the Sahara; but they are not restricted to this region. See *ÆOLIAN ACCUMULATIONS*; *WIND*.

BLOODROOT. See *SANGUINARIA*.

BLOOD-STAINS. In some criminal trials it is a matter of extreme importance to determine whether certain stains found upon various weapons, upon clothing, or upon carpets, walls, furniture, etc., have been made by blood or by some other substance. Further, there comes up the question as to whether a blood-stain has been made by human blood or by the blood of one of the lower animals. The appearance of blood-stains varies, depending largely on the character of the substance stained, age of the stain, etc. As a rule the more permeable the substance, the brighter is the stain. Thus, on cloth the serum is quickly absorbed, leaving a rather bright stain from the colored elements of the blood; while stains on hard surfaces, such as metal and polished wood, are usually of a dark color. The question as to whether a given stain is blood is in most cases comparatively easy to answer. The determination may be made by chemical means, by the use of the microscope, or that of the spectroscope. The *Guaiacum test* is as follows: If a drop of blood, or a drop of water with which a blood-stain has been moistened, be placed upon a blotting-paper and a drop of tincture of guaiacum added, the further addition of a drop of hydrogen peroxide will result in the production of a sapphire-blue color. The fact that certain substances other than blood may give this or a similar reaction tends to vitiate the value of this test. Another test, known as the *Hemin test*, is as follows: To a little of the powder scraped from a blood-stain is added a drop of glacial acetic acid with a trace of sodium chloride. After standing for some time the mixture is gently heated. As evaporation takes place the specimen should be examined under the microscope, when numerous rhomboidal crystals will be seen of a reddish, brown, or yellow color. These are produced from the coloring matter of the blood, and are known as hemin crystals. A positive result from this test is extremely reliable. On the other hand, a failure to obtain crystals cannot be considered positive proof that the stain is not blood. Very accurate results may be obtained by *spectroscopic* examination of blood-stains. The fact that hemoglobin (from a fresh stain) and hematin (from an old stain)

exist each in two states of oxidation, and that each state has its own characteristic absorption bands in the spectrum, increases the accuracy of this test. The *microscope* alone is often of value in determining the nature of blood-stains. Thus, if a stain be moistened with a little normal saline solution (sodium chloride 6 per cent. in water), and some of the fluid be examined under the microscope, it is often possible, even in the case of very old stains, to recognize the blood-corpuscles.

The differentiation of the blood of a man from that of a woman or child, or of the blood of one person from that of another, is apparently impossible. The differentiation of a human blood-stain from a stain made by blood from one of the lower animals is mentioned in the article *BLOOD* (q.v.).

BLOODSTONE. See *HELIOTROPE*.

BLOOD-TRANSFUSION. See *TRANSFUSION OF BLOOD*.

BLOOD-VESSELS. Tubes of various sizes which serve as channels for the passage of the blood to the different organs and tissues of the body. While all are connected with one another and with the heart, three main forms of vessels may be differentiated, depending on size, function, and structure. These are capillaries, arteries, and veins.

CAPILLARIES. These are the smallest of the blood-vessels. They form extensive networks in almost all tissues and organs, and serve as connection between the arteries on the one hand and the veins on the other. Their average size is from 7 to 12 micromillimeters. It is thus seen that they are little larger than the corpuscles which pass through them. The wall of a capillary consists of a single layer of endothelial cells. These cells are large and flat, with bulging nuclei, and are united to one another by cement substance. This single layer of endothelium serves as the lining of the entire vascular system, extending uninterruptedly throughout capillaries, arteries, veins, and heart.

ARTERIES. Passing from a capillary toward the artery, the first change noted is the addition of a little connective tissue outside of the endothelium. This is the beginning of the outer coat of the artery, and is known as the *tunica adventitia*, or the *adventitia*. A few muscle-cells next appear between the connective tissue and the endothelium and this small vessel with three coats, an outer connective tissue coat (*adventitia*), a middle coat consisting of a single layer of smooth muscle-cells (*tunica media* or *media*), and the lining endothelium (*tunica intima* or *intima*), is called an arteriole. In a larger artery these same coats are present, but more complex. Thus the *intima*, instead of being a single layer of endothelium, consists of three layers—an inner endothelial, a middle layer of connective tissue, and a limiting elastic membrane. The *media* or muscular coat consists of quite a thick layer of smooth muscle-cells, placed circularly, while the *adventitia* layer is also of considerable thickness.

The aorta differs from other arteries in having a much larger amount of elastic tissue in its walls. This elastic tissue is distributed throughout the muscular coat, almost equaling the muscle-tissue itself in quantity. There is usually no definite elastic membrane limiting the *intima*.

VEINS. These have the same coats as do the arteries. Their walls are, however, thinner and

present certain points of difference. The endothelial and middle layers of the *intima* are essentially the same as in arteries, but there is no limiting elastic membrane. The result is that there is no sharp line of demarcation between *intima* and *media*. The *media*, instead of being made up almost entirely of muscle, as in the arteries, has intermingled with its muscle-fibres a large amount of fibro-elastic tissue. The *adventitia* is usually thicker than in an artery of corresponding size. Many veins have valves for controlling the flow of blood. These consist of folds of the *intima* with some strengthening bands of elastic tissue and sometimes a few muscle-fibres. See AORTA; BRACHIAL ARTERY; ARTERY; VEIN, etc.

BLOODWORM. The name of various red worms and annelids. That commonly known to British anglers as the bloodworm, used for bait, is the worm-like aquatic larva of a midge (*Chironomus plumosus*), which swarms about stagnant pools.

BLOODY ASSIZES. The name given to a series of trials for treason conducted by Lord Chief Justice Jeffreys in the western counties of England after the suppression of Monmouth's rebellion in 1685. See JEFFREYS, GEORGE.

BLOODY BROTHER, THE, OR ROLLO, DUKE OF NORMANDY. The title of a tragedy by Fletcher, and probably Rowley and Massinger (1639). Rollo, the covetous son of the deceased Duke of Normandy, murders his brother, clasped in their mother's arms, and is himself slain by the captain of the guard. Some authorities give the play mainly to Beaumont.

BLOODY MARY. The popular designation of the daughter of Henry VIII., Queen of England in 1553-58, because of the persecution of Protestants which took place during her reign.

BLOODY TOWER. The name given to one of the towers of the Tower of London, in which Richard III. is said to have procured the murder of the young sons of Edward IV.

BLOOM. The white, waxy or glaucous covering of various fruits and leaves, especially common on the leaves of drought plants. See XEROPHYTES.

BLOOM. An appearance on paintings resembling in some measure the bloom on certain kinds of fruit, such as peaches, plums, etc. (hence the name), produced, in all probability, by the presence of moisture in the varnish, or on the surface of the painting when the varnish is laid on. The bloom destroys the transparency, and is consequently very injurious to the general effect of a picture. It is best prevented by carefully drying the picture and heating the varnish before applying it, after which a soft brush should be employed to smooth the surface of the picture, which should be finally placed in the sunshine to dry.

BLOOMER, AMELIA JENKS (1818-94). An American reformer. She was born in Homer, N. Y., and for several years lectured and wrote on the temperance question. She was a prominent advocate of woman's suffrage, but is remembered chiefly for her enthusiastic adoption of the so-called 'bloomer' costume, originally devised and introduced by Mrs. Elizabeth Smith Miller.

BLOOMERISM. See DRESS REFORM.

VOL. III.—9.

BLOOM'ERY, BLOOM'ARY, or BLO-MARY, blōom'ā-rī (Engl. *bloom*, AS. *blōma*, a mass or lump, in *isenen blōma*, a lump or bloom of iron). A furnace for transforming pig iron into wrought or malleable iron, or for making such iron directly from ore. See IRON AND STEEL.

BLOOM'FIELD. A town and the county-seat of Green County, Ind., 80 miles southwest of Indianapolis; on the White River, and on the Evansville and Indianapolis and the Louisville, New Albany and Chicago railroads. It has flour and lumber mills, and manufactures of novelties of steel, iron, wood, and clay; and carries on considerable trade in coal, agricultural produce, lumber, grain, and live stock. Population, in 1890, 1229; in 1900, 1588.

BLOOMFIELD. A city and the county-seat of Davis County, Iowa, 70 miles northwest of Keokuk; on the Burlington and the Wabash railroads (Map: Iowa, E 4). It has a public library, a fine high-school building, and the Southern Iowa Normal School. There is some manufacturing, but the more important interests are commercial, a large trade being carried on in the products of the adjacent agricultural region. The city owns and operates its water-works and electric-light plant. Population, in 1890, 1913; in 1900, 2105.

BLOOMFIELD. A town in Essex County, N. J., adjoining Newark, and 11 miles from New York City; on the Erie and the Lackawanna railroads, and on the Morris Canal (Map: New Jersey, D 2). It is the seat of the German Theological Seminary of Newark (Presbyterian), opened in 1869, and contains, among the more prominent features of interest, the Bank Building, Jarvie Memorial Library, and Westminster and First Presbyterian churches, the latter built in 1796. The town has a number of suburban residences, and, as one of its chief attractions, a park developed from the 'Common' used during the Revolution as training-grounds. There are important manufactures, including woolen cloth, silk, electric elevators, hats, rubber goods, paper, pins, and railroad brake-shoes. Under a charter of 1900 the government is vested in a town council, of which one member, elected at large, usually serves as chairman. Population, in 1890, 7708; in 1900, 9668. Settled as early as 1675, Bloomfield was a part of Newark until incorporated as a separate township in 1812. Its present name was chosen in 1796 in honor of General Joseph Bloomfield, a Revolutionary officer, afterwards Governor of New Jersey. Consult Shaw, *History of Essex and Hudson Counties, New Jersey* (Philadelphia, 1884).

BLOOMFIELD, JOSEPH (? -1823). An American soldier, born in Woodbridge, N. J. He attained the rank of major in the Revolutionary War, and from 1801 to 1812 was Governor of New Jersey. He served as brigadier-general in the American Army during the War of 1812, and from 1817 to 1821 was a member of Congress.

BLOOMFIELD, MAURICE (1855—). An American philologist and Sanskrit scholar. He was born in Bielitz, Austrian Silesia, February 23, 1855. He came to the United States in 1867; studied at the old University of Chicago and at Furman University, Greenville, S. C., and was a graduate pupil of William Dwight Whitney's at Yale, 1877-78. He was a fellow of Johns Hopkins University, 1878-79; and then studied in

Berlin and Leipzig, 1879-81. On his return to America in 1881 he received an associate professorship in Johns Hopkins, and afterwards the full professorial chair of Sanskrit and comparative philology, which he holds in that university. In 1896 Princeton bestowed the LL.D. degree upon him. He is an extensive contributor to the Oriental journals and philological periodicals; and his researches in connection with the Atharva-Veda are especially important. Mention may be made of his edition of the *Kaṇḍika-Sūtra*, New Haven, 1890 (American Oriental Society's Journal, Vol. XIV.); *Hymns of the Atharva-Veda Translated*, Oxford, 1897 (Sacred Books of the East, Vol. XLII.); *The Atharva-Veda*, Strassburg, 1899 (Bühler's *Grundriss der indo-arischen Philologie*); *The Kasmirian Atharva-Veda, reproduction of the manuscript by chromolithography* (Baltimore, 1901); and he is publishing a *Vedic Concordance* (to appear in the Harvard Oriental Series).

BLOOMFIELD, ROBERT (1766-1823). An English pastoral poet. He was born at Honington, Suffolk, December 3, 1766, and was the son of a poor tailor, who died, leaving Robert an infant. His mother with difficulty subsisted by teaching a school, where Bloomfield learned to read. At the age of 11 he was hired to a farmer, but ultimately became a shoemaker in London, where in a poor garret he wrote his *Farmer's Boy*. It was published in 1800, had extraordinary popularity, and was translated into a number of languages. He subsequently published *Rural Tales*, *Wild Flowers*, and other pieces. Though efforts were made for him by persons of rank, his health broke down, and he died, nearly insane, at Shefford, in Bedfordshire, August 19, 1823. Consult Weston, *Works* (London, 1824); Hart, *Selections from Correspondence* (London, 1870).

BLOOMFIELD-ZEISLER, blōm'fēld-tsī's'lēr, FANNY (1866—). An American pianist, born in Bielitz, Austrian Silesia, July 16, 1866. In 1868 her parents came to America, settling in Chicago. At the age of six, before receiving any musical instruction, she began picking out tunes on the piano. In 1877 Mme. Essipoff, then on tour in the United States, heard her play, and advised that she become a pupil of Leschetizky, which she did the following year, remaining with him until 1883. After successful appearances abroad she returned to America, where she has played with the principal orchestras. She also has given many recitals and has made several brilliantly successful foreign tours, playing in the summer of 1896 at Cologne at the Lower Rhine Music Festival. She is one of the foremost living pianists.

BLOOMINGTON. A city and the county-seat of McLean County, Ill., 126 miles southwest of Chicago; on the Illinois Central, the Chicago and Alton, the Lake Erie and Western, and the Cleveland, Cincinnati, Chicago and Saint Louis railroads (Map: Illinois, D 3). It contains the construction and repair shops of the Chicago and Alton Railroad, and has extensive coal-mining, pork-packing, fruit-canning, and stove-manufacturing interests, besides flour-mills, foundries, furnaces, and brickyards. The city is the seat of the Illinois Wesleyan University (Methodist Episcopal), founded in 1852, and at Normal, two miles north, is the Illinois State Normal University. Bloomington has several

parks, a marble court-house, a fine city hall, and a public library of over 22,000 volumes. There is also a soldiers' orphans' home at Normal. Settled in 1831, Bloomington was chartered as a city in 1850 and in 1900 celebrated, with appropriate ceremonies, the semicentennial of its incorporation. Under the charter of 1897, now in effect, the city is governed by a mayor elected for two years, and a city council. All heads of departments, excepting that of the school board, are selected by the mayor with the concurrence of the council. Town meetings are convened annually to levy road, bridge, and town taxes. The city owns and operates its waterworks and electric-light plant. Population, in 1890, 20,484; in 1900, 23,286.

BLOOMINGTON. A city and the county-seat of Monroe County, Ind., 50 miles southwest of Indianapolis; on the Chicago, Indianapolis and Louisville Railroad (Map: Indiana, C 3). It is the seat of the Indiana State University (q.v.). The city has vast quarrying interests, principally of limestone, and manufactures of furniture, hubs and spokes, leather, etc. It was settled about 1819. The government, under a general State law, is administered by a mayor, elected every four years, and a municipal council. Population, in 1890, 4018; in 1900, 6460.

BLOOMSBURG. A town and county-seat of Columbia County, Pa., 40 miles southwest of Wilkesbarre; on the Susquehanna River, the Pennsylvania Canal, and the Lackawanna, the Philadelphia and Reading, and the Bloomsburg and Sullivan railroads (Map: Pennsylvania, E 2). It is the seat of a State normal school, and has fine county and town buildings. The city is in a region which produces iron, and contains, among its industrial establishments, iron furnaces and foundries; car works; flour, woolen, silk, and lumber mills; carriage, furniture, desk, and carpet factories, brass-works, etc. Population, in 1890, 4635; in 1900, 6170.

BLOT IN THE 'SCUTCHEON, A. The title of a tragedy by Robert Browning (1843), played by Lawrence Barrett in America. It is based upon the fatal consequences of a childish passion, uselessly concealed.

BLOUET, blō'ā', PAUL. See O'REIL, MAX.

BLOUNT, blūnt, SIE FREDERICK. A lispng character in Bulwer's play, *Money*. He pays nonchalant addresses to Georgiana Vesey and her £10,000.

BLOUNT, HARRY ('Unnurtured Blount'). The page in Scott's poem *Marmion*.

BLOUNT, WILLIAM (1744-1800). An American politician, born in Bertie County, N. C. He was a member of the North Carolina Legislature for several terms after 1780, of the Continental Congress in 1783-84, and again in 1786-87, and of the Constitutional Convention of 1787. In 1790 he was appointed by Washington to be Governor of "The Territory of the United States South of the Ohio" (including the present Tennessee), and soon afterwards founded the city of Knoxville. When Tennessee was admitted to the Union, in 1796, Blount was elected to the United States Senate from that State; but in July, 1797, he was detected in a conspiracy to wrest New Orleans and the Floridas from the Spaniards on behalf of Great Britain, and was summarily expelled on a charge of "high misde-

meanor entirely inconsistent with his public trust and duty." The pro-British scheme caused much excitement at the time, both in and out of Congress, and has since been known as 'Blount's Conspiracy.' His formal trial was postponed until 1798, and early in 1799 the Senate decided to dismiss the impeachment on account of a lack of jurisdiction, Blount not then being a member. The whole incident increased considerably Blount's popularity in Tennessee, and soon after his expulsion he was elected to the State Senate, over which he presided for some time. Consult an article by Mrs. M. J. Lamb, in *Magazine of American History*, Vol. XIII. (New York, 1884).

BLOUSE, blouz (of uncertain origin). A name borrowed from the French for the loose, sack-like over-garment which, as worn in England by wagoners and farm laborers, is called a smock-frock. The English smock-frock is made of coarse and unbleached linen, sometimes plaited and embroidered. In Germany it is frequently tightened to the body by a belt, and is sometimes made of coarse woollen. France is preëminently the country of blouses. There they are worn universally by the laboring classes in towns, and so characteristic is this garment that the French populace are often called the 'Blouses.' The white blouse is a Sunday dress with the working classes in France, and has often served as a countersign among the leaders of sections in secret societies.

BLOW, blō, JOHN (1648-1708). An English composer and musician; born (probably) at North Collingham (Nottinghamshire). He was trained in music as one of the children of the Chapel Royal under Capt. Henry Cooke. In 1669 he was appointed organist of Westminster Abbey, and in 1685 composer-in-ordinary to James II. From 1687 to 1693 he was master of the choristers at Saint Paul's Cathedral, and in 1699 became composer of the Chapel Royal. He published *Lessons for the Harpsichord* (1698) and a collection of songs entitled *Amphion Anglicus* (1700). His other works, mostly unprinted, comprise fourteen services, about a hundred anthems, sacred songs, and many odes, including the setting for Dryden's ode on the death of Purcell (1695).

BLOWFLY. See FLESH-FLY.

BLOWGUN. A weapon used both for war and hunting by the tribes formerly inhabiting the Gulf region of the United States, by the natives of equatorial South America, and by the Malays of the East Indies. It consists of a straight tube from eight to twelve feet in length, from which a light arrow is forcibly expelled by the breath. The tube is made of a hollow reed or cane, the joints of which have been bored or burned through, or from two pieces of wood hollowed out and fitted together in flute fashion. In South America the arrow is usually tipped with poison, so that a slight scratch will produce death or paralysis. Among the Cherokees the arrow is feathered with thistle-down, put on so as to fill the bore of the tube.

BLOWING-MACHINES. Mechanical contrivances for producing an artificial current of air, often of considerable intensity. For the purpose of description, blowing-machines may be divided into the following classes or types: (1) bellows; (2) piston blowers; (3) fan blowers; (4) rotary blowers; (5) jet blowers.

BELLOWS. Some form of bellows was probably the earliest form of blowing-machine. A very primitive form of bellows is still in use in some Eastern countries, consisting simply of the skin of some animal sewed into a rude bag, with a valve and nozzle. The older forms of domestic bellows are all constructed on the same principle—viz. a chamber formed of two boards with flexible leather sides, having at one end a nozzle with a narrow mouth; and in the lower board a valve of considerably larger area for the admission of air. When the bellows are distended by drawing the boards apart, air is sucked in by the valve, to replace the vacuum which would otherwise be formed, and then, when the boards are being closed, the valve, which only opens inward, is shut by the compressed air; and the latter, having no other escape, is forced out at the nozzle. The great fault of the common bellows is that it gives a succession of puffs and not a continuous blast. A former remedy for this was to use two bellows, so that one was blowing while the other was filling; but it was afterwards found that the double bellows secured a still more uniform blast. This machine is merely the common bellows, with a third board of the same shape as the other two placed between them, so as to form two chambers instead of one. The middle board is fixed, and both it and the lower one have valves placed in them opening inward. A weight on the lower board keeps the under chamber filled with air; and when this board is raised by a lever or otherwise, the air which it contains is forced into the upper chamber. The exit-pipe is attached to the latter, and a weight is placed on the upper board sufficiently heavy to press the air out in a continuous stream, the continuity being maintained by the large quantity of air always present in the upper chamber, and the uniform pressure of the weight. Sometimes a spring is used instead of a weight to press out the air. This is the usual construction of the ordinary blacksmith's bellows. Even with the double bellows, however, the constant refilling of the upper portion from the lower prevents the blast from being quite regular, and its use is therefore limited to such simple requirements as are furnished by blacksmiths' forges and domestic fireplaces.

PISTON BLOWERS. The Chinese bellows is one of the earliest and simplest forms of piston blowers. It consists of a square chamber of wood, with a close-fitting piston, which, when drawn back, sucks air in through a flap valve like the ordinary bellows-valve, and when pushed forward compresses this air and forces it out through a nozzle. The modern form of piston blower is virtually an air-pump or compressor for producing low pressures. (See AIR-COMPRESSORS.) Its most extensive use is for supplying the air-blast to blast-furnaces, Bessemer converters, etc. Steam is the power most commonly used; but gas-engines have recently been introduced, and any other power, such as a fall of water, may be employed. A blowing-engine of modern construction usually consists of a steam-cylinder and an air-cylinder set tandem, either vertically, one above the other, or horizontally, one ahead of the other, with a common piston-rod and a heavy fly-wheel to regulate the operation. The air-cylinder is usually placed uppermost in a vertical engine and foremost in a horizontal engine, and the air is usually compressed

on both the forward and the return stroke of the piston. Often the steam-cylinders are compounded. The air from the air-cylinder passes sometimes into a receiver, but more often directly into the blast-pipes, which are made large enough to act as a receiver or reservoir for maintaining a steady supply of air to the furnaces.

The following are brief descriptions of a number of representative modern blowing-engines: A blowing-engine built for the Hernadthaler Iron-Works at Krompach, Hungary, in 1898, is a horizontal cross-compound engine, with a high-pressure steam-cylinder 35 inches in diameter, a low-pressure cylinder 54 inches in diameter, and an air-cylinder 76 inches in diameter, all with a stroke of 55 inches. The contract with the builders required that this engine should have a capacity of 28,250 cubic feet of air at 10 pounds pressure, with a steam-pressure of 112 pounds, and making $52\frac{1}{2}$ revolutions per minute. Among the more important vertical blowing-engines are those for the Dominion Iron and Steel Company of Sydney, Cape Breton, Canada, to supply the blast for the five blast-furnaces built in 1900. These engines have high-pressure steam-cylinders 50 inches in diameter, low-pressure steam-cylinders 96 inches in diameter, air-cylinders 96 inches in diameter, and a piston-stroke of 60 inches.

The largest gas-engine blower ever built is that constructed by the John Cockerill Company, of Seraing, Belgium, and exhibited at the Paris Exposition of 1900. This engine is of 600 horsepower; the gas-cylinder is 51.2 inches in diameter, with a piston-stroke of 55.1 inches; the air-cylinder is 66.9 inches in diameter, with a piston-stroke of 55.1 inches, and the engine is horizontal, with the air-cylinder ahead of the power-cylinder.

DISK BLOWERS. Disk blowers consist of an axle carrying several blades arranged something like the blades of a screw propeller and revolving concentric with and inside of a cylindrical casing open at both ends. This form of blower is used chiefly for ventilating purposes,

FIG. 1. DISK BLOWER.

and in such cases is set in the wall of a building with one end of the cylindrical casing opening into the building and the other end opening to the outside air. In this position the axle and blades are rotated by means of an electric motor or belt, and by means of this rotation suck or

force the vitiated air from the room into the outer atmosphere. By setting the blower so that it faces into the building, fresh air from the outside may be forced into the room instead of the foul air being drawn out. The familiar 'electric fan' is a form of disk blower. Disk blowers are built of varying sizes, from 1 foot to 8 feet in diameter, and have a capacity of from 1500 cubic feet to 90,000 cubic feet of air per minute, depending upon their size and the speed at which they are run.

FANS. Fans are a form of rotary blower, something like a disk blower, except that the axle carries radial arms or spokes, to the ends of

FIG. 2. POSITIVE BLOWER.

which are fastened flat blades parallel to the axle. These blades revolve inside a chest or casing so arranged that the air is sucked in through circular orifices at the sides and is expelled through an outlet in the periphery. Several modern forms of rotary fan blowers have curved blades instead of flat paddles, as described above.

POSITIVE BLOWERS. A recent form of rotary blower much used is the positive blower, of which the Root blower, shown in Fig. 2, is the most familiar form. This blower consists of two encased 'revolvers,' shaped something like a figure 8 and carried by two horizontal shafts, which are connected by gear-wheels outside of the casing, so that their relative motion is invariable. These 'revolvers' fit the casing closely, and also mesh closely with each other when revolving. As is clearly shown by the engraving, the air is taken in at the bottom of the casing and forced out at its top. These blowers are capable of developing considerably greater pressure than fans or disk blowers.

JET BLOWERS. A jet of steam or of water forced through a pipe of small diameter inserted in an air-pipe of larger diameter, open at both ends, creates a current of air through the air-pipe in the direction of the escaping jet, which is often used for blowing purposes. The most familiar forms of steam-jet blowers are the exhaust nozzles used in the smokestacks of locomotives and fire-engines. In these instances the exhaust steam from the engine-cylinders is employed to furnish the steam-jet. A water-jet blower, called a *trompe*, was frequently used in the early days of metallurgy to furnish the blast for iron-furnaces. In this device a stream or jet of water

fell downward through a vertical pipe having openings for the admission of air at its top, and terminating at its bottom in an air-tight reservoir. The air sucked in at the top of the pipe by the falling water rises to the top of this reservoir from which it is piped off for use, while the water remains at the bottom and is drawn off by suitable valves or openings. There are various other forms of blowing-machines; but they are of such limited application, or have become so nearly obsolete, that they need not be described here. The modern blowers of greatest importance in mechanical operations are the bellows, the blowing-engine, and rotary blowers of the fan, disk, and positive types. See HEATING AND VENTILATION.

BLOWITZ, blô'vitz, HENRI GEORGES STEPHANE ADOLPH OPPER DE (1832—). A French journalist. He was born at Blowitz, Pilsen, Bohemia, but early removed to France, where he was for many years a teacher of languages at Tours, Limoges, and Marseilles. During this time he became known as a writer on European politics, contributing to the *Gazette du Midi* and other journals. He was naturalized as a French citizen in 1870 and became a warm supporter of Thiers, and for his services in aiding in the suppression of the Commune at Marseilles in 1871 was decorated with the cross of the Legion of Honor. In July, 1871, he began his long career as Paris correspondent of the *London Times*. His services on the *Times* have been noteworthy, in particular his revelation, in 1875, of the plans of the German military party for the second invasion of France, and his publication of the entire text of the Treaty of Berlin before it was signed.

He was one of the first newspaper men to see the value of the 'interview.' Besides having contributed over 4000 columns to the *Times*, he has published *Feuilles volantes* (1858); *Midi à quatorze heures*, a comedy; *l'Allemagne et la Provence* (1869); *Lemariage royal d'Espagne* (1878); *Une Course à Constantinople* (1884).

BLOWPIPE. A conical tube of metal terminating in a small opening, and used in the arts for soldering metals, and in mineralogy and analytical chemistry for determining the nature of substances. According to Berzelius, Anton von Swab, a Swedish counselor of mines, first used the blowpipe in 1738 to test minerals and ores. Its use extended from Sweden to Germany, and thence throughout the Continent of Europe and

The blowpipe commonly used in analytical work consists of a conical brass tube about 8 inches long, terminating at the wider end in a convenient mouthpiece, of horn or rubber, while at the lower end a small tube with a finely perforated nozzle and a platinum tip is inserted at right angles to the larger tube slightly above its end, the space below being intended as a chamber projected in a lateral direction as a long, pointed cone; the air thus supplied being sufficient for the moisture from the breath.

When the nozzle of the blowpipe is placed within an ordinary flame and a somewhat strong current of air is blown through it, the flame is projected in a lateral direction as a long, pointed cone; the air thus supplied being sufficient for complete combustion, the flame is colored blue and is very hot. If the point of this flame is directed against metals, the latter are rapidly transformed into their oxides, and hence the flame is called an *oxidizing flame*. On the other hand, when the nozzle of the blowpipe is placed near but outside a flame, and a gentle current of air is blown through it, the flame retains its luminosity, and, owing to the presence in it of incandescent carbon, is capable of reducing oxides to the metallic state; whence the name, *reducing flame*. See also FLAME.

In certain tests the substance is heated before the blowpipe on a piece of charcoal, the formation of colored coatings often indicating the nature of the compound; thus, lead deposits on the charcoal a yellow coating of its oxide. In other tests the substance examined is mixed with reagents, usually borax, sodium carbonate, microcosmic salt, and cobalt nitrate. The first four of these form, with metallic oxides, colored glass-like beads which serve to determine the composition of the substance. With borax, a bottle-green glass bead is obtained when iron salts are present; an amethyst-colored bead indicates manganese, and a blue-colored bead, cobalt. Sodium carbonate and microcosmic salt also yield characteristic colored beads that serve to indicate the presence of certain ingredients. The solution of cobalt nitrate, when applied to a powder on a piece of charcoal, yields characteristic colors for certain compounds that are distinctive, notably the blue coloration for aluminium salts.

Blowpipe analysis is generally used for qualitative determinations, and finds its greatest application in field-work as an easy means for determining the composition of minerals. In certain cases, it is possible to make also a quantitative estimation of ores, especially those of silver and lead, by the use of the blowpipe. But the insignificant quantity of the material employed renders the results scarcely precise enough even for the purposes of technical analysis.

The blowpipe is the common instrument used by goldsmiths and jewelers for soldering metals. It is also used by glass-blowers in their work, but in their manipulations the form of the blowpipe is usually the Bunsen blast-lamp, in which the heat of the gas-flame is increased by a current of air that is supplied from a bellows.

Consult: H. B. Cornwall, *Manual of Blowpipe Analysis, Qualitative and Quantitative, with a Complete System of Determinative Mineralogy* (New York, 1891); C. F. Plattner, *Manual of Qualitative and Quantitative Analysis with the Blowpipe*, trans. Cornwall (New York,

BLOWPIPES.

to England. Cronstedt, Bergman, Gahn, and Berzelius have successively introduced valuable improvements in the form of the blowpipe. The present form, however, is due to Plattner and his successors in the Royal Saxon Mining Academy in Freiberg.

1892); W. A. Ross, *The Blowpipe in Chemistry, Mineralogy, and Geology* (London, 1889); and Moses and Parsons, *Elements of Mineralogy, Crystallography, and Blowpipe Analysis from a Practical Standpoint* (New York, 1895). See ANALYSIS, CHEMICAL.

BLÜCHER, bluk'ér, GERHARD LEBERECHE VON, Prince of Wahlstadt (1742-1819). A Prussian field-marshal. He was born at Rostock, in Mecklenburg-Schwerin, December 16, 1742. At the beginning of the Seven Years' War he joined a regiment of Swedish hussars, and in his first action was taken prisoner by the Prussian hussars, whose colonel persuaded him to enter the Prussian service and gave him a lieutenancy. Another lieutenant having been promoted over Blücher's head, the latter immediately wrote to Frederick the Great as follows: "Von Jägersfeld, who has no merit except that of being the son of the Margrave of Schwedt, has been put over my head. I beg to request my discharge." Blücher was put under arrest and after repeated applications for discharge, he received from Frederick the curt intimation: "Captain Blücher is at liberty to go to the devil!" Blücher betook himself to his estate at Gross-Raddow, in Pomerania, and devoted himself to farming, but soon tired of bucolic life, and in 1787 rejoined the army. He fought as colonel of hussars against the French on the Rhine, evincing great ability as a leader of cavalry. In the campaign of 1806 he took part as lieutenant-general in the battle of Auerstädt. Blücher, with the greater part of the cavalry, covered the retreat of the Prince von Hohenlohe through Pomerania. He was accused of not giving the Prince due support, and thus causing the capitulation at Prenzlau. Blücher marched into the territory of the free town of Lübeck, and hastily fortified the city; but the French took it by storm, and he was forced to surrender on the plain of Ratkow, near Lübeck, whither he had escaped with a few troops. A fortnight later he was exchanged for the French General Victor, and immediately on his arrival in Königsberg was sent at the head of a corps to assist in the defense of Stralsund. After the Peace of Tilsit he was employed in the War Department in Königsberg and Berlin, and subsequently became commandant of Pomerania. At a later period he was placed on the retired list, together with several other men of note, at the instance, it was said, of Napoleon. He was one of the few to combat the general belief in the invincibility of Napoleon, which had grown into a sort of fatalism in high places. In common with Stein and Hardenberg, he labored to remove all weak and unpatriotic counselors from about the King. When all the leaders of the army lost courage, his constancy revived confidence and made him the centre of all hope for the future. When his countrymen at last rose against the French in 1813, Blücher was appointed to the chief command of the Prussians, reinforced by General Winzingerode's Russian corps. At the battles of Lützen, Bautzen, and Haynau, he displayed heroic courage. At the Katzbach he defeated Marshal Macdonald and cleared Silesia of the enemy. In vain did Napoleon himself attempt to stop the "old captain of hussars," as he called him, in his victorious career. In the battle of Leipzig he won a great advantage over Marshal Marmont, at Mückern, October 16, 1813, and on the same day pressed on to the suburbs of the city. On the

18th, in conjunction with the Crown Prince of Sweden, he had a large share in the defeat of the French, and on the 19th his troops were the first to enter Leipzig. Opposing the policy of Austria, Blücher insisted that the taking of Paris was the end to be sought. On the first day of January, 1814, he crossed the Rhine, garrisoned Nancy on the 17th of the same month, and after winning the battle of La Rothière, pressed forward toward Paris. But his scattered corps were routed by Napoleon, and he fought his way back to Châlons with great loss. On March 9, however, he defeated Napoleon at Laon; and at the end of the month, after being joined by Schwarzenberg and his corps, he again advanced toward Paris. The day of Montmartre crowned the brilliant deeds of this campaign, and on March 31 the Allies entered the French capital. Blücher himself, who was suffering from a malady of the eyes, abstained from entering the city on that day. Frederick William III. created him Prince of Wahlstadt, in remembrance of the victory at the Katzbach, and gave him an estate in Silesia. In England, whither he followed the allied sovereigns, he was received with an enthusiasm never before excited by a German. The University of Oxford conferred on him the degree of doctor of laws. After Napoleon's return from Elba, in 1815, Blücher once more assumed the general command, and promptly led an army into the Netherlands. On June 16, 1815, he lost the battle of Ligny, and narrowly escaped being killed by his horse falling on him. The victory of the Allies in the battle of Waterloo was decided by Blücher's timely appearance on the field. He ordered his Prussians to pursue the flying enemy, which they did the whole night. Declining the offered truce, Blücher marched against Paris, and on the second taking of that city manifested a strong desire to retaliate on Paris the spoliation that other capitals had suffered at the hands of the French; but he was held in check by the Duke of Wellington. In order to reward Blücher's services to Prussia and the common cause, Frederick William III. created the Order of the Iron Cross, the badge of which consisted of an iron cross surrounded by golden rays. On August 26, 1819, a colossal bronze statue was erected in his honor in his native town. Blücher died September 12, 1819, after a short illness, at his estate of Kriebowitz, in Silesia. Consult: Scherr, *Blücher, seine Zeit und sein Leben* (Leipzig, 1887); Varnhagen von Ense, "Fürst Blücher von Wahlstadt," Vol. III. of the *Biographische Denkmale* (Leipzig, 1872); von Colomb, *Blücher in Briefen aus den Feldzügen, 1813-15* (Stuttgart, 1876).

BLUDOFF, blud'ôf, DIMITRI NIKOLAYEVITCH Count (1785-1864). A Russian statesman, born in the Government of Vladimir. He studied in Moscow, entered the diplomatic service, was appointed Secretary of State under Nicholas I., and in 1832 became Secretary of the Interior. He worked unceasingly for the welfare of the peasants. As Minister of Justice he obtained two ukases (1842, 1847) for the amelioration of the condition of the serfs, and as president of the Imperial Council and of the Council of Ministers he set his signature to the act abolishing serfdom. For his biography, consult Kovalevski (Saint Petersburg, 1866).

BLUE (from Fr. *bleu*, in itself borrowed from the Germanic nations; OHG. *blāo*, AS. *blōw*, Ger. *blau*). A primary color of the same shade as the clear sky and the turquoise, and located in the solar spectrum after the green and before the violet. This color has been conspicuously used as a badge to designate military bodies. It was the favorite color of the Scottish Covenanters in the Seventeenth Century, when it was called 'true blue,' and is the color commonly worn by the soldiers of the United States Army. The sailors of most navies are dressed in uniforms of a darker color, called *navy blue*. Among blue minerals, the sapphire and the turquoise are highly valued as gems; the lapis-lazuli has been extensively used for ornamental purposes. The coloring matter of blue flowers is due to a pigment called *anthocyanin*. Among the more important blue pigments are the following: *Antwerp blue*, a mixture of Prussian blue and alumina; *azure blue*, a cobalt oxide fused with glass and ground to powder; *Berlin blue*, another name for both Antwerp blue and Prussian blue; *Bice blue*, originally native azurite powdered and washed, more commonly, however, a preparation of smalt; *Bremen blue*, chalk or whiting mixed with a solution of copper in nitric acid; *China blue*, crude cobalt oxide ground with potash and mixed with feldspar, fused, and powdered; *cobalt blue*, 10 parts of alumina mixed with 1 part of a cobalt salt, slowly dried, and heated to a dull redness and ground to powder; *King's blue*, a cobalt carbonate; *mountain blue*, native copper carbonate or azurite; *mineral blue*, a synonym for Antwerp blue; *Paris blue*, a synonym for both cobalt blue and Prussian blue; *Prussian blue* is iron ferrocyanide made by adding potassium ferrocyanide to a solution of ferrous sulphate, and the resulting precipitate washed and dried; *Queen blue*, a synonym for lump blue used in laundries (bluing); *Saunders blue*, ultramarine ashes obtained from the resinous mass in making ultramarine; *Sawon(y) blue*, Prussian blue and aluminium hydrate; *smalt*, a cobalt ore heated with flint and potash, and ground to a powder; *Thénard blue*, a synonym for cobalt blue; *ultramarine*, originally prepared from lapis-lazuli, but now made synthetically by heating together kaolin, sodium sulphate, sodium carbonate, sulphur, and charcoal, then pulverizing, washing, and drying. Among the dyestuffs that yield a blue color are the following, the origin of many of which is indicated by their names: *Alizarin blue*; *aniline blue*; *anthracene blue*; *chemic blue*, a solution of indigo; *Couper's blue*, derived from induline; *dahlia blue*, derived from rosaniline; *ethylene blue*, derived from diethylaniline; *indigo blue*, originally derived from the indigo plant and now made synthetically; *logwood blue*, an extract of logwood; *methylene blue*, derived from methylaniline; *night blue*, derived from rosaniline; *resorcine blue*, derived from phenol; *soluble blue*, derived from rosaniline; and *Victoria blue*, derived from rosaniline.

Blue Stone, or *Blue Vitriol*, is the commercial name for copper sulphate.

BLUE, VICTOR (1865—). An American naval officer, born in North Carolina. He graduated at the United States Naval Academy at Annapolis in 1887, served on the *Sucanee* in the Spanish-American War, and attracted general attention

in June, 1898, by penetrating seventy-two miles within the Spanish lines in the vicinity of Santiago, Cuba, and definitely determining for the first time the presence of the Spanish fleet in Santiago Harbor. After the battle of Santiago he was placed in command of the *Alvarado*, a gunboat captured from the Spanish, and on August 12, 1898, participated in the attack upon the Spanish batteries at Manzanilla. In 1900 he served as flag-lieutenant on the staff of Rear-Admiral Kempff during the Boxer disturbances in China, and subsequently was assigned to duty in the Philippines.

BLUE AND THE GRAY, THE. A well-known poem by Judge Francis Miles Finch (1867), published in the *Atlantic Monthly*, and based on the decoration of the graves of Federal and Confederate soldiers in a Southern cemetery.

BLUEBACK. The name of various fishes having bluish backs; specifically, the Fraser River salmon (*Oncorhynchus nerka*), of the northwest coast of America. See *SALMON*.

BLUEBEARD. A fictitious hero of the familiar tale which in the Eighteenth Century found its way into English from the French of Charles Perrault (c.1697). In this story, the Chevalier Raoul, whose surname is due to the color of his beard, had married seven wives. Six of these had mysteriously disappeared, and the seventh is represented as subjected to a singular test of obedience. Having occasion to go away, Raoul commits to Fatima the keys of his castle, and enjoins her that, though she may otherwise have free course, she must not open a certain chamber. Her curiosity is enhanced by her loneliness, and proves too strong for her. Opening the door, she beholds the charnel-house, where lie the bones of her predecessors. Her lord returns, discovers her disobedience by the blood upon the key, and tells her that in five minutes she must die. From the top of the castle, however, her sister Anne observes horsemen approaching in the distance, who are the brothers of the ill-fated wife, and they arrive just in time to rescue their sister by slaying Bluebeard. Though Bluebeard is imaginary, there is thought to be a historic prototype in Gilles de Laval, Baron de Retz (1396-1440). He fought like the brave man he was against the English in their invasion of his country; but his intrepidity pales before his diabolical cruelties, and it is by these that he is remembered. Because of some disloyalty to the Duke of Brittany, he was burned alive near Nantes in 1440. That Laval is the original of Bluebeard is conjecture at best, and from the fact that the story is found with more or less variety of detail in the folklore of different peoples, this doubt is enhanced.

Besides the French version of Perrault, there are tales of a similar kind in Straparola's *Piacevoli notti* (1569), and in the *Pentamerone* of Gian Alesio Abbatutis. There is at Marbihan an interesting pictorial representation in some frescoes of the Thirteenth Century, mentioned by Violeau in his *Pèlerinages de Bretagne*. And it has been pointed out that the resemblance is very close to the Arabian Nights' tale of the Third Calendar. In his *Phantasmus* Tieck has wrought the matter into a clever drama; Grétry has, in his *Raoul Barbe-Bleue* (1789), given it the setting of comic opera; Offenbach produced

lent quality upon good soils, does not yield a large quantity, and on this account it is less valuable for hay than as a pasture and lawn grass. For these purposes it is not surpassed by any other grass in regions adapted to its growth. It is a perennial, attaining a height of from a few inches to two feet, with an abundance of long, narrow, soft root-leaves. It spreads with rapidity by means of its rootstocks, soon forming a dense sod. On this account it stands pasturing well, the ordinary tramping of stock not injuring it to any extent. Blue grass should enter into every mixture for permanent pastures in the eastern and middle United States. The seed, as marketed, usually contains much chaff and is of low vitality; hence it should be sown rather thickly. To make a good firm sod, about three years are required, after which little attention is necessary. Pastures more than sixty years old are still in good condition. This grass does not do well in the warmer parts of the Southern States. In the South, the Texas blue grass, *Poa arachnifera*, replaces it. This species is closely related to the Kentucky blue grass, differing from it principally in its more vigorous growth and having its 'seed' more or less covered with wool. This grass is propagated by seed or by setting out portions of sods, the woolly seed making sowing difficult. It spreads rapidly, and promises to become one of the best grasses for the regions to which it is adapted. Texas blue grass withstands drought better than the former species. There are a number of other species of *Poa* that resemble these blue grasses, and some of them may prove especially adapted to regions where the others are not suited. Kentucky blue grass has the following percentage composition: Water, 65.1; proteid matter, 4.1; fat, 1.3; nitrogen-free extract, 17.6; crude fibre, 9.1; mineral matter, 2.8. Its feeding value, like that of other grasses, depends chiefly on its nitrogen-free extract, crude fibre, and protein content. It is a wholesome and nutritious feed, relished by all kinds of stock. Hay made from this grass, cut when the seed is in the milk stage, contains, on an average per cent., water, 24.3; proteid matter, 6.3; fat, 3.6; nitrogen-free extract, 34.3; crude fibre, 24.5; and mineral matter, 7.0. Hay made from grass cut when the seed is ripe contains, on an average, a little less nutritive material. As regards composition, it compares favorably with hay and other grasses.

BLUE-GRASS REGION. A beautiful section of the State of Kentucky, famed for its trotting horses and blooded stock. The soil is specially adapted to the cultivation of hemp and tobacco.

BLUE-GRASS STATE. Kentucky. See STATES, POPULAR NAMES OF.

BLUE-GREEN ALGÆ. See CYANOPHYCÆ.

BLUE-HEN STATE. Delaware. See STATES, POPULAR NAMES OF.

BLUE ISLAND. A city in Cook County, Ill., $2\frac{1}{2}$ miles south of the city limits of Chicago, on the Calumet River and on the Illinois Central, the Chicago, Rock Island and Pacific, the Chicago and Grand Trunk, and the Chicago and Calumet Terminal railroads (Map: Illinois, E, 2). It is a popular suburb of Chicago, is an important railroad and commercial centre, and has brick-yards, stone-quarries, breweries, oil-works, smelt-

ing-works, etc. Settled in 1833, Blue Island was incorporated as a village in 1872. It was the storm-centre in the early phase of the great railway strikes of 1894, which tied up the traffic of half the country and led to the sending of United States troops to Chicago and elsewhere. The government is administered under a charter of 1901, which provides for a mayor, biennially elected, and a city council. The water-works and electric-light plant are owned and operated by the municipality. Population, in 1890, 3329; in 1900, 6114.

BLUE JAY, SHARK, TIT, etc. See the substantives.

BLUE KNIGHT, THE. Sir Persaunt of India, the fourth of the brothers, the Black, Red, Green, and Blue Knights. Sir Beaumains, or Gareth, conquers him in chapter 131 of Malory's *Morte d'Arthur*. He is spoken of as 'The Blue Knight' in chapter 133.

BLUE LAWS. A name given to certain enactments supposed to have been made by the New Haven Colony, in Connecticut, in the early days of the settlement. The supposition is based upon the fact that, as usual, in the Puritan days the personal conduct of citizens was often subject to judicial supervision and animadversion, and Sabbath-breaking was especially odious to the magistracy. A Tory minister, the Rev. Samuel A. Peters, who had charge of the English churches in Hartford and Hebron, but who was compelled by the Revolution to flee to England, published there, in 1781, what purports to be a *General History of Connecticut*, a work whose exaggeration and spite make it almost a curiosity. Many years ago a small book containing these supposed laws, which were really extracts from Peters's history, was published, and is even now referred to as authority by the unsuspicious. These laws were formerly supposed to have been invented out of hand by Peters, and to have had no existence in fact; but recent investigations have shown that, although many of them are not to be found in the New Haven statute-books, all except two or three out of the forty-five are to be found either in the works of an earlier writer (Neal) or, with slight modifications, in the statute-books of the various New England colonies. Consult: an article "An Examination of Peters's Blue Laws," by W. F. Prince, in the *Annual Report of the American Historical Association* for 1898; and J. H. Trumbull, *True Blue Laws of Connecticut and New Haven; and the False Blue Laws Invented by Rev. Samuel Peters* (Hartford, 1876).

BLUE LAWS OF HAWAII, a compilation of Hawaiian statutes, largely of a paternal character, promulgated in 1840 by Kamehameha III. These laws were due to missionary influence, and were obnoxious to the native population of the islands because of their interference with the ancient customs and habits of the people. They were republished in 1894 under the title of *Hawaii's Blue Laws*.

BLUE LIGHT, BENGAL LIGHT, or BENGAL FIRE. A brilliant signal-light used at sea to attract attention, give warning, etc., and in ordinary pyrotechny for illuminating a district of country. It is prepared from nitre, sulphur, and the tersulphuret of antimony. The materials are reduced to fine powder, thoroughly

dried, and intimately mixed in the following proportions by weight: nitre, 6; sulphur, 2; tersulphuret of antimony, 1. The mixture constitutes the blue light, and when kindled by a red-hot coal, red-hot iron, or flame, immediately bursts into rapid and vivid combustion, evolving a brilliant, penetrating, but mellow light, which, during the darkness of night, readily overcomes the gloom for a considerable space. As the fumes evolved during the combustion of the blue light contain an oxide of antimony, and are poisonous, the light cannot be used with safety in rooms or inclosed spaces.

BLUE LIGHT. In American political history, a name applied to a member of that faction of the Federalist Party (q.v.) which opposed the War of 1812. It was derived from the fact, or alleged fact, that when Decatur, with two frigates, was blockaded by a superior English fleet in the harbor of New London, Conn., in 1813-14, certain Federalists warned the English commander by burning blue lights at the entrance of the harbor each time the Americans attempted to get to sea under cover of darkness.

BLUE MANTLE (so named from the color of his robe). The title of an English pursuivant-at-arms. See PURSUIVANT.

BLUE MONDAY. A name originally referring to a custom in parts of Europe, especially in Bavaria, in the Sixteenth Century, of decorating churches in blue colors on the Monday preceding Lent, when the people celebrated the carnival festivities; but the excesses committed led to the legal abolition of the custom. In the United States it is a custom of some women of the poorer class to call every Monday by this name, as it is the general day for doing the hard laundry-work of the week.

BLUE MOUNTAINS. The name of several mountain chains in New South Wales, Australia, Jamaica, West Indies, and New Jersey and Pennsylvania. (1) The Blue Mountains of New South Wales run nearly parallel with the coast, and form a part of the complex Cordillera of Australia, which extends from Cape York on the north to Wilson's Promontory on the south. They are composed of horizontal sandstone strata broken by cañons and deep gullies, and present a precipitous front toward the east. The highest point of the Blue Mountains, Mount Beemarang, is about 4100 feet high. They are crossed by a railway which affords communication between Sydney and the rich pasturage and mining regions of the interior (Map: New South Wales, E 4). (2) The Blue Mountains of Jamaica traverse a considerable part of the length of the island, and attain an extreme altitude of 7400 feet. (3) The Kittatinny and the Shawangunk mountains forming the second ridge of the Appalachian Mountains in New York, Pennsylvania, and New Jersey are also called the Blue Mountains. These are to be distinguished from the Blue Ridge.

BLUE NILE. See NILE.

BLUE NOSE. A nickname for the Nova Scotians, from the effect of the climate, or from a kind of potato called 'Blue Nose' raised in that region.

BLUE PETER (blue + 'peter, for repeater). A rectangular blue flag with a white centre of similar shape, but of about one-fourth of the dimensions. It is the letter 'P' of the inter-

national marine code (see SIGNALS, INTERNATIONAL); when hoisted alone at the fore (i.e. at the fore-truck, or top of the foremast) it signifies that the vessel will shortly sail, or is ready to sail. In the United States Navy a flag called the cornet takes the place of the blue peter as a sailing-signal.

BLUE PILL (*Pilula hydrargyri*). The most simple form in which mercury can be administered internally. It consists merely of two parts of mercury rubbed up with three parts of conserve of roses, till globules of mercury can no longer be detected; to this is added powdered licorice-root, so that a pill of five grains contains one grain of mercury.

In cases of torpid condition of the liver or inflammation of that organ, blue pill is much used as a purgative, either alone or combined with some other drug, such as rhubarb. As a saline purgative, the common dose of blue pill is one or two pills of five grains each, followed by a purgative draught, such as a Seidlitz powder. There is always danger of salivation, with the accompanying deterioration of gums and teeth, and the medicine should be taken only when ordered by a physician. It is recorded that a blue pill taken on each of three successive nights caused fatal salivation. Many proprietary purgative pills contain metallic mercury.

BLUE-RIBBON ARMY. The name adopted in England by a society of total abstainers, from the blue badge worn by the members. Since 1883 the society has been known as the 'Gospel Temperance Union.' The organization originated in America in 1878, where it was known from its founder as the Murphy Movement. See TEMPERANCE SOCIETIES.

BLUE RIDGE. The name of the most easterly range of the Appalachians in the United States (Map: United States, eastern part, K 3). It forms an almost continuous chain from West Point in New York (the Highlands) down to the north of Alabama, through New Jersey (Schooley's Mountain), Pennsylvania (South Mountain), Virginia, the Carolinas, and Georgia. In New Jersey and Pennsylvania the name of Blue Ridge is sometimes, but inaccurately, applied to the 'second' range, properly the Blue (or Kittatinny) Mountains, which runs parallel with this, and is separated from it by a part of the Great Valley. The Blue Ridge proper refers especially to that part of the range below Pennsylvania, which separates the Great Valley from the Piedmont Region. In south Virginia the range widens into a broad plateau, which reaches its widest extent in North Carolina, where it is intersected by numerous groups known as the Black, Cowee, Nantahala, and South mountains. These groups run transverse to the main axis of the Blue Ridge, and their valleys are occupied by numerous streams with a general northwesterly course. The Black Mountains include the highest summits of the range as well as of the Appalachians. Mount Mitchell, or Black Dome, the loftiest point, is 6710 feet, while Guyot's Peak, Sandoz Knob, Gibbe's Peak, and several others are over 6000 feet. Toward the north the Blue Ridge falls off in elevation; in Virginia the summits are about 4000 feet, and in Pennsylvania and New Jersey they are much less. The range is crossed by several large rivers flowing through narrow defiles or gaps, as the Hudson in its traverse of the Highlands, and the Potomac at

Harper's Ferry. See APPALACHIANS; BLACK MOUNTAINS. Consult Whitney, *United States* (Boston, 1889).

BLUE RIVER, or BIG BLUE RIVER. A river rising in Washington County, Ind., flowing southwest and emptying into the Ohio River a few miles above Leavenworth. It has a course of less than 100 miles, but it affords some water-power. This name is also applied to the east fork of the White River. See WHITE RIVER.

BLUE SEA. See ARAL LAKE.

BLUE SICKNESS. See HOG-CHOLERA.

BLUE-STEM GRASSES. See ANDROPOGON.

BLUESTOCKING CLUB. A social gathering, probably an Anglicization of the *Hôtel de Rambouillet* movement of Seventeenth-Century France, which extended to England in the Eighteenth Century. The meetings, held at the houses of Mrs. Montague, Mrs. Vesey, and other literary women, were characterized by plainness of dress. One of the members, Mr. Benjamin Stillingfleet, is said to have habitually worn blue hose, and the wits were not long in dubbing the coterie 'The Bluestocking Club.' The name 'bluestocking' (*bas bleu*) has been applied since then to any woman who makes a pretense to learning. An interesting account of these meetings may be found in the *Memoirs* of Elizabeth Carter (London, 1816).

BLUE STRING, ROBIN. A name applied to Sir Robert Walpole, because of the blue ribbon of his decoration as a Knight of the Garter.

BLUE THISTLE, See VIPER'S BUGLOSS.

BLUETHROAT. A remarkable little European bird, allied to the robin (and hence sometimes called 'bluebreast' in England, where it is an infrequent visitor), assigned to the genus *Cyanecula*; and characterized by a bright-blue throat, separated from the white below it by crescentic bands of black and rust-red. Two species are known, one having a white spot in the centre of the blue (*Cyanecula leucocyanea*), and ranging from Barbary to Holland and Germany; and the other (*Cyanecula suecica*) with a brick-red fan-shaped patch in the midst of the blue. (See Colored Plate of SONG-BIRDS.) This latter species is highly migratory, spending its winters in tropical Africa and India, and going each summer to breeding-haunts in Scandinavia, northern Russia, Siberia, and western Alaska. One feature of this migration renders it extraordinary—namely, that the bird has almost never been seen in the countries intermediate between its summer and winter homes, so that apparently it makes the whole journey of not less than 1500 miles in a single flight, either at night or at an invisible altitude. (See MIGRATION.) The Alaskan visitors also cross Bering Strait twice annually, never migrating southward in America.

The bluethroat is known throughout northern Europe as the Swedish nightingale on account of its fine singing; and the Laplanders style it 'the bird of the hundred voices,' because of its remarkable powers of mimicry. Seebohm and Brown (*Ibis*, VI., 125, 1876) were greatly impressed by this power in Siberia, where it is exceedingly abundant in thickets and along stream-courses as far north as 71°, making its nest in bushes and weeds. They mention its imitating the trilling of the sandpiper, the rich song of the redwing, and various other birds. "Sometimes

he runs these together in such a way as to form a perfect medley of bird-music." Consult the books on the ornithology of Europe, Siberia, and Alaska, mentioned under BIRDS.

BLUE VITRIOL. See COPPER.

BLUEWING. A duck. See TEAL.

BLUFF, COLONEL. The name of a character in *The Intriguing Chambermaid* (1734), by Fielding.

BLUFFTON. A city, the county-seat of Wells County, Ind., 25 miles south of Fort Wayne, on the Wabash River, and on the Lake Erie and Western and the Toledo, Saint Louis and Kansas City railroads (Map: Indiana, D 2). It has a considerable grain and lumber trade, foundry and machine shops, wind-pump factory, and manufactures of barrels, hoops, staves and headings, buck-handles, clay pottery, mittens, etc. Settled in 1837, Bluffton was incorporated in 1849. The government is administered by a mayor, elected every two years, and a municipal council. The city owns and operates its water-works and electric-light plant. Population, in 1890, 3589; in 1900, 4479.

BLUHME, blø'me, CHRISTIAN ALBRECHT (1794-1866). A Danish statesman, born in Copenhagen. He studied jurisprudence from 1811 to 1816, was appointed director of the general custom-house in 1843, and in 1848 Minister of Commerce. In 1851 he became Minister of Foreign Affairs. He took measures for the maintenance of Danish neutrality during the Crimean War, and having resigned in 1854, was brought to trial with the remainder of the ministry on the ground that the expenditures for national defense had been made without appeal to the Rigsdag. He was acquitted in 1856, and again in 1864-65 took charge of the portfolio of Foreign Affairs, and at the same time acted as president of the Council of the Ministry.

BLUHME, FRIEDRICH (1797-1874). A German jurist and judge. He was born in Hamburg, and educated in Göttingen, Berlin, and Jena. In 1833 he was appointed judge of the High Court of Appeal at Lübeck, and was professor successively at Halle (1823), Göttingen (1831), and Bonn (1843). His works include many valuable studies in Roman and German law, among them *Grundriss des Pandektenrechts* (1844), and *Encyklopädie der in Deutschland geltenden Rechte* (1847-58). The treatise "Die Ordnung der Fragmente in den Pandektentiteln" (*Zeitschrift für geschichtliche Rechtswissenschaft*, Vol. IV., 1820) explained the method followed in arranging the excerpts in Justinian's Pandects.

BLUING. A blue, soluble compound used in laundry-work to neutralize the yellow tinge of white clothes. Formerly a preparation of indigo, such as indigo and starch, was chiefly used, but more recently soluble Prussian blue or other soluble blue pigments, frequently made up into balls, have come into use.

BLUING OF METALS. See TEMPERING METAL.

BLUM, Fr. pron. blēm, ERNEST (1836—). A French dramatist, born in Paris. He made his début as a writer at the age of sixteen with *Une femme qui mord*. As a journalist he has been associated with *Charivari*, *Rappel*, *Gaulois*, and other publications. Many

of his dramatic works were written in collaboration with Clairville, Flan, Monnier, Brisbarre, Labiche, and others. Among the vaudevilles, librettos, and dramas of this versatile writer, the following are especially noteworthy: *Les noces de diable* (1862); *Rocambole* (1864); *La jolie parfumeuse* (1874); *Rose Michel* (1875); *Espion du roi* (1876); *Le petit chaperon rouge* (1885); *Les femmes nerveuses* (1888); *La rieuse* (1894); *Le carillon* (1897).

BLUM, bloom, HANS (1841—). A German publicist and author, son of Robert Blum, born in Leipzig, and educated at the universities of Leipzig and Bern. He was a member of the North German Reichstag from 1867 to 1870 and from 1869 to 1897 a barrister in Leipzig. During the Franco-Prussian War he was in the field as correspondent for *Daheim*, and in 1871-79 edited the *Grenzboten*. His extensive and varied publications include works on contemporary politics, such as *Die Lügen unserer Socialdemokratie* (1891), contributions to history in *Fürst Bismarck und seine Zeit* (1894-95); *Das erste Vierteljahrhundert des deutschen Reichs* (1896), and other volumes, some fiction, two dramas, and *Persönliche Erinnerungen an den Fürsten Bismarck* (1900).

BLUM, ROBERT (1807-48). A German patriot. He was born in very humble circumstances in Cologne, November 10, 1807, and after a brief military service in 1830, became scene-shifter, and afterwards secretary of a theatre in Cologne, and subsequently in Leipzig. In this situation he remained, devoting his leisure time to literature and politics until 1847, when he established himself as a bookseller and publisher. In 1840 he founded in Leipzig the *Schillerverein*, which celebrated the poet's anniversary, as a festival in honor of political liberty. In 1845 he acquired great reputation as a popular orator in connection with the German Catholic movement, and particularly through his action at a turbulent meeting of armed citizens and students of Leipzig, whom he dissuaded from storming the barracks. He became the champion of the Liberal Party of Saxony on the outbreak of the Revolution of February, 1848, and was elected vice-president of the Preliminary Parliament at Frankfurt. In the National Assembly he became leader of the Left; and was one of the bearers of a congratulatory address from the Left to the people of Vienna when they rose in October. In Vienna he joined the Students' Corps, was arrested, and shot on November 9. Blum was a man of strong intelligence and great oratorical power. Consult *Hans Blum, Robert Blum* (Leipzig, 1878).

BLUM, blum, ROBERT FREDERICK (1857—). An American painter, born in Cincinnati, Ohio. He studied at the Academy of Fine Arts, Philadelphia, Pa., and exhibited in New York City in 1879. Among his works are "Going and Coming" (1881); "Bright Day at Venice" (1882), and some fine mural decorations, including those for Mendelssohn Hall, New York City.

BLUMAUER, blou'-mou-ër, ALOYS (1755-98). A German poet, born in Steyer. His works, which are chiefly coarse satires on the clergy and on the Jesuit Order (of which he himself had become a member a year before its dissolution in 1773), enjoyed a wide popularity. He is remembered, however, chiefly for his *Abenteuer des*

frommen Helden Æneas (1784-88; published with introduction and commentary by E. Griesbach, 1872), a coarse travesty on Vergil's *Æneid*, which is still widely read in Germany. His complete works, *Sämtliche Werke*, appeared after his death in 4 vols. (1801-03; republished 4 vols., 1884). Consult Hofmann-Willenhof, *Aloys Blumauer* (Vienna, 1885).

BLUMENBACH, blou'-men-bag, JOHANN FRIEDRICH (1752-1840). A German naturalist, physiologist, and anthropologist, born in Gotha. He studied in Jena and in Göttingen, where he graduated with the degree of M.D. in 1776. He began to teach in Göttingen in 1776, became a professor in 1778, and exercised the greatest influence as a teacher for more than fifty years. He founded the science of anthropology. His *Collectio Craniorum Diversarum Gentium* (1790-1828) gave the results of observations upon the skulls of different races. He advocated the theory of the unity of the human race, and divided it into five types—Caucasian, Mongolian, Malay, American, and Ethiopian. His *Handbuch der Naturgeschichte* (1780) has gone through many editions. He was the first to place comparative anatomy on a thoroughly scientific basis, and in 1805 published his *Handbuch der vergleichenden Anatomie*. He speculated on the power of generation and regeneration, and imagined that a *nus formativus*, or formative tendency, was possessed by all living things. Consult his *Ueber den Bildungstrieb und das Zeugungsgeschäft* (Göttingen, 1791).

BLUMENTHAL, blou'-men-täl, JACOB VON (1820—). A German pianist and composer, born in Hamburg. He studied under Grund, Bocklet, Sechter, Halévy, and Herz, and in 1849 went to London. There he was appointed pianist to Queen Victoria, taught music, and composed many brilliant pieces for the pianoforte and popular songs, of which "My Queen," "The Bend in the River," "The Broken Flower," and "The Venetian Boat-Song" are the best known.

BLUMENTHAL, LEONHARD, Count von (1810-1900). A Prussian field-marshal. He was born July 30, 1810, at Schwedt-on-the-Oder. He received a military education in the Prussian Cadet Corps, and in 1827 became an officer in the Reserve Guard. From 1830 to 1833 he studied at the Berlin Military Academy, and later served in all branches of the army, in order to acquire a full military training. In 1848 he became a member of the Prussian General Staff. He was chief of staff of the Schleswig-Holstein Army in 1849; became aide-de-camp to Prince Frederick Charles (1858); colonel of the Seventy-first Infantry (1860); and chief of staff of the Austro-Prussian Army in the war against Denmark (1864). In the same year he was made a major-general, and in the campaign of 1866 against Austria acted as chief of staff to the Crown Prince Frederick William, and distinguished himself at Königgrätz. After the war Blumenthal became a lieutenant-general. During the Franco-Prussian War he again acted as chief of staff to the Crown Prince, and participated in the events leading up to Sedan and the capitulation of Paris. He was afterwards intrusted with the command of the Fourth Army Corps, with headquarters at Magdeburg, and given the rank of general of infantry in 1873. In 1888 he was created field-marshal, and given

important duties as inspector-general of the Fourth Division. He died December 22, 1900.

BLUMENTHAL, OSKAR (1852—). A German dramatist and satirist, born in Berlin. He founded there the Lessing Theatre (1888), which he managed from 1888-97, and devoted chiefly to the production of contemporary comedies. Among his own works first produced at the Lessing Theatre, the most popular are the comedies, *Der Proberfeil* (1882); *Die grosse Glocke; Im weissen Rössel*, with G. Kadelburg (1898); *Matthias Gollinger*, with M. Bernstein (1898); *Die strengen Herren*, with G. Kadelburg (1900); *Der schwarze Schleier* (1887); and *Heute und Gestern*, with G. Kadelburg (1892). He has also published satirical articles and epigrams. Consult Wald (1885), and Wolff (Berlin, 1887).

BLUMER, GEORGE ALDER (1851—). An Anglo-American physician, born in Sunderland, England. He studied at the University of Edinburgh, graduated in 1879 at the medical department of the University of Pennsylvania, and in 1879-80 was resident physician at the German Hospital, Philadelphia, Pa. From 1880 to 1886 he was assistant physician at the Utica State Hospital, of which he was superintendent in 1886-89. In 1889 he was appointed superintendent of the Butler Hospital for the Insane, Providence, R. I. He also became an associate editor of the *American Journal of Insanity*.

BLUMER, blö'mër, JOHANN JAKOB (1819-75). A Swiss statesman and historian, born in Glarus. He studied in Zürich, Bonn, and Berlin. In 1843 he was elected to the Landrat, and in 1861 became president of the Court of Appeals. Between 1861 and 1874 he completed his revision of the civil and criminal law of Switzerland, and subsequently he was chosen president of the Permanent Court of the Swiss Federation. His books include *Staats- und Rechtsgeschichten der Schweizerischen Demokratien* (1850-59), and *Handbuch des Schweizerischen Bundesstaatsrechts* (1877-87).

BLÜMNER, blum'nër, Hugo (1844—). A German classical archaeologist, born in Berlin, August 9, 1844. He taught in the universities of Breslau and Königsberg, and has been since 1877 professor in the University of Zürich. He is author and editor of many philological and archaeological works, of which the most important are: *Die gewerbliche Thätigkeit der Völker des Klassischen Altertums* (1869); *Technologie und Terminologie der Geuerbe und Künste bei Griechen und Römern* (4 vols., 1874-88); *Leben und Sitten der Griechen* (1887); *Maximaltarif des Diokletian*, with Theodor Mommsen (1893); *Pausaniæ Græciæ Descriptio* (1896); reviser of Hermann, *Griechische Privataltertümer* (1881), etc.

BLUNDELL'S SCHOOL. One of the best of the smaller English public schools, especially noted in the west of England. It was founded in 1604 by Peter Blundell, in Tiverton, Devonshire. Beginning life as a poor boy, he amassed a considerable fortune, most of which was left to charities, the greatest of which was this school. There were founded in connection with it five scholarships at Balliol College, Oxford, for scholars of this school, which have brought many men from there to Balliol. Among the distinguished men who came from Blundell's are Bishops Bull, Hayter, and Conybeare, Abraham

Hayward, the essayist, and R. D. Blackmore, the novelist. John Ridd, the hero of *Lorna Doone*, was also a member of the school.

BLUNDERBUSS (either corruption of Dutch *donderbus*, thunder-box, i.e. musket, or from *blunder* + Dutch *bus*, Ger. *Büchse*, box, barrel of a gun). An old-fashioned short musket with a wide, smooth bore sufficient to take in several shots or bullets at one charge. A number of the English and German troopers in the Seventeenth Century were armed with this weapon, which had a limited range, and was more particularly effective at close quarters, or in the defense of narrow passages. It has long been obsolete. See **SMALL ARMS**.

BLUNT, JAMES G. (1826-81). An American soldier. He was born in Trenton, Maine, and in 1849 graduated at the Starling Medical College, Columbus, Ohio. In 1856 he settled in Kansas, where he strenuously opposed the introduction of slavery, and was a member of the convention that framed the State Constitution. He entered the Federal Army as lieutenant-colonel at the outbreak of the Civil War, and in 1862 was made brigadier-general, and placed in command of the Department of Kansas. On December 7, at Prairie Grove, he defeated a force under General Hindman, and thus checked the advance of the Confederates into Missouri. He was raised to the rank of major-general in November, 1862, but in 1863 was relieved of the command of the department, and assigned to the Army of the Frontier.

BLUNT, JOHN HENRY (1823-84). An English High-Church theologian and writer on ecclesiastical history. He was born in Chelsea, studied at University College, Durham, and was ordained a priest of the Established Church in 1855. He was appointed a Vicar of Kennington in 1868, and in 1873 rector of Beverston. He contributed much to reviews and periodicals, and his publications include *The Atonement* (1855); an *Annotated Book of Common Prayer* (1884); and an important *History of the Reformation of the Church of England* (1862-82), written from the High-Church standpoint.

BLUNT, JOHN JAMES (1794-1855). An English clergyman and author, born in Newcastle-under-Lyme, Staffordshire. He graduated in 1816 at Saint John's College, Cambridge, was curate at Hodnet, Shropshire, to Reginald Heber, whom he succeeded; and subsequently was curate also at Chetwynd. In 1834 he became rector of Great Oakley, Essex, and in 1839 professor of divinity at Cambridge. He wrote a considerable number of works on ecclesiastical history and biblical criticism, besides several volumes of sermons. The best-known of his publications is *Undesigned Coincidences in the Writings both of the Old and New Testament, an Argument of their Veracity* (1847). Consult Selwyn, "Memoir," in Blunt's *Two Introductory Lectures* (1856).

BLUNT, WILFRID SCAWEN (1840—). An English traveler and poet. He was born near Crawley, England, August 17, 1840. His mother being a Catholic convert, he was educated at Stonyhurst and at Saint Mary's, Oscott. He served for some years as attaché to various British embassies in Europe, and in 1869 married Anne, daughter of the Earl of Lovelace, and granddaughter of Lord Byron, with whom he

traveled through Spain, Algeria, Egypt, and the Syrian Desert. In 1882 he championed the cause of Arabi Pasha (q.v.), and later took up the Nationalist cause in Ireland. In 1887-88 he was imprisoned for two months for taking part in a prohibited meeting at Woodford, in County Galway. Blunt won attention by the *Love Sonnets of Proteus* (1880), containing a fine sonnet on Gibraltar. This volume has been followed by *Esther* (1892); *Griselda* (1893); the *Quatrains of Youth* (1898); *Satan Absolved: A Mystery* (1899); and many other poems. Blunt's poems are intensely human and realistic. Consult Henley and Wyndham, edd., *The Poetry of W. Blunt* (London, 1898).

BLUNTHEAD. A curious colubrine innocuous snake (*Amblycephalus boa*) of Java and the East Indies, the type of the family Amblycephalidae, and allied to the night tree-snakes (Dipsadidae). It is slender, about 3 feet long, and purplish in color, densely marbled and mottled with brown, with rosy spots and cheeks, and lips carnation-red. Its large head is shaped like that of a mastiff, "which animal it further resembles by snapping at whatever disturbs it." Having a prehensile tail, it climbs with great ease, and at night creeps about the thatch of houses in Java and Borneo, in search of insects, the natives welcoming it as a vermin-destroyer.

BLUNTSCHLI, blunt'shlé, JOHANN KASPAR (1808-81). A German jurist, born in Switzerland, 1808; graduated at Bonn in 1829. He was professor of law in the University of Zürich, a member of the grand council of the local government, and strongly opposed the civil war of 1847-48. In 1848 he became professor of German and international law at Munich, and in 1861 professor of political science and jurisprudence at Heidelberg. In 1864, with Baumgarten and others, he founded the Protestant Union, and subsequently presided over several Protestant conventions, and over the General Synod at Baden in 1867. He also presided, in 1861, over the International Congress of Jurists in Dresden. Bluntschli was one of the founders and (1875-77) president of the Institute of International Law at Ghent, and was generally considered one of the highest European authorities on international law and the laws of war. He was a Liberal in politics, and in 1867 was elected to the *Zollparlament* (customs parliament). He died in 1881. His valuable library is now owned by the Johns Hopkins University of Baltimore. His legal writings include *Geschichte des allgemeinen Rechts* (1864); *Das moderne Kriegerrecht* (1866); *Das moderne Völkerrecht* (1868); and *Die Lehre vom Staat* (1875).

BLUSHING (AS. *blyscan*, to glow, *blysa*, a torch). A sudden reddening of the face, neck, and breast, owing to some mental shock, most commonly of the character of shyness, shame, or modesty. It is produced by an increased flow of blood into the capillary vessels over the parts where the blush extends, resulting from a temporary vasomotor paralysis. Besides reddening the complexion, it creates a sensible augmentation of heat in those parts. The feeling that accompanies a blush is one of distress—of heat and general discomfort. Children rarely blush. Darwin is authority for the statement that people of races that habitually are nearly naked blush down to the waist. There is a nerve fila-

ment, from the sympathetic system, lying within the sheath of and parallel with each artery and capillary, controlling the expansion and contraction of the muscular coat of the vessel. This is called a vasomotor nerve. During the mental stress that accompanies blushing, the action of the vasomotor nerve is suspended and the arteries and capillaries dilate, producing the phenomenon, the heart's action being unaffected. Mental stress of a nature to moderate or control the heart's action is more likely to cause pallor of the surface, owing to the decreased amount of blood passing through the arteries and the correspondingly greater contraction of their coats. Consult Darwin, *Expression of Emotions in Man and Animals* (London, 1872).

BLÜTHGEN, blut'gen, VICTOR (1844—). A German author. He was born in Zörbig, near Halle; studied theology at the University of the latter city; assisted in the preparation of a theological dictionary, and was employed for a short time as a journalist. His best-known works are his *Gedichte* (1881); a number of books for the young, including his text to Flinzer's *Schelmenspiegel* (1876); *Froschmäusekrieg* (1878); *Ilesperiden* (1879), a volume of tales, which was translated into Danish; the novelettes *Bunte Novellen* (2 vols., 1880), *Der Friedensstörer* (1883), *Poiret-house* (1884), and *Die Stiefschwester* (1887); and the novels *Aus gärender Zeit* (2 vols., 1884), and *Frau Gräfin* (2 vols., 1892).

B'NAI B'RITH, b'ni b'rëth, INDEPENDENT ORDER OF. An organization of Israelites of German extraction, founded in America in 1843, and since extended through Germany and in the East. It somewhat resembles the Masonic organization, without its secrecy and ceremonial. Its object is the moral elevation of its members, who now number some 28,000 in more than 400 lodges.

BOA, bö'a (Lat. *boa*, *bova*, a large serpent; perhaps akin to *bos*, ox, owing to its size). Any of the large non-venomous snakes of tropical America of the family Boidæ. These are closely related to the pythons; and popularly the name is applied to any large snake that entwines its prey, crushes it, and swallows it whole—a 'boa-constrictor.' These great serpents feed upon living animals of all sorts, for which they lie in wait, often hanging for hours together from trees. The weight of the body is borne under such conditions partly by the prehensile tail and partly by two opposing hooks on each side of the vent. These hooks are held by muscles attached to several bones, all below the skin, which are the rudiments of the hind limbs of the higher vertebrates. The boa seizes its prey with a swift dart of the head and forward part of the body, and the numerous long backward-leaning teeth hold the struggling animal until the snake throws one or more folds about it and compresses it to death. It may also seize an animal by knotting a fold of its tail or some part of its body around it; and thus boas have been seen to capture, crush, and hold two or three victims at once. The swallowing is a slow and laborious process, aided by a copious flow of saliva, which serves both to lubricate and to digest the mass of food. Boas are able to swallow creatures considerably larger than their own heads, because the loose and elastic articulation of the jaws (see SNAKE) enables the mouth to be opened both

vertically and horizontally. While the process of digestion is going on, for which weeks may be necessary, the boa remains in a state of torpidity, and then is easily killed. The boas are afflicted with many and at times fatal intestinal worms, received from the bodies of their victims. Excepting such adversaries, the larger of these powerful serpents have almost nothing to fear.

The name *Boa-constrictor* properly belongs to one of the smaller of the boas, 12 feet long, which is most abundant in Guiana and Brazil. It is an exceedingly handsome serpent, brownish, with a series of complicated and connected blotchings. (See accompanying plate.) The emperor (*Boa imperator*) of Central America and Mexico resembles it, but has the markings separated by light lines along the sides. A third allied species is the lamaunda, to which a sort of worship was paid by the ancient Central Americans, named *Boa divinitoquaz*, of which the Mexican boa (var. *Mexicana*) is a northerly form. A fourth, and probably the best-known, species, is the ringed boa (*Epicrates cenchria*), which is found all over Brazil, but nowhere numerous, and northward to Costa Rica; it is about 5 feet long, and is marked with circular or 8-shaped spots, having a dark border. This is one of the species called aboma and jiboya—Brazilian terms which, like 'boiguacu' and some others that have found currency in books, are very indefinite. The genus *Epicrates* embraces the 'tree-boas,' most of which are slender snakes of moderate length, having distinct necks and somewhat triangular heads, which obtain their food in trees and bushes, or by hanging from branches and striking passing prey; they have the singular faculty of clinging firmly to the upper surface of a leafy branch without curling any part of the body around it, and no amount of wind-waving or other agitation will loosen the hold of their looped length short of complete overturning. The swiftness of their stroke is too great to follow with the eyes. Another genus is often represented in menageries by the dog-headed boa (*Xiphosoma caninum*) of the Amazon region. It often exceeds 5 feet in length and is green above and bright yellow beneath, ornamented with clustered white spots edged with purplish black. The sand-snakes (*Eryx*), the Californian lichenuræ, and various other generic forms also belong to the Boa family.

The greatest of all the boas is the water-boá (*Eunectes murinus*), best known as the anaconda. Although the home of this huge serpent is wholly within the valleys of the Amazon and Orinoco, the name was borrowed from the Portuguese name of a Ceylonese python, and fixed by Cuvier in 1817; its most widespread Brazilian name is 'sucuriuba,' or simply 'sucuria.' It is far more aquatic in its habits than any other big American snake, spending a large part of the time in the water, to which its structure is adapted, the nostrils being very small, placed vertically in the top of the heavily scaled nose, and closable by valves. Thus it can swim safely under water, and need only push the merest point of its head above the surface in order to take breath. Its eyes, also, are elevated, prominent, and so placed that it can see both ahead and downward (into the water), which most snakes cannot do. Although, like the others, it hangs from trees or lies coiled on the bank, waiting to seize anything manageable that may come in its way, it also sinks

its body in the water and waits at chosen places near the bank until some animal comes down to drink, when it seizes it by the nose with a grip from which beasts rarely escape before they are dragged down, enfolded, and drowned in its crushing embrace. One of the Brazilian names is 'deer-swallower,' and stories are told of its killing and eating cattle, horses, and jaguars; but these must be regarded as fanciful tales, inspired by the same imagination which says it reaches a length of 50 or 80 feet. The largest specimen actually measured is that (a stuffed skin) in the British Museum, which is 29 feet long; it is not probable that this is often much exceeded, while the average length is, no doubt, nearer 20 than 30 feet. A snake of the largest size could certainly kill, and might swallow, one of the small Brazilian deer, at any rate a hornless doe or fawn; but the more ordinary food consists of rodents, from the capybara down, peccaries, birds and their eggs, and fishes and reptiles, including their own kind. This serpent is rich green in color and marked with round blackish blotches, which often run together, as shown in the accompanying illustrations.

Not much is known as to the reproduction of boas, most of which seem to produce their young alive, while some are known to lay eggs. The rather contradictory experience on this point, derived from observation of captive specimens, is given in Miss Hopley's *Snakes*. All the boas are hardy and long-lived, and those mentioned above are to be seen in various zoölogical gardens, where they usually thrive well if protected from cold and intelligently treated, and often come to know their keepers and be very friendly with them. Certain species are constantly tamed and kept as pets among the villagers of Brazil and Central America; and occasionally completely tamed specimens have been known in other parts of the world, not only among performers in animal shows, but in private, of which the most famous recent example is the boa 'Cleo,' kept by Mr. and Mrs. Mann in London, and described by Frank Buckland in *Land and Water* and elsewhere about 1877. For special information, consult: Moles and Ulrich, "Serpents of Trinidad," in *Proc. Zool. Soc. of London*, 1894, page 499 et seq.; Hopley, *Snakes* (London, 1882); and Gosse, *A Naturalist's Sojourn in Jamaica* (London, 1851).

BOABDELIN, MAHOMET. A character in Dryden's *The Conquest of Granada*.

BOABDIL, bo'ab-del' (corrupted from Abu-Abdallah). The last Moorish King of Granada, surnamed *El Chico*, 'The Little.' He dethroned his father, Abu'l-Hassan, in 1481, and two years later was defeated by the Castilians near Lucena, and taken prisoner, but on agreeing to pay tribute was set free and returned to Granada to struggle for the throne against his father and his uncle, Abdallah-el-Zaghal. The power of the Moors was greatly shaken by this civil conflict, and the dispute was finally settled by Ferdinand of Aragon, who in 1492 captured Granada, in spite of the reckless courage of the Moors and of Boabdil. The story goes that Boabdil, having handed over to Ferdinand the keys of the city, was riding on toward the mountains, when he turned, at Padul, on a spur of the Alpujarras, to take a last look at the towers of Granada. "Allhu Akbar!" (God is great), he exclaimed,

BOAS, SHOWING SPECIFIC MARKINGS

1. COMMON BOA (*Boa constrictor*).
 2. DOG-HEADED BOA (*Xiphosoma caninum*).
 3. ABOMA OR RINGED BOA (*Epicrates cenchria*).

4. ANACONDA (*Eunectes murinus*).
 5. MEXICAN BOA (*Boa divinalloquax*, var. *Mexicana*).
 6. IMPERIAL BOA (*Boa imperator*).

bursting into tears. His mother standing beside him exclaimed, "You may well weep like a woman for what you could not defend like a man." The spot still bears the name of *El Último Sospir del Moro*, 'the last sigh of the Moor.' Boabdil soon crossed to Africa and lost his life in battle. See GRANADA.

BOAC, bô-âk'. A town of Mindoro, Philippines, situated about 48 miles from Calapan, the capital (Map: Philippine Islands, F 6). Population, 14,725.

BO'ADICEA (? A.D. 62). Queen of the Iceni, a tribe inhabiting the eastern coast of Britain. Prasutagus, her husband, who died about A.D. 60, left his wealth jointly to the Roman Emperor and to his two daughters, hoping that by this artifice his kingdom would be protected from oppression; but the Roman soldiery, taking advantage of the defenseless condition of the country, began to plunder unscrupulously. Boadicea herself was scourged, her daughters were violated, and the noblest among the Iceni were treated as slaves. These outrages drove them into a revolt, in which they were joined by the Trinobantes. Boadicea gathered round her a large army, attacked and captured the Roman colony of Camulodunum (Colchester); took Londinium and Verulamium, and destroyed, according to Tacitus, 70,000 Romans. Suetonius, the Roman Governor of Britain, now advanced at the head of about 10,000 legionaries against Boadicea, who, it is said, had under her command over 200,000 men. A dreadful battle ensued (A.D. 62), in which 80,000 Britons were said to have perished, and only 400 Romans. These figures, of course, cannot be trusted; but the victory must have been decisive, as it established the authority of the Romans in Britain. Boadicea, overwhelmed with despair, committed suicide. Consult: Tacitus, *Annales*, Book XIV. (London, 1872); Elton, *Origins of English History* (London, 1882); Rhys, *Celtic Britain* (London, 1882).

BOAR (AS. *bār*, OHG. *bār*, Ger. *Bär*, brood-boar; cf. Russ. *borovâ*, boar), WILD. The common and most typical species (*Sus scrofa*) of wild swine, which exceeds the largest domestic swine in size, and is far superior to them in strength and swiftness. It is grayish-black in color, covered with short, woolly hair, thickly interspersed with stiff, coarse bristles, which assume the form of a mane along the spine. The ears are always black. Its great tusks are formidable weapons, but when old the tusks curve over the snout and are no longer serviceable for goring; then, however, the teeth of the upper jaw protrude and curve outward, serving the same purpose as the tusks had done. The animal is native in Europe, Asia Minor, and North Africa, inhabiting the deep recesses of marshy forest grounds. Boars were common in England until the time of Henry II., and then not found until, in the reign of Charles I., an unsuccessful attempt was made to raise them in the New Forest. In the time of the Conqueror any one killing a wild boar was liable to have his eyes put out. Consult Harting, *British Animals Extinct Within Historic Times* (London, 1880).

It was for centuries a favorite beast of chase with the nobles of Europe, and was hunted chiefly on foot with the spear, aided by a breed of great dogs now nearly extinct (see HOUND), its

strength and ferocity rendering the sport alike exhilarating and dangerous. There is little of boar-hunting now, except upon certain great estates in eastern Europe, where the animals are bred for the purpose of sport. In India, however, the wild boars of that country are pursued and speared by mounted men, who regard 'pig-sticking' as the most exciting sport the Orient affords. The courage and tenacity of life exhibited by pursued and wounded animals are surprising. The animal seeks its food at night, and feeds chiefly on roots and grain, though it will eat smaller animals, birds' eggs, etc. The bristles of the boar are much used for brushes. Besides this one, several other species of boar have been described, of which three at least seem to be valid—*Sus vittatus* of Asia and Africa, *Sus venucosus* from Java and Celebes, and *Sus barbatus* from Borneo. No species of the genus *Sus* are natives of America or Australia. See PECCARY; SWINE.

BOARD (AS. *bord*, Ger. *Bord* and *Brett*). In nautical language, a term which has numerous significations. The terms *plank* and *board* were formerly used without much discrimination; hence the application of the word *board* to express in a figurative manner the deck or side of a vessel. From this use are derived the expressions *aboard*, *on board*, *boarding* (i.e. the act of going on board for a friendly or inimical purpose), *inboard* (inside the rail or bulwarks), *outboard*, etc. Before the days of keels, and for small boats until comparatively recent times, a broad board called a *leeboard* was secured to the side and projected into the water in a manner to prevent *leeway* (q.v.) when under sail. From this resulted the expressions *a good board*, which meant to lose nothing to leeward on a single stretch while tacking (q.v.), *a half board*, *stern board*, etc. The operation of *boarding* a vessel of the enemy meant the forcible entry for the purpose of capturing it; in the days of sailing vessels, slow steamers, and slow-firing guns it was an operation of importance, but it would not now be attempted except in unusual circumstances.

BOARD (from the *board*, or table, at which the officers sit). The general name applied to persons who in their collective capacity have the management of some public office or department, bank, railway, charity, or, indeed, of any other trust.

BOARDING-HOUSE (from *board* or table for food). The legal liability of a boarding-house keeper differs from that of an innkeeper (q.v.) in three important respects. The first difference is due to the fact that he does not hold himself out as engaged in a common public employment. Consequently, he is at liberty to reject any person who may apply for accommodations, whether his house is full or not. No person has a right to insist upon boarding with him until a special agreement has been made between them. In the second place, a boarding-house keeper is not subject to the extraordinary liability for his patrons' property which rests upon an innkeeper for the chattels of his guests. He is bound to exercise only such care of it as an ordinarily prudent man would take of his own property in similar circumstances. But that degree of care the boarding-house keeper is legally bound to exercise, at least over his board-

ers' goods which are fairly within his custody. In the third place, the keeper of a boarding-house has no lien on his boarders' property for bills owing by them, at common law, although by statute in some jurisdictions a lien has been accorded. It is held, generally, that a boarding-house keeper impliedly undertakes that his premises are reasonably fit for occupation. It is not necessary that he make that statement in express terms. His offer of the premises to boarders is a representation that they are fit for such use. See the authorities referred to under **INN-KEEPER**.

BOARDMAN, GEORGE DANA (1801-31). An American missionary. He was born in Livermore, Me., graduated at Waterville College (now Colby University) in 1822, and studied at Andover Theological Seminary. He was ordained as a Baptist minister in 1825, and in the same year sailed for Calcutta as a missionary. In 1827 he established a mission at Burma, and was especially zealous in his work among the Karen villages. His widow married the Rev. Adoniram Judson (q.v.). Consult A. King, *Memoir of George Dana Boardman* (Boston, 1856).

BOARDMAN, GEORGE DANA (1838—). An American Baptist clergyman. He was born at Tavoy, Burma, and was educated at Brown University (1852), and at the Newton Theological Institution. He was pastor of the First Church, Philadelphia, from 1864 to 1894. In June, 1899, he established at the University of Pennsylvania the permanent lectureship known as the 'Boardman Foundation in Christian Ethics.' He is ex-president of the Christian Arbitration and Peace Society, and of the American Baptist Missionary Union. His most important production is a monograph, *Titles of Wednesday Evening Lectures*. It embraces 981 of his lectures, delivered between 1865 and 1880, and comprises a complete exegesis of the Bible. His other writings include *The Epiphanies of the Risen Lord* (New York, 1879); *The Problem of Jesus*; *Disarmament of Nations* (1890); *The Coronation of Love*; *The Two Bibles*; *The Kingdom* (1899); *The Church* (1901); *The Golden Rule* (1901).

BOARD OF TRADE. See **TRADE, BOARD OF**.

BOARFISH. A southern European fish (*Capros aper*) of the family Caproidæ, having a much protracted hog-like snout. The body is oval, compressed, and carmine in color, with seven transverse orange bands on the back. The flesh is little esteemed. For illustration, see **PLATE OF HARVEST-FISH**.

BOARHOUND. See **HOUND**.

BOAR'S HEAD, THE. The haunt of Shakespeare's Falstaff and his crew. It was a tavern in Eastcheap, London. It fell in the great fire of 1666. It was rebuilt, but had to give way for an approach to London Bridge. The site is now occupied by a statue of William IV.

BOAS, bô'as, EDUARD (1815-53). A German author, born at Landsberg. He is remembered chiefly for his works on Goethe and Schiller, including *Nachträge zu Schillers sämtlichen Werken* (Stuttgart, 1838-40); *Nachträge zu Goethes sämtlichen Werken* (Leipzig, 1841); and *Schiller und Goethe im Xenienkampf* (1851). His *Schillers Jugendjahre* (1856) and *Schillers*

und Goethes Xenienmanuskript (1856) were published posthumously by W. von Maltzahn. His other works include *In Skandinavien. Nordlichter* (1844); the humorous novel *Des Kriegskommissars Pipitz Reise nach Italien* (1841); and the idyllic poem *Pepita* (1844). He published selections from his prose and poetical works in his *Schriften*, 5 vols. (1846-49).

BOAS, FRANZ (1858—). A German-American anthropologist. He was born at Minden, Westphalia, studied at Heidelberg, Bonn, and Kiel, and in 1883-84 made a scientific journey through the Baffin's Land region. He was assistant in the Royal Ethnographical Museum in Berlin from 1885 to 1886, and an instructor in geography at the University. From 1886 to 1888 he was an associate editor of *Science*; from 1888 to 1892 instructor in anthropology at Clark University, and in 1899 was appointed professor of anthropology at Columbia University. He is a member of the National Academy of Science, in 1900 was president of the American Folk-Lore Society, and in 1901 became curator of ethnology in the American Museum of Natural History. His publications include *Baffin's Land* (1885), and "The Central Eskimo," *Sixth Annual Report, United States Bureau of Ethnology* (1888).

BOAST (origin uncertain). A term used in sculpture to define the first contour of a roughly hewn block before the working out of ornament and details. Portions of buildings that were designed for ornamentation, if in obscure places, are often left in this rude state.

BOAT (AS. *bāt*, Ger. *Boot*; cf. Fr. *bateau*, boat, from Low Lat. *batellus*, dimin. of *battus*, *batus*, boat). A small vessel propelled by oars, sail, or steam. The name is also applied to large vessels built to navigate rivers and interior waters, and sometimes to large sea-going vessels; but in such cases it is ordinarily used as part of a compound word or expression, e.g. steamboat, ferryboat, canal-boat, packet-boat, etc. Boats are of numerous types and forms, representing the various developments of the raft and dugout principles, which may be said to meet in the framed open boat, as it embodies the hollow form of the dugout and the framing of the raft. The simplest form of boat is called a *punt* or *bateau*, and it is much used in shallow interior waters, where it is often propelled by pushing with a pole instead of using oars; it has a flat bottom and sides made of single boards. The *dory* is a variety of punt, but, being intended for use in rough water, it is deeper and more shapely. Dories are used in great numbers by fishing-vessels. Small, shallow, framed boats are called wherries or Whitehall boats. In the United States Navy boats are of three types—*cutter*, *whaleboat*, and *steamer*. The cutter type includes the dingies and launches, the former being smaller than the cutter, and the latter being larger; all are square-sterned. The whaleboat is sharp at both ends. Steamers resemble cutters in build, but are heavier and have rounded sterns; the smaller steamers are frequently called steam-cutters. *Gigs* and *barges* are commonly of cutter build, but are larger, narrower, and of less depth; some gigs are of whaleboat form. Dingies usually have four oars; cutters and whaleboats from six to fourteen; gigs five or six; barges twelve to fourteen; and launches twelve to sixteen. All are supplied with *masts*

and sails to be used when desired. In modern men-of-war boats are stowed on skid-frames amidships in order to keep them out of way of the guns; a certain number of davits are fitted, however, as a matter of convenience during ordinary service. The boats of merchant ships are of various types, and their number depends upon the size of the vessel and the character of the service; dories are much used in the United States coasting-vessels, but large boats are usually carried; deep-sea sailing ships usually have one large boat, called the *launch* or *longboat*, in addition to smaller ones.

Boats are usually built of wood; they are liable to receive many minor injuries, and the repair of an iron hull is a much more difficult matter than that of a wooden one; moreover, an iron boat is much more likely to punch a hole in her bottom or side in striking a sharp object than is a wooden one. There are three different methods of building wooden boats: The *carrack*, with fore-and-aft planks, the edges meeting, but not overlapping; the *clinker*, also with fore-and-aft planks, but with the edges overlapping each other like shingles; and the *diagonal*, the planking of which runs diagonally, the inside planks running in a contrary direction to the outside ones, and their edges meeting. On some steamers the number of passengers carried is so great that sufficient room cannot be found for boats of the ordinary type, and these vessels often carry a number of collapsible boats with wooden frames and covered with canvas. Boats are *single* or *double banked*, as they have one or two oars to a thwart. The seats for the crew of a boat are called the *thwarts*, the strip on which the thwarts rest is called the *rising*, the space abaft the after thwart the *stern sheets*, that forward of the foremost thwart the *fore-sheets*, the spaces for the oars the *rowlocks*, and where the coxswain of a man-of-war boat sits, the *coxswain's box*.

BOAT-DAVIT. When not resting inboard on chocks or skid-frames, boats are carried at the *davits*. These are secured to the ship's side, the end resting in sockets or saucers (if the davits revolve), with a collar around the davit higher up and near the ship's rail. Davits are sometimes straight, but are usually curved somewhat in the shape of an inverted letter J (thus *J*). The upper blocks of the *boat-falls* (see **BLOCK**; also **TACKLE**) are secured to the curved arms of the davits, and the lower blocks hook into rings in the boat. Boat-davits are usually made of round iron bars, but stronger and lighter davits are made of T-rail iron or of box-girders.

BOAT-HANDLING APPARATUS. The size and weight of many boats now carried by ships preclude their being hoisted by davits, and all boats carried inboard on men-of-war require special apparatus. In the United States Navy boats stowed on skid-beams are usually handled by a *boat-crane*, which is shaped like a boat-davit, but is many times larger. The power to operate it is either steam or electric. The boats, when about to be hoisted, have wire-rope contrivances called *slings* fitted to them, and the tackle of the boat-crane hooks in the ring of the slings. In the British Navy large boats and those on the skid-beams are handled with *boat-derrick*s, consisting of strong booms hinged at the heel in heavy sockets on the mast. *Life-*

boats are carried at davits of the usual pattern, but they have special apparatus for lowering them and for detaching them after they are lowered. There are many types of such devices in use; the general feature which is common to all is an arrangement whereby the boat is instantaneously released from the hoisting-gear, and it is customary to detach the boat two or three feet above the water and let it fall the rest of the distance. In a rough sea it is very difficult to unhook the ordinary falls, and a failure to do so promptly might cause the boat to swamp or be crushed against the ship's side.

BOATBILL. A South American night-heron (*Cancroma cochlearia*), differing from the true herons mainly in the form of the bill, which is comparatively short and very broad, as shown in the accompanying illustration. It is about the size of a domestic fowl, has shorter limbs than most of the herons, but resembles them in plumage, and is abundantly provided with elongated feathers on the back of the head and neck, which it erects when irritated. The skin beneath the lower jaw is bare and distensible in a large gular pouch. Its general color is rusty red, the forehead and breast whitish. It inhabits Guiana, Brazil, etc., sits perched upon trees which hang over streams, and darts down upon fish, which seem to be its principal food. Another species (*Cancroma zelandoni*) inhabits Central America. These form a sub-family, characterized by having four powder-down tracts. See **HERON**.

HEAD OF A BOATBILL.

BOAT-FLY. See **WATER-BOATMAN**.

BOATSWAIN (*boat* + *swain*, servant). An officer of the navy of warrant rank. On board ship he has, under the executive officer, charge of the rigging, anchors, cables, cordage, etc. He summons the crew at all general evolutions, and acts as assistant to the executive in carrying on the business of the ship; on old-type ships his station was on the fore-castle. A boatswain's *call* or *whistle*, which he uses in summoning the crew or to call attention as a preliminary to passing orders, etc., is his badge of office. In 1902 there were 73 boatswains on the active list of the United States Navy. When a boatswain has served ten years in that grade, he is advanced to the grade of *chief boatswain* and commissioned with the rank of ensign. It is the custom at present to fill vacancies in the boatswain's list by advancing competent petty officers who were formerly naval apprentices. The compensation when at sea is \$1200 for the first three years' service, and is increased \$200 for every additional three years until the maximum of \$1800 is reached. Chief boatswains receive the same pay as ensigns.

BOATSWAIN, or BOATSWAIN-BIRD. A sailor's name for two sorts of sea-wandering birds: (1) A skua-gull or jaeger, especially Richardson's (*Stercorarius parasiticus*); (2) a tropic bird (q.v.). The reference in each case seems to be to the long, pointed feathers in the tail, which

suggest a marlinspike, the boatswain's badge of office; in fact, skuas are also known locally in New England as 'marlinspikes.'

BO'AZ. See JACHIN.

BOBAC, bô'bâc (Pol. *bobak*, Russ. *babakû*). A gregarious marmot or woodchuck (*Arctomys bobac*) of Eastern Europe and Central Asia, which resembles the American prairie-dog in appearance and habits.

BOB'ADIL, CAPTAIN. A blustering, cowardly braggart, whose personality, lines, and fate form the most entertaining element in Ben Jonson's *Every Man in His Humour*. He lodges with Cob and Tib and is given to the use of 'dainty oaths.' His name has been thought to have been adopted from that of Bobadilla, Governor of Cuba, who sent Columbus back to Spain as a prisoner.

BOBADILLA, bô'bâ-dé'lyâ, FRANCISCO (? - 1502). A Spanish commander of the Order of Calatrava, appointed in 1499 to supersede Columbus as Viceroy of the Indies. He was fully empowered to conduct an investigation of the affairs of the Colony of Hispaniola, and set sail with two caravels from Cadiz in June, 1500. He was both insolent and inefficient, and he had no sooner landed in the island than he proceeded to high-handed and stupid demonstrations of authority. By his orders Columbus was seized, placed in chains, and sent back to Spain. The Admiral was, however, received with great consideration by the nation and Court. In 1502 Columbus set out on his fourth and final voyage, and arrived at Hispaniola on June 29. On the first of July, Bobadilla, who, after his utter mismanagement, had been recalled under arrest, left San Domingo in one of the vessels of a large fleet commanded by Torres, and was drowned in a hurricane.

BOBBIN (Fr. *bobine*, of uncertain origin). A small wooden or metal roller, flanged at one or both ends, on which thread or yarn is wound for sewing, weaving, etc. Bobbins for weaving are commonly made with a flange at one end only, but most other forms of bobbins are flanged at both ends. The ordinary 'spool' on which sewing-thread is wound is a familiar example of a wooden bobbin, and the metal implement for holding the thread in a sewing-machine shuttle is a good example of a metal bobbin. The manufacture of bobbins, which are used in enormous numbers, is usually carried on by means of automatic machinery. In the manufacture of bobbins or spools for sewing-thread the wooden blocks, cut to the proper length, are thrown into the hopper of the machine, whence they are taken automatically, turned, flanged, bored, and discharged complete and ready for use. See SEWING-MACHINE; WEAVING; THREAD.

BOBBIN-BOY, THE. A boy's book, founded on the life of Gen. Nathaniel P. Banks, who was popularly called by this name, because, when a youth, he had spent several years working in a cotton-factory.

BOB'INET' (*bobbin* + *net*). A machine imitation of pillow lace. (See LACE.) A fabric composed of hexagonal meshes, formed by a series of threads crossing and partially twisting around each other.

BOBBIO, bôb'bê-ô. An episcopal city in north Italy, near the confluence of the Bobbio and the Trebbia, 37 miles northeast of Genoa (Map:

Italy, D 3). In 612 Saint Columbanus founded an abbey here, whose famous library, consisting of 700 manuscripts, made known to the world by Niebuhr and others, is now partly in the Vatican, partly in the Ambrosian Library at Milan. Population, in 1881 (commune), 4500; in 1901, 4848.

BOBOLI (bô'bô-lê) **GARDENS.** Magnificent public gardens near the Pitti Palace, in Florence, planned in 1550, under the patronage of Eleanor of Toledo and the direction of the sculptor Tribolo.

BOBOLINK (earlier *boblinkoln*, *Bob o' Lincoln*, *bob-o-lincoln*; in imitation of the sounds produced by the bird). One of the most conspicuous and interesting song-birds of North America, found wherever plains, prairie meadows, or cultivated fields offer it a suitable home. It is a member of the Icteridæ, but stands apart from the orioles and blackbirds by reason of its pointed tail-feathers and long middle toe, as *Dolichonyx oryzivorus*. The length is about 7 inches, of which 2¾ inches go to the tail; the spring or breeding plumage of the adult male is black, with the hind head and nape, scapulars, rump, and upper tail-coverts buff, inclining to ochraceous on the neck and ashy toward the tail; in this plumage a popular local name is skunk-blackbird. The female is protectively denied this gay suit, and is clothed in neutral yellowish brown, much streaked; and the young of both sexes wear a similar dress until the males mature. (See Plate of BLACKBIRDS.) Over the region of the dry Western plains and mountains, as far as the Salt Lake Valley, a paler form prevails, distinguished as variety *albinucha*. Such is the early summer gayety of plumage, when the males are rollicking above the fields where they are breeding in the Northern States and southern Canada, few stopping for that purpose south of latitude 40°. For their nests they choose open grassy spaces or fields of cultivated grass and grain; and as the spreading cultivation of the country has multiplied these conditions they have dispersed much more widely, especially in the East, than they originally extended, and for a long time vastly increased in numbers. Arriving from the South in May, a pair take possession of a field. The female constructs on the ground a nest of grasses skillfully entwined and often ingeniously hidden among the stems of the growing plants, in which are laid four or five eggs (see Plate of EGGS OF SONG-BIRDS), dull white, flecked and marbled with Vandyke brown, upon which she sits very closely for about a fortnight.

HEAD AND FOOT OF BOBOLINK.
Male in summer plumage.

During this nuptial season—from their first arrival until mid-July—the male is driving from the vicinity every intruder he can frighten away, especially rivals of his own kind, and making himself delightfully conspicuous by his gay activity upon the wing, and his loud, sprightly, and unceasing song, which has a peculiar ringing or *chinking* quality adapted to a rattling melody,

seemingly uttered in an ecstasy too vivid to permit of any tune or modulation. It is to this the bird owes its name, which the poets have turned to Bob-o'-Lincoln, and played upon in many verses. As summer advances the black of the plumage of the male, which in reality is formed only by the tips of feathers, begins to wear off (see **MOLTING**), leaving the males in a rusty garb, which later becomes scarcely distinguishable from that of the females and young. Their brilliant song dwindles to the call-note, *Chink!* and in August the males gather upon marshy meadows in vast flocks, where they are gradually joined and followed by their families, and the southward migration begins. By the end of September all the bobolinks have left the northerly parts of the country, and are gathered upon southerly seacoasts or inland marshes. At this time they are fat, and along Chesapeake Bay and the Southern 'sounds' are shot in immense numbers under the name *reed-birds* as an autumn delicacy. Such as escape move on southward, where enormous flocks fall upon the ripening rice-fields of Carolina and the Gulf coast, where they are called *rice-birds*. Here they do very serious damage by eating the rice-grains, and more by shaking down a vast quantity, and armies of boys are set to shoot or drive them off—a process in which a great number of other quite innocent birds are also destroyed. So systematic and severe has been this persecution of late years that the species has been seriously diminished, and bobolinks are becoming rare in many parts of the northeastern United States and Ontario, to the sorrow of the people, who everywhere rejoice in the presence of this merry-andrew of the meadows.

BOBRINETZ, bô-bré'něta. A thriving town in the Government of Kherson, South Russia, 120 miles north of the city of Kherson, on the high, rocky banks of a small river (Map: Russia, D 5). Flour-milling and retail trading are its principal industries. In the neighborhood of Bobrinets are interesting mounds. Population, in 1890, 10,050; in 1897, 14,350.

BOBRUISK, bô-brô'ěsk. A fortress of the first class and the capital of a district in the Government of Minsk, Russia, 108 miles southeast of the city of Minsk (Map: Russia, C 4). It is situated on the high right bank of the Beresina, at the mouth of its tributary, the Bobruisk, and is a station for the steam-packets navigating the Dnieper and Beresina. Its manufactures are less important than its commerce, which consists principally in exports of grain and timber. During the reign of Alexander I. it was fortified, and in 1812 it was ineffectually besieged by the French. Czar Nicholas I. converted it into a fortress of the first class. In 1902 it was almost totally destroyed by a conflagration. Population, in 1867, 24,700; in 1897, 25,100.

BOBZYNSKI, bôb-zhîn'skê, MICHAEL (1849—). A Polish historian, born at Cracow, in Galicia. In 1877 he was made professor of law in the University of Cracow. From 1885 to 1891 he was a member of the Reichsrat. His most important publications are his *Geschichte Polens* (1879), which aroused much criticism on account of its bitter attacks on Poland's past, and his contributions to Lenel's *Polnische Rechtsdenkmäler* (1874-82).

BOBS. A nickname given by his soldiers and by the English people to General Lord Roberts.

BOBSTAY. See **SHIP**.

BOB-WHITE. An American quail. See **QUAIL**.

BO'CA (Sp. *boca*, mouth, from Lat. *bucca*, cheek). A term applied to the entrance of various straits and rivers, chiefly in South and Central America. (1) *Boca Chica*, the channel 28 miles in length which leads to Cartagena, in Colombia. (2) *Boca de Navios*, the largest and most southerly outlet of the Orinoco. (3) *Boca Grande*, a bay of the Caribbean Sea, at the mouth of the Zucar, in Costa Rica. (4) *Boca del Toro*, in the Caribbean Sea, in Costa Rica, in latitude 9° 20' N. and longitude 82° W. (5) *Boca Grande* and *Boca Chica* are the two channels connecting Darien Harbor with San Miguel Bay, Panama. The bays of Almirante and Chiriqui, in Panama, are connected with the Atlantic by the bocas del Drago, del Toro, and del Tigre.

BOCAGE, bô'kâzh', HENRI (1835—). A French dramatist, younger brother of Paul Bocage, who wrote comedies as well as fiction. Henri Bocage, though by profession an engineer, is the author, alone or with collaboration, of several pieces which were successful on the Paris stage. Among them may be mentioned the comedies *L'architecte de ces dames* (1869); *La canne de Damoclès* (1871); *Une fille d'Eve* (1875); *Les trois bougies* (1880); *En partie fine* (1884); and *La vie à deux* (1890); and the comic operas *La girouette* (1880), with music by Coedès, and *Les poupées de l'infante* (1881), with music by Grisar.

BOCAGE. PIERRE MARTINIEU JOUSEZ (1797-1863). A well-known French actor of the romantic period. He was born in Rouen, and had a hard struggle with poverty and obscurity before, in 1826, he secured an engagement at the Odéon. There he had some success, but later at the Gaité and Porte Saint Martin theatres he found a more congenial opportunity in plays of a more melodramatic character, such as *Alice, ou les fossoyeurs écossais* and *Neugate, ou les voleurs de Londres*. In *Antony* and *the Tour de Nesle* he added so much to his reputation that he was engaged at the Théâtre Français. Among his greatest successes were those in *Angèle* and other pieces by Alexandre Dumas. From 1845 to 1848 he was director of the Odéon, and later (1860), for a time, of the Théâtre Saint Marcel. His final achievement was in the production, at the Ambigu, of *Les beaux messieurs de Bois-Doré* (1862).

BO'CA TI'GRIS (Portug. translation of Chinese *Hu-Mun*, the tiger's mouth or gate), or **THE BOGUE**. A passage in the Canton River, China, between the island of Tycoektow on the west and the islands of An-ung-hoi and Chuen-pi on the east. It is about 2½ miles wide, and below it the Canton River expands into a broad estuary. The Boca Tigris contains a number of small islands, with remnants of old forts, which were repeatedly taken by the British. At present the entrance is guarded by modern fortifications.

BOCAUE, bô-kou'â. A town of Luzon, Philippines, in the Province of Bulacan. It is situated about 4½ miles northeast of Bulacan, a short distance from the railway line (Map: Luzon, E 7). Population, 10,400.

BOCCACCINO, bók'-a-ché'nò, **BOCCACCIO** (1460-c.1518). An Italian painter. He was born in Cremona, and was either a pupil or co-disciple of Domenico Panetti. Few facts of his life are known. Influenced by Mantegna, he painted a series of frescoes in Sant' Agostino, Cremona (1497), and afterwards kept a school in his native city, where Benvenuto Garofalo was one of his pupils. His most celebrated work is the frieze in the Cathedral of Cremona, representing the "Birth of the Virgin" and some subjects from her life. His remaining works, which include the "Marriage of Saint Catharine" (Venice Academy), the "Virgin and Child with Four Saints" (Venice, San Giuliano), the "Virgin and Two Saints" (Cremona, San Quirilo), and the "Holy Family" (Paris, Louvre), are considered by Lanzi remarkable for richness of drapery, variety of color, spirit and grace of attitude, and harmony of landscape. Several works formerly attributed to Perugino, Pinturicchio, and Vanucci are now ascribed to Boccaccio.

BOCCACCIO, bók-ká'-chò, **GIOVANNI** (1313-75). The third great figure in Italian literature, who, lacking the inspiration of Dante and the perfect form of Petrarch, is remembered in the history of culture as the creator of a classic Italian prose, and, through the *Decameron*, as the father of the modern novel. In spite of recent critical studies, many details of his life are still obscure. It seems, however, generally conceded that he was the natural son of a Florentine merchant, Boccaccio di Chellino, and that he was born about 1313, in Paris, where his father was temporarily residing. Of his French mother little is known beyond the bare name, Giannina, which still survives in that of her son. His early boyhood was passed in Florence, but at fifteen he was already living in Naples, placed there, some say, with a mercantile firm by his father, who meant to make a merchant of him, like himself. But the gay life and natural beauty of the city only strengthened the lad's distaste for commerce, which he finally abandoned for the study of canon law at the Neapolitan University; but this proved scarcely more congenial. Meanwhile he was unconsciously laying the foundations of that knowledge of life and human nature which was to inspire his future work. Naples, under King Robert, had already become a centre of culture and learning, and Boccaccio, who seems to have had abundant pecuniary means at this time, soon formed valuable friendships with Niccolò Acciajuoli, who was later Grand Seneschal of the kingdom; with Paolo Perugino, the King's librarian, who taught him astronomy, and with many others. Many women also influenced his life in these early, impressionable years. Galla, Pampinea, Abrocomia, are some of the names which found a lasting record in his writings. But his one serious passion was that inspired by Maria, daughter of King Robert and wife of a gentleman of the Court circle, but celebrated by Boccaccio under the name of 'Fiammetta.' Unlike the loves of Dante and Petrarch, this passion was not destined to be an abiding influence in Boccaccio's life. Fiammetta quickly proved to be of a far less obdurate nature than Beatrice or Laura, and seems as quickly to have wearied of him and to have transferred her favors elsewhere. Yet she certainly influenced his literary career. His earliest work, the *Filocolo*, was written for

her amusement; *Ameto* and *Fiammetta* both celebrate her charms; while some critics find much significance in the fact that the close of his activity as an imaginative writer coincides with the supposed date of her death. In 1340 he was recalled to Florence by his father, after which the scanty records give fugitive glimpses of him, first in one place and then another. In 1346 he is in Ravenna; in 1348 in Forlì; then possibly back again in Naples; but at all events not in Florence during the terrible year of the plague, of which he has painted such a grim picture from hearsay. The loss of his father the following year devolved upon him the care of a younger brother, and the death of Fiammetta, which conjecturally soon followed, effectually closed the period of youthful indiscretion.

A strong influence for good, which at this time came into his life, was the friendship of Petrarch, whom it fell to his lot to entertain when the poet visited Florence in 1350; and the first of a series of public missions intrusted to Boccaccio by the city had for its object to petition Petrarch to make Florence his home. During this period he was deeply interested in humanistic studies. He busied himself with making copies of manuscripts of Terence and Apuleius, and resumed the study of Greek under Leonzio Pilato, for whom he secured a professorship at the University of Florence. At this time the revenues of the small estate left by Boccaccio's father failed to meet his necessities, and he went once more to Naples, drawn thither by the roseate promises of Niccolò Acciajuoli, now Grand Seneschal; but the promises were not fulfilled, and, giving ear to the exhortations of a dying priest, he returned to Florence, fully intent upon taking religious orders and retiring from the world, but was effectually dissuaded by Petrarch. In 1373 he received the last and most fitting honor that Florence was destined to confer upon him in the form of a charge to expound the *Commedia* in a series of public readings, for which he was to receive the yearly sum of 100 golden florins. It was practically the establishment of the first chair at any university for the study of Dante, and could not have been bestowed more worthily. The course was begun in October, but was soon interrupted, owing to failing health. Boccaccio retired to his small estate at Certaldo, where he died December 21, 1375.

Aside from the *Decameron*, Boccaccio's writings include: (1) The *Filocolo* (1338), his first and longest work of fiction, which may perhaps have fulfilled its purpose of amusing the Princess Maria, but which modern taste finds sadly tedious. Yet its curious and naïve conglomeration of pagan and chivalric legends, of classic mythology and medieval Christianity, is at least amusing. It is also interesting as forming the transition from the metrical romance to the prose novel. (2) The *Filostrato* (about 1338) and (3) the *Teseide* (about 1341), two poems in the octave stanza, interesting to English readers as having formed the basis of Chaucer's *Knight's Tale* and *Troilus*. (4) *Ameto* (1341-42), the earliest modern example of the pastoral romance, in which a number of shepherdesses, Fiammetta among them, successively relate their adventures. (5) *Fiammetta* (about 1343), which is partially autobiographic, and really contains the first germ of the modern psychological novel. Boccaccio, however, has reversed

their relative positions, representing Fiammetta as the one who is abandoned, so that the story becomes simply a personal record of her grief and sufferings. (6) *Ninfale Fiesolano*; (7) *Amorosa Visione*; and (8) *Corbaccio*—three minor works of uncertain date. (9) *Vita di Dante* (1364); and (10) numerous Latin poems and prose writings. The work, however, upon which his fame rests is the *Decameron*, a collection of 100 stories, supposed to have been told during ten successive days by a party of ten people who, to escape the plague, have retired to a charming retreat a short distance outside of Florence. The stories themselves are few of them original with Boccaccio. They are drawn from the French *fabliaux*, from classical or Oriental sources, from current folk-lore, and are pruned and polished and worked over in order to suit the spirit of the time and place and the supposed characters of the narrators. He went for his material and his inspiration mainly to the simple and homely humor of the people; he turned it, with an alchemist's touch, into literary gems, which in his own time won the plaudits of the most fastidious. The licentiousness of these stories has been, from his time to the present, a standing reproach against Boccaccio; yet allowance must be made for his age and his environment. He gave only what he found, and the chief interest which the *Decameron* possesses to-day is due to the fidelity with which it mirrors for us the life of his time and country, while in the delicate art of the short story—of clear, vivid, swift narration—he set a standard which has seldom been attained by those who have come since.

The *Decameron* has been translated into almost all modern languages, and has proved a useful mine for many a later author—Shakespeare, Molière, and La Fontaine among them. Of Italian editions, the earliest of all, the so-called "Deo gratias" edition, is without date; the second is dated Venice, 1471. Both are folios and both very rare. For biographies of Boccaccio, consult: Baldelli, *Vita di Giovanni Boccaccio* (Florence, 1806); Landau, *Boccaccio, sein Leben und seine Werke* (Stuttgart, 1877); translated by Antona-Traversi, much amplified (Naples, 1881); and Cochin, *Boccaccio, études italiennes* (Paris, 1890).

BOCCAGE, MANOEL MARIA BARBOSA DU (1765-1805). A popular Portuguese poet, born at Setubal. His admission to the army at the age of 14; his five years' service in the East Indies, with the rank of lieutenant; his return to Lisbon in 1790, where he soon became the most distinguished member of the circle of young poets known as the *Nova Arcadia*; his eager advocacy of the cause of the French Revolution, his arrest in 1797 and imprisonment for the revolutionary and atheistic tone of certain poems, notably his "Verdades Duras," and his death in 1805, complete the chronicle of his short and troubled life. The quality of Boccage's poems is extremely uneven. He had an unusual gift for improvisation, and wasted himself to a large extent upon verse of that sort, often upon the most frivolous subjects. Yet among his poems there are some of high order—sonnets that are little masterpieces of polished verse and amply justify the admiration of his contemporaries; while the popular and national spirit that animates them is the new note which

he introduced into Portuguese literature, and which later found further expression in the younger national school led by Almeida-Garrett and Castilho. An excellent biography of Boccage, by Braga, forms the introduction to the latest edition of his poems (Oporto, 1876).

BOCCAGE, MARIE ANNE FIQUET DU (LEPAGE) (1710-1802). A French poetess, remarkable chiefly for the praises she inspired as "Venus in form, Minerva in art." She was a member of the academies of Rome, Bologna, Padua, Lyons, and Rouen. She imitated Milton in *An Earthly Paradise* (*Paradis terrestre*) (1748), and wrote also miscellaneous *Poems* (1746), and *La Columbiade* (1756). Her letters to her sister while traveling in England, Holland, and Italy have still an interest quite absent from her verses.

BOCCALINI, bók'ka-lé'né, TRAJANO (1556-1613). An Italian satirist, born at Loreto. Under favor of Gregory XIII. he held several offices, the most important being that of Governor of Benevento. His principal work is his *Ragguagli di Parnaso* ("News from Parnassus"), in which he professes to give information regarding events in the Kingdom of Apollo. The work, which is full of cutting satire, enjoyed great popularity in its day, and was extensively translated. It probably exerted considerable influence upon Swift and Addison. Other works by Boccacini are the *Pietre del Paragone Politico*, and his *Commentaries Upon Tacitus*, which earned him, from Bentivoglio, the title of 'grande anatomista di Tacito.'

BOCCHÉ DI CATTABO, bók'ka dé kát'ta-rò. See CATTABO, BOCCHÉ DI.

BOCCHERINI, bók'ka-ré'né, LUIGI (1743-1805). An Italian composer and violoncello virtuoso. He was born in Lucca, February 19, 1743. He was the son of a contrabassist, who instructed him on the violoncello. Afterwards he studied in Rome, and traveled through Italy and Germany, playing in concerts with success. He went to Pa (1768) and to Madrid (1769), and became composer and violoncellist in the Chapel of the Infante Don Luiz, which post he held until 1785. Owing to impaired health, he fell into poverty, and was aided by friends. Boccherini occupies a place in Italian music somewhat similar to that of Haydn and Mozart in German. His style is antiquated, but the simple melodies are still fresh in their naïveté and grace. His adagios and minuets are noted for their quaint beauty. Boccherini's quintets are famous. They are written for two violins, viola, and two violoncellos—an arrangement that has seldom been imitated; and they are noted for the difficulties of the first violoncello part, evidently written to display his ability as a virtuoso. He died in Madrid, May 28, 1805.

BÖCCHUS, bók'kūs (Gk. Βόχχος, *Bokchos*). King of Mauretania and father-in-law of Jugurtha. With Jugurtha he made war against the Romans, but afterwards (B.C. 106) delivered him up to Sulla, the quæstor of Marius (Sallust, *Jug.* 80-120; Plutarch, *Mar.* 8-32).—BÖCCHUS (?—33 B.C.). A son of the preceding. In the early part of his career he reigned over Mauretania with his brother, Bogudes, and after assisting Cæsar in his war against the Pompeians in Africa was rewarded with a part of the king-

dom of Massinissa. After the murder of Cæsar Bocchus sided with Octavianus and Bogudes with Antony; and during his brother's absence in Spain Bocchus usurped the sole government of Mauretania, in which he was confirmed by Octavianus. After his death his kingdom became a Roman province.

BOCHART, bô'shâr', SAMUEL (1599-1667). A noted French Orientalist and Protestant divine. He was born in Rouen; studied in Paris, Sedan, Saumur, Oxford, and Leyden, and then became pastor of the Protestant church in Caen, where he remained for forty-two years. In 1629 he gained great reputation by his victory, in a public discussion of several days' duration, over the famous Jesuit Père Veron. In 1646 appeared his *Geographia Sacra*, and in 1663 his *Hierozoicon*, or Scripture zoölogy, to which he devoted many years of his life. In 1652 he was invited to Stockholm by Queen Christina, and went thither, accompanied by his friend Huet. Court life, however, did not suit him, and his visit was short.

BOCHNIA, bôk'nî-â. A town of Galicia, Austria-Hungary, situated about 24 miles by rail from Cracow (Map: Austria, G 2). It has in its vicinity extensive salt and gypsum mines, and is the seat of thriving industries and trade. Population, in 1890, 8849; in 1900, 10,049, including 2200 Jews.

BOCHOLT, bô'kôlt. A town in the Prussian Province of Westphalia, on the Aa, 35 miles west by south of Münster (Map: Prussia, B 3). It is known for its spinning and weaving of cotton, and manufactures hearths, leather, iron, and trimmed lumber. Population, in 1890, 13,000; in 1900, 21,200.

BOCHUM, bô'kûm. A town in the Prussian Province of Westphalia, about 9 miles east of Essen (Map: Prussia, B 3). It is a centre of the iron, steel, and coal industry of Westphalia, which gives employment to thousands of men. Bochum possesses five or six churches, a gymnasium and several other schools, and a theatre. The town owns its water-supply, a modern sewage system, and a slaughter-house. The city is governed by a municipal council of 24 members, electing an executive board of 7. (See GERMANY, paragraph on Local Government.) Population, in 1890, 47,601; in 1900, 65,600.

BOCK, KARL ERNEST (1809-74). A German anatomist and medical writer. He was born in Leipzig, studied at the University of Leipzig, and was appointed professor there in 1839. He wrote, in popular style, a number of successful and frequently translated works—such as *Handbuch der Anatomie des Menschen* (1838); *Lehrbuch der pathologischen Anatomie und Diagnostik* (1848), and *Bau, Leben und Pflege des menschlichen Körpers* (1900).

BOCK BEER. See BEER; and BREWING.

BÖCKING, bô'king, EDUARD (1802-70). A German jurist of note. He was born in Trarbach, studied in Heidelberg, Bonn, Berlin, and Göttingen, and in 1829 was appointed professor of law in Bonn. He was deeply learned in historical jurisprudence, and prepared a number of valuable critical editions of legal classics. These include *Corpus Legum sive Brachylogus* (1829), (with Kleuze) the *Institutiones* of Gaius and Justinian (1829), and *Notitia Dignitatum Utri-*

usque Imperii (1839-50). His other works include *Römisches Privatrecht. Institutionen des römischen Civilrechts* (1862), and editions of the works of Ulrich von Hutten and A. W. von Schlegel.

BÖCKLIN, bôk'lin, ARNOLD (1827-1901). A Swiss landscape painter. He was born in Basel, and studied in Düsseldorf (under Schirmer), in Brussels, Paris, and Rome. He returned to Germany in 1856, and lived in Hanover, and then in Munich, where Count Schack, afterwards his chief patron, was first attracted by his talent. In 1860 he was appointed professor at the newly founded art school in Weimar, but resigned in 1862 to revisit Italy, whence in 1866 he returned to his native Basel. In 1871-74 he was again in Munich, then made Florence his home until 1885, and returned there in 1892, having in the meanwhile resided in Zürich. Although an artist of the highest rank, he was understood by only a few, was often ridiculed even by his fellow artists, and never became popular. Endowed with wonderful creative power and a grandly picturesque imagination, he painted only what poetically interested and inspired him; caring little for the public, and while fantastic and sensational in the choice of his subjects, was always original in his design and fascinating in his manner of painting. Notable for his glorious color-tones and poetic apprehension, he was an exceptionally fine delineator of southern nature, but in his figures only too often seemed to be impelled by the wish to represent the eternal contrast between beauty and ugliness. Hence the most perfect and enjoyable of his creations are those in which the landscape portion preponderates and his landscapes pure and simple. Some of his most noteworthy pictures are: "Castle by the Sea Surprised by Corsairs," "Chase of Diana," both in Basel Museum; "Venus Reposing," "Pan in the Rushes" (Munich Gallery); "Villa by the Sea," "Centaur Struggle," "Panic Terror," "Anacreontic Shepherd Boy," "The Isle of the Blessed" (Berlin Museum). Most of his finest paintings are in private collections in Germany and Switzerland, the largest number of them in the Schack Gallery in Munich, among which is the "Sea Idyl," one of his most original compositions, and a great masterpiece from the coloristic point of view. Consult: Lehrs, *Arnold Böcklin, ein Leitfaden zum Verständnis seiner Kunst* (Munich, 1897); Heinrich Brockhaus, *Arnold Böcklin* (Leipzig, 1901).

BOCLAND (AS. *bōcland*, bookland, charterland, from *bōc*, book, charter), or BOOKLAND. In Anglo-Saxon law, land held in free tenure by grant (i.e. deed or charter) from the Crown. It is contrasted with *folcland* (q.v.), or land held, without written title, by customary law. The term does not describe a particular form of tenure, feudal or non-feudal, nor was bocland necessarily allodial in the sense of being held absolutely and independently of any superior. It seems that the distinguishing characteristic of such a title was that it derived all its qualities and incidents from the deed or charter creating it. Folcland, being governed by the customary or common law, must have presented uniform qualities, as of heritability, alienability, etc. But every tenure of bocland might be different from every other. It might be inheritable or not,

or inheritable only by a certain class of heirs. It might be alienable or not, or alienable only to a limited class of persons. It might be allodial, in the later meaning of that term, as free from the claims of any superior lord, or it might be held by a feudal tenure of the most restricted and burdensome sort. See *ANGLO-SAXON LAW*. Consult: Digby, *Introduction to the History of the Law of Real Property* (4th ed., Oxford, 1892); Pollock and Maitland, *History of English Law* (2d ed., Boston, 1899); Lee, *Historical Jurisprudence* (New York, 1900).

BOCQUILLON-WILHELM, bô'kê'yôn' vé-lân', GUILLAUME LOUIS (1781-1842). A French musician. He was born in Paris, studied at the Paris Conservatory, was instructor in music at the College of Saint Cyr, and from 1810 professor of vocal music at the Lycée Napoléon (afterwards the College of Henry IV.). In 1835 he was appointed superintendent of vocal music in the public schools; in 1838 in the universities. The classes he thus organized, combined with the workmen's evening classes later established, formed the basis of the Orphéon, whence was developed the French system of choral societies. He set to music Béranger's songs, and published a *Manuel Musical* (1846).

BOCSKAY, böch'kô-ê, STEPHEN (1556-1606). A Hungarian national leader. He was brought up at the Court of the Báthoris, and in 1604 headed the Hungarians in their revolt against Rudolph II. of Austria, who was aiming at the overthrow of Protestantism. After defeating the Imperial troops in several battles, he was proclaimed Prince of Transylvania (1605), was recognized as such by Sultan Ahmed I., and was also invested with the supreme power by the estates of Upper Hungary. In 1606 he concluded the peace of Vienna with Rudolph II., and thereby secured religious freedom to the Protestants of Hungary. Bocskay died soon after becoming Prince of Transylvania. Consult Szilágyi, *Monumenta Comititalia Regni Transylvaniæ* (Budapest, 1879).

BODE, bô'de, JOHANN ELEET (1747-1826). A German astronomer. When a boy he made astronomical observations from the garret of his father's house, with a telescope constructed by himself, and at the age of 18 calculated an eclipse of the sun. The next year he wrote on the solar eclipse of August 5, and an elementary treatise on astronomy which was especially successful. In 1776 he commenced the *Astronomisches Jahrbuch*, which is still continued. But his fame rests chiefly on the *Uranographia*, published in 1801, in which he included 17,240 stars, or 12,000 more than can be found in any previous charts. Bode reproduced the statement of the relations of the planetary distances, previously made known by Titus of Wittenberg, but afterwards called 'Bode's Law' (q.v.).

BODE, JOHANN JOACHIM CHRISTOPH (1830-93). A German musician and translator, born in Brunswick. He was at various times an oboist, instructor in music and languages, composer, editor, printer, and translator. His translations, including Burney's *Present State of Music in Germany*, *Tristram Shandy* (1774); the *Vicar of Wakefield* (1776), and the *Essais* of Montaigne (1793-97), had decided influence on German literature. Consult Böttiger, *Bodes literarisches Leben* (Berlin, 1796).

BODE, WILHELM (1845—). A German art critic. He was born in the Duchy of Brunswick, and began his career as a lawyer. In 1869, however, he began the study of art and archæology in Berlin, and was made director of the Department of Christian Plastic Art at the Museum of Berlin in 1880, and finally director of the Picture Gallery (1890). His works, which deal chiefly with the Dutch masters and with Italian and German plastic art since the Middle Ages, are distinguished by their originality and judicious criticism. They include: *Studien zur Geschichte der holländischen Malerei* (1883); *Geschichte der deutschen Plastik* (Vol. II. of the *Geschichte der deutschen Kunst*, 1885); *Italienische Bildhauer der Renaissance* (1887); *Die Gemäldegalerie der Königlichen Museen zu Berlin*, with J. Meyer and H. von Tschudi (1888); *Rudolf Henneberg* (1895); *Rembrandt, Beschreibendes Verzeichnis seiner Gemälde, Geschichte seines Lebens und seiner Kunst*, with Hofstede de Groot (1897-1900); and *Kunst und Kunstgewerbe am Ende des 19. Jahrhunderts* (1901). He also edited the *Denkmäler der Renaissance-sculptur Toscanas*, published by Bruckmann (Munich, 1892, et seq.).

BODEN-SEE, bô'den-zâ'. See CONSTANCE, LAKE OF.

BODENSTEDT, FRIEDRICH MARTIN VON (1819-92). A German poet and journalist. He was born in Peine, April 22, 1819, and educated for commerce; but forced his way to the university, studying in Göttingen, Munich, and Berlin, after which he lived three years as tutor in Moscow, making excellent translations of poems by Pushkin, Kazloff, and Lermontoff (1843). In 1843 he became instructor in the gymnasium in Tiflis, and in 1845 published a translation of Russian folk-songs under the title of *Poetische Ukraine*. In Tiflis he prosecuted Oriental studies under a Tartar teacher (Mirza Schaffy), and began the translations and echoes of Persian thought which, under the name 'Mirza Schaffy,' suggest FitzGerald's *Omar Khayyam*. Later he traveled widely in the Caucasus and the East, and as a result wrote *Die Völker des Caucasus und ihre Freiheitskämpfe gegen die Russen* (1848) and *Tausend und ein Tag im Orient* (1850). Poems from this book, with others, were collected as *Lieder des Mirza Schaffy* (1856). Their warm imagery, their sensuous joyousness, and their melodious charm claimed general applause. The book has passed through a hundred and fifty editions, and has been translated into nearly all European languages. A continuation, *Aus dem Nachlass des Mirza Schaffy* (1874), was more serious and less successful. Bodenstedt was for a time a very efficient director of the noted theatre in Meiningen. In 1881 he lectured in the United States. *Vom Atlantischen zum Stillen Ocean* (1882) is an account of this journey. His part in the translation of Shakespeare's works, undertaken by the German Shakespeare Society, is also noteworthy, as are his autobiographical *Erinnerungen aus meinem Leben*. He wrote many tales and some dramas, but his talent showed to greatest advantage in his translations and adaptations. He made himself a permanent place in German literature as the poet of Mirza Schaffy. Consult Stern, *Studien zur Litteratur der Gegenwart* (Dresden, 1895).

BODENSTEIN, bô'den-stîn. See CARLSTADT.

BODE'S (bô'dez) **LAW**. An arithmetical relation which is supposed to establish a connection between the distances of the planets from the sun. It may be thus stated: Write, in the first instance, a row of fours, and under these place a geometrical series beginning with 3, and increasing by the ratio 2, putting the 3 under the second 4; and by addition we have the series 4, 7, 10, etc., which gives nearly the relative distances of the planets from the sun.

4	4	4	4	4	4	4	4	4	4
	3	6	12	24	48	96	192	384	
4	7	10	16	28	52	100	196	388	

Thus, if 10 be taken as the distance of the earth from the sun, 4 will give that of Mercury, 7 that of Venus, and so forth. The actual relative distances are as follows, making 10 the distance of the earth:

Mercury	Venus	Earth	Mars	Asteroids
3.9	7.2	10	16.2	26.5
Jupiter	Saturn	Uranus	Neptune	
52.0	95.4	191.8	300.5	

Close as is the correspondence between the law and the actual distances, except in case of Neptune, no physical reason has been given to account for it, and there is little probability that such exists. Bode's law, therefore, in the present state of science, is purely empirical. Kepler was the first to perceive the law, and Bode argued from it that a planet might be found between Mars and Jupiter, to fill up the gap that existed at the time in the series. The discovery of the asteroids has proved the correctness of this prediction. Similar relations, though expressed in different numbers, are found to subsist in the distances of the satellites of Jupiter and Saturn from their primaries; but these also are doubtless mere coincidences.

BODHISATTVA, bô'd'hê-sât'vá. In Buddhist theology, a person who is approaching the state of perfect knowledge.

BOD'IE, or **BOD'YS ISLAND**. A sand strip in Dare County, N. C., between Albemarle and Roanoke sounds and the Atlantic Ocean (Map: North Carolina, G 2). The sand is shifting in character, inlets from the ocean appearing and disappearing from time to time. Haghead, a popular seaside resort, is built upon the site of a former inlet of that name. There is a first order light in latitude 35° 49' N., and longitude 75° 33' W., at a height of 156 feet above sea-level.

BODIERON, bô'dî-ê'rôn (origin obscure). The green rock-trout (*Hexagrammus lagocephalus*) of Puget Sound and northward, known to the Cape Flattery Indians as tsebarqua. It resembles other rock-trout, especially the boregat, but its flesh is greenish. See ROCK-TROUT.

BODIN, bô'dân', **JEAN** (1530-90). A French writer on politics, born in Angers. He was a lecturer on law in Toulouse, and subsequently practiced as an advocate of the Parlement of Paris, before he devoted himself to the study of political theory. His exceptional talents, and the positive attitude he assumed in support of the doctrine of absolute monarchy, gained him the good will and protection of Henry III. and of his brother, the Duc d'Alençon. With all his leanings toward conformity in politics and religion, Bodin was an enemy of persecution,

and his antagonism to the course adopted by the ultra-Catholics cost him the favor of his royal patrons. At the States-General of Blois in 1576, Bodin, as a representative of the Third Estate from Vermandois, succeeded in securing an interim of peace and toleration for the adherents of the Reformed religion. After the assassination of the Duke of Guise in 1588, Bodin joined the League, but was expelled not long after for his lukewarm Catholicity, and spent the rest of his life in retirement. He died in Laon in 1596. In his *Methodus ad Facilem Historiarum Cognitionem*, published in 1566, Bodin already gave evidence of a philosophical spirit and a deep store of learning; the appearance, ten years later, of his *Six livres de la république* assured him almost from the first the leading place among the political writers of the Renaissance, not even excepting Machiavelli. By his vast erudition and bold grasp on the principles underlying historical fact, Bodin, in the estimation of modern authorities, deserves a place with Aristotle and Montesquieu as one of the three greatest political philosophers in history. His most valuable contribution to the science of society and statecraft is the conception of sovereignty which he was the first clearly to formulate and to develop. Starting with the family as the unit of society, Bodin defines the State as a collection of families united by common interests and common possessions living under the right authority of a sovereign. This sovereign is described as power 'supreme and perpetual, absolute, and subject to no law.' The kinds of government are three: democracy, aristocracy, and monarchy or despotism, according as the sovereign power reposes in the mass of the people, in a few, or in one; mixed governments there can be none, since in the nature of things the sovereign is one and indivisible. Of the three forms of government Bodin much prefers monarchy, and inasmuch as he endows his ruler with all the gifts of Plato's philosophizing, he finds it easy to bestow on him the full attributes of sovereignty. Custom, law, the will of the people as expressed through their parliaments and magistrates, are undoubtedly of great importance; but in the last instance, the King is subject to no restraint save that of his own conscience. Equally celebrated with his theory of sovereignty is Bodin's analysis of the effect of climate on society and government. In general he finds that the nations of the north are characterized by the predominance of physical strength, those of the south by mental power, those of the temperate zones by a happy mixture of the two. In the north, the dominant force is brute will; in the south, superstition; in the central regions, reason. The ideal commonwealth would embrace the entire world, in which the northern peoples should supply the workers and fighters, the southern peoples the priests, poets, and artists, and the inhabitants of milder climates the legislators, magistrates, and judges. The *Colloquium Heptaplomeres*, published only in 1847, is a plea for toleration. Seven men—a Roman Catholic, a Lutheran, a Zwinglian, a Jew, a Mohammedan, an Epicurean, and a Theist—debate on the subject of what is the true religion, and arrive at the conclusion that it is best for each man to live in accordance with his own belief, provided his creed be not opposed to public morality and the welfare of the State. Far ahead of his times in his liberality of view with regard

to so many sides of life, Bodin belonged to the Middle Ages in his superstition. He devotes an entire book of the *Republic* to an erudite discussion of the influences of the planets on the affairs of men, and in his *Démonomanie* (1580) advocates the burning of wizards and witches. Consult: Baudrillart, *Jean Bodin et son temps* (Paris, 1853); Barthélemy, *Etude sur Jean Bodin* (Paris, 1876).

BODIO, bô'dyô, LUIGI (1840—). An Italian political economist and statistician. He was born in Milan and studied in Pavia and Pisa. In 1864 he was appointed professor of political economy at the Technical Institute, Leghorn; in 1867 professor in Milan, and in 1868 professor of statistics and commercial geography at the Venice Commercial School. In 1872 he became director of the National Statistical Bureau. He has published a considerable number of important statistical works, among which is *Sui documenti statistici del regno d'Italia* (1867).

BODKIN (origin obscure). An instrument used by women of antiquity to fasten up the hair at the back of the head. It was the method commonly adopted by the priests of Cybele, as well as by the female characters in Greek tragedy, the bodkin being highly ornamented. Silver bodkins are still worn in a similar way by the peasant girls of Naples. The term 'bodkin' is also applied to a sharp-pointed instrument for piercing holes in cloth, as well as to a blunt instrument, having an eye, and used for drawing tape or ribbon through loops, and it was at one time a very common name for a dagger.

BOD'LE, or **BOD'DLE**. An ancient copper coin in Scotland, in value the sixth of a penny sterling. The bodle is said to have been so called from a mint-master of the name of Bothwell.

BODLEIAN (bôd'le-an) **LIBRARY**. The great library of the University of Oxford, England. The first library, the foundation of Humphrey, Duke of Gloucester, was destroyed by the fanaticism of Edward VI.'s Commissioners for the Reform of the University. Sir Thomas Bodley's was a restoration (1602), and his active quest of valuable publications was equalled by his munificence. Formally opened with great ceremony, November 8, 1603, it was the next year granted letters patent by James I., who himself gave it the name of its founder. One of Bodley's first acts was the presentation of a large collection of valuable books, purchased on the Continent at an expense of £10,000. Through his influence and noble example, the library was speedily enriched by numerous other important contributions. Among the earliest subsequent benefactors were the Earl of Pembroke, who presented it with 250 volumes of valuable Greek manuscripts; Sir Thomas Roe; Sir Kenelm Digby; and Archbishop Laud, who made a magnificent donation of 1300 manuscripts in more than twenty different languages. About 8000 volumes of the library of the famous John Selden also went to the Bodleian Library. General Fairfax presented it with many manuscripts, among which was Roger Dodsworth's collection of 160 volumes on English history. The first catalogue of printed books was published by the first librarian, Dr. James (1605). Among some of the important bequests of the Nineteenth Century were the collections of Richard Gough, on British topography and Saxon and northern lit-

erature; of Edmund Malone, the editor of Shakespeare; and of Francis Douce; also, the sum of £40,000, by the Rev. Robert Mason, the interest to be expended on books. By purchase, the library acquired some fine collections of Oriental, Greek, Latin, and Hebrew books and manuscripts. The Bodleian Library is particularly rich in biblical codices, rabbinical literature, and materials for British history. Along with the British Museum, it enjoys the right of receiving a copy of every book appearing in England. There are more than half a million bound volumes, 30,000 volumes of manuscripts, besides valuable pictures and relics. The buildings contain also many art treasures, as the Pomfret and Arundel marbles, and the Hope collection of portraits. One of its most interesting paintings is that of Sir Thomas Bodley, full length. There is also a marble bust of him. Members of the university who have taken a degree are admitted to the use of the library, a small addition to the matriculation fees and an annual payment being charged for the privilege. Literary men, properly recommended, are allowed to make extracts from the works in the library, which is usually open from 9 o'clock in the morning to 5 in the afternoon. Connected with the main library is now a circular structure called the Camera Bodleiana, the gift of Dr. Radcliffe, which is kept open from 10 A.M. to 10 P.M. It contains the more common books, and is used as a reading-room. The tercentenary of the foundation was celebrated with great splendor in the fall of 1902. Consult Macray, *Annals of the Bodleian Library* (Oxford, 1868).

BODLEY, Sir THOMAS (1545-1612). An English scholar and diplomatist, now best known through the Bodleian Library (q.v.). During the reign of Mary his parents were for a time in Geneva, where Thomas studied Greek, Hebrew, and divinity, the last with Calvin. The family returned on the accession of Elizabeth, and the son, entering Magdalen College, Oxford, was duly graduated B.A. in 1563, and was made a probationer fellow of Merton College. The following year he was made actual fellow, and in 1566 received M.A. For a while he delivered a Greek lecture, was in 1569 elected proctor, and on one occasion was public orator. Employed by the Queen in diplomatic missions, he was sent to the courts of Denmark, France, and Holland. He was proficient in the Continental tongues, and his diplomatic career was so distinguished that he was solicited to become Secretary of State, but the scholarly quiet of the Oxford life appealed to him more strongly, and he returned thither in 1596. Now relieved of public cares, he considered how he might "do the true part of a profitable member of the State," and the restoration of the library seemed to him a rare opportunity. He was fortunate in securing the hearty coöperation of his countrymen. Himself indefatigable, he had an agent go to the Continent and buy largely. He also permanently endowed the library, and in his will he made the university his chief beneficiary. Knighted by James I., he desired that he might be buried in keeping with his knightly rank, and accordingly directed that £666 13s. 4d. be expended for great ceremony. His remains were laid in the Chapel of Merton College. There, too, a monument was erected in 1615. Bodley's autobiography up to 1609, with

his letters, was published under the title of *Reliquiæ Bodleianæ* (London, 1703). See BODLEIAN LIBRARY.

BODMER, CHARLES (1809—). A Swiss engraver, born in Zürich. His works include drawings, etchings, engravings, and paintings for books and magazines. His favorite subjects are the environs of Fontainebleau, where he lived. He received a medal at the Expositions of 1851, 1855, and 1863, and the Cross of the Legion of Honor in 1876.

BODMER, GEORG (1786-1864). A noted Swiss mechanic, born in Zürich. He was apprenticed to a mechanic in Hauptweil, and made valuable improvements in wool-spinning machinery in 1805. In 1808 he invented a cannon for firing bombs, which exploded upon striking. He continued to manufacture and improve industrial machinery and firearms, and in 1824 established large works in Manchester, England. Subsequently he turned his attention to railway construction in Austria.

BODMER, JOHANN JAKOB (1698-1783). A German-Swiss poet and critic. He was born in Greifensee, became professor in Zürich, and was chief mover in the emancipation of German literature from French classic tradition. He published, with Breitinger, a critical periodical *Diskurse der Maler* (1721-23), which attacked the then popular poets of the Silesian School. His æsthetic writings, especially *Vom Wunderbaren in der Poesie*, precipitated a literary war between him and the powerful Leipzig critic Gottsched (q.v.). While he at first hailed Klopstock as a worthy successor to Milton, he later on became involved in a personal quarrel with him, and he totally failed to appreciate the new development in German literature due to Lessing and Wieland. Schiller's *Räuber* he criticised unmercifully. He revealed, however, to Germany the beauties of the Minnesingers and of the Nibelungen, translated Milton's *Paradise Lost* and Homer, and did much to awaken in Germany an interest in English literature. Consult: Breitmaier, *Geschichte der poetischen Theorie und Kritik von den Diskursen der Maler bis auf Lessing* (2 vols., Frauenfeld, 1888-89); and Bächtold, *Geschichte der deutschen Litteratur in der Schweiz* (Frauenfeld, 1892).

BODMIN (from Cymr., Celt. *bod*, dwelling + *min*, high rock; or possibly *bod-manach*, dwelling of monks). The county town of Cornwall, England, 26 miles west-northwest of Plymouth (Map: England, B 6). It consists principally of one street a mile long. Its ancient church is one of the largest in Cornwall, but has been much injured through frequent restoration. It has an ancient grammar school, founded by Queen Elizabeth, a hospital, and the county lunatic asylum. Its chief trade is in cattle, horses, and sheep. Population, in 1891, 5100; in 1901, 5400. Bodmin arose in the Tenth Century, and was long an important place, having a priory, a cathedral, and thirteen churches. Consult *Guide to Bodmin and Neighborhood* (Truro, 1872).

BODONI, bô-dô'nê, GIAMBATTISTA (1740-1813). An Italian type-cutter and printer. The son of a printer, he was born in Saluzzo, Piedmont, and was successively a compositor in Rome and the superintendent of the Duke of Parma's private press. He was distinguished rather for

his elegance than for his accuracy, and is best known by his editions of the *Iliad*, Vergil, and the Lord's Prayer, the last in 155 languages. Worthy of mention, too, is his *Manuale tipografico* (1818). He died in Padua. For his life, consult Bernardi (Saluzzo, 1873).

BODY, CHARLES WILLIAM EDMUND (1851—). An English theologian. He was born at Clapham, England, and was educated at Saint John's College, Cambridge. He was provost and vice-chancellor of Trinity University, Toronto, Canada, from 1881 to 1894. His principal publication is *The Permanent Value of Genesis* (one of the Paddock Lectures for 1884).

BODY, DEAD. See CORPSE.

BODY AND MIND. The question of the relation of body to mind, together with the deeper question whether we have a right to separate these two terms and to speak at all of a 'relation' between them, is subject-matter for metaphysical inquiry. We refer to the articles DUALISM; EPISTEMOLOGY; MATERIALISM; MONISM; SPIRITUALISM. Here we are concerned simply to discuss the views which have been adopted by psychologists as working hypotheses upon the scientific level, without regard to their ultimate metaphysical validity. Just as physics may postulate, for its own purposes, the existence of a matter which certain philosophical systems repudiate, so may psychology accept a theory of the relation of mind to body which some or all systems of philosophy would pronounce erroneous or inadequate. Every science must assume its data as realities, and has a right to its working hypotheses. And some sort of theory of the relation of mind to body has become a necessity for psychology, since Fechner (q.v.) has shown that the presupposition of an exact science of mind is the uniformity of mental response to physical stimulus.

Psychologists are, at the present day, sharply divided into two groups, the one holding a theory of the interaction of mind and body, the other a theory of psycho-physical parallelism. The former theory, which has all the weight of common opinion on its side, avers that mental processes are able to act causally upon bodily; that an idea may 'make' us act—i.e. condition bodily movements—just as truly as a blow may make us feel pain. The chain of events is made up of two kinds of links—material processes and mental processes; and the links are interchangeable and equally effective. The latter theory maintains that the two series, the material and the mental, are disparate; that they never pass into or interfere with each other. The mental series is conditioned upon the material, runs parallel with it, term for term; but there neither is nor can be any transition from the one to the other. It should be said, emphatically, that there is no necessary connection between the theory of interaction and a metaphysical monism or idealism, and none between parallelism and a metaphysical dualism or materialism. Either theory, held as a scientific working hypothesis, is compatible with any one of these ultimate metaphysical beliefs.

The main arguments for interaction are as follows: (1) "The particulars of the distribution of consciousness point to its being efficacious" (James). Consciousness can apparently 'load the dice' of the brain—i.e. can bring

"pressure to bear in favor of those of its performances which make for the most permanent interests of the brain's owner." "Consciousness is only intense when nerve-processes are hesitant. . . . Where indecision is great consciousness is agonizingly intense." This argument squares with the doctrine of biological evolution, in that it gives to mind, which is a highly complex development, a survival value in the organism's struggle for existence. (2) A damaged brain may recover and work normally; the parts remaining take on the duties of the parts lost, by the principle of 'vicarious function.' The restoration is intelligible if consciousness direct it; unintelligible, if the brain machine be subject to no such direction. (3) Pleasures are associated with beneficial stimulation, pains with detriment to the organism. This correlation seems to imply that pleasures and pains exert a direct influence upon the bodily processes. (4) The assumption of the interaction of mind and body assures the universality of the causal connection and the uniformity of natural law throughout the known universe.

To the first argument there is the reply that it offers no proof of the actual interference of consciousness in the struggle for existence. Mind may be a mere concomitant of brain; a concomitant that varies in complexity as its physical substrate varies, and that is thus an index or symptom of brain-efficacy; but that is not itself a factor in survival. An animal may surpass its fellows, not because it has a better mind, but because (as its better mind shows) it has a better brain. The presence of an intense consciousness during deliberation and doubt offers no difficulty. (See ACTION; ANIMAL PSYCHOLOGY.) As for vicarious function, the developed brain is, by hypothesis, an exceedingly complex and plastic structure, not a machine definitely shaped for a few particular ends. Hence there is no need for the intervention of consciousness. The correlation of pleasure with stimuli that further life, and of pain with stimuli that thwart it, is readily explicable as a coincidence due to the continued operation of natural selection (Spencer). An animal that 'liked' to be hurt would not exercise any considerable influence upon the further development of its species. Finally, the demand for a universal causality is rather a metaphysical than a scientific postulate.

The arguments in favor of parallelism may be summed up as follows: (1) The hypothesis is a necessity for scientific psychology. If our psychological experiments, in which we submit the mind to various forms of physical stimulation, and observe the results, were liable to interruption by the reaction of mind itself upon the stimuli employed, there could be no hope of erecting 'laws' of mind, of discovering mental 'uniformities.' Our most laborious and careful researches might be upset at any moment by the interjection of some mental influence. The fact that laws and uniformities have been established indicates that the mental is conditioned, unequivocally, by the physical, and that there is no reciprocal conditioning. (2) The categories of mind and body are the most diverse of all that are recognized by science. They are entirely heterogeneous. But it is a rule of logic that one may not argue from category to category;

reasoning is valid only within the limits of a single 'kind' or 'genus.' Hence we may not interpolate mental links in the chain of physical causation, and *vice versa*. (3) Reflex and secondary reflex movements show that the organism can act 'teleologically,' i.e. as if with set purpose and with a view to a determinate end, without the aid of consciousness. (4) The law of the conservation of energy requires that motion produce and be produced by motion; it forbids any arbitrary increase of the energy of the organism, such as must follow from the direct action of mind upon brain-cell.

The first of these arguments is difficult to meet. It rests upon a basis of positive fact; whatever our theoretical belief, we can but grant the utility of the parallelistic principle in the practice of experimental psychology. We might, however, urge that the heuristic value of a working hypothesis is no evidence that the hypothesis will endure. A proposition that appears self-evident at one stage of the history of a science may be utterly overthrown by later discovery. It may be, then, that as our experimental methods grow in refinement, and we attack the higher and more complex processes of mind, we shall gain evidence of the very mental action which now seems to be precluded by the results of experiment. The second argument is less strong. No formal considerations can limit the province of cause and effect; experience must decide in each case, irrespective of homogeneity or heterogeneity of the terms. The purposiveness of the reflex movements "proves only that the same effect can proceed from different combinations of conditions" (Stumpf). Moreover, it is probable that these movements are, one and all, degenerate impulsive actions (see ACTION); so that their teleology may, after all, be consciously conditioned. Lastly, there is no good reason why we should not rank 'mental energy' alongside of chemical, thermal, electrical, etc., energy, and assume that it, like these, has its precise mechanical equivalent.

We shall incline to the one side or the other, then, as our interests and experience prompt. The descriptive psychologist, keenly alive to the manifestations of mental life about him, and influenced by the traditions of psychological thought, will tend toward an acceptance of interaction; the experimental psychologist, revolutionary in temperament, and dominated by the methods of the laboratory, will tend toward a parallelistic theory. The impossibility of present decision may mean that we have not as yet sufficient facts at our disposal for a solution of the problem; or it may mean that the problem is wrongfully formulated, and will be transcended by a true philosophy. In either case, we must put our trust in time and further work. And, in the meanwhile, we shall do well to push to its logical extreme the hypothesis which makes the stronger appeal to us, for the clash of honest opinion is of the very greatest import for scientific progress.

BODY CASTLE. See ALMA.

BODY-COLOR. That material which contributes substance to pigments, more particularly the solid white known as Chinese White, used in water-colors, which by rendering them opaque distinguishes them from the transparent and fluid washes which mark the water-color method pure and simple.

BODY-SNATCHING. The common-law misdemeanor (q.v.) of unlawfully taking and carrying away a dead human body. When the body is taken from a grave the offense is commonly called *body-lifting*. The taking is ordinarily for the purpose of dissecting the body or selling it for dissection. By statute in many of the United States a person has the right to direct the manner in which his body shall be disposed of after his death, unless he is a convicted felon. In the latter case his body may be turned over to medical authorities for dissection. Statutes frequently provide also for the exhumation and dissection of buried bodies, under the direction of proper officers, for the purpose of discovering the cause of death. But the removal of a dead human body after burial, or while awaiting burial, if made without authority of law, with intent to sell or use it for dissection, is in nearly every jurisdiction a statutory or a common-law offense, punishable by imprisonment or a fine, or by both. While the law does not recognize a right of property in a human corpse, it does secure to the near relatives the right of controlling and of burying it, except in cases where public officials have the power to intervene. As a human corpse is not property, and as its prompt and decent burial is a legal as well as a moral duty, it cannot be attached, levied upon, or detained for debt. See CORPSE, and the authorities referred to under CRIMINAL LAW.

BOECE, bois, or **BOETHIUS**, HECTOR (1465-1536). A distinguished Scottish historian. He was born in Dundee, and belonged to the family of Bois or Boyis, modern Boice or Boyce. He was educated in Dundee, and studied at the University of Paris, where he took the degree of B.D. He was appointed professor of philosophy at the Collège Montaigu, and acquired there the friendship of Erasmus, who has praised him in his writings. He left Paris reluctantly to preside over the new University of Aberdeen, the prosperity of which he greatly promoted. He also became canon of Aberdeen and rector of Tyrie. In 1522 he published his lives of the bishops of Mortlach and Aberdeen. His fame rests chiefly on his *History of Scotland*, published 1527, for which he received the degree of D.D. from the university and a royal pension. This work contains a large amount of fiction, but is worthy of the commendation it has received on the score of style. It is supposed that Boece died in 1536, for on November 22 of that year the King presented the rectory of Tyrie, vacant by the death of Mr. Hector Boiss, to John Garden. Consult: Irving, *Lives of Scottish Writers* (Edinburgh, 1839); and Burton, *History of Scotland* (Edinburgh, 1873).

BOECKH, bæk, AUGUST (1785-1867). A German classical scholar. He was born in Karls-

rùhe, November 24, 1785, and was enrolled as student in the University of Halle in 1803, where the lectures of F. A. Wolf (q.v.) induced him to devote himself exclusively to philology. In 1807 he became professor at Heidelberg, and in 1811 was called to the newly established University of Berlin, which owed much of its early fame to him, in company with Hegel and Schleiermacher. Boeckh lectured in Berlin with great success for over fifty years to a total of many thousand students. The range of his studies was very wide, and he was the first to develop philology on a philosophic basis. He conceived of that science as an organically constructed whole, which aims at nothing short of a complete intellectual reproduction of antiquity. His lectures therefore included both formal and historical grammar, exegesis, archæology, history of ancient literature, philosophy, politics, religion, and society. Boeckh's concept of philology excited much opposition at first, but gradually won adherents, and unquestionably gave a great stimulus to classical scholarship; at the present time, after many of the subjects which Boeckh regarded as subdivisions of philology have been exalted to the position of independent sciences, there are significant signs of a return to his general view of the unity of philology. His earliest publication, dedicated to Wolf, was *Commentatio in Platonis Minorem* (1806); in his *Græcæ Tragediæ Principum Æschylis, Sophoclis, Euripidis. Num Ea Quæ Supersunt Genuina Sint*, etc., published 1808, he discussed the possible revisions due to repeated productions and the interpolations of actors in the extant tragedies. He also produced some monographs on Plato while professor at Heidelberg.

His great works are the following: An edition of Pindar in 4 vols. (1811-22), the completion of which he intrusted to his friend G. L. Dissen (q.v.), professor in Göttingen. This marked an epoch in Pindaric studies by its criticism of the text and scholia, and especially by Boeckh's investigations on the metre. The introductory essay on the criticism of Pindar is still of great value. His work *Die Staatshaushaltung der Athener* (2 vols., 1817; 3d ed., edited by Fränkel, 1886) applied the methods of his master, Wolf, and of his older contemporary, Niebuhr, to questions of the commercial and State economy of the Athenians in a masterly manner; by it Boeckh established the science of public antiquities, in which he was followed by K. F. Hermann, G. F. Schoemann, and M. H. E. Meier (q.v.); and the work remains a permanent monument of thorough research, analysis, and vast learning. In his investigations Boeckh had been led to a careful study of Attic inscriptions. He now planned a comprehensive collection of Greek inscriptions, the cost of which was undertaken by the Berlin Academy. With Boeckh were associated Ph. Buttmann, Schleiermacher, Immanuel Bekker (q.v.), and later many others; the result of their work was the *Corpus Inscriptionum Græcarum* (4 vols., 1825-62). Among his other important works are *Philolaos' des Pythagoreers Lehre* (1819); *Metrolologische Untersuchungen über Gewichte, Münzfüsse und Masse des Altertums* (1838); *Urkunden über das Seewesen des attischen Staates* (1840); *Sophokles Antigone* (2d ed., 1884); *Encyklopädie und Methodologie der philologischen Wissenschaften*, never published by himself, but edited from his lectures on

the subject by Bratuscheck (1877; 2d ed., Klussmann, 1886). This is still the most important work in its field. His *Opuscula* fill 7 vols., (1858-74). He died in Berlin, August 3, 1867.

BOËDROMIOS (Help-giver). An epithet of Apollo, the origin of which is assigned to various events of Greek history. From this epithet was derived the name of the third Attic month, Boëdromion, corresponding to portions of September and October, on the 7th day of which the festival Boëdromia was celebrated in honor of Apollo.

BOEHLER, bē'ler, PETER (1712-75). A Moravian bishop. He was born at Frankfort-on-the-Main, Germany; studied at Jena, and in 1737 was ordained as a Moravian minister by Count Zinzendorf (q.v.). On his way to America, where he had been sent as a missionary to Carolina and Georgia, he stopped in England, and there became acquainted with John and Charles Wesley, over whom he had a powerful influence. He worked among the negroes in Georgia, and among the Germans in South Carolina, some of whom he ultimately transferred to Bethlehem, Pa. For a year Boehler labored as missionary to the Indians. He then went to Europe, and returned with a large number of Moravian colonists. This addition to the growing community at Bethlehem caused the founding of Nazareth, near the original town. In 1742 Boehler was appointed bishop of the Moravian churches in America, England, Ireland, and Wales. While on a parochial visit to his new charge he died in London. Consult T. P. Lockwood, *The Memorials of the Life of Peter Boehler* (London, 1868).

BOEHM, bēm, HENRY (1775-1875). An American Methodist minister. He was born in Lancaster County, Pa., and became a preacher in 1800. He was an intimate friend and associate of Bishop Asbury, and greatly contributed to the extension of Methodism, particularly among the German-speaking people of Pennsylvania.

BOEHM, Sir JOSEPH EDGAR (1834-90). An English sculptor. He was born in Vienna, but was educated in England, and lived there from 1862. He made careful study of the Elgin marbles and of copies of old masters in the galleries of the British Museum. In 1856 he won the first imperial prize in Vienna, and he gained a deservedly high reputation in England. In 1881 he was elected a member of the Royal Academy. Among his works are the colossal statue of Queen Victoria at Windsor, and statues of John Bunyan at Bedford, of Lord John Russell at Westminster Hall, London, of the Duke of Wellington at Hyde Park corner, and of Thomas Carlyle on the Thames embankment. Of the Carlyle, Ruskin, in his *Notes* for 1875, said: "Here is a piece of vital and essential sculpture; the result of sincere skill, spent carefully on a subject worthy of care."

BOEHM-BAWERK, bēm' bā'vĕrk. See BOEHM VON BAWERK.

BOEHMERIA (after the German naturalist Böhmer). A genus of plants of the natural order Urticaceæ. The fibres of a number of species are used for making ropes, twine, nets, sewing-thread, and cloth, and some of them appear likely to acquire much economical and commercial importance. The commercially important

species now known are *Bœhmeria nivea* and *Bœhmeria tenacissima*, the latter being often considered as merely a variety of the former. *Bœhmeria nivea* grows in temperate and sub-tropical regions, while the variety flourishes in sub-tropical and tropical countries. It yields a great part of the fibre employed in China in the manufacture of the beautiful fabric known as China-grass cloth (q.v.). It is a perennial herbaceous plant, with broad ovate leaves, which are white and downy beneath, and is of the general habit though destitute of the stinging powers of the nettles. It is carefully cultivated by the Chinese, by whom it is called *tchou ma*. It is propagated either by seeds or by parting the roots. It loves shade and moisture. Three crops are obtained in the season, new shoots springing up after it has been cut. Great attention is bestowed upon the preparation of the fibre. This is extracted by hand stripping, by boiling the stalks in water or some chemical solution, or by machinery. Machine methods have so far not met with unqualified success. On the other hand, the first-named two ways of extracting the fibre are more or less intricate and involve a large amount of hand-labor. As a consequence, the bulk of the fibre is produced in China and India, where cheap labor is plentiful. To *Bœhmeria nivea* properly belongs the name China grass; ramie or rhea should be retained for the plant which Dr. Roxburgh strongly recommended to attention about the beginning of the Nineteenth Century under the name of *Urtica tenacissima* (see RAMIE). An allied species, *Villebrunnea integrifolia*, is common in Nepal, Sikkim, and other parts of the Himalaya, to an elevation of 3000 feet above the sea. It is not cultivated, but often overruns abandoned fields. It grows to a height of 6 or 8 feet, and varies from the thickness of a quill to that of the thumb. The plant is cut down for use when the seed is formed, the bark is then peeled off, dried in the sun for a few days, boiled with wood-ashes for four or five hours, and beaten with a mallet to separate the fibres, which are called *pooah* or *poec*, and also *kienki* or *yenki*. When properly prepared, the fibre is quite equal to the best European flax. The fibres of a number of coarser species are employed in different parts of the East Indies for making ropes. The cultivation of *Bœhmeria nivea* has been introduced into the southern part of the United States, and with the invention of satisfactory methods of decortication and degumming it will doubtless prove an important industry. *Bœhmeria cylindrica* is indigenous in the United States, occurring as an annual in waste places from Canada to Florida and westward. See Royle, *Fibrous Plants of India* (London, 1865); Dodge, *Descriptive Catalogue of Useful Fibre Plants* (Washington, 1897).

BOEHM VON BAWERK, bēm fôn bā'vĕrk, EUGEN (1851—). An Austrian political economist. He was born in Brünn, Moravia, February 12, 1851, was educated at the University of Vienna, and from 1872 to 1879 continued his study of political economy in Heidelberg, Leipzig, and Jena, under Knies, Roscher, and Hildebrand. He held for a short time a place in the Austrian Ministry of Finance, lectured in 1880, at the University of Vienna, but was called thence to the University of Innsbruck, where he remained till 1889. He then entered once more the Govern-

ment service, in the department of finance, and was Minister of Finance from June 18 to October 2, 1895. He was then appointed professor in the University of Vienna and became president of one of the superior courts of administration. In 1897-98 he was again Minister of Finance; in 1899 he was called to the House of Peers, and since January, 1900, he has again been in charge of the Ministry of Finance. Boehm von Bawerk is one of the leading economists of the so-called Austrian school. With Karl Menger and others, he has contributed to the development of a theory of value which has received wide acceptance, and has been the cause of still wider discussion, in the economic world. This theory, as elaborated by Boehm von Bawerk, is based largely upon psychological principles. Its chief feature consists in a searching analysis of 'subjective value.' (See VALUE.) In his *Kapital und Kapitalzins* (1884-89), translated by Smart in 1890 under the title of *Capital and Interest*, the author makes a brilliant and original study of these two subjects. He does not accept the common classification of land, labor, and capital as the three sources of production, but regards the two former only as real sources, while capital is only a means of production. 'Interest' is employed as a general term for interest in the common sense, and for profits, and its cause and justification are found in the great principle of the difference in value between present 'goods' and future 'goods.' The term 'positive theory of capital' has been applied to the teachings of which Boehm von Bawerk on the Continent is the chief exponent, and which were discussed at great length in contributions to the *Quarterly Journal of Economics* from 1890 to 1895. Valuable articles on the subject are those by Bonar in the same publication on the "Austrian Economists" and on the "Positive Theory of Capital," Vol. III. (1889). See CAPITAL; INTEREST; JEVONS.

BEO'TIA (Gk. *Bowrla*, *Boiōtia*). In ancient geography, next to Attica, the most important political division of Central Greece, bounded on the north by Locris and the Eubæan Gulf, on the east by the narrow strait of the Euripus, on the south by Attica, Megaris, and the Corinthian Gulf, and on the west by Phocia. Bœotia had a surface estimated at 1000 square miles. The plains inclosed on the south by Mounts Cithæron and Parnes, on the west by Mount Helicon, on the north by the slopes of Mount Parnassus and the Opuntian Mountains, fall naturally into two divisions—the basin of Lake Copais, now called Topolias, and that of the Asopus, together with the coast district on the Corinthian Gulf. The principal stream was anciently called the Cephissus. It entered the country from Phocia at Chæronea; and in the spring, when it was swollen by innumerable torrents, converted the Copaic plain into a shallow lake. There were underground channels for the outlet of the waters that congregated in this plain, but only four were active at the time the French engineers began work. To recover this valuable region to agriculture and remove the malarial marshes, extensive drainage operations were begun by a French company in 1833 and carried to a successful completion. The draining of the bed showed that similar works had been carried out by the Minyæ of Orchomenus in the Mycænæan period; a large dike ran along the north shore, collecting

the waters of the Cephissus and Melas, and emptying them through a great natural subterranean passage. Another dike kept back the waters from the south shore, and brought them to the same outlet. A dike near the centre seems to have been connected with a system of irrigation. Forts secured the outlets against hostile attack. With the fall of the Mycænæan kingdom at Orchomenus, the works seem to have been neglected, and a change in the sea-level seems to have rendered the outlets useless, so that the region became again flooded. An attempt to clear out the old passages and open new ones was made during the reign of Alexander the Great, and there are traces of similar attempts later, but none with success. Bœotia in ancient times was a productive region, abounding in corn and fruits; marble, potters' clay, and iron were obtained, and it was also celebrated for flute-reeds. The inhabitants in the legendary age were the Minyæ of Orchomenus and the Cadmeans of Thebes, both Greek races and hostile to one another. Later, the country was occupied by the Bœotians, an Æolian people, who were driven from Thessaly. The Bœotians excelled as cultivators of the soil, and were gallant soldiers, both on foot and on horseback, but they were rude and unsocial, and took little part in the gradual refinement of manners and intellectual development of the rest of Greece, so that the name became proverbial for illiterate dullness. This was usually ascribed to their thick damp atmosphere. Yet there were not wanting among them eminent generals, as Epaminondas and Pelopidas; and poets and historians, as Hesiod, Pindar, Corinna, and Plutarch. The greater cities, of which the number was about fourteen, Thebes, Haliartus, Thespiæ, etc., with their territories, formed the Bœotian League. At the head of this were seven Bœotarchs, who held office for one year, commanded the army of the league and conducted its diplomacy, though the final decision in matters of policy seems to have rested with the four councils, concerning whose composition we are not informed. The internal history of Bœotia is largely concerned with the efforts of Thebes to maintain her leadership through this league against the efforts of Thespiæ, Orchomenus, and other cities for autonomy. The power of Thebes and the league was at its height in the years succeeding the battle of Leuctra (B.C. 371), when Epaminondas (q.v.) placed Thebes at the head of Greece. After the battle of Chæronea, in which Philip established the Macedonian throne on the ruins of Grecian liberty, the political importance of the country declined so rapidly that about B.C. 30 only two cities, Tanagra and Thespiæ, had any prominence. Bœotia now forms one of the nomes of the Kingdom of Greece. The capital is Livadia. Area, about 1550 square miles. Population, in 1896, 57,000. Consult: W. Rhys Roberts, *The Ancient Bœotians* (Cambridge, 1895); for the works in Lake Copais, E. Curtius, *Die Deichbauten der Minyer* (Berlin, 1892); and for topography, Ulrichs, *Reisen und Forschungen in Griechenland* (Bremen, 1840).

BOER, *bōor* (Dutch *boer*, farmer, Ger. *Bauer*, peasant, Eng. *boor*, husbandman, rustic). The name given to the Dutch inhabitants of South Africa who are descended from the original settlers of Cape Colony. Separated for centuries from the rest of the world, these people, in their rude pioneer life, preserved their belief in the

stern tenets of early Calvinism, a belief which colored their whole life. When, in 1814, Cape Colony was ceded by Holland to England, the English administrators failed entirely to understand the people with whom they had to deal, and they increased the hostility which the Dutch naturally felt for the English by their drastic legislation against practices which were a part of the religion as well as the life of these simple people, possessing many of the faults as well as many of the virtues of a primitive state of society. As a result there was a series of *treks* or emigrations, by which the more determined Boers sought to free themselves from British control. The first considerable movement of this kind was the 'great trek' of 1836. The Boers at first attempted to establish themselves in Natal, but they came into collision with the native Kaffirs, who were under British protection, and when Natal became an English colony they removed beyond the Drakenberg Mountains, taking possession of an extensive region on both sides of the Vaal, the principal affluent of the Orange River. Here they founded two states, the Transvaal or South African Republic, in the north, and the Orange Free State in the south. The Boers believed in their right to enslave the natives, and the abolition of slavery under English rule was one of the grievances that led to the *trek*. This attitude of the Boers won them the hatred of the native peoples. The Sand River Convention of 1852 between commissioners for the Cape Government and for the Boers gave autonomy to the Transvaal, with a reservation against the practice of slavery. The convention of Bloemfontein two years later brought the Orange Free State into being. The Boers have continued to be, for the most part, farmers clinging with the utmost conservatism to their antiquated religious ideas and their primitive mode of life. Their tenacity of purpose and stubborn independence in opposition to the British power in South Africa have won respect for the rugged virtues of their character, although the rudeness of the mass of this people seems to separate them from modern currents of life. The original roughness of the Boer character, however, has been greatly modified in the towns and among those Afrikaners who remained in the more cosmopolitan Cape Colony. For the later and more detailed history of the Boers, see **CAPE COLONY**; **ORANGE RIVER COLONY**; **SOUTH AFRICA**; and **TRANSVAAL COLONY**.

Consult also: Theal, *History of the Boers in South Africa* (London, 1888); David Livingstone, *The Transvaal Boers* (Edinburgh, 1881); F. W. Chesson, *The Dutch Boers and Slavery in the Transvaal* (London, 1869).

BOERHAAVE, bōər'hā'və, HERMANN (1668-1738). A Dutch physician. He was born at Voorhout, near Leyden. In 1682 he went to Leyden to become a clergyman, and studied Greek, Latin, Hebrew, Chaldean, ecclesiastical and secular history, and mathematics. In 1689 he was made doctor of philosophy, and in 1690 began the study of medicine. Though mainly self-educated in medicine—as in chemistry and botany—he gained his doctor's degree at Harderwyck, 1693, and returned to Leyden, where, in 1701, he was appointed lecturer on the theory of medicine. In his inaugural lecture he recommended to the students the ancient method of Hippocrates

in medicine; but in 1703 his views had become greatly enlarged, and he elaborated various mechanical and chemical hypotheses to explain the diseases of the body, especially in the case of the fluids. In 1709 he was elected professor of medicine and botany in the place of Hotton. About this time he published the two works on which his great fame chiefly rests: *Institutiones Medicæ in Usus Annuæ Exercitationis Domesticæ* (1708), and *Aphorismi de Cognoscendis et Curandis Morbis, in Usum Doctrinæ Medicæ* (1709), both of which went through numerous editions, and were translated into various European languages, and also into Arabic. In the first work—a model of comprehensive and methodical learning—he gives a complete outline of his system, including a history of the art of medicine, an account of the preliminary knowledge necessary to a physician, and a description of the parts and functions of the body, the signs of health and disease, etc.; in the second, he gives a classification of diseases, with their causes, modes of treatment, etc. Boerhaave also rendered important services to botany. Of his best lectures are those delivered on his resignation of the office of rector of the university, *De Comparando Certo in Physicis* (Leyd., 1714), and *De Honore Medici, Servitute* (1736). To combine practice with theory, he caused a hospital to be opened, where he gave clinical instruction to his pupils. Though so industrious in his own profession, he undertook, in 1718, after Lemort's death, the professorship of chemistry, and published in 1724 his *Elementa Chimiæ*, a work which did much to render this science clear and intelligible, and one that will always occupy a high place in the history of chemistry. His fame had meanwhile rapidly increased. Patients from all parts of Europe came to consult him. Peter the Great of Russia visited him; and it is even said that a Chinese mandarin sent him a letter, addressed 'Boerhaave, celebrated physician, Europe.' Consult: Burton, *Account of the Life and Writings of Boerhaave* (London, 1743); Johnson, *Life of Boerhaave* (London, 1834).

BOESWILLWALD, bēs'vil-vālt, EMILE (1815-96). A French architect, born in Strassburg. He felt very early the reaction in favor of a return to the old French architecture, and joined Viollet-le-Duc and Lassus in their endeavor to restore the ancient models. So strong was the prejudice against anything Gothic that his drawings were refused at the Salon of 1840, but his talent was too evident to be long ignored. Three years afterwards he became one of the commission for the care of historic monuments, and as inspector-general of the commission was in charge of the excavations in Algeria and Tunis. His principal works are the restoration of the Cathedral of Luçon, and, with Dauban and Lassus, the restoration of the Sainte Chapelle. He was, in company with Viollet-le-Duc and Lassus, one of the inspectors of Notre Dame. Among his designs are those for a number of churches and public buildings in France and Spain. He was a member of the Institutes of London and Vienna. He received the cross of the Legion of Honor in 1865 and was made commander of the order in 1880.

BOËTHIUS, bō-ē'thī-ūs, or **BOËTIUS**, bō-ē'-shī-ūs. See **BOECE**.

BOETHIUS, or **BOËTIUS**, ANICIUS MANLIUS TORQUATUS SEVERINUS (480-524). A Roman statesman and philosopher. The family to which he belonged had been distinguished for both its wealth and dignity for two centuries. His father, who held the office of consul, died when Anicius was still a boy, and consequently the latter was brought up under the care of Symmachus, whose daughter, Rusticana, became his wife. It is known that he studied philosophy, mathematics, and poetry, translated and elucidated with laborious care the writings of Aristotle, and of the old mathematicians, Euclid, Archimedes, Ptolemy, and others; but the story of his eighteen years' stay in Athens is entirely unhistorical. Boëthius soon attracted notice; he became a patrician before the usual age, a consul in 510, and also *princeps senatus*. Having, moreover, gained the esteem and confidence of Theodoric, King of the Ostrogoths, who had fixed the seat of his government at Rome in the year 500, he was appointed by that monarch *magister officiorum* in his Court. His influence was invariably exercised for the good of Italy, and his countrymen owed it to him that the Gothic rule was so little oppressive. His good fortune culminated in the prosperity of his two sons, who were made consuls in 522. But his bold uprightness of conduct, springing from what seemed to have been the essential characteristics of the man—viz., a strong faith in the truth of his philosophic ethics, and a courage to regulate his official conduct by them—at last brought down upon his head the unscrupulous vengeance of those whom he had checked in their oppressions and provoked by his virtues. He was accused of treasonable designs against Theodoric; and the King, having become despondent and distrustful in his old age, was induced to listen to the charges. Boëthius was stripped of his dignities, his property was confiscated, and after imprisonment at Pavia, he was executed about 524, according to one account, under circumstances of horrible cruelty. During his imprisonment Boëthius wrote his famous *De Consolatione Philosophiæ*, divided into five books, and composed in the form of a dialogue, in which Boëthius himself holds a conversation with Philosophy, who shows him the mutability of all earthly fortune, and the insecurity of everything save virtue. The work is composed in a style which happily imitates the best models of the Augustan Age, and the frequent fragments of poetry which are interspersed throughout the dialogue are distinguished by their truthfulness of feeling and metrical accuracy. The *Consolatio* is piously theistic in its language, but affords no indication that Boëthius was a Christian; and if the doctrinal treatises ascribed to him are, as the acutest criticism maintains, not genuine, we must class him in religion rather with Marcus Aurelius than with his alleged friend Saint Benedict. He was the last Roman writer of any mark who understood the Greek language and literature. During the Middle Ages he was regarded with profound reverence, as the Augustine of philosophy, but on the introduction of the Aristotelian metaphysics in the Thirteenth Century his reputation gradually sank. The first edition of Boëthius's entire works appeared at Venice, 1491-92; standard edition of the entire works in Migne, *Patrologia Latina*, Vols. LXIII.-LXIV. (Paris, 1860). The oldest edition of the

Consolatio is that published at Nuremberg, 1473, but many manuscript translations into various languages had appeared long before the invention of printing. Among these may be mentioned that by King Alfred into Anglo-Saxon, and by Chaucer and Queen Elizabeth into English. Best edition by Peiper, Leipzig (Teubner), 1875; a new translation by James (London, 1897). Consult also Stewart, *Boëthius: An Essay* (Edinburgh, 1891). The most interesting question in connection with Boëthius's mathematical works relates to his knowledge of Hindu numerals, characters evidently derived from them appearing on the apices or small cones used on the abacus. A discussion of this question may be found in Cantor's *Geschichte der Mathematik*. Consult also A. Hildebrand, *Boëthius und seine Stellung zum Christenthum* (Regensburg, 1885).

BOETTI, bô-ët'tê, GIOVANNI BATTISTA (1743-98). An Italian adventurer whose place of birth is unknown. After a series of remarkable adventures Boetti, under the title of an emissary of Mohammed, put himself at the head of a small army, and within a year subdued Kurdistan. He afterwards engaged in war with the Russians, by whom he was finally taken prisoner. He died in captivity on the island of Solovetsk, in the White Sea.

BOETTICHER, bē'tik-ēr, P. A. DE LAGARDE. See LAGARDE.

BŒUF BAYOU, bœf br'oo. An overflow stream in Arkansas and Louisiana, fed in time of inundation by the Mississippi. It unites with the Washita River, and at high water affords 100 miles of steamboat navigation.

BOFFIN, NICODEMUS. A character in *Our Mutual Friend*, by Dickens. He is residuary legatee of his employer, but gives up the £100,000 when Harmon marries Bella Wilfer.

BOFFIN'S BOWER. The name given by Mrs. Boffin, in Dickens's *Our Mutual Friend*, to the place she made her home, as being more cheerful than its original of Harmon's Jail.

BOG (Gael. *bogan*, quagmire, Ir. and Gael. bog, soft, moist). Wet land covered with moss, and often underlain by it to a variable depth. Owing to the spongy character of the material, bogs are often saturated with water and converted into a kind of quagmire. The term 'peat-bog' is especially applied to those swamps or bogs which are underlain by an accumulation of peat, a vegetable gathering caused largely by the growth and decay of sphagnum, or bog-moss. Peat-bogs are especially abundant in the north temperate regions, much of Ireland and portions of England, as well as northern Germany, Nova Scotia, and Canada being covered by them. Tradition reports that at the battle of Solway, in 1542, a fugitive troop of horse plunged into the moss, which instantly closed in upon them; and in the end of the Eighteenth Century this tradition was confirmed by the discovery, made during peat-digging, of a man and horse in complete armor.

Bogs often originate by a process of lake-filling, ponds or even estuaries being partly filled by the inwash of sediment and partly by the spread of bog-mosses from the shore into the ever-shallowing water. As soon as one layer of bog-moss decays another growth springs up. A distinction is sometimes made between red

bogs and black bogs, the former being filled by vegetable matter in a more advanced stage of decomposition. It is said that the red bogs of Ireland cover 1,500,000 acres. The term 'climbing bogs' is applied to those formed on hill-sides, the supply of moisture being kept up by mountain springs. In many regions the peat is dug and utilized for fuel. When properly treated, bogs also yield arable land of much value. The reclamation of bogs for farming purposes involves the proper drainage of the area, and the plowing up of the soil in order to aerate it and bring about the necessary oxidation processes. In some cases clay is plowed in, although this requires time and expense. Oats are usually the best first crops. In Devon many bogs are cultivated as grass-meadows. In many localities in Great Britain the people have used 'pattens'—boards fastened upon the soles of the feet—for walking over bogs.

The bog-oak is a tree favoring peat-bogs; the wood of the tree is black and dense, and is used for carvings. The word bog is of Irish origin, being from a Gaelic root that signifies a bobbing, quaking motion. See BENT GRASS; WASTE LANDS; PEAT; SPHAGNUM; MARSH.

BO'GAARD, MARTIN VAN DEN. See DESJARDINS, MARTIN VAN DEN BOGAARD.

BOGAERS, bō'girs, ADRIAAN (1795-1870). A Dutch poet, born at The Hague. He studied linguistics, and there were published two posthumous volumes of his, entitled respectively, *Taalkundige opstellen* (Philological Papers, 1872) and *Woordenboek op de dichtwerken van Bilderdijk* (Lexicon of Bilderdijk's Poetical Works, 1878). Better known, however, are his poems *De Togt van Heemskerk naar Gibraltar* (The Voyage of Heemskerk to Gibraltar, 1842) and *Jochebed* (1861). His collected poems have been edited by N. Beets (Haarlem, 1871).

BO'GAN, or NEW-YEAR RIVER. The Allan Water of Oxley, an interior stream of east Australia, joins the Darling after a generally north-westerly course of more than 300 miles, about latitude 30° S. and longitude 146° E. Its source is in the Harvey range, about latitude 33° S. and longitude 148° 30' E.

BOGARDUS, ANNEKE. See JANS, ANNEKE.

BOGARDUS, EVERARDUS (?-1647). A minister of the early Dutch Reformed Church in New Amsterdam, the second minister in the colony. In 1638 he married Anneke Jans, a widow, who owned 60 acres of land in what is now an important business part of New York. The farm subsequently came into possession of Trinity Church and up to 1847 was the occasion of many lawsuits for recovery by the descendants of one of the heirs of Anneke Jans and Bogardus. In 1647 Bogardus sailed for Holland to answer certain charges made by his ecclesiastical superiors, but lost his life by shipwreck in Bristol Channel. See JANS, ANNEKE.

BOGARDUS, JAMES (1800-74). An American inventor. He was born in New York, and became a watchmaker and engraver. His inventions include the eight-day, three-wheeled chronometer clock, and other improvements in timepieces; the ring-flyer for spinning cotton; the eccentric mill, in which both stones run the same way, but with different speed; an engraving-machine; a transfer machine for producing

bank-note plates from separate dies; the first dry gas-meter; the first pencil-case without a slot; a medallion engraving-machine; a machine for engine-turning; an improved method for making postage-stamps, etc.; a machine for pressing glass; several machines for cutting and working india-rubber; a new pyrometer; a dynamometer; and other contrivances of less importance. In 1847 he erected in New York for his factory a cast-iron building, the first one of that material ever erected. Soon afterwards he introduced wrought-iron beams.

BOG-ASPHODEL. See ASPHODEL.

BOG-BUMPER, **BOG-JUMPER**, or **BOG-PUMPER**. Names for the bittern.

BOG-BUTTER. An organic compound which has been found in the bogs of Ireland, and is known mineralogically as *Butyrellite*. Its properties and chemical composition led to the supposition that it was of vegetable origin, and had been formed by the decomposition of the peat in which it was found, especially so in consequence of its general resemblance to mineral resins, such as asphalt and bitumen. However, a thorough examination by McAdam in 1885 seemed to demonstrate its animal origin, as all of the samples analyzed showed the presence of hairs that were microscopically identical with those of a cow. It is probably safe to say that it is a variety of adipocere—i.e. that it was formed by the decomposition of animal matter out of contact with the air. It resembles butter in color and consistency, and becomes liquid at 51° C. (123.8° F.).

BOGDANOVITCH, bōg'dā-nō'vèch, IPPOLIT FEODOROVITCH (1744-1803). A Russian poet, born at Perevolotchna, Little Russia. His fame rests entirely upon his poem *Dushenka*, published in 1773. The story of Psyche forms the groundwork of the poem, which is characterized by a refined and graceful style and vivacious playfulness of language. Its publication made him famous, as well as obtained for him the high favor of the Court; but there can be no doubt that the popularity of the work was as much owing to the adventitious circumstances in which it was produced—nothing of the kind having been previously attempted in Russia—as to its intrinsic merits. Though he wrote much afterwards, he never equaled his first performance.

BO'GERMAN, JAN (1576-1637). A Dutch theologian, born at Oplevert, East Friesland. He actively participated in the Arminian controversy, was in 1618 president of the Synod of Dort, and in 1633 became professor of divinity at the University of Franeker. In addition to his translation of the *De la punition des hérétiques* of Beza as *Van Let Ketter straffen* (1601), he published the polemical *Annotationes contra H. Grotium*. He prepared, in collaboration with four others, a vernacular translation of the Bible. This rendering, of which the Old Testament was for the most part by him, continues to be the common Dutch version.

BO'GERT, GEORGE H. (1864—). An American artist, born in New York City. He was a pupil at the National Academy of Design, and afterwards went to Paris, where he studied under Puvis de Chavannes, Aimé Morot, and E. Boudin. He obtained the Webb prize for landscape in 1898, the first Hallgarten prize in

1899, and a bronze medal at the Paris Exposition of 1900. Mr. Bogert has confined his brush entirely to landscape.

BOGGS, CHARLES STUART (1811-88). An American naval officer, born in New Brunswick, N. J. He entered the United States Navy as a midshipman in 1826, became a lieutenant in 1837, served in Commodore Conner's squadron during the Mexican War; distinguished himself under Farragut at New Orleans, in April, 1862, and the same year was raised to the rank of captain. In 1870 he became a rear-admiral, and three years later was retired.

BOGGS, FRANK M. (1855—). An American artist, born in Springfield, Ohio. He studied at the Ecole des Beaux Arts in Paris, and afterwards under Gérôme. In 1885 he was awarded a prize of \$2500 at a competition in New York City for his "Rough Day at Honfleur," bought by the Boston Museum of Fine Arts. He was awarded a silver medal at the Paris Exposition of 1900. Mr. Boggs is represented at the Luxembourg Museum by a fine painting, "La Place de la Bastille," which was bought by the French Government in 1882.

BØGH, bøg, ERIK (1822-99). A Danish writer. He was born in Copenhagen, and first won a considerable reputation with his dramas, exceeding one hundred in number, and published collectively as *Dramatiske Arbejder*, 7 vols. (1858-71). He also published a volume of *Digte* (1855), and several prose works, including *Huldrebakken* (1852); *Kalifen paa Eventyr* (1857); *Hundrede Viser* (1862); and *Mester Olas Praediken* (1877). His style is in general characterized by finish rather than originality.

BOGHAZ-KIEUL, bō'gāz kyē'ē, or **KÖI, kē'ē**. A village of Asia Minor in the Vilayet of Angora, about 17 miles from the town of Yozgad, in latitude 40° 1' N. and longitude 34° 35' E. The modern village is insignificant, but the heights near by contain many ancient ruins and a number of remarkable sculptures. The place was an important seat of Hittite civilization, and fragments of pottery seem to show intercourse with the Mycenaean lands. For a description of the remains and drawings of the sculptures, consult Van Lennep, *Travels in Asia Minor* (London, 1870); and for the recent excavations, E. Chantre, *Mission en Cappadoce* (Paris, 1898), whose statements as to a Babylonian colony must be received with caution; consult also Hall, *Oldest Civilization of Greece* (London and New York, 1901). The common identification with the ancient Pterium has recently been rendered doubtful by the explorations of Dr. Belek.

BOGHEAD COAL. A bituminous coal of Scotland, more valuable for making gas than for fuel. The coal is named from the chief place of deposit, Boghead, Linlithgowshire. See **COAL**.

BOG-IRON ORE. A name applied to deposits of limonite (hydrous ferric oxide) that are often found in alluvial soils, bogs, meadows, lakes, etc. It is abundant in some of the northern and western islands of Scotland and in the northern countries of Europe generally; also in North America. Sometimes the ore accumulates with great rapidity; thus, in some Swedish lakes a layer half a meter thick accumulates

every fifteen to thirty years. Its constituent iron is dissolved out from the rocks by spring-water, from which it is precipitated in an insoluble form when exposed to the air. The amount of iron oxide in the ore commonly ranges from 40 to 50 per cent.; phosphoric acid is usually present in quantities varying from 2 to 11 per cent.; silica, alumina, oxide of manganese, and other substances make up the rest. The color of the ore is brown—either yellowish brown or blackish brown. Some varieties are earthy and friable and are formed of dull, dusty particles; others are in masses with an earthy fracture, often vesicular; still others are more compact and have a conchoidal fracture. The ore is often mixed with so much clay and sand that these have to be separated by washing before the ore can be used. Owing to the low percentage of iron, the commercial value of bog-iron ore is rarely very high, although the quality of the iron yielded is good. Bog-iron ore, which contains much clay and has a uniform color, is sometimes used as a paint. See **MINERAL PAINTS**; **IRON**; and **LIMONITE**.

BOGIŠIĆ, bō'gē-shich, BALTHASAR (1840—). A Slavic jurist. He was born in Ragusavecchia (Dalmatia), and studied in Vienna, Berlin, and Paris. In 1869 he was appointed professor of the history of Slavic law at Odessa, and was then charged with the task of elaborating a code of civil laws for Montenegro. In 1893-99 he was Minister of Justice in Montenegro. He has published several important studies, such as *Compilation of Legal Usages among the Southern Slavs* (1874), and *Aspeçu des travaux sur le droit contumier en Russie* (1879).

BOG-MOSS. See **SPHAGNUM**.

BOGNOR, bōg'nēr. A popular seaside resort in Sussex, England, on the English Channel, 5½ miles southeast of Chichester (Map: England, F 6). It has a fine pier and esplanade. Population, in 1891, 4600; in 1901, 6200.

BOGNOR BEDS. See **LONDON CLAY**.

BO'GO. A seaport town of Cebu, Philippines, situated 60 miles north of Cebu. It has a good harbor and a population of 16,400.

BOGODUKHOV, bō'gō-dōō'kōf, or BOHO-DUKHOV. A fortified town of Russia, capital of a district in the Government of Khar'kov, 40 miles northwest of the city of that name (Map: Russia, E 4). A town of some commercial significance until 1820, it has now lost all of its importance owing to new railways which have transferred its trade to other towns. Tanneries and flour-mills are the only industrial establishments. Population, in 1897, 12,000.

BOGOLYUBOFF, bō'gō-lyōō'bōf, ALEXEI (1824-96). A Russian painter. He was born at Pomerano (Novgorod), studied at the Imperial Academy of Design in Saint Petersburg, and under Achenbach in Düsseldorf, and in 1861 was appointed a professor at the Saint Petersburg Academy. He is best known for his marine views and sea-battles, including "Battle of Sinope" (1853); "Peter the Great with his Galleys"; and "Roadstead of Cronstadt" (1878).

BOG'OMILES. A religious sect which came into notice in the Twelfth Century, whose chief seat was in Thrace. They resembled the Paulicians and Cathari. Their name, if derived from the Slav. *Bog*, 'God,' and *miluy*, 'have

mercy,' may perhaps refer to the frequency of their prayers; but more likely it comes from Bogomil, the name of their founder. The basis of their creed was as follows: Out of the eternal divine essence or being sprang two principles—Satanal and Logos; the former, at first good, afterwards rebelled, and created in opposition to the original spiritual universe a world of matter and human beings. These human beings, however, received from the Supreme Father a life-spirit; but this was kept in slavery by Satanael until the Logos or Christ came down from heaven, and, assuming a phantom body, broke the power of the evil spirit, who was henceforth called only Satan. The Bogomiles, like all similar sects, practiced a severe asceticism, despised images, and rejected the sacraments. Instead of baptism, they placed their hands and an apocryphal Gospel of Saint John on the head of the neophyte, singing at the same time the Lord's Prayer, which they repeated seven times during the day and five times during the night. They accepted the whole of the New Testament, but of the Old Testament only the Psalms and Prophets, which they interpreted allegorically. In 1118 that vehement hater of heretics, Alexius Comnenus, burned their leader Basilus. Persecution, however, did not put an end to the Bogomiles, and at the time of the Mohammedan conquest of Bosnia (Fifteenth Century), we find that the greatest number of the renegade Christians who embraced the religion of the conquerors belonged to this sect. There are some Bogomiles even at the present day. Consult Heard, *The Russian Church and Russian Dissent* (New York, 1887).

BOGORODSK, b'gò-ròtsk'. The chief town of a district in the Government of Moscow, Russia, 52 miles east-northeast of the city of Moscow, on the Klyazma, and on a branch of the Moscow and Nizhni-Novgorod Railway (Map: Russia, E 3). It carries on a prosperous trade in silk and cotton fabrics, produced in the mills of the district, and in woolens, brandies, and liquors manufactured in the town. Population, in 1888, 2470; in 1897, 11,200.

BOGOS, b'gòz. An Abyssinian tribe inhabiting the highlands north of Abyssinia, about Keren. They speak a Hamitic language called Bilin, which is akin to the Agau, though Tigré is very generally understood among them. Their name, Bogos, means 'robber.' They are slightly above the medium stature, rather robust, and in color reddish-brown, betraying an admixture of negro and other blood. Primarily they belong to the Hamitic group. They are largely nomadic and pastoral. Nominally the Bogos are Christians, but the Christian religion has no very strong hold upon them. Their territory was for a long time an object of dispute between Egypt and the Abyssinian kings. It now forms a part of the Italian colony of Eritrea. For an account of the Bogos, consult: Munzinger, *Ostafrikanische Studien* (Schaffhausen, 1864); Brinton, *Races and Peoples* (New York, 1890).

BOGOSLOV, b'gò-slòf'. A volcanic islet off the northwest coast of Unalaska in the Aleutian Islands, Alaska, U. S. It was formed by a volcanic upheaval in the year 1796. It is a haunt of sea-lions.

BOGOTÁ, b'gò-tá' (under Spanish rule Santa Fé de Bogotá). The capital of Colombia and

an archiepiscopal city situated on a plateau, 8700 feet above sea-level, at the western base of the Guadalupe and Monserrate mountains, in the eastern Cordillera of the Andes (Map: Colombia, C 3). The plateau is surrounded by high mountains on all sides, except to the southwest, where the river Bogotá or Funcha cuts a narrow channel through a rocky precipice, on its way to the Magdalena, and 14 miles from the city leaps from a height of over 475 feet, forming what is called the fall of Tequendama. The climate of Bogotá is moist and moderate, the temperature varying between 57° and 61° F., with two rainy seasons each year. The city is regularly laid out, is rhomboidal in shape, and occupies an area of 6 square miles, measuring 3½ miles from north to south, and half that length from east to west. The city is divided into four parts by the San Francisco and San Augustin rivers, which are crossed by twenty bridges. The streets cross at right angles, are broad, well paved, and well shaded. Around the principal square, la Plaza de la Constitución, or de Bolívar, are the Government buildings and the cathedral, a magnificent edifice in the Corinthian style. In the middle is the bronze statue of Bolívar by Pedro Tenerani. The city possesses two theatres, a museum of natural history and antiquities, a national university, a public library of more than 50,000 volumes, a mint, and an observatory. The museum and library are situated in a former Jesuit monastery. The museum contains many interesting specimens of Inca civilization, and the library has a rich collection of plants and national literature. There are many churches and convents, and in the former may be found paintings by Murillo, Spagnoletto, and Vasques. The city is governed by a municipal council that elects the mayor and also the police inspectors of the wards (barrios), while one of the President's secretaries is the governor of the department.

Besides the national university there are colleges and schools giving instruction to more than 10,000 children of both sexes. There are about forty periodicals of all sorts, and the city ranks among the foremost in South America for culture and education. Bogotá suffers much from its lack of communication, but this is being remedied by governmental improvement of the roads and rivers throughout the country. There is a railroad to Girardot on the upper Magdalena. The city communicates with Honda and La Dorada on the Magdalena by highways, and a projected railway is to connect it with the Orinoco Basin. The industries of the city are not numerous, but include the manufacture of cloth, carpets, matches, glass, cordage, and porcelain. Through Bogotá passes the current of the import trade for the inland States of Colombia amounting to not less than \$25,000,000 a year, mostly carried on by natives of the country. The exports of the interior also find their point of distribution here. The district north and east of Bogotá is rich in coal, iron, limestone, sand, manganese, and fire-clay. At Zipaquirá, north of Bogotá, are large salt-mines, worked by the Government, which supply nearly the whole of Colombia with salt and are a great source of revenue.

Bogotá was settled in 1538 by the Spaniards under Gonzalo Jimenez de Quesada, on the site of Tensaquillo, but then called Santa Fé, after the founder's birthplace. In 1598 it became the

capital of the Viceroyalty of New Granada, and it was the meeting-place in 1811 of the Congress that followed Venezuela in declaring for a republic (November 12). The Spaniards seized it in 1816, but it was recaptured, and on the proclamation of the independence of the viceroyalty (July 20, 1810) it became the capital of the Republic of Colombia, which split up into three States—Venezuela, Ecuador, and New Granada—in 1831, since which time it has been the seat of the Government of New Granada, later Colombia. Population, about 100,000.

BOG-SPAVIN. See SPAVIN.

BOG-TROTTER. An appellation sometimes contemptuously given to the lower class of the Irish peasantry. It owes its point to the ability acquired by many of them of traversing the extensive bogs of their native country, where a stranger would find no secure footing, and in the frequent use which they have made of this means of escape from soldiers, officers of police, or other pursuers.

BOGUE, bōg, DAVID (1750-1825). A Scottish preacher, and the organizer of the London Missionary Society. He was educated at Edinburgh University, and in 1771 went to London, where he was for some time employed as a teacher. He afterwards accepted the charge of an Independent church at Gosport, where he established a seminary for the education of students who purposed to become Independent ministers, and in 1795 he and others organized the London Missionary Society. He also took an active part in the establishment of the British and Foreign Bible Society and of the Religious Tract Society. He was the author of *An Essay on the Divine Authority of the New Testament* (1801), which has had a wide circulation; *Discourses on the Millennium* (1813-1816); and, in connection with Dr. James Bennet, a *History of Dissenters*, from 1688 to 1808 (1812). Consult Morison, *Fathers and Founders of the London Missionary Society* (London, 1846).

BOGUE FORTS. Forts of granite masonry, erected by the Chinese on the rocky islands in the channel of the Boca Tigris (q.v.), to defend the approach to the city of Canton. One remarkable island mass of rounded granite with precipitous sides, rising to a height of about 400 feet, seemed to the Chinese as a tiger's head, though Europeans imagine that of an elephant. The waters of the channel formed the tiger's mouth, or, as the Portuguese translated it, 'boca tigris.' These forts were attacked and captured by the British in 1841 and again in 1856, and are now demolished.

BOGUSLAWSKI, bō'gōō-slāv'ské, ADALBERT (1759-1829). A Polish actor and playwright, born in Glinno. In 1790 he was appointed director of the Royal Theatre in Warsaw, where he established a school of dramatic instruction. He is to be regarded as the real founder of a Polish national drama, to whose repertory he contributed a large number of translations and original works. He also introduced opera into Poland. A complete edition of his dramas, in nine volumes, appeared in Warsaw in 1820-25.

BOGUUSLAV, bō'gōō-slāv'. A town of the Government of Kiev, Russia, situated on the river Rossa, about 100 miles from the city of Kiev. It has a trade in woollens, leather, and sheepskins, and a population of 9000, 67 per

cent. of which is Jewish. The town was annexed to Russia in 1793.

BOHADDIN, bō'hā-dēn', or **BEHA-EDDIN** (ABUL-MOHASSEN YUSUF-IBN-SHEDDAD) (1145-1234). An Arabian historian and statesman. He was born in Mosul, and after concluding his studies there settled first as a tutor in Bagdad, but in 1173 he returned to his native place. In 1187 he went on a pilgrimage to Mecca and Medina, and later to Jerusalem and Damascus. By a work on the *Laws and Discipline of Sacred War*, he attracted the attention of Saladin, and until the death of that prince he was in his employ as cadi of Jerusalem and of the army. After the death of Saladin he remained in the service of Saladin's successor as cadi of Aleppo, where with his own means he established a school. His most important work was a *Life of Saladin*, which was published, with a Latin translation by Schulteus (Leyden, 1732). He died in 1234.

BOHEMIA (Med. Lat., from Lat. *Boiohaemum*, from *Boii*, a Celtic tribe + OHG. *heim*, Old Sax. *hēm*, home; called by its Slavic inhabitants, the Czechs, Cechy). A former kingdom of Europe, and now a crownland of the Cisleithan (Austrian) half of the Austro-Hungarian monarchy (Map: Austria, D 2). It occupies the northwestern end of Austria, and is bounded by Saxony on the northwest, Prussian Silesia on the northeast, Moravia and Lower Austria on the southeast, Upper Austria on the south, and Bavaria on the southwest. Extending from latitude 48° 34' to 51° 3' N., and from longitude 12° 7' to 16° 50' E., it comprises an area of 20,060 square miles.

Bohemia is separated from Germany by mountain barriers, which cover all the three sides on which it touches that empire. The Bohemian Forest forms the boundary line on the southwest, the Erzgebirge, or Ore Mountains, on the northwest, and the Riesengebirge, or Giant Mountains, on the northeast. These mountain ranges, together with the Bohemian-Moravian highlands, in the southeast, form a great basin, in the shape of a lozenge. In the interior there are some minor elevations. The rivers of Bohemia, with a few exceptions, flow from south to north. The Elbe, which rises on the northeastern frontier, with its numerous tributaries, drains the larger part of the area. After Elbe, the chief rivers of Bohemia are the Moldau and the Eger, both tributaries of the Elbe. In the northwestern part of the country are famous mineral springs, including those of Karlsbad, Marienbad, Franzensbad, and Teplitz.

The climate of Bohemia is Continental in its character. The average annual temperature of Prague, in the centre of the region, is 48.6°. The maximum reached at Prague, for a period of 30 years, is 97.5° F., and the minimum is 16.24° F. The climate is healthy throughout, mild in the valleys and cold in the mountains, the higher peaks being covered with snow during a considerable part of the year.

Bohemia is still an agricultural country, although some of its manufactures have attained a very high degree of development. The soil is generally fertile, especially in the districts along the upper Elbe, in the vicinity of Königgrätz, in the valley of the Eger, in the lands called the 'Paradise,' near Teplitz, and in a tract in the midland mountains. The chief agricultural prod-

ucts are cereals, to which about 64 per cent. of the arable land is devoted. Potatoes, sugar-beets, hops, flax, and fruits are grown. The grain of Bohemia is of excellent quality, while its hops are famous throughout Europe.

It is estimated that of the total area of about 12,840,000 acres, 99 per cent. is productive. Of this, about 50.50 per cent. is arable land, 29 per cent. forest land, covered mainly with conifers, 10 per cent. meadows, and 5 per cent. pasture-land. A great part of the land is divided into small holdings. In 60 per cent. of it there are about 600,000 holdings, half of which embrace less than 1.5 acres each. The remainder, about 5,000,000 acres, is divided into about 1800 holdings. Cattle-raising forms a very important adjunct to agriculture. Horned cattle, sheep, goats, and swine are reared extensively in some districts, and in the south geese form an important item in the resources of the country. Silk-culture and bee-keeping receive considerable attention.

The forests of Bohemia, in which various kinds of game are found, are very extensive, and the lumber industry gives occupation to a considerable part of the population. Next to agriculture, mining occupies the first rank. In regard to its mineral deposits, Bohemia stands first among the crownlands of Austria-Hungary, the annual value of its mineral products exceeding \$20,000,000. About nine-tenths of this sum represents the value of the lignite and coal mined. The bulk of the remainder represents the product of silver, iron, and lead. Among other metals obtained in considerable quantities are gold and tin. Copper, nickel, cobalt, antimony, arsenic, uranium, and tungsten are also found. Other mineral products are alum, kaolin, and garnets. Bohemia is famous for its manufactures of glass, and its textile industries are on a vast scale. The manufacturing of beet-sugar is also very important, as well as the distilling of spirits. There are large iron and steel works, and the manufacture of chemicals is extensively carried on. Among other important industries are the manufacture of agricultural implements, paper-making, and milling. The beer of Pilsen and the china of Karlsbad are celebrated. The tobacco-factories employ about 10,000 hands, mainly women. In general, Bohemia is not only the most important manufacturing province of Austria-Hungary, but also one of the most advanced among the manufacturing countries of Europe. Most of the manufacturing is carried on on a large scale, and the tendency toward concentration is very pronounced. There are still, however, a number of industries carried on almost exclusively in the houses of the workmen, such as lace-knitting, the manufacture of musical instruments, toys, etc.

The commerce of Bohemia is naturally very extensive, and is greatly facilitated by the numerous financial institutions, as well as by the excellent transportation facilities. In 1898 Bohemia had a total railway mileage of about 340, or about 17 miles of railroad per 100 square miles of territory, which is as much as the States of New York and Indiana have. The chief navigable river is the Elbe, and there is also a considerable mileage of artificial waterways.

The Diet of Bohemia consists of 242 members, including the Archbishop of Prague, the heads of

the three sees of Leitmeritz, Königgrätz, and Budweis, two rectors of universities, 70 representatives of the large landholders, 87 representatives of towns and chambers of commerce and industries, and 79 representatives of the rural communities. The representatives of the landed aristocracy, as well as those of the towns and industrial centres, are elected directly on a property qualification, while the delegates from the rural communities are elected by a board of electors returned by voters paying a certain amount of taxes. Bohemia is represented in the Lower House of the monarchy by 110 members, of whom 23 represent the landed nobility, 32 the towns, 7 the chambers of commerce, 30 the rural communities, while 18 are elected by all qualified voters.

Public education in Bohemia is well advanced, the line of demarcation between the two elements of the population, Czech and German, being very sharply drawn. There are a German and a Czech university at Prague, the former of which was founded in 1348, several technological institutes, over 40 gymnasias, besides a considerable number of real gymnasias (i.e. gymnasias with a scientific instead of a classical course), preparatory schools, and trade and commercial schools. There are nearly 5500 elementary schools, of which 2315 are German. The schools are attended by about 1,040,000 pupils, or 98 per cent. of the school population.

The population of Bohemia in 1900 was 6,318,697, or nearly 315 per square mile, making Bohemia one of the best-populated crownlands of Austria-Hungary. The increase for the last decade was 8.10 per cent., against 5.16 per cent. for the period of 1880-90. In regard to nationality, the population is 63 per cent. Czech (see division on *History*) and 37 German. The Catholic religion is professed by 96 per cent. of the population, while somewhat more than 2 per cent. belong to the different Protestant denominations and 1.6 per cent. profess the Jewish religion. The capital, Prague, had a population of 204,478 in 1900.

HISTORY. In the First Century B.C., the Celtic people, called Boii, who had settled in Bohemia and who gave it its name, were compelled by the advance of the Germans to emigrate from the country. Bohemia was then occupied by the warlike tribe of the Marcomanni. At the time of the great migration of nations the Marcomanni moved westward, and in the Sixth Century we find the region peopled by Slavic immigrants, who soon appear under the common name of Czechs. By the close of the Ninth Century the petty chiefs who ruled the Czechs had been converted to Christianity, which in the main was introduced by the Germans, while the conversion of the adjoining Moravians was undertaken by the great missionaries of the Eastern Church. For a brief period Bohemia formed part of the great Moravian realm of Svatopluk, which fell before the onslaught of the Magyars at the beginning of the Tenth Century. From about this time Bohemia was united under the sway of a line of dukes of the House of Přemysl, who acknowledged the overlordship of the kings of Germany. In the latter part of the Tenth Century the bishopric of Prague was constituted. The princes of the House of Přemysl sought to elevate themselves to the rank of kings, and from the close of the Twelfth Century they were

permanently recognized as such by the German sovereigns, their State forming part of the Holy Roman Empire of the Germans. Under Ottokar II. (1253-78) Bohemia was for a brief period one of the most powerful realms in Europe. His sway extended from the region of the Elbe to the shores of the Adriatic. Ottokar succumbed to the arms of the Emperor Rudolph of Hapsburg, and his realm was dismembered. His son, Wenceslas II. (1278-1305), who succeeded him in Bohemia and Moravia, was also King of Poland. Ottokar II. and Wenceslas II. did much for the civilization and economic development of Bohemia by encouraging the immigration of German artisans and colonists. With the death of Wenceslas III., in 1306, the dynasty of Přemysl became extinct. From 1310 to 1437 Bohemia was ruled by a line of kings of the House of Luxemburg—John (1310-46), Charles (1346-78), Wenceslas (1378-1419), Sigismund (1419-37). The last three were emperors of Germany. Charles of Luxemburg, who was German Emperor as Charles IV., exerted himself in every way to promote the welfare and greatness of Bohemia. In 1348 he founded the University of Prague, the first established within the bounds of the old German Empire. The good work of Charles was to a great extent undone by the incompetence of his son, Wenceslas. His reign witnessed the great religious movement inaugurated by John Huss and Jerome of Prague. This was one of the most significant anticipations of the Reformation of the Sixteenth Century. The Hussite Wars (q.v.) broke out in the year in which Wenceslas died and lasted at most to the end of the reign of his successor, Sigismund, who, in addition to being German Emperor, was King of Hungary. The Bohemians heroically repulsed the crusading forces of the Catholic Church, and then engaged in a bloody internecine religious strife.

The Hussite movement quickened the spirit of nationality among the Czechs, and arrested the process of Germanization which had made such progress under Charles of Luxemburg. Endless internal dissensions and the extraordinary complexity of the political fabric, with its maze of jurisdiction, stood, however, in the way of the erection of a permanent Slavic monarchy. From 1458 to 1471 the throne of Bohemia was occupied by the shrewd and able George Podiebrad. His successor, Ladislas II., of the Polish House of Jazellon (1471-1516), was chosen to succeed Matthias Corvinus on the throne of Hungary. Louis, the son and successor of Ladislas II., was likewise King of Hungary. He lost his life in 1526 on the field of Mohács, where Sultan Solymán the Magnificent overwhelmed the Hungarians. The Estates of Bohemia now bestowed the crown upon Louis's brother-in-law, Ferdinand of Hapsburg, the brother of the Emperor Charles V. Ferdinand ruled over the old hereditary dominions of the House of Austria, and simultaneously with his election in Bohemia was chosen King by a portion of the Hungarians. Thus were laid the foundations of the Slav-German-Magyar State of Austria-Hungary. The Bohemian realm, or the lands belonging to the crown of Saint Wenceslas, at this time included Bohemia, Moravia, Silesia, and Lusatia. The crown of Bohemia soon became virtually hereditary in the House of Hapsburg. The Hussite movement had paved the way for the introduction of the Reformation

into Bohemia. The Hapsburgs directed their energies toward the suppression of Protestantism, and in the struggle that ensued Bohemia lost alike her political freedom and her religious liberties. Ferdinand I. was unable to stem the progress of the Reformation, which continued to spread rapidly under his successors. Bohemia had arrived at a high state of culture at this time. The University of Prague was one of the greatest seats of learning in Europe. The national literature of the Czechs witnessed its Golden Age in the First Century after the Reformation. In 1618 the Protestants of Bohemia rose against the Hapsburgs and precipitated the struggle of the Thirty Years' War. In 1619 the Bohemian estates placed the crown upon the head of the Elector Palatine, Frederick V. (son-in-law of James I. of England), who had to take up the struggle against the Catholic League of Germany, in arms for the newly elected Emperor of Germany, the bigoted Ferdinand II. of Austria. The Catholic forces triumphed at Prague (battle of the White Mountains) in November, 1620. Bohemia lay prostrate at the feet of Ferdinand, who wreaked his vengeance in a merciless way, crushed out Protestantism, and turned the country over to the Jesuits.

Bohemia was a bloody battle-ground in the Thirty Years' War, which ended where it had begun, at Prague. It is estimated that the population of about 2,000,000 was reduced to 700,000, and the civilization of the country suffered a blow from which it never recovered. The people bore meekly the rule of the Hapsburgs, no considerable portion of the population being any longer estranged from them by differences of religion. In the latter part of the Eighteenth Century, however, there was a vigorous reawakening of the national feeling among the Czechs, which, under the stimulus of patriotic writers, gradually developed into an active yearning for national independence. An emphatic utterance was given to this sentiment in 1848, when a Pan-Slavic Congress was convened in Prague. At this time the capital was the scene of an insurrection, which was suppressed by the guns of Windischgrätz. Since then the efforts of the Czechs to regain their autonomy have played an important part in the history of the Empire. The reorganization of Austria-Hungary on the present dualistic basis only intensified the antagonism between the Germans and the Slavs of Bohemia. The Czechs refused to enter the Vienna Reichsrat of 1867; their leaders, Palacky and Rieger, ostentatiously attended the Pan-Slavic Congress at Moscow in 1868, and the demands for national autonomy grew more emphatic with each concession, made by the Taaffe and Badeni ministries, as to the establishment of a Czech university at Prague and the status of the Czech language in the courts and the administration. United as the Czechs are as against the Germans on national issues, they are sharply divided within themselves on other points, the Old Czechs representing the feudal and clerical party, and the Young Czechs the radical and irreconcilable element. It is the latter that has within recent years placed itself into such violent antagonism to German pretensions in the Vienna Reichsrat. The apparent impossibility of reconciling the Czechs to the existing order of things in Austria-Hungary constitutes the chief danger that threatens the stability of the Empire.

BOHEMIAN BRETHREN. See BRETHREN, BOHEMIAN.

BOHEMIAN FOREST, or BÖHMERWALD. A mountainous region of Central Europe, separating the Austrian crownland of Bohemia from Bavaria, and extending from the Fichtelgebirge on the northwest to the Danube, below Passau, on the southeast. It forms part of the watershed between the basins of the Elbe and the Danube (Map: Germany, E 4). The region is about 125 miles long and from 20 to 40 miles wide, and covers an area of about 4400 square miles, of which a considerable portion belongs to Bavaria and forms what is known as the Bavarian Forest, or *Bayrischer Wald*. The region is thickly covered with forests, which grow to an altitude of 4000 feet, and abounds in picturesque scenery. The highest summits, which are found in the Bavarian section, in the group of the Arber (Great Arber, Rachel), exceed 4700 feet. The rock formation is chiefly granite, schist, and gneiss. The rainfall is very heavy, and there is an abundance of pasture. The chief products are grain. The inhabitants of the region are chiefly Germans and Czechs.

BOHEMIAN GIRL, THE. The title of a popular opera by Balfe (1843), the book being by Bunn. "Then You'll Remember Me" is a very familiar song from it.

BOHEMIAN LANGUAGE AND LITERATURE. See CZECH LANGUAGE.

BOHEMUND I. (Lat. *Bohemundus*) (c.1055-1111). The eldest son of Robert Guiscard, the Norman Duke of Apulia and Calabria, born some time between 1052 and 1060. He distinguished himself in the war carried on by his father against Alexius Comnenus (1081-84). Robert Guiscard died in 1085, leaving his property to his younger son, Roger, but Bohemund fought with the latter until 1089, when a peace was made by which Bohemund received a part of Apulia. When the First Crusade was preached Bohemund saw in it an opportunity for extending his possessions. He was the ablest of all the Crusaders, and as long as he remained with them was really their leader, although not officially recognized as such. In June, 1098, when Antioch was captured, he received it as a principality and remained there, taking no further part in the expedition against Jerusalem. In August, 1100, he was captured by the Mussulmans, and held a prisoner until May, 1103. During his absence his cousin, Tancred, ruled over Antioch. In 1104, after suffering a great defeat, he returned to the west to seek aid, and while in France married Constance, the daughter of Philip I. In 1107 he found himself at the head of a large army of adventurers, who had been attracted by his renown. Seized with the restless Norman desire of adventure, he led his forces against the Greek Empire, with

which he had been at enmity since 1098. He failed, and after a year's fighting a peace was made by which Bohemund became the vassal of the Emperor for his principality of Antioch. He never returned to Syria, going instead to Apulia, where he died in 1111. Consult Hagenmeyer's *Gesta Francorum* (Heidelberg, 1890), which, in the notes, gives full reference to all facts.—**BOHEMUND II.**, son of Bohemund I., was a minor at the death of his father, and became Prince of Antioch only in 1126. In 1127 he married Alice, daughter of Baldwin II. of Jerusalem. He was killed in battle in 1130. The later rulers of this name are of little importance. Their dates are: **BOHEMUND III.** (1162-1201); **BOHEMUND IV.** (1201-33); **BOHEMUND V.** (1233-51); **BOHEMUND VI.** (1251-68), the last Prince of Antioch. Consult Röhrich, *Geschichte des Königreichs Jerusalem* (Innsbruck, 1898).

BOHLEN, bö'l'en, PETER VON (1796-1840). A German Oriental scholar. He was born at Wuppels in Oldenburg, studied at Halle and Bonn, and after 1826 was professor of Oriental languages at Königsberg. Among his publications are: *Das alte Indien* (1830-31); *Die Genesis historisch-kritisch erläutert* (1835); and editions of the *Sententiæ* of Bhartṛihari and the *Ritusanhara* of Kalidasa. Consult his *Autobiographie*, edited by Voigt (Königsberg, 1841).

BÖHLER, bë'lër, PETER (1712-75). A Moravian bishop and theologian. He was born in Frankfort-on-the-Main, December 31, 1712; was educated at Jena; went to Amsterdam in 1738; and founded Nazareth, in Pennsylvania (1740), and exerted a formative influence upon the religious opinions of John and Charles Wesley, whom he met in the early meetings of the Moravian Church in London (1738). He died in London, April 27, 1775.

BÖHM, bëm, THEORALD (1794-1881). A Bavarian flute-player and manufacturer of wind-instruments. He is chiefly remembered for his improvements in the construction of the flute. He wrote *Ueber den Flötenbau und die neuesten Verbesserungen desselben* (1847), and *Die Flöte und das Flötenspiel*, and also had some reputation as a composer.

BÖHME, bë'me, or **BÖHM**, bëm, JAKOB (1575-1624). A German theosophist and mystic. He was born of poor parents at Altseidenberg, near Görlitz, in Upper Lusatia, and spent his boyhood in tending cattle. He received no instruction till he was ten years of age; but even then the contemplation of earth and sky had so excited his naturally pious imagination that he conceived himself inspired. He learned the trade of a shoemaker, but continued to devote much of his time to meditation on divine things. About 1612 he composed his first book, called *Aurora, oder die Morgenröte im Aufgang*. The manuscript fell into the hands of the authorities, got him into trouble, and was condemned as heretical. It was not published till 1634. Böhme's fundamental doctrine is that everything exists and is intelligible only through its opposite. Thus, in the very nature of goodness evil is necessary as an element in its perfection. Without evil the will would rest content with its present state, and progress would be impossible. God himself contains conflicting

elements in His nature, the whole sensible universe being a constituent in His divine holiness. Böhme stated his doctrine in technical theosophic language which makes it quite unintelligible to the uninitiated. Numerous attacks from theologians disturbed Böhme's last years, but he bore them all with great meekness. They were probably occasioned by a tract on repentance, *Der Weg zu Christo*, which his friends had printed without his knowledge. In addition to the two works already mentioned, perhaps his *Mysterium Magnum* should be noted as a characteristic production. The first collection of his writings was published by Beets (Amsterdam, 1660); the most complete in 1730, at the same place; and the latest (1831-47), by Schiebeler, at Leipzig. Next to Germany, Holland and England are the countries in which Böhme's works have been received with most favor. In England, where Böhme was generally called Behmen, a translation was published by William Law in 1764. In 1697 Jane Lead, a fanatical disciple of Böhme, founded a sect called the Philadelphians, for the exposition of his writings. In more recent times, and in connection with speculative philosophy in Germany, his views, which had come to be regarded as empty mysticism, have acquired fresh interest and importance. This arises from the kindred character of his fundamental principle with the spirit pervading the systems of Spinoza, Schelling, and Hegel. The intellectual contemplation of the absolute, out of which the contradictions in the world of phenomena proceed, and into which they return, is common to these systems and to Böhme; Hegel, indeed, expressly represents Böhme's negativity, the active principle of development, as an obscure foreshadowing of his own intuitions, and on that account places him at the head of modern philosophy. Consult: Hamberger, *Die Lehre des deutschen Philosophen Jacob Böhme* (Munich, 1844); Fechner, *Jacob Böhme, sein Leben und seine Schriften* (Görlitz, 1857); Peip, *Jacob Böhme, der deutsche Philosoph* (Leipzig, 1860); and Hartmann, *Life and Doctrines of Böhme* (London, 1893).

BÖHMER, bē'mēr, JOHANN FRIEDRICH (1795-1863). A German historian. He was born in Frankfort-on-the-Main, studied in Heidelberg and Göttingen, and from 1830 to 1862 was librarian of Frankfort. In various libraries and archives of the Continent he made valuable researches for the sources of German history during the Middle Ages. His books include *Urkundenbuch der Reichstadt Frankfort*, Vol. I. (1836); *Die Regesten des Kaiserreichs*, etc. (1844, 1849, 1857); and *Fontes Rerum Germanicarum*, Vols. I-IV. (1843-68).

BÖHMERT, bē'mért, KARL VICTOR (1829—). A German writer on political economy. He was born in Quesitz, Saxony, and studied in Leipzig. In 1857-60 he edited the *Bremer Handelsblatt*, from 1866 to 1875 he was professor of political economy at the University of Zürich, and from 1875 to 1895 director of the bureau of statistics of Saxony. He was appointed in 1875 professor of political economy and statistics at the technological institute in Dresden. He has sought steadfastly to promote free trade, and to liberate German industry from its medieval restrictions. He has in many ways sought to improve the con-

dition of the working classes, and has written *Briefe zweier Handwerker* (1854); *Freiheit der Arbeit* (1858); *Der Sozialismus und die Arbeiterfrage* (1872); and other important studies.

BÖHMERWALD, bē'mēr-vált. See BOHEMIAN FOREST.

BÖHMISCH-LEIPA, bē'mish lī'pá. See LEIPA.

BOHN, bōn, HENRY GEORGE (1796-1884). An English author, translator, and publisher, of German parentage, born in London. He rendered a valuable service to the English-speaking world by republishing, at a cheap rate, a vast number of the most valuable works in literature, science, philosophy, and theology. He obtained distinction as the editor of the *Bibliotheca Parviana*, of Lowndes's *Bibliographer's Manual* (1857-58), and as a translator of Schiller, Goethe, and Humboldt. He also compiled a *Polyglot of Foreign Proverbs* (new ed., 1884); a *Pictorial Handbook of Modern Geography* (1847); and a *Handbook of Pottery and Porcelain* (1849). He acquired great wealth and made valuable collections of china, paintings, ivories, etc.

BOHNENBERGER, bō'nen-bérk'ér, JOHANN GOTTLIEB FRIEDRICH VON (1765-1831). A German astronomer and mathematician, born at Simmozheim, Württemberg. He studied at the University of Tübingen; in 1796 became connected with the observatory of the University, and in 1798 was appointed professor of mathematics. He was an assistant editor of several scientific periodicals, and published *Anleitung zur geographischen Ortsbestimmung* (1795), an *Astronomie* (1811), and *Anfangsgründe der höhern Analysis* (1812).

BOHNSTEDT, bōn'stét, LUDWIG (1822-85). A Russo-German architect of note, born in Saint Petersburg. He studied in Berlin at the University, the School of Architecture, and the Art Academy, and in 1858 was appointed a professor in the Art Academy in Saint Petersburg. In Russia he made the plans for the reconstruction of the Chinese palace at Oranienbaum, and for numerous prominent buildings in Saint Petersburg, Moscow, and Riga. In 1863 he left Russia, and removed to Gotha, where he died. His most important work is generally considered to be the Cathedral of San Torquato at Guimarães, Portugal.

BOHOL, bō-hōl'. One of the Bisayas group of the Philippine Islands, in latitude 9° 50' N., and longitude 124° 15' E., situated between the islands of Cebu, Leyte, and Mindanao (Map: Philippine Islands, J 10). It is about 47 miles long and 34 miles wide. Its surface, covering 1440 square miles, is generally mountainous and the north and west coasts are bordered by reefs. The island is not very fertile, but produces cacao, tobacco, cotton, hemp, rice, sugar, and corn, and is also well wooded. Tagbilaran is the provincial capital. Under the Spanish régime Bohol formed, together with the neighboring island of Davao, the province of Bohol, with a population of 247,745 inhabitants.

BO'HOR. An antelope (*Cervicapra bohor*), one of the larger reitboks. It ranges in East Africa from Abyssinia to Rhodesia. See REITBOK.

BÖHTLINGK, bêt'lipk, OTTO VON (1815—). A Russian-German Orientalist and Sanskrit scholar. He was born in Saint Petersburg, studied there and in Berlin and Bonn, and in 1842 returned to Saint Petersburg. He became a member of the Academy of Science in 1855 and a privy councillor in 1875. In 1868 he left Russia and moved to Jena. In 1885 he moved again to Leipzig. In collaboration with Prof. Rudolph Roth of Tübingen, he published his most important work, the great *Sanskrit Wörterbuch* (Saint Petersburg, 1853-75). An abridgment and supplement of this appeared in 1879-89. His edition of the great Sanskrit grammarian Panini (2d ed., Leipzig, 1878), and of a series of Sanskrit apothegms and proverbial verses, *Indische Sprüche* (2d ed., 3 vols., Saint Petersburg, 1870-73), are standard works; and among his many other publications may be mentioned a *Sanskrit-Chrestomathie* (Saint Petersburg, 1845; 2d ed., ib. 1877-97), and an edition with translation of a treatise on Hindu poetics by Dandin, *Kāvya-darśa* (Leipzig, 1890).

BO'HUN. The name of several English nobles. HUMPHREY, fifth of the name (?-1247), went on the Crusades in 1250, in 1257 was in charge of a portion of the Welsh marches, supported the King against Simon de Montfort, and was taken prisoner at Lewes (May 14, 1264). —HUMPHREY, seventh of the name (?-1298), was prominent with Roger Bigod in opposition to the measures of arbitrary taxation resorted to by Edward I. During Edward's absence in Flanders he and Bigod obtained from the regent a confirmation of the charters, with supplementary articles whereby the King was to surrender the right to taxation without national consent. This confirmation was subsequently ratified by the King. —HUMPHREY, eighth of the name (1276-1322), joined the barons in their armed protest against Piers Gaveston, the favorite of Edward II. In 1321 he appeared with troops in London in revolt against the Despencers, who were forthwith banished. In October of that year, however, Edward took the field in attack upon Bohun and other rebellious lords, and Bohun was killed at Boroughbridge (Yorkshire) March 16, 1322.

BOIARDO, bō-yār'dō, MATTEO MARIA, Count of Scandiano (c.1434-94). A celebrated Italian poet, born at Scandiano. Educated at the University of Ferrara, he long resided at the Court of Borso and Ercole d'Este, Dukes of Ferrara, who were his steadfast friends and patrons. He was made Governor of Reggio in 1478, Captain of Modena in 1481, and was in 1487 reappointed Governor of Reggio, continuing in this office until his death. Encouraged in his literary ambitions by his masters, he produced his *Orlando Innamorato* (1486), a wildly romantic epic, only three books of which were attempted, the third being left incomplete. The poem, published in 1495, was written in ottava rima (which Byron employed so skillfully in *Don Juan*), and is concerned with the Charlemagne cycle, representing Roland in love with the Princess Angelica of the East. Gorgeous in coloring, and filled with chivalrous incident, it was thrice reprinted before 1520, passed through sixteen editions before 1545, and, early translated into French, has gone into almost every European language. Three additional books were written by Niccolò degli Agostini (1506-31), which, though very medio-

cre, have remained a part of the poem. In 1541 Francesco Berni brought out his *rifacimento*, and in 1545 another version was completed by Lodovico Domenichi, both of which proved more popular than the original, though not so meritorious. The poem is the more famous as having suggested Ariosto's *Orlando Furioso*. Almost forgotten, the original form was issued by Panizzi in 1830-31. Other works by Boiardo are: *Sonnetti e canzoni* (1499); *Il Timone* (1500); *Carmen Bucolicon* (1500); *Capitoli in terza rima* (1523); *Apulejo dell' asino d'oro* (1516); *Asino d'oro de Luciano tradotto in volgare* (1523); *Erodoto Alicarnasseo istorico, tradotto di greco in lingua italiana* (1533). Consult Panizzi, Boiardo, *Orlando Innamorato*; Ariosto, *Orlando Furioso*, with an essay on the Romantic Narrative Poetry of the Italians, *Memoirs, and Notes* (9 vols., London, 1830).

BOIELDIEU, bwa'ldyē', FRANÇOIS-ADRIEN (1775-1834). An eminent composer of French *opéra comique*. He was born December 15, 1775, Rouen, son of an archbishop's secretary. He ran away from his teacher, the organist Broche, to Paris (1787), whence he was ignominiously brought back; and Broche's lessons seem to have been all the formal instruction that Boieldieu received. The local success of his operas *La fille coupable* (1793) and *Rosalie et Myrza* (1795) induced him to go again to Paris, where he had to earn a living by tuning pianos for the Erards. Here he made the acquaintance of Méhul, Cherubini, and the tenor Cîrat, who made Boieldieu famous by singing his songs in public. *Les deux lettres* (1796) and *La famille suisse* (1797) had an enormous success at the Opéra Comique. He published various instrumental pieces and then triumphed again with *Calife de Bagdad* (1800). Some caustic remarks of Cherubini about "undeserved success" made Boieldieu apply himself to serious study of counterpoint, the results of which were noticeable in *Ma tante Aurore* (1802). About this time his home life became so unbearable that he removed to Saint Petersburg (1803) to become *maître de chapelle* to the Court. In the eight years of his sojourn there he produced no work of merit, though bound by contract to write three operas annually in addition to other specified duties. Lung trouble hastened his return to Paris, where *Jean de Paris* (1812) was hailed with delight. He succeeded Méhul (q.v.) as professor of composition in 1817; *Le chaperon rouge* was given in 1818, and after a seven-year silence, *La dame blanche*, generally conceded to be his masterpiece, created a veritable sensation. The next work, *Les deux nuits* (1829), had only a *succès d'estime*, and Boieldieu did not try his hand again. He retired from the Conservatory on a pension, but this was revoked by the Government in 1830. Boieldieu died near Grosbois, October 8, 1834, of laryngeal phthisis, his sufferings somewhat relieved by the care and love of his second wife. His operas—of which *La dame blanche*, *Jean de Paris*, and *Le Calife de Bagdad* still hold the stage—are the finest examples of *opéra comique* in its earlier stage of development. Genuine comedy, intermingled with romanticism, seductive melody, orchestration that fairly glows with color yet never obscures the voice, grace, delicacy, and unflagging interest—such are the characteristics of Boieldieu's music. The list of works written in collaboration with Cherubini, Méhul, Isouard, Berton,

Kreutzer, and others runs into dozens. Among his pupils, the most famous were Adam, Fétis, Zimmermann, and Labarre. Consult: A. Pougin, *Boieldieu, Sa Vie et ses Œuvres* (Paris, 1875); and G. T. Ferris, *Great Musical Composers* (New York, 1887).

BOIES, HORACE (1827—). An American politician. He was born in New York, and in 1858 was a member of the New York Assembly, but removed to Iowa in 1867. In 1883 his opposition to the tariff and prohibition policy of the Republican Party, which he had joined in early life, led him to identify himself with the Democrats, by whom, in 1889, and again in 1891, he was elected Governor of Iowa.

BOII, bō'i-i. A Celtic people, who early migrated eastward from Gaul into northern Italy, Bohemia, and the region of the Eastern Alps. In Italy they stubbornly resisted the Romans, sometimes victors, often vanquished. They united with both Hannibal and a lesser Hamilcar against the common enemy, but in B.C. 191 they were definitely defeated by Scipio Nasica, and about half their lands seized. About a century and a half later the Germanic peoples pressed into the northern abodes of the Boii, who were unable to resist them. A fragment of the tribe joined the Helvetians in their migration into Gaul, and were met by Cæsar, who settled them in the land of the Ædui. The country of the Boii, to the north of the Danube, after it had been overrun by the Marcomanni, was still called Boiohæmum, the land of the Boii, the modern Bohemia. Another survival of the name is Bavaria.

BOIL (allied to Lat. *bullā*, a bubble), or **FURUNCLE** (Lat. *furunculus*). An acute circumscribed suppurative inflammation of the skin and subcutaneous tissue. It begins as a small hard point of a dusky-red color, which is hot, painful, and throbbing. This point extends, and during several days these symptoms increase in severity until finally the boil ceases to enlarge. It is then of a conical form, with a broad, firm base, and presents on the apex a whitish blister, which contains a little pus. This opens, and after a few days more there is discharged a core or slough of cellular tissue, and the small cavity left heals rapidly, leaving a white depressed scar. Boils are most common in the spring, and in young and plethoric persons, and their appearance is quite consistent with robust health. Men somewhat overtrained for athletic contests, and others who have suddenly changed their diet and daily habits, are subject to them. In some, boils continue to succeed each other for a length of time. In the treatment of boils, the intestinal canal should be cleared out by laxative medicines, and the digestive power improved by tonics and antacids. The skin should be kept healthy by frequent washing, while the inflamed spots should be poulticed with a solution of flaxseed mixed with an antiseptic, to avoid infection of neighboring parts. A weak antiseptic lotion (bichloride of mercury, 1 to 5000, or carbolic acid, 1 to 200) is a sufficient application after the core has been thrown off. Deep incision after pus appears is the best and most satisfactory treatment. The cause of boils is infection with a pus-germ, generally the *Staphylococcus bacillus*, which enters a hair-follicle or a sweat-gland.

ALEPPO BUTTON or Aleppo Boil.—An endemic disease of hot countries, consisting of a scab or

an ulcer which attacks the face chiefly, and is due to infection of a micro-organism. It is also called *Biskra button*, *Gafsa button*, *Kandahar sore*, *Natal sore*, *Delhi boil*, and *Oriental boil*. It is found in the countries bordering the southern and eastern shores of the Mediterranean Sea, in Crete, Cyprus, the Crimea, and especially in Persia. It was first described by Russell, who saw it in Aleppo in 1756.

Aleppo button is caused by a diplococcus, which is found in the blood of ulcers, as claimed by Duclaux, who is quoted approvingly by Flexner. Others have found a similar if not the same micrococcus in the nodules. In the course of the disease a red spot appears, which soon becomes a papule (pimple), then a nodule, and then a scab forms. Under the scab is a sharply punched ulcer, which is uncovered later, when its border becomes thicker. The period of incubation after inoculation of the face or any uncovered part is from three days to several months. The disease is not constitutional. Usually there is but one boil, but there may be as many as ninety on the face and body (Crocker). The disease runs a course of six to twelve months, and hence the Persians call it 'the one-year boil.' Distorting cicatrices result. It is most common in children over 2 years of age. The best treatment is to scrape the surface with a sharp spoon and cauterize with nitric or carbolic acid.

BOIL, Span. pron. bō-él', BOYLE, or BUIL, BERNABO. A Spanish Benedictine friar of the monastery of Montserrat, Catalonia, and the first priest to visit the New World. Under Papal appointment (1493) as apostolic vicar of the Indies, he accompanied Columbus on the Admiral's second voyage (1493-94). He was attended by three other friars, and on Epiphany Sunday (January 6), 1494, said the first mass performed in America. He was one of the four commissioners selected to govern the colony of Isabella during the absence of Columbus on a voyage of further discovery (April 24, to September 29, 1494). Already, it would appear, jealous of the Admiral, he now turned traitor, and with Margarit and others similarly disloyal, sailed for Spain, there to spread every sort of misstatement against his commander.

BOILEAU-DESPREAU, bwa'lo'da'prā'v, NICHOLAS (1636-1711). The most distinguished of French critics in the age of Louis XIV., known as the 'legislator of Parnassus.' He was in criticism an incarnation of correct commonplace common sense, a schoolmaster in careful workmanship, sworn enemy of all false sentiment and preciosity, such as marred the poetry and fiction of his immediate predecessors. He was born in Paris, November 1, 1636, studied first for the priesthood, then for the law, but found his place instinctively in the rather Bohemian literary company of Molière, La Fontaine, Racine, the philologist and realistic novelist Furetière, and the witty Ninon de l'Enclos. Of the Hôtel Rambouillet and its literary coterie he made one trial and never another. Louis XIV. liked his rare honesty and gave him a pension, but he shunned the Court, save when he could serve a friend there (e.g. Corneille), for he was a bourgeois and not at ease with the aristocracy. Feeble, asthmatic, in later life a little deaf, poetry was his aspiration, and criticism, justly weighed and carefully balanced, his delight. His life was uneventful. He never left Paris and its environs save at the com-

mand of the King, who made him a royal historiographer, and he died at Auteuil, March 13, 1711. His satire on the vices of Paris was his first success, and by its date gave a name to the 'school of 1660.' Seven other satires appeared in 1666, and five more complete the list. They are in rhymed couplets, polished, harmonious, witty, with the maliciousness of merciless personalities. This was destructive criticism with a vengeance. In the *Art poétique* (1674) he was constructive, and, following Horace's *Ars Poetica*, gave a theory of poetic composition in four cantos, of which the first lays down general rules, the second applies these to lyric poetry, the third to the epic and the drama, while the fourth contains general reflections, advice, and cautions, all spiced with brilliant wit and barbed with personal allusion. He preached a reign of literary law, truth in subject, conscientious workmanship in form, unity, clearness, proportion. He sought to establish literature on an unchanging foundation and to give canons of classicism for the ages. And indeed his work has a perennial reasonableness, though it allows scant scope for "the heat and height of sane emotion" and the unchartered play of genius. For Boileau's mind was material, logical, lacking in

The best edition of Boileau's *Works* is by Gidel, 4 vols. (1870-73). Consult: Deschanel, *Le romantisme des classiques*, 4th series (Paris, 1888); Lanson, *Boileau* (Paris, 1892); Morillot, *Boileau* (Paris, 1892); Faguet, *XVII. Siècle, Etudes littéraires* (Paris, 1887); Hemon, *Cours de littérature* (Paris, 1880-95).

BOILER. In steam engineering, a vessel in which steam is generated at a high pressure for heating or power purposes. In its simplest form, it consists of a closed vessel made of sheet metal, having apertures for the admission of water and egress of steam, fitted with apparatus for showing the level of the water and the pressure of the steam, and set or mounted in combination with a furnace, either internal or external. When water is boiled in an open pan, the temperature of the water and of the steam rising from it remains at, or very near, 212° F., and the tension or pressure of the steam is no more than sufficient to make its way into the atmosphere, being exactly equal to that exerted in all directions by the atmosphere itself—namely, 14.7 pounds per square inch. In a closed vessel, on the other hand, the temperature and pressure to which we can raise the steam are only limited by the strength of the

DOUBLE-FLUE BOILER.

imagination. He has been studied by generations because his is the art that can be learned, as Pope, his best pupil, learned it, though his own Horace might have taught him that the true poet could not be made. Boileau repeated and enforced his critical views in the prose *Dialogue des héros de roman*, whose authorship he at first concealed, and in *Réflexions critiques sur Longin* (1693). His own best verses are twelve *Épîtres* and a mock-heroic epic, *Le lutrin*, which was his most popular work. It was published in part in 1673, but not in full till after his death. This and all the poems are filled with cleverly turned lines that remain as familiar quotations, but Boileau should be most gratefully remembered as the first systematic critic of France, the first to make criticism an art. He was narrow and sometimes unjust, he never fully grasped the fundamental principles of the classic art he admired; but his honest, loyal, stubborn, rough good sense did much to direct the talent of Molière, Racine, and La Fontaine to its most fruitful channels and to guide the next generation to a true, though partial, naturalism. On the lyric poetry of succeeding generations its effect was to cultivate a formal technique and so to check inspiration that first fully revives in the Romantic School.

vessel or boiler against bursting. The form of a boiler is determined by two considerations—namely, strength to withstand internal pressure, and efficiency in producing steam; and the object of the designer is to combine in one apparatus sufficient strength to work safely at the proposed pressure, with such a form and arrangement as shall abstract the maximum of heat from the gases of combustion, and at the same time be in all respects suitable to the special circumstances of the case. The globular form is that best adapted for strength, and was the earliest to be used. It presents to the fire, however, the minimum area in proportion to its contents, and therefore has a minimum efficiency. After spherical boilers, cylindrical ones came into use, at first set on end, and afterwards laid on their sides, and later on these were furnished with internal cylindrical tubes for furnaces. Watt's 'wagon boiler' (so called from its shape) was used for many years, but being quite unfit for any but the lowest pressures, it has long been discarded; and the 'egg-end' boiler, or plain cylinder with hemispherical ends, also much used at one time, has now almost disappeared on account of its small evaporative efficiency, it being used only where large

quantities of waste fuel material, such as saw-dust, can be had practically without cost.

Modern steam boilers may be classified according to their form and construction, or according to the character of their employment. Under the first division we have horizontal and vertical boilers, internally and externally fired boilers, shell and sectional boilers, fire-tube and water-tube boilers, or boilers combining two or more of these several features. Under the second division are included stationary boilers, locomotive boilers, marine boilers, and various forms of portable or semi-portable boilers. The variety of forms and methods of construction of stationary boilers are very great, but the locomotive boiler is practically limited to a single form, and marine boilers are usually of the drum type known as the Scotch boiler, although water-tube boilers of various forms are coming into use more and more. Recently considerable attention has been devoted to the development of a boiler for automobiles. See AUTOMOBILE.

The most familiar form of boiler is, perhaps, the cylindrical tubular boiler. It consists of a cylindrical shell closed at the ends by circular plates, and has a number of tubes extending lengthwise of the boiler and terminating in the end plates. These tubes are open at both ends and through them pass the gases of combustion. The grate or furnace is placed underneath the front end of the boiler-shell, and from it the gases pass back under the shell to its rear end, thence up and forward through the tubes to the front end, and thence out of the chimney. In this passage the hot gases give up a portion of their heat to the water surrounding the tubes inside of the shell. Technically classified, this boiler is a horizontal, externally fired, fire-tube shell boiler. Another form of horizontal shell boiler frequently used has the numerous fire-tubes replaced by two large cylindrical flues. This type of boiler is less efficient than the tubular boiler, but its greater simplicity, and its accessibility for cleaning give it advantages, especially where the feed-water is bad. The flue boiler has several modifications which are known by special names. The Lancashire boiler has two flues which are crossed at intervals by conical-shaped tubes whose purpose is to provide an internal bracing for the flues and to add to the heating surface. In this boiler the grates are placed inside the flues at the front; or, technically classified, it is an internally fired, horizontal, double-flue, shell boiler. The Galloway boiler has two flues at its front end like the Lancashire boiler, but a short distance back of the grate these flues converge into one large flue which is crossed by water-tubes like those used in the Lancashire boiler. The Cornish boiler has one large instead of two smaller flues. Both the Galloway and Cornish boilers are internally fired.

Vertical boilers consist of a cylindrical shell set on end, with the grate at the bottom and fire-tubes running vertically. In large stationary boilers of this type the boiler is mounted on a masonry foundation, but in small portable boilers, such as are commonly used for hoisting-engines, the boiler is set on a cast-iron base which contains the grate and ash-pit complete. Some of the larger stationary vertical boilers built at present are from 20 feet to 30 feet high. Fire-engine boilers are always of the vertical type. See FIRE-ENGINES.

The Scotch marine boiler is a cylindrical shell boiler, but little, if any, longer than its diameter, resembling a large drum in shape. It is set horizontal. In the lower half of the boiler there are from two to four flues which terminate in a combustion chamber at the rear, and in the upper part there are a large number of fire-tubes terminating in the combustion chamber and in the uptake to the smokestack at the front. Double-ended boilers of this type have furnaces at each end, and resemble two single-ended boilers placed back to back. Sometimes

SCOTCH MARINE BOILER, END VIEW.

a common combustion chamber is used for both sets of furnaces in a double-ended Scotch boiler, but it is considered to be better practice to have a separate combustion chamber for each set of furnaces. In recent years, as has previously been stated, water-tube boilers of various forms have been substituted for Scotch boilers, particularly for naval vessels. The locomotive boiler consists essentially of a rectangular fire-box and a cylindrical barrel through which numerous fire-tubes extend from the fire-box to the smoke-box. The latter forms a continuation of the barrel from which the products of combustion pass up the smokestack.

All the boilers so far described have been of the fire-tube type—that is, the tubes and flues passing through the boiler-shell have been for the conveyance of hot gases from the furnace. The idea of using tubes and flues is to provide a greater heating surface, and thus use the heat from the fuel more thoroughly and generate steam more rapidly. To economize heat and increase the rapidity of raising steam still further, the water-tube boiler has been developed, and is now being extensively used. In water-tube

BOILERS

4. BABCOCK AND WILCOX MARINE WATER-TUBE BOILER.
5. MANNING VERTICAL FIRE-TUBE BOILER.

boilers there are two or more shells or drums connected by tubes of small diameter. These drums and tubes are filled with water and the hot gases from the furnace pass around and between the tubes, and so heat the water contained within them. A great variety of water-tube boilers are used, some having only one drum, and others having as many as four drums. The tubes connecting these drums vary from

SCOTCH MARINE BOILER, LONGITUDINAL SECTION.

perfectly straight tubes to tubes bent to various degrees of curvature, approaching in some boilers a complete spiral. Water-tube boilers may be made light, powerful, and compact, and are well adapted for forced draught; steam may be raised rapidly from cold water or a sudden demand for increased pressure quickly met. For these reasons, particularly, they are largely used on war-vessels, especially of the torpedo-boat and torpedo-boat-destroyer classes, though most vessels in the merchant marine continue to employ the Scotch boiler. The water-tube boiler is also extensively employed in large power-generating plants on land.

Boiler-settings are the supports of masonry or metal upon which the boiler rests and by which it is oftentimes wholly or partly inclosed. Large stationary boilers usually have masonry settings, while portable and semi-portable boilers have settings of cast-iron. Locomotive boilers can hardly be said to have settings unless the locomotive frame upon which they are carried may be said to be one. Marine boilers are seated on plates and castings, which are built into the bottom framing of the ship. In externally fired boilers the setting usually contains the furnace. (See FURNACES.) Boiler fittings or accessories comprise steam-pipes and blow-off pipes, safety, check, and gate valves for various purposes (see VALVES); dampers and regulators; feed-pumps and feed-water heaters; steam-traps and steam-separators, and steam-gauges and water-glasses, besides a number of minor contrivances for one purpose or another in the operation of the boiler.

The material chiefly employed in the manufacture of boilers is steel, but wrought-iron, copper, bronze, brass, cast-iron, and malleable iron are sometimes employed. In order to make certain that the material used has the proper strength and toughness, it is usually required that the plates be tested by cutting off small

pieces and breaking them in a testing machine (see TESTING MACHINES) previous to use. After passing the tests the plates, which are shipped to the boiler-shop perfectly flat and of various sizes to suit the different sizes of boilers and the different uses to which they are put, are cut or sheared to the proper dimensions, the edges are planed, flanged, punched for riveting, and bent by means of heavy rolls to the proper curve. The next step is to assemble the different parts and rivet them together. Finally, when the boiler is complete, it is tested by filling it with water under pressure, which determines whether it has the proper strength to carry the steam-pressure, and whether there are any leaks. Very often, a boiler is also tested after it has been installed ready for operation to determine its economy and efficiency in generating steam. It is the usual practice to rate and sell boilers by the horse-power, this custom having originated early in the days of the steam-engine. The term horse-power, as applied to a steam boiler, has a purely arbitrary significance only, since the power from the steam is developed in the engine, and since the economy in the use of the steam depends on the engine only and often arises in different types of engines and under different conditions of maintenance and operation. The rule established by the American Society of Mechanical Engineers is to consider 30 pounds of water evaporated per hour from a temperature of 100° F. under a pressure of 70 pounds by the gauge as equivalent to one horse-power. See HORSE-POWER.

Boiler explosions may occur from various causes, but the most frequent cause is the very simple one that the boiler is too weak to endure service of the regular working pressure. A new boiler may be weak through defective design or workmanship, and an old boiler is liable to become weak through rust and general deterioration. The safety of a boiler from explosion is insured only by careful and correct design, honest and thorough workmanship, and intelligent care in service. See ENGINES.

BIBLIOGRAPHY. The literature on boilers is very extensive, and students have the choice of a number of standard books treating of the history, design, and construction of such apparatus. The following works will be found to cover the subject thoroughly: Thurston, *A Manual of the Steam Boiler* (New York, 1896); Barr, *Boilers and Furnaces* (Philadelphia, 1899); Bertin, *Marine Boilers* (London, 1898).

BOILING. See COOKERY.

BOILING-POINT. The temperature at which a liquid substance boils. Evaporation of water takes place, more or less rapidly, at all temperatures (even at temperatures at which it rapidly freezes), no matter how great the pressure of air or other gases on its surface. When some water is placed in a closed vessel, evaporation will go on until the escaping vapor has attained a certain definite pressure of its own, whose magnitude is dependent on nothing but the temperature of the water; this pressure of water-vapor is called the *vapor-tension* of water at the given temperature. Now, though the magnitude of vapor-tension has nothing to do with the presence or absence of air in the vessel, the rate at which evaporation proceeds is greatly influenced by the pressure which air inclosed within the vessel may exert on the sur-

face of the water; the presence of air checks the speed of evaporation, though it cannot prevent it from going on until the vapor-pressure has finally attained its limit determined by the temperature.

While the presence of air thus diminishes the rate of evaporation, an elevation of temperature causes, on the contrary, a corresponding increase of that rate. As the temperature of the water rises, its vapor-tension continuously increases, and with it increases the rate of evaporation. Finally, when the temperature has risen to the point at which the vapor-tension is equal to the external pressure of the air, evaporation becomes very rapid indeed, and bubbles of water form in brisk succession throughout the volume of the liquid, throwing it into more or less violent commotion; the water is then said to be *boiling*. If the steam is now allowed to escape, boiling will go on until all the water has been evaporated; and if, while the liquid is boiling, the bulb of a mercury thermometer be placed near the surface of the water, the thermometer will register a constant temperature (provided the water is pure). This constant temperature, the lowest at which, under a given pressure, water will continue to boil, is called the boiling-point of water at that pressure.

The so-called normal boiling-point of water is 100° Centigrade (212° F.). This is the temperature at which water boils under normal atmospheric pressure; i.e. when the height of the mercury barometer is exactly 760 millimeters (30 inches). A change of pressure will at once result in a corresponding change of the boiling-temperature. In elevated positions, where the atmosphere is rare and the barometric pressure comparatively low, the boiling-point is lower than at the level of the sea. At the City of Mexico, 7000 feet above the sea, water boils at 93.3° C. (200° F.); at certain points in the Himalayas it boils at 82.2° C. (180° F.). Boiling water is thus not always equally hot, and in elevated places many substances cannot be cooked by boiling. Once the boiling-temperatures of water corresponding to different heights have been ascertained, we can, conversely, determine the height of a mountain by observing the boiling-point of water at its summit.

The above statements as to the boiling-point of water are true only of water which is chemically pure and contains no admixture of any sort. If, instead, we take a solution, say, of ordinary salt, we will find: (1) that when heated under normal atmospheric pressure, the solution will begin to boil at some temperature higher than 100° C.; and (2) that, whatever the temperature at which boiling will begin, if the steam is allowed to escape, the temperature of the boiling solution will continuously rise; in other words, the solution will not continue boiling at a constant temperature. When the 'boiling-point of a solution' is spoken of, it should be understood to mean the degree of heat at which boiling just commences. The only reason that a solution will not boil at constant temperature lies in the fact that, during the process of boiling, its composition changes; for when a solution boils, water escapes in the form of steam, while the solid substance remains behind and its proportionate amount in the solution consequently increases. If, however, the steam is continually condensed by means of a suitable cooler, and

thus made to return to the solution, the composition of the latter will remain unchanged, and no matter how long boiling is kept up, the temperature will remain constant; this temperature is evidently the point at which otherwise, if the steam were allowed to escape, boiling would just commence.

From what has been said of boiling solutions, it may be seen that the boiling-point of a liquid is the higher, the greater the amount of foreign substance contained in it.

This is, however, not the only factor on which the temperature of a boiling solution depends. The molecular weight of the dissolved substance is another factor. If we were to take two equal quantities, say, of water, heat them to boiling and then add to them, respectively, equal weights of two different substances, we would find that the elevation of temperature is greater in the case of the sample to which we have added the substance of smaller *molecular weight*. Experiments carried out in this manner with many different substances permit us to induce the law, that *the difference of the boiling-temperatures of a solution and of the pure solvent is inversely proportional to the molecular weight of the substance dissolved*. It must, however, be borne in mind that the law is limited to solutions which do not conduct electricity; in solutions of electrolytes relations are not quite so simple. (See articles SOLUTIONS and DISSOCIATION.) In the case of solutions of non-electrolytes, such as many of the carbon compounds, the law holds with considerable precision; and it has proved especially useful in this, that it permits us to determine the unknown molecular weights of newly discovered substances. To ascertain, by this method, the molecular weight of a new substance, all the chemist has to do is first to observe the rise of temperature produced in a boiling solvent, when a certain quantity of his substance is added to it, and then to compare the rise of boiling-point to the rise produced by the same quantity of some other substance, of known molecular weight. These important determinations are carried out with considerable precision by the use of Beckmann's apparatus (see figure).

The apparatus consists essentially of two parts: an inner tube, *a*, containing the solution, and an outer vessel, *b*, containing the pure solvent and separated from *a* near the bottom by a sheet of asbestos. The coolers *c* and *d* serve to condense the escaping vapors. To determine the rise of boiling-point caused by a given substance, the operator introduces into *a* first a few cubic centimeters of the pure solvent,

BECKMANN'S APPARATUS.

observes the boiling-point, then introduces also a known amount of his substance, and again observes the boiling-point. In the case of most solvents, the inner tube need not be heated directly, and heating only the outer vessel is sufficient to keep the liquid in the inner tube boiling.

What has been said above of pure boiling water applies equally well to any other compound in the liquid state; any liquid consisting of one single chemical compound has a definite boiling-point depending on nothing but the external pressure. Thus, under normal atmospheric pressure, the boiling-point of ether is 35° C.; the normal boiling-point of pure alcohol is 78°; aniline boils at 183°, and the hydrocarbon picene at 520°. The boiling-temperature is, of course, very easy to determine; and since it is one of the highly characteristic properties of a liquid, a chemist determines that point usually before inquiring into other properties when called upon to identify a liquid compound. Further, since in the case of a pure chemical compound, if the vapors are allowed to escape, the boiling-temperature remains constant, while in the case of a solution (or any other homogeneous liquid mixture), it continuously rises; whenever a chemist wants to ascertain whether he is dealing with a single and pure chemical compound, he subjects his liquid to distillation, to see whether the boiling-point will remain constant. If it does not remain constant he knows that he is dealing with a mixture or that some chemical change is taking place in the liquid.

From the fact that every compound has a characteristic boiling-point of its own, chemists were naturally led to think: (1) that some definite relation must surely exist between the chemical nature of compounds and their boiling-points, and hence (2) that in comparing compounds of similar constitution, definite numerical relations should be expected to exist between the boiling-points of such compounds. As a matter of fact, in the homologous series of organic chemistry, the boiling-point is generally found to increase with the complexity of the molecule (see, for example, the article HYDROCARBONS); which shows that the boiling-point of compounds is really dependent on their nature and structure. The numerical relations hitherto discovered are, however, far from being definite and general. Probably we do not know as yet how to search for the more definite relations.

BOILLY, bwā'yé', LOUIS LÉOPOLD (1761-1845). A French painter, born at La Bassée (Nord). He was at first a portrait painter, and began working in Paris in 1779. He won a considerable popularity as a depicter of the bourgeoisie from the reign of Louis XVI. to the close of the Restoration. He has been credited with no less than five thousand pictures, many of them Revolutionary scenes, and the best belonging to the epoch extending from the Revolution to the Consulate. In design he is firm and accurate, in color generally even. Many of his works were engraved, and he himself did creditable lithographing. His two most famous paintings are perhaps "The Arrival of the Diligence" (1803) and "Isabey's Atelier" (with portraits of twenty-four artists).

BOIS D'ARC, bwā'dārk'. See OSAGE ORANGE.

BOIS DE BOULOGNE, bwā de bōō'lō'ny'. A famous and beautiful park of Paris covering about 2250 acres. It derives its name from the

town of Boulogne-sur-Seine on its south. The park was formed under Napoleon I. out of the old *Fôret de Rouvray*, and remained in the possession of the State until transferred to the city by Napoleon III. in 1852, since which time it has been the favorite drive of Parisians. The Bois was greatly injured by bombardment during the siege of Paris in 1870-71, but was soon restored. It contains the great Auteuil and Longchamp race-courses. With the races for the Grand Prix of Longchamp (100,000 francs), held in the early part of June, the Parisian season closes. The Bois contains also the *Jardin d'Acclimatation*. See PARIS.

BOIS DE CHYPRE, bwā' de shé' pr'. See ELM.

BOISDEFFRE, bwā'dэфr', RAOUL FRANÇOIS CHARLES LE MOUTON DE (1839—). A French soldier, born at Alençon (Orne). He studied at the College of Saint Cyr and at the Staff-College. During the Franco-Prussian War he was a major of cavalry and aide-de-camp of General Chanzy, and in 1882 was promoted to be colonel. In 1890 he became assistant chief-of-staff, and in 1893 chief-of-staff. At the trial of Emile Zola (1898), during the Dreyfus agitation, he appeared full-uniformed in court, and in a much-applauded address to the jury, affirmed the existence of a third secret document incriminating the accused officer. When subsequently it transpired, through the confession of Lieutenant-Colonel Henry, that the document to which he had referred in good faith was a forgery, he tendered his resignation.

BOIS DE VINCENNES, vān'sēn'. A park of 2250 acres on the west of Paris, formerly a hunting forest of Louis IX. A large part of the park is taken up by the *Champ de Manœuvres*, an infantry drill-ground, a race-course, and the *polygone d'artillerie*.

BOISE, boi'ze. A city, the county-seat of Ada County, Idaho, and capital of the State, 400 miles northwest of Salt Lake City, Utah, on the Boise River and on the Oregon Short Line Railway (Map: Idaho, A 4). It is the centre of an agricultural and mining district, and has large stock-raising interests; it is one of the most important inland wool markets in the United States, and controls a large general trade with southern Idaho. Water derived from the Boise River is utilized for irrigation, and also for power in the manufacturing industries. Natural hot water exists here in abundance, and is extensively used in heating the buildings of the city. Among the prominent features are a natatorium, the public library, several academies and a high school, business colleges, United States assay office, United States court, United States land office, the State capitol, penitentiary, and Soldiers' Home. Boise was settled in 1863, and in 1864, with a population of 300, it was organized as a city and became the capital of the State. Its charter provides for a mayor, elected biennially, and a single-chambered city council. Population, in 1890, 2311; in 1900, 5957.

BOISE, boiz, JAMES ROBINSON (1815-95). An American educator. He was born at Blandford, Mass., and in 1840 graduated at Brown University, where he was professor of Greek from 1843-50. From 1852 to 1868 he was professor of Greek language and literature at the University

of Michigan, and from 1868 until his death filled a similar chair at the University of Chicago. During the latter period he was also professor of New Testament interpretation at the Baptist Union Theological Seminary (1877-95), and professor emeritus of New Testament Greek at the University of Chicago. In addition to several classical text-books, he published notes on the Epistles to the Galatians, Romans, Ephesians, Colossians, and Philippians.

BOISE, OTIS BARDWELL (1844—). An American musician and composer. He was born at Oberlin, Ohio, studied music in Leipzig and Berlin, and for some time was instructor in composition at the New York Conservatory and organist of the Fifth Avenue Presbyterian Church. From 1881 to 1888 he was in business in New York, and since then has been active in professional work in Berlin. His compositions include a *Concertstück* for piano and orchestra, and a G minor piano concerto. He has also written *Harmony Made Practical* (1900), and *Music and its Masters* (1901).

BOISGOBEY, bwa'gô'bâ', FORTUNÉ ABRAHAM DU (1821-91). A sensational French novelist of criminal adventure and detection of crime. Characteristic tales are *Les gredins* (1873); *l' chevalier Casse-cou* (1873); *Le demi-monde sous la Terreur* (1877); *La Vieillesse de M. Leccocq* (1878); *La main coupée* (1880); *La revanche de Fernande* (1882); and *La bande rouge* (1886). Many of his works are translated and adapted under titles that do not suggest the originals.

BOIS-GUILBERT, bwa'gêl'bar', SIR BRIAN DE. In Scott's *Ivanhoe*, a Knight Templar of inferior character who loves Rebecca and rescues her from a burning castle. When she is accused of sorcery he is appointed to meet her champion, Ivanhoe, in combat, but dies in the lists. Rebecca's innocence is thus deemed to be proved.

BOISGUILLEBERT, PIERRE LE PESANT, Sieur de (? -1714). A French political economist, born in Rouen. In 1690 he was appointed lieutenant-general (civil) of his bailiwick. He published in 1699 *Le détail de la France sous le règne de Louis XIV.*, and by a *Supplément au détail de la France* (1707), brought upon himself the wrath of the ministry and exile to Auvergne. The *Détail* he republished as *Testament politique de M. de Vauban* (1712). Under both styles this work violently attacks Colbert. It is, however, interesting both for its otherwise unobtainable information regarding the France of that day, and for its speculations as to the freedom of commerce and the importance of agriculture.

BOIS-LE-DUC, bwa'le-duk' (Dutch *Hertogenbosch*, 'Duke's Forest'). The capital of the Dutch Province of North Brabant, and seat of a Catholic bishop, situated at the junction of the Dommel and the Aa (Map: Holland, D 3). Its fortifications were destroyed in 1876, but the natural situation of the town is very strong, as the surrounding country can be flooded, leaving only two roads passable. It is a clean, well-built town, about five miles in circumference, intersected by canals, and has a citadel called Papenbril. Bois-le-Duc has a very fine cathedral, the museum of the province with a collection of Roman and mediæval remains, academy of arts, a grammar school, several hospitals, etc. The

town has thriving manufactures of gold and silver articles, shoes, woodenware, cigars, and mirrors. Its trade with the interior and its shipping are considerable. The population is chiefly Catholic, and numbers (1900) 44,034. Bois-le-Duc is a place of considerable antiquity, having been founded in 1184 by Godfrey III., Duke of Brabant. The surrounding forest was cut down by his son and successor, Henry, who strengthened the town with walls. In the Sixteenth Century Bois-le-Duc separated from the Dutch States, and was ineffectually besieged in 1601 and 1603 by Prince Maurice of Nassau, but had to surrender to a Dutch force in 1629. In 1794 the town was taken by the French; and in 1814 retaken by the Prussians. Consult Prempart, "The Siege of Bois-le-Duc," in *The Military Engineer* (London, 1759).

BOISSERÉE, bwa'srâ', SULPIZ (1783-1854). A German art critic and antiquary. He was born in Cologne, August 2, 1783. A visit which he and his brother Melchior (1786-1851), along with their friend Bertram, paid to Paris in 1803, inspired the trio with the idea of collecting and preserving the scattered specimens of early German painting. The realization of this idea became the single object of their lives. After years of research they had gathered at Heidelberg in 1810 a collection of nearly 200 pictures. In 1818 it was taken to Stuttgart, where the collection was arranged chronologically in a spacious building. This disclosed the fact that in the Fourteenth Century Germany possessed an original school of panel-painting, and that it was strongly modified by the Flemish masters, especially the Van Eycks, in the Fifteenth Century. In 1827 the collection was sold to the King of Bavaria for 120,000 thalers and, except for about forty which were taken to Nuremberg (now in the Germanic Museum), they became the nucleus of the Royal Pinakothek in Munich, to which place the brothers Boisserée followed it. In 1845 the two brothers removed to Bonn, and devoted all their energies to the study of the Cologne Cathedral, pleading for its completion. Sulpiz died May 2, 1854, Melchior May 14, 1851. They published lithographic plates of the gallery, and Sulpiz, who widened his studies to include all German mediæval art, wrote several valuable works on the Cologne Cathedral, on the architecture of the Rhineland, etc. Their collection became a valuable source for the study of primitive German painting. Sulpiz Boisserée had considerable influence on Goethe's studies of German art. His widow published a biography of her husband under the title, *Sulpiz Boisserée* (Stuttgart, 1862).

BOISSIER, bwa'syâ', MARIE LOUIS GASTON (1823—). A French historian and archaeologist, born in Nîmes. He studied at the Ecole Normale, and was an instructor in rhetoric from 1847 to 1857, in Nîmes, and subsequently at the Lycée Charlemagne of Paris. In 1861 he was appointed to the chair of Latin eloquence at the Collège de France, where he later was transferred to that of the history of Latin literature. In 1865 he became lecturer in Latin language and literature at the Ecole Normale. He was elected in 1876 to the French Academy, in 1886 to the Academy of Inscriptions and Belles-lettres. In addition to extensive contributions to the reviews, he has published a number of scholarly works, written

in a style at once clear and distinctive, and including *Le poète Attius* (1857); *Etude sur la vie et les ouvrages de Terentius Varron* (1861); *La religion romaine, d'Auguste aux Antonins* (1883); *La fin du paganisme* (1894); and, in particular, *Cicéron et ses amis* (1892) and *Promenades archéologiques, Rome et Pompéi* (1892), two reconstructions of antiquity remarkable for vividness and the minute accuracy of their details.

BOISSIEU, bwā'syē', JEAN JACQUES (1736-1810). A French painter and engraver, born in Lyons. He studied painting under Lombard and Frontier, and engraving under Wille, and won recognition with his landscapes. He was appointed a *trésorier* in the bureau of general finance, in Lyons, and subsequently became distinguished as the foremost French aquafortist. Among his paintings is "Valley with River" (1773, Berlin Museum). His engravings include much original work, as well as numerous landscapes after Ruysdall, Winants, and others.

BOISSONADE, bwā'sónád', GUSTAVE-EMILE (1825—). A French jurist, the son of Jean François Boissonade, the Greek scholar. He was born in Vincennes. He is best known through his important mission to Japan, where he went in 1873 to draw up the principal codes for the Japanese Government. M. Boissonade is, moreover, the author of the following valuable books: *Histoire des droits de l'époux survivant* (1852), *Histoire de la réserve héréditaire* (1873)—both crowned by the Académie des Sciences Morales; *Projet revisé de code de procédure criminelle* (1882); *Projet revisé de code pénal* (1886). He was decorated with the Legion of Honor in 1881.

BOISSONADE, JEAN FRANÇOIS (1774-1857). A French classical scholar. He was born in Paris, August 12, 1774, of a noble Gascon family. He was originally intended for an administrative career, but renounced it for philology. He soon made himself known to the learned world by his contributions to the philological journals, and was appointed professor of Greek in the University of Paris in 1812. In 1813 he was admitted to the Academy of Inscriptions, and in 1828 he succeeded Gail as professor of Greek literature in the Collège de France. His most important works are: *Philostrati Heroica* (1806); *Marini Vita Procli* (1814); *Tiberius Rhetor de Figuris* (1815); *Sylloge Poetarum Græcorum*, 24 vols. (1823-26); *Babrii Fabulæ* (1844).

He contributed in his earlier years numerous papers on philological subjects to Parisian, English, and German journals, and gave the cause of classical study in France a powerful and still perceptible impulse by his eloquent and attractive lectures from his chair. In addition to his many and laborous works in classical philology, he also signalized himself as a French lexicographer and belle-lettrist, and was one of the most copious and valued contributors to the *Biographie Universelle*. He died September 8, 1857.

BOISSY D'ANGLAS, bwā'sé' dān'glās', FRANÇOIS ANTOINE, Count (1756-1826). A French statesman, born at Saint Jean-le-Chambre, in the Department of Ardèche. In 1789 he was elected a deputy of the States-General. While a member of the Constituent Assembly, he

was accused of plotting to change the French monarchy into a Protestant republic. After the execution of Robespierre, whom he helped to overthrow, he became a member of the Committee of Public Safety (1794), and proved himself a man of marked ability. He was director of the supply of provisions for Paris during the riotous and sanguinary proceedings of the 12th Germinal and 1st Prairial in the year III. of the Republic, and in this capacity met the popular menaces with singular firmness. Subsequently he became president of the Council of Five Hundred; was a Senator under Napoleon, and a peer under Louis XVIII. He wrote *Recherches sur la vie, les écrits et les opinions de Malesherbes* (1819) and *Etudes littéraires et poétiques d'un vieillard* (1825).

BOISTEREB. The name of a servant in *Fortunio*, a fairy tale by the Countess d'Aulnoy.

BOITO, bō-ē'tō, ARRIGO (1842—). An Italian composer, born in Padua. It is an anomalous fact that Boito owes his musical fame to an opera, *Mefistofele*, which has been a comparative failure, and that this work, despite its apparent lack of lasting popularity, should be considered epoch-making—one of the most important Italian musical products of the Nineteenth Century—because it forms the pivotal point on which Italian opera turned from mere tunefulness to the new dramatic school exemplified in the later Verdi and in Ponchielli, Mascagni, Puccini, and Leoncavallo. The writing of the libretto, the composition and remodeling of this 'remarkable failure' occupied Boito for nearly twenty years. The son of cultured parents—his father was an Italian painter, his mother a Polish woman, a parentage which is supposed to account for the blending of southern and northern temperament in his artistic nature—he entered the Milan Conservatory in 1856. While studying there he composed the garden scene in *Mefistofele* and other portions of the work. But the score was not finished and rearranged for stage production until 1868. Meanwhile, Boito had done much literary work and had lived in France, Germany, and Poland. *Mefistofele* was produced on March 5, 1868, at La Scala, Milan. The performance lasted six hours, and though it had several repetitions (amid scenes of disorder, due to hissing and applause, which caused the work to be withdrawn by order of the public authorities), its failure was undoubted. Boito again remodeled the opera, among other changes making Faust a tenor, instead of a baritone, rôle. In 1875 the revised version was produced in Bologna with great success, which was repeated in other European cities. Nevertheless, it has not maintained itself as a popular opera in the *répertoire*. The difficulty seems to be that Boito has attempted to cover too much of the Faust legend in a single work. Gounod's *Faust*, especially when given without the Brocken scene, tells a consecutive story of love, betrayal, and death. In *Mefistofele* the story is episodic—delayed by a prologue, and interrupted not only by the Brocken, but by the classical scene in which Marguerite reappears as Helen of Troy to the utter mystification of the greater portion of an operatic audience, so that however fine they may be musically, these parts of the work detract from the impression as a whole. Boito's music, though showing traces of such utterly different geniuses as the early Verdi and Wagner, is, nevertheless, a notable

achievement and the most musicianly score brought forward by an Italian prior to the new Italian school. Marguerite's death is one of the most dramatic and deeply moving scenes in all opera. In this country *Mefistofele* was produced at the Metropolitan Opera House, New York, in 1883, with Campanini and Nilsson. A noteworthy revival occurred at the same house in 1896 with Calvé as Marguerite and Edward de Reszke as Mefisto, and another in 1901 with Plancon in the title-rôle. Boito's other operas, *Ero e Leandro*, *Nerone*, and *Orestiaide*, have never been performed. The libretto of the first-named he afterwards gave to Bottesini (q.v.) and to Mancinelli (q.v.). He also wrote the libretti for Faccio's *Amleto*, Ponchielli's *Gioconda*, and for Verdi's *Otello* and *Falstaff*. Boito is a Cavaliere, a Commendatore, and an officer of the Legion of Honor.

BOIVIN, bwa'vân', MARIE ANNE VICTOIRE GILLAIN (1773-1841). A French midwife. She was educated in a convent and studied anatomy and midwifery at Etampes with a relative, the superior of the *hospitalières*, and afterwards at the Hôtel Dieu of the same place. She received the degree of M.D. from the University of Marburg. After the death of her husband she took the place of midwife in the Maternity Hospital, and in 1801 became chief overseer. She caused the establishment by Chaptal of a special school of accouchement. She refused the brilliant offers of the King of Prussia in order to remain at her modest post. Her *Mémorial de l'art des accouchements* (1812) is a well-known work.

BOJADOR (bô'zhâ-dôr') CAPE (Portug., one that juts or bulges). A headland on the western coast of Africa, in latitude 26° 7' N., longitude 14° 30' W., at the northern coast boundary of the Spanish possessions (Map: Africa, C 2). In consequence of its extreme flatness, and the shoreward tendency of the currents, the coast, extending northward to Cape Nun, abreast of the Canary Islands, is very dangerous for navigation. The Portuguese doubled this cape in 1433, and from them it received its name Bojador Cape, signifying 'a round cape.'

BOJANO, bô-yâ'nô (anciently, Samnite *Bovianum*, Gk. *Bolanor*, *Botanon*). A city in the Province of Campobasso, in Abruzzi and Molise, south Italy, on the Biferno, 18 miles southwest of Campobasso (Map: Italy, J 6). It lies in a deep valley on the northeastern slope of the Matese Mountains, which for four months of the year shut off the light of the sun. It is the seat of a suffragan bishop, and has a cathedral, five churches, and a seminary. There are ruins of a Roman theatre and a temple, and of the walls of the ancient Bovianum, which during the Samnite wars was often besieged. During the Second Punic War it was several times the headquarters of the Roman Army, and in the great Social War the Confederates, on the fall of Corfinium, made it their capital. It has suffered greatly from earthquakes, especially in 1805. Population of commune, in 1901, 6337.

BOJAR, bô-yâr'. See BOYAR.

BOJER, bô'yër, JOHAN (1872—). A Norwegian author, born in Drontheim. His works include the historical drama *Olaf den Hellige* (1897, "Saint Olaf"), and the stories *Helga* (1895) and *Den evige Krig* (1899).

BOKER, GEORGE HENRY. (1823-90). An American poet, dramatist, and diplomatist, born in Philadelphia. He was the son of a banker, graduated at Princeton in 1842, studied law, but did not practice, and after a tour in Europe published a volume of poems, *The Lesson of Life* (1847). His tragedy *Culaynos* (1848) was staged with success, and he produced many others: *Anne Boleyn*; *Leonor de Guzman*; *Francesca da Rimini*; *The Betrothed*; and *The Widow's Marriage*. Of these, *Francesca da Rimini* is considered the best. It has been revived several times by Barrett and other actors. Boker collected his *Plays and Poems* in two volumes in 1856. The Civil War inspired him to much patriotic poetry, which made up his *Poems of the War* (1864). Later volumes of verse were: *Street Lyrics* (1869); *Königsmark and Other Poems* (1869); *The Book of the Dead* (1882); and *Sonnets* (1886). The interval between these last volumes he spent largely in diplomatic service. He was appointed minister to Turkey in 1871, and transferred to Russia in 1875, where he remained till 1879. Boker's poems and dramas are much above the average in style and power, but have never achieved real popularity. The aftermath of his muse is a volume of *Sonnets* published in 1886.

BOKELMANN, bô'kel-mân, CHRISTIAN LUDWIG (1844-94). A German painter. He was born at Saint Jürgen, studied under Wilhelm Sohn at the Düsseldorf Academy, and won a reputation as a painter of portraits and of genre pictures, both humorous and serious. The best of his works are "House of Sorrow" (1873); "Pawnbroker's Shop" (1876); "Opening of the Will" (1879); and "Portrait of Klaus Groth's." His subjects are taken from modern life and are vivid representations of such scenes as occur in any large city. There are usually many figures in his pictures, grouped against an impressive architectural background.

BOKHARA, bô-kâ'-rà, or BUKHARA. A Russian protectorate in Central Asia, bounded by Russian Turkestan on the north, the Pamir region on the east, Afghanistan on the south, and the Russian Trans-Caspian Territory and Khiva on the west (Map: Central Asia, E 2). It lies approximately between latitudes 37° and 42° N. and longitudes 62° and 72° E. The extent of its area cannot be ascertained with accuracy, owing to the unsettled state of some of the boundary lines. General estimates vary from 80,000 to 93,000 square miles.

A considerable extent of the country consists of desert land and steppes, interspersed with fruitful oases. The eastern part is very mountainous. The most fertile and cultivated regions are found along the rivers. The chief river is the Amu Darya, which forms the southern boundary and flows close to the western boundary, and with its tributaries drains a large part of the country. The Srafschan flows through the northwestern part, losing itself in the sands a short distance from the Amu Darya. The climate is warm and generally healthful. The summers are hot, and the winters very cold, with considerable snowfall. The rainfall is very scant, and occurs mostly in the spring.

Agriculture forms the chief occupation, and according to current estimates about 10 per cent. of the total area is under cultivation. The

dry climate of Bokhara makes it necessary to utilize almost all the smaller rivers for irrigation. The chief agricultural products are wheat, rice, barley, tobacco, lucerne, flax, cotton, and dye-plants. There are also produced large quantities of fruit, including several varieties of grapes, peaches, apricots, and nuts. Silk-culture is carried on. Cattle-raising has always been one of the most important occupations of Bokhara, the native sheep being especially known for the wool used extensively in Russia for sheep-skin coats. Horses, goats, and camels are also raised in large numbers. The manufacturing industries of Bokhara are chiefly confined to the production of textiles, and are carried on on a very small scale and by the most primitive methods. The chief products are cotton and woolen fabrics, silk, coarse cloth, and a kind of felt called *koshma*, leather goods, including footwear and saddles, and small metal products, such as knives, locks, etc. The mineral industry is as yet undeveloped, although Bokhara is supposed to be very rich in minerals. The chief minerals worked are salt and gold, the latter worked by the Russians in Safet-Darya.

The foreign commerce of Bokhara is quite important, owing to its central location, and Bokhara, the capital, although it has lost a considerable portion of its commercial importance and splendor, is still considered an important seat of commerce in Central Asia. The trade is chiefly with Russia, India, and Persia, and is carried on mostly by means of caravan routes and the Trans-Caspian Railway, as the wagon-roads of Bokhara are very few and in poor condition. The annual trade with Russia is estimated at about \$10,000,000, and the entire foreign trade of Bokhara at about \$15,000,000. The Trans-Caspian Railway, which runs through Bokhara for about 186 miles, has had a very good effect on the commerce of the country, which has considerably advanced under the protection of Russia. Bokhara, the capital, is connected by telegraph with Tashkent. In its form of *government*, Bokhara is an absolute monarchy, the Ameer being invested with unlimited powers. The immediate administration is in the hands of several high officials, each at the head of a separate department. For purposes of administration, Bokhara is divided into several districts, administered by beks, who are obliged to turn in a certain sum of money every year into the treasury of the Ameer, in addition to suitable gifts, consisting mostly of cattle and other products. The beks are not paid by the Government, but are expected to get their share out of the taxes collected by them. The army consists of a regular force and a militia, and is recruited chiefly from volunteers; but in case of a holy war, every Mussulman capable of bearing arms is liable to military service. The standing army is estimated all the way from 15,000 to 30,000 men. There are about 20 guns, mostly made of copper, and the regular army is, to a certain extent, organized after European fashion.

The *population* is estimated at from 2,500,000 to 3,000,000. It consists of Uzbeqs, Kirghizes, who are largely nomadic, Tadjiks, Turkomans, Arabs, Afghans, Sarts, Persians, some Jews and Russians. The prevailing religion is Mohammedan. With the exception of Bokhara (q.v.), the capital, and Samarkand, there are few towns of any importance.

HISTORY. Under the name of Transoxiana, Bokhara was inhabited in antiquity by Iranian tribes professing Zoroastrianism. At a very early period the country was invaded by Turanian newcomers, who were Buddhists, and a long struggle ensued between the two, in which the difference in religion played no less important part than that of race. Under the Arabs, who brought with them the faith of Islam, Bokhara was a field of incessant contests and fighting, until, with the rise of the Samanid dynasty, in the latter part of the Ninth Century, it became a mighty monarchy, the bulwark of Islam, and a great centre of learning. The dominions of Bokhara at that time reached down into Afghanistan and Khorasan. At the beginning of the Eleventh Century, the country, together with much of the Mohammedan world, was conquered by the Seljukian Turks. Under the rulers of that period (1004-1133), Iranian and Arabic continued as the languages of culture, Turkish being employed by the Court for conversation only. After that Bokhara was a bone of contention between competing rulers, until conquered by Jenghiz Khan in 1218, when the capital was burned to the ground, the kingdom devastated, and most of the inhabitants slain. For nearly two centuries the invaders ruled over Bokhara. Having embraced Mohammedanism, they favored their kindred, the Turks, so that the latter soon gained the ascendancy. Under Timur, or Tamerlane (died 1405), Bokhara became of great political and commercial importance, its capital, Samarkand, being full of gorgeous palaces, splendid mosques, and very extensive gardens. After his reign, however, it became the arena of bloodshed and wars for nearly a hundred years, until conquered by the Turko-Mongolian Uzbeqs about the year 1500, which marks the beginning of Bokhara's decline. With the single exception of the scholarly Abdullah-Khan (in the Sixteenth Century), her monarchs have been typical Oriental rulers, cruel and steeped in fanaticism. Nasr-Ulla-Khan (1827-60) was perhaps the most infamous in a long series of infamous potentates. It was he who caused, in 1842, the death of Colonel Stoddart and Captain Conolly, who went on a mission to Bokhara. Dr. Wolff, who visited the country in 1844, with a view to ascertain their fate, narrowly escaped with his life, after a detention of some months. By the middle of the Nineteenth Century the steady, aggressive expansion of Russia in Central Asia cast a shadow on the Khanate of Bokhara, and a clash of arms became imminent, unless the Khan were to submit to the rule of the Czar without resistance. In 1865 the Russians occupied Tashkent, and Khan Mozaffar-Eddin, son of Nasr-Ulla, accepted this as a challenge to open hostilities. He took the field in person, but his army was badly defeated at Irjar, on May 20, 1866. The Russians now pushed farther, and after many successful battles entered Samarkand, in May, 1868. The fortress of Katti-Kurghan was then stormed and taken, and on June 14 the Ameer was completely defeated on the Zerabulak Heights. By the terms of the peace concluded in July, 1868, Samarkand, and the Katti-Kurghan, Penjekent, and Urgut districts—the best portions of the Zerafshan Valley—were ceded to Russia. Besides paying 500,000 rubles indemnity, the Ameer granted special privileges to Russian trade. This final blow brought Bo-

khara into Russian vassalage. In return for complete obedience, the Russians gave the Ameer active assistance in suppressing revolt within his possessions. Thus, in 1868, the Russians dispersed the hordes of rebels who wanted to enthroned the Ameer's eldest son, Abdul-Malik-Mirza. After the Russian expedition against Khiva (1873), Bokhara was given a large strip of Khivan territory for supplying the Russian army of invasion with camels and provisions. In 1877 the territory of Bokhara was expanded eastward by the conquest of Darwaz and Karategin. In 1885 the present Ameer, Sayid-Abdul-Ahad, came to the throne. In 1886 he abolished slavery. He visited Saint Petersburg in 1893, and left there the heir to the throne to be given a Russian education. The Ameer has now become a mere puppet in Russian hands.

(London, 1880); Réclus, "Asiatic Russia and the Middle Asiatic Khanates," in *Universal Geography* (Paris, 1876-94); Capus, *A travers le royaume de Tamerlan* (Paris, 1892); Rickmers, "Travels in Bokhara," *Geographical Journal*, Vol. XIV. (London, 1899).

BOKHARA (Mongol. *bukhar*, church). The capital of the khanate of the same name, and one of the most important commercial centres of Central Asia, situated in a valley near the river Zerafshan, and only a few miles from the Trans-Caspian Railway (Map: Central Asia, E 2). It is irregularly built and surrounded by a high mud wall. The streets are narrow and crooked and mostly unpaved. The houses, built, as a rule, of mud or clay, are low and without windows on the streets. Bazaars, both covered and open, are numerous and well stocked with Oriental wares as well as with European manufactures. Bokhara has as many mosques as streets, but only a few of them are noteworthy. The chief of them is the Mirghara, surmounted by a cupola 100 feet high, covered with blue tiles. Adjoining it is the high minaret which was used until 1871 for the execution of criminals by hurling them from its top. The citadel is situated on an artificial elevation, and contains the palace of the Ameer, the houses of the higher officials, the jail, and the water-cisterns. The city is intersected in several directions by a canal, which is spanned by numerous bridges. Bokhara is regarded as a centre of culture in Central Asia, and contains about sixty high *medresses* and a large number of minor ones. There are a considerable number of manufacturing establishments, producing silk fibres, coarse cloth, blades, and other metal articles. The commerce is carried on to a large extent in articles of Russian manufacture, textiles, leather articles, etc. A few miles distant from the capital, on the railway line, is situated a small Russian settlement named Russian Bokhara, and containing about 300 inhabitants. The population of the capital is estimated at 60,000.

BOKHARA CLOVER. See MELILOT.

BOL, bōl, FERDINAND (1616-80). A Dutch painter and etcher, born in Dordrecht. He was the favorite pupil of Rembrandt in Amsterdam,

and much influenced by him in his early career, but later adopted a style differing materially from that of his master. His biblical and historical compositions are less satisfactory than his portraits, for which he was highly esteemed. His principal works are to be found in Gouda, Leyden, and Amsterdam. Noteworthy also are "Repose in Egypt," "Jacob's Dream," and "Joseph Before Pharaoh," all in the Dresden Gallery. One of his best-known portraits is that of Rembrandt's wife, Saskia, in the Brussels Museum.

BO'LA BO'LA, or **BO'RA BO'RA**. One of the Society Islands (q.v.), about 200 miles to the northwest of Tahiti, in latitude 16° 30' S. and longitude 152° E. (Map: World, L 6). It rises to a height of nearly 2400 feet, is fertile, and has a population of about 1800 inhabitants.

BO'LANDEN, KONRAD VON. See BISCHOFF, JAMES EDUARD KONRAD.

BOLAN (bō-lān') **PASS**. A defile in the mountains of British Baluchistan on the great highway leading up from the Indus via Shikarpur, Dadar, and Quetta to Kandahar. It extends northwestward from the neighborhood of Dadar, for a distance of about 55 miles, until it reaches a plateau nearly 6000 feet above the sea. The average ascent is about 90 feet to the mile. It is bounded throughout by eminences 500 feet in height. A military railroad has been constructed by the British at great expense through the Bolan Pass to connect Sindh with Kandahar. It is now completed as far as the border of Afghanistan.

BOLAS, bō'lās' (Sp. *bola*, ball, from Lat. *bullo*, bubble, round object). A hunting weapon used by various tribes of Mexico and South America, particularly those of the Pampas. It consists of three leather-covered balls of clay or stone, radiating from a central knot and attached to the end of a stout rawhide rope. It is thrown from horseback in such a way as to entangle the legs of the animal and hold it until the hunter comes up.

BOLBEC, bōl'bēk'. A town of France in the Department of Seine-Inferieure, about 18 miles from Havre (Map: France, G 2). The Bolbec, on which it stands, supplies water-power for its mills, where cotton, woolen, and linen goods are manufactured. It has also considerable trade in grain, horned cattle, and horses. Population, in 1896, 12,230. Consult "Cités Ouvrières de Bolbec," in *Nouvelles Annales de la Constitution* (Paris, 1878).

BOLDINI, bōl-dē'nē, GIOVANNI (1845—). An Italian painter. He was born in Ferrara, studied at the Florence Academy, and worked for some time in London. He is known for his genre pictures, landscapes, and portraits. The last, by reason of accuracy and finish in drawing and skill in characterization, are particularly excellent. His works, many of which are in American private collections, include the following: "The Connoisseur," "Gossips," "Delivering the Despatch," "Kitchen Garden," and "Portrait of Menzel."

BOLDREWOOD, bōl'dēr-wūd, ROLF (Thomas Alexander Browne). See AUSTRALIAN LITERATURE.

BOLD STROKE FOR A HUSBAND, A. The title of a comedy by Mrs. Hannah Parkhouse Cowley (1782). It has two plots. In one,

Olivia wins Julio by steadily refusing all lovers until he becomes conscious of her attractions. In the other, a married woman disguises herself as a boy, Florio, to recover from her husband's mistress the fortune he has given away.

BOLD STROKE FOR A WIFE, A. The title of a comedy by Mrs. Susannah Centlivre (1718). It deals with the diplomacy with which Colonel Feignwell wins the orphan heiress, Anne Lovely, and her dowry of £3000. He accomplishes his purpose by flattering his mistress's impossible guardians, a beau, a dilettante, a broker, and a Quaker.

BOLE (Gk. *βῶλος*, *bōlos*, lump of earth, clod, nugget). A hydrous aluminium silicate that is found massive, and constitutes a variety of halloysite. It is a claylike body, containing more or less iron oxide, which gives it a yellowish to red-brown or dark color. It has a conchoidal fracture, and when thrown into water falls to pieces. It is unctuous to the touch, and some varieties adhere to the tongue. It is found in Armenia, Italy, France, Germany, Ireland, Scotland, and South America. Bole is used as food by the natives of certain parts of South America, and by the Japanese it is favorably regarded as a means for producing leanness. *Armenian bole* is of a bright red color, due to the oxide of iron that it contains, and has been used as a dentifrice. It has also been prescribed as a tonic and as an astringent medicine, finding in recent years its most important use in veterinary practice. *Lemnian bole* is of similar character, and is obtained from the island of Lemnos. When calcined, washed, and ground it is applied as a pigment, and is known variously as *Blois bole*, which is yellow in color; *Bohemian bole*, which is yellowish-red; *French bole*, which is pale-red; and *Silesian bole*, which is pale-yellow.

BOLERO, *bō-lā'rō* (Sp.). A Spanish national dance, mostly in the time of a minuet, with a sharp, marked, and peculiar rhythm. It is accompanied with the castanets and the cithern, and frequently with the voice; and the dancer in the movements seeks to represent the different degrees of feeling from coyness to the highest ecstasies of love.

BOLETUS (Lat. *boletus*, from Gk. *βωλίτης*, *bōlītēs*, a kind of fungus). A genus of fungi of the order Hymenomycetes, family *Polyporaceæ*. The older botanists included it in the numerous species now forming the genus *Polyporus* (see *AMADOU*; *DRY-ROT*) and other genera; but even as now restricted, it is a very extensive genus. Many of the species resemble the common mushroom and other species of *Agaricus* in form; but instead of gills, the under side of the cap (*pileus*) is occupied by a layer quite distinct from it in substance, and pierced by pores so as to be composed of a multitude of small tubes on the inside of which the spore-cases or seed-vessels are produced. Some of the species are edible. *Boletus edulis* is much used in France; also in Germany, Hungary, Russia, etc. It is the *ceps ordinaire* of the French markets. It grows on the ground in woods, in places covered with moss, heath, or grass. In moist, warm summers, it sometimes appears in immense quantities, attaining a size of six inches or more across. The tubes are removed along with the skin and stem, and only the flesh of the cap is eaten, which is firm, white, delicate, of agreeable smell, and is prepared like

the common mushroom. For illustrations, see Colored Plate under *MUSHROOMS*.

BOLEYN, *bul'en*, *ANNE* (1501?-36). Queen of England as second wife of Henry VIII. She was the mother of Queen Elizabeth. The date of her birth is given as 1501 or 1507, the former being the more probable. The family name is frequently found in contemporary writings as Bullen, Bouleyn, Boullan, or Boulain. She was the daughter of Sir Thomas Boleyn, afterwards Earl of Wiltshire and Ormond. In her twelfth year Anne went to France, where her elder sister, Mary, had previously accompanied Mary Tudor, the affianced bride of Louis XII. of France, and sister of Henry VIII. She remained at the French Court three years, and soon after her return to England was wooed by Lord Henry Percy, the heir to the earldom of Northumberland, and by King Henry himself, who, in April, 1522, began to shower wealth and honors on her father, and before this had dishonored her sister Mary. Henry's 'religious scruples' regarding the lawfulness of his marriage with Catharine became too urgent for the slow decision of the Court of Rome, but not till the King's divorce was set afoot (in May, 1527) did Anne favor his addresses. However, long before Cranmer pronounced the divorce (May 23, 1533), she was Henry's mistress, and in the preceding January they had been secretly married. She was crowned with great splendor in Westminster Hall on Whitsunday; but within three months Henry bade her "shut her eyes to his unfaithfulness, as her betters had done, for he could abase yet more than he had raised her." His cooling passion was not revived by the birth (September, 1533) of the Princess—afterwards Queen—Elizabeth. The new Queen, naturally light and gay of heart, and educated at the French Court, where these qualities were likely to be developed to the utmost, conducted herself toward the courtiers with an easy familiarity not customary in England for one in her position. Concerning the first two years of her married life we have little information. It is said that she was favorable to the Reformation, and promoted a translation of the Bible. In January, 1536, the Queen gave premature birth to a son. The mishap is said to have been caused by learning of the King's newly developed passion for Jane Seymour, her successor. The King became more and more estranged, and her freedom of manners had given but too good grounds for her enemies to speak evil of her. On May 1 the annual tournament was held at Greenwich, in the presence of the King and Queen. The tilting had commenced, the challengers being Viscount Rochford, brother to the Queen, and Sir Henry Norris, one of the gentlemen of the King's Privy Chamber. Suddenly the King rose, his outward bearing manifesting inward disturbance, left the tourney, and with a small party rode up to London, leaving the Queen at Greenwich. The popular account is that the King had seen her drop a handkerchief into the lists in order that one of her presumed lovers might wipe his face; but the necessity for any such romantic and sudden pretense of jealousy is annulled by the fact that in the previous week a commission composed of members of the Privy Council had been secretly engaged in examining charges of adultery against Anne; indeed, two of her alleged accomplices, Sir William Brereton, a gentleman

of the King's household, and Mark Smeton, a musician at Court, had already been arrested. The Queen remained at Greenwich that night. On the following morning she was examined before the Privy Council, and protested her innocence. In the afternoon she was sent up the river to the Tower. Sir Henry Norris, and Sir Francis Weston, another courtier, along with Smeton, were also examined, and all at first declared their innocence of the charge imputed to them; but under torture, the musician confessed to the crime. In the Tower, the Queen's every action and word were watched and reported; but anything she said while a prisoner seems quite as compatible with innocence as guilt. Her letter to Henry, written on May 6, speaks decidedly in her favor, but this letter is now supposed to be a fabrication of the time of Elizabeth. On the 10th of May the Grand Jury of Middlesex found a 'true bill' on the indictment which charged the Queen with committing adultery with no less than five persons, including her own brother, Lord Rochford, and of conspiring with them, jointly and severally, against the life of the King, the adultery being alleged to extend over a period of nearly three years. On the 11th the Grand Jury of Kent also found a true bill. On the 12th the four commoners, Brereton, Weston, Norris, and Smeton, were found guilty, the last confessing to the charge of adultery only, the other three pleading not guilty to both charges. With her case thus prejudged, on the 15th, the Queen and her brother were tried before 27 peers. Their uncle, the Duke of Norfolk, was president, and their own father was one of the judges. The accused affirmed their innocence, but were found guilty and condemned, the Queen to be burned or beheaded on the Tower Green. On the 17th Smeton was hanged, and the other four beheaded; general protestations of unworthiness by them at the hour of death being regarded by some historians as evidence of guilt. On the 19th the Queen was beheaded, with her last words praying a blessing on Henry, who, she said, had ever been to her a good and gentle lord, but making no confession of guilt. Henry married Jane Seymour the next day.

It is difficult to form anything like a just and satisfactory estimate of the character of Anne Boleyn—historians, for the most part, having made her but a lay figure upon which to hang the drapery of religious partisanship, or to display the colors of individual sympathy. That she was guilty of adultery with Henry is certain; but that she was guilty of the other heinous offenses laid to her charge remains at least not proved, and it is a suspicious fact that every trace of evidence has vanished. The character of this 'mother of the English Reformation' was not saintly; but she was not the Jezebel that Saunders, the Jesuit, would have us believe. According to him, she was even in person ugly, misshapen, monstrous; but although Holbein's portraits do not confirm the statements of others that she was 'comely,' we know that she had beautiful eyes and hair, and that her only positive defect was a supplemental nail. Consult: Strickland, *Queens of England*, Vol. II. (London, 1875-80); Froude, *History of England* (New York, 1871); Lingard, *History of England*, Vol. VI. (Boston, 1853-56); Green, *History of England*, Vol. II. (New York and London, 1899); Dixon, *Two Queens* (London, 1873-74); Wyat, *Extracts*

from *Life of Queen Anne Boleigne* (London, 1817-25); and especially Friedmann's critical *Anne Boleyn* (London, 1885). Original materials are contained in Brewer and Gairdner (ed.), *Letters and Papers of Henry VIII.*; Ellis, *Original Letters* (London, 1824—); "Love-Letters from Henry VIII. to Anne Boleyn," in *Harleian Miscellany*, Vol. III. (London, 1744, 1808); and Wriothesley, *Chronicle* (Camden Society, 1875-77).

BOLGARY, bôl-gä'rî (Russ., the Bulgarians). Also called **USPENSKOYE**. A village in the Russian Government of Kazan, near the Volga, about 16 miles from Kazan, and four miles from the Volga. It is well known for the historical remains it contains in the form of buildings, walls, minarets, etc. It occupies the site of Bolgar, called by the Russian chroniclers Veliki Gorod (the 'Great Town'), capital of the old Bulgarian kingdom. The time of its foundation is unknown. But in the writings of Ibn-Khankal, in the latter half of the Tenth Century, it is stated that after the town had been ravaged by two victorious Russian armies, it still had a population of about 10,000. At a much later period, when Bolgary was conquered by the Mongols, the old capital declined considerably. Sacked and almost destroyed by Timur (Tamerlane) in the Fourteenth Century, it was completely ruined at the time of the fall of the 'Golden Horde.'

BOLGRAD, bôl-gräd' (for *Byelgrad*; see **BELGRADE** for derivation). A town in the Russian Government of Bessarabia, situated about 75 miles southwest of Akerman (Map: Russia, C 5). It has some trade in grain and produces brick and tallow. Population, in 1897, 12,388, mostly Bulgarians.

BOLLI, or **BOLY** (corrupted in popular speech from Gk. *πόλις*, *polis*, the city, from Hædrianopolis; cf. Turk. *Stambul*, Constantinople, for *ἐς τὴν πόλιν ἐς τὴν πόλιν*, to the city). A town of Asiatic Turkey in the Vilayet of Kastamuni, on the left bank of the river Boli, and 136 miles east of Constantinople (Map: Turkey in Asia, E 2). The town occupies an eminence at the extremity of a fertile plain. It has several mosques, baths, and cotton and woolen mills. Boli is on the caravan route from Constantinople to Erzerum. Population, estimated at from 5000 to 10,000.

BOLIDE. See **METEORS**.

BOLIN, bô'lën, ANDREAS WILHELM (1835—). A Russo-Swedish scholar, philosopher, and author. He was born in Saint Petersburg, studied in Helsingfors, and was appointed university librarian there, with the title of professor, in 1873. In philosophy he is a disciple of Ludwig Feuerbach. He has published in Swedish an edition of Shakespeare (Hagberg's translation) and several original works, including *Undersökning of läran om viljans frihet* (1868). In German he has written *Ludwig Feuerbach, sein Werk und seine Zeitgenossen* (1891), and many essays for periodicals.

BOLINGBROKE, bûl'ing-brûk. The name of a character in Shakespeare's *Henry VI.*, part 2, who prophesies the deaths of the Dukes of Somerset and Suffolk.

BOLINGBROKE, bôl'ing-brûk, formerly bûl'ing-brûk, Viscount HENRY ST. JOHN (1678-1751). An English statesman, orator, and author. He was born at Battersea, October 1, 1678. He was

educated at Eton, and, it is said, at Oxford; but the only ground for this assertion is that of the honorary degree conferred upon him by the university in 1702. During 1698-99 he resided on the Continent, and acquired a knowledge of the French language, which was afterwards of service to him. His early manhood was notorious for extreme licentiousness, but having entered Parliament in 1701, he devoted himself to politics, and joining the Tory Party, soon made himself prominent as an orator. In 1704 he was made Secretary of State for War. This office he retained till 1708, when the Whigs came into power, after which he retired from politics, and gave himself up to study, but still retained great influence as the Queen's favorite counselor. On the fall of the Whig Party in 1710, he was made Secretary of State for Foreign Affairs. In 1712 he was called to the House of Lords with the title of Viscount Bolingbroke, and in 1713, against the wish of nearly the entire nation, concluded the Peace of Utrecht. Having previously quarreled with his old friend Harley—now Earl of Oxford, and his most powerful rival—he contrived his dismissal in July, 1714, and immediately proceeded to form a strong Jacobite Ministry, in accordance with the well-known predilections of his royal mistress. Her death, however, a few years after, disconcerted his schemes, and the accession of George I. proved a deathblow to his prospects. On the 28th of August he was deposed from office; in March, 1715, he fled to France, and in August of the same year was attainted. For some time he held the office of Secretary of State to the Pretender; but his restless and ambitious spirit yearned for the 'large excitement' of English politics. His efforts to obtain a pardon not proving in the meantime successful, he retired to a small estate which he had purchased near Orleans. In 1718 his first wife died, and in 1720 he married the rich widow of the Marquis de Vilette. A judicious use of this lady's wealth enabled him to return to England in September, 1724. His property was restored to him, but he was never permitted to take his seat in Parliament. He therefore betook himself to his villa at Dawley, near Uxbridge, where he occasionally enjoyed the society of Swift, Pope, and others of his old friends, with whom he had corresponded in his exile, and where he diversified his moral and metaphysical studies by his attacks on the Ministry in his periodical, *The Craftsman*, in which the letters forming his *Dissertation on Parties* first appeared. In 1735, finding his political hopes clouded forever, he went back to France in chagrin, and continued there till 1742. During his second residence abroad he wrote his *Letters on the Study of History*, in which, as a Deist, he violently attacked the Christian religion. He is believed to have influenced the thought of Voltaire. He died, after a long illness, in 1751. Bolingbroke has been styled 'the Alcibiades of his time,' and was admired by his contemporaries for his graceful person and charming manners. His talents were brilliant and versatile; his style of writing was polished and eloquent, and repays study to the present day; but the lack of sincerity and honest purpose which characterized him, and the unscrupulous ambition which made him aim for power, hindered him from looking wisely and deeply into any question. His philosophical theories are not profound, nor are his conclusions solid, while his

criticism of passing history is worthless. His collected writings were published by Mallet (London, 1753-54).

BOLINTINEANU, bô-lên-tê-nê-ân', DIMITRI (1826-72). A Rumanian poet, born at Bolintina, Wallachia. He was a member of the civil service, but lost his post through the publication of political articles and poems. Subsequently, at the time of the revolutionary outbreak against the Russian protectorate, he was proscribed and fled the country. After his return, he was appointed Minister of Public Instruction (1859). He was the representative poet of the Rumanian Renaissance. In addition to his *Rumanian Melodies* (1858) and other verse, he wrote dramas, satires, and works of fiction.

BOLIVAR'. A city and the county-seat of Polk County, Mo., 39 miles north-northwest of Springfield, Mo., on the Saint Louis and San Francisco Railroad (Map: Missouri, C 4). It has a considerable trade in apples, poultry, eggs, patent medicines, horses, and mules. The city is the seat of the Southwest Baptist College, opened in 1878. Settled about 1835, Bolivar was incorporated in 1855, and is now governed under a charter of 1881, which provides for a mayor elected biennially, and a city council. The water-works and electric-light plant are owned and operated by the municipality. Population, in 1890, 1485; in 1900, 1869.

BOLÍVAR, bô-lé'vâr. A northern department of the Republic of Colombia, bounded by the Magdalena River on the east, the Department of Antioquia on the south, Cauca on the west, and the Caribbean Sea on the west and north. It covers an area of 21,345 square miles (Map: Colombia, B 2). It has a low surface, mostly still overgrown with thick forests and very little cultivated. Its chief rivers are the Magdalena with its tributary, the Cauca, and the Sinú, all navigable. The climate is hot and extremely unhealthy. Population, about 300,000. Capital, Cartagena (q.v.).

BOLÍVAR. The largest State of Venezuela, bounded by the Orinoco on the north, Colombia on the west, the territory of Alto Orinoco and Brazil on the south, and the territory of Yuruary on the east (Map: Venezuela, E 2). It covers an area of 88,700 square miles and has a population exceeding 50,000. Capital, Ciudad Bolívar (q.v.).

BOLIVAR. See RIOBAMBA.

BOLIVAR, *Sp. pron.* bô-lé'vâr, SIMON, or **BOLIVAR Y PONTE** (1783-1830). A South American patriot, called the Liberator. He was born in Caracas, July 25, 1783, of a noble and wealthy family. After studying law in Madrid, he traveled extensively on the Continent, married, and returned to his native country, where his

wife died. He then revisited Europe, and in 1809 returned by way of the United States, where he became an enthusiastic admirer of republican institutions, and resolved to free his own country from foreign despotism. Arriving at Venezuela, he at once associated himself with a secret organization of the patriots there; and after the insurrection of Caracas, April 19, 1810, he was sent to London to gain the interest of the British Cabinet. The British Government, however, declared its neutrality, and Bolivar speedily returned. He fought under General Miranda in several successful engagements. In 1812 the Spaniards recovered possession of Venezuela, and Bolivar fled to Curaçao. He did not, however, remain long inactive, but won the sympathy of the republican President of New Granada, raised a force of volunteers, defeated the Spaniards several times, his army increasing with each victory; and on August 4, 1813, entered Caracas as a conqueror. He was hailed as the liberator of Venezuela, and made absolute dictator in civil and military affairs. After defeating the Spaniards in several engagements, he was himself beaten in the battles of La Puerta and Aragua. He now went to Cartagena, and afterwards to Kingston, in Jamaica. In Haiti he assembled the insurgent refugees, landed (December, 1816) on the island of Margarita, where he convoked a congress, instituted a government, and proclaimed the abolition of slavery. The following two years were marked by successes over the Spanish general, Morillo. In February, 1819, a congress was opened at Angostura, and Bolivar, chosen President, was armed with the power of dictator. He conducted his forces over the almost impassable Cordilleras to New Granada, and achieved the victories of Tunja and Sojaca. Soon afterwards (in 1819) New Granada united with Venezuela as the Republic of Colombia, of which he became the first President. By 1822 the new republic was completely cleared of Royalist troops. Bolivar was summoned the same year to help the Peruvians, and in February, 1824, was named Dictator of Peru. By 1825 the Spaniards were driven from Peru also; and Bolivar, calling a congress at Lima, formally resigned the dictatorship. The southern part of the country was erected into a separate State and named Bolivia (q.v.), of which he was chosen President for life. A form of government suggested by him was adopted by Bolivia in 1826. Widespread dissatisfaction in Colombia, where, in spite of considerable opposition, he was confirmed in the presidency in 1826 and 1828, led to a conspiracy against his life, which was suppressed by the execution of the leaders and banishment of 70 accomplices. In 1829 Venezuela separated itself from the Republic of Colombia, which was generally disturbed by factions. Bolivar's ambition was loudly denounced, and, virtually forced to resign, he retired to Cartagena. He died at San Pedro, December 10, 1830, having shortly before his death written a farewell address to the people of Colombia, in which he vindicated his character from the aspersions that had been cast on it, and complained bitterly of ingratitude. The war of liberation and the peculiar elements with which he had to deal, compelled him to assume dictatorial power; but there is no proof that he was ever insincere in his devotion to liberty. His property was mainly devoted to the services of his country. He has been described as the Washing-

ton of South America. By a resolution of the Congress of Colombia in 1842, his ashes were removed with great pomp from Santa Maria to Caracas. A statue of Bolivar was erected in Central Park, New York, 1884. The official documents connected with the career of Bolivar were published by the Government at Caracas in 1826, and his correspondence, in two volumes, at New York in 1865. Consult Ducoudrey-Holstein, *Mémoires de S. Bolivar* (London, 1830).

BOLIVAR (bô-lé'vâr) CITY. See CIUDAD BOLIVAR.

BOLIVIA, *Sp. pron.* bô-lé'vyâ (in honor of Simon Bolivar). An inland South American republic, situated in the western part of the continent, and extending from about latitude 8° S. to 22° 50' S., and from longitude 58° W. to 73° 20' W. It is bounded by Brazil on the north and east, by Paraguay and Argentina on the south, and by Chile and Peru on the west. Its area, excluding the disputed territory of El Chaco Gran (q.v.) and the Littoral Department held by Chile since the War of 1879-80, is estimated to be about 515,000 square miles.

TOPOGRAPHY. Bolivia is one of the highest regions in America. In a general way it resembles Colombia, in that its western part belongs to the region of the Andes (q.v.), while the eastern part is occupied by extensive plains, or llanos. Two parallel chains of the Andes traverse the country from northwest to southeast, with several minor ranges branching toward the east. The eastern chain, or Cordillera Real, contains some of the highest peaks of the two American continents: Illampul, or the Nevado de Sorata, and the Illimani, both over 21,000 feet high; Todos Santos, 19,500 feet; Chorolque, 18,500 feet; and the Cerro de Potosí, 15,500 feet. In the western range the peaks are generally much less lofty, but they include the giant volcano Sajama, estimated to be nearly 21,000 feet in height. Between the two ranges lies the region known as the Bolivian Highlands, or *Altiplanicie*, a plateau with an elevation of 12,000 to 13,000 feet. It is traversed by a number of small chains, and contains a portion of Lake Titicaca (q.v.), which lies at an elevation of 12,500 feet, and is believed to be a remnant of an inland sea. The mountain chains of Bolivia include many volcanoes, some of which are active at the present time. Cretaceous formations are found in the western range, while in the Cordillera Real Paleozoic rocks seem to predominate; but the geology of the region is only imperfectly known. The portion of the country east of the Andes, known as the Montaña, is occupied by an extensive plain, which is traversed by numerous navigable rivers, and covered with dense forests. The surface is generally level, and its decline from about 3000 feet near the Andes to about 300 feet at the eastern boundary is so gradual as to be almost imperceptible. The chief rivers of the country flow through this section, which belongs to the basins of the Paraguay and the Madeira. The former, which forms part of the boundary with Brazil, is reached through the Pilcomayo and the Bermejo, both watering the southern part of the country, while the Madeira takes in the larger portion of Bolivia through the navigable rivers Beni, Itenez, and Mamoré, with their numerous tributaries. Steamboat navigation has been established on some of these waters. In the region of the Bolivi-

ian Highlands there are only a few insignificant streams, such as the Desaguadero, which connects the lakes of Titicaca and Aullagas, the latter also connected by a short river with the salt lake of Coipasa.

CLIMATE. In regard to climate, Bolivia may be divided into three regions: the eastern llanos, or *tierras calientes*, where the climate is hot and damp; the highland region, or *tierras templadas*, with a more or less temperate climate; and the mountain regions, or *tierras frias*, where the climate is comparatively cold. At La Paz, situated at an altitude of nearly 12,500 feet, the temperature ranges from 44° to 73°, with an average of about 50°. The coldest months are June, July, and August, when the temperature is marked by extreme fluctuations. During December, January, and February, which constitute the wet season, rains and hail-storms are frequent, and the rivers are subject to overflow. In the eastern plains the wet season lasts from November to April, but rains occur also during other parts of the year, and inundations are frequent. This portion of the country is the most unhealthy, owing to the exhalations from partly submerged plains and the poor circulation of the air. The most salubrious and temperate climate prevails in the region of the Medio Yunga, which embraces all the territory lying between 5000 and 9000 feet. For Europeans the climate is rather trying. Dysentery is the usual affliction of newcomers, and fevers and smallpox are not infrequent, even among the natives.

FLORA. The flora of Bolivia is most luxuriant in the region below 6500 feet, where the vegetation is essentially tropical, and where the coffee, cacao, pineapples, bananas, cotton, sugar-cane, rice, cinnamon, and vanilla, besides numerous medicinal plants, such as cinchona, sarsaparilla, etc., are cultivated. The forests, which are especially abundant in this region, are composed largely of ebony, mahogany, rosewood, cedar, wax, cork, rubber, and numerous species of palm. The temperate zone includes all the territory lying between 6500 and 12,000 feet, and embraces the southeastern and a portion of the western departments. Here are found lemons, grapes, figs, peaches, and other European and southern fruits and vegetables, as well as the common cereals, wheat, corn, barley, etc. In the frigid zone, or Puna, which comprises, in the territory lying above 12,000 feet, the mountains of the Andes and the high table-land around Lake Titicaca, the Bolivian Highlands, trees are entirely wanting, and the cereals are cultivated only in the more favored regions. It affords, however, extensive grazing-lands, and is inhabited chiefly by Indians engaged in pastoral pursuits.

FAUNA. The fauna of Bolivia is also characterized by great variety, but the difference between the zones is not so well marked as in the case of the flora. The jaguar, puma, tapir, armadillo, several varieties of monkeys, alligators, and many other South American species are well represented. In the higher regions are found the vicuña, guanaco, and llama. Birds also are numerous, and include a variety of parrots, pigeons, toucans, chatterers, and humming-birds, a few of which fly to altitudes above 14,000 feet.

AGRICULTURE, MINERAL PRODUCTION, AND INDUSTRY. Agriculture, notwithstanding the favorable natural conditions, is utterly neglected. The land, though held partly by whites, is culti-

vated chiefly by the Indians. The methods employed are extremely primitive, most of the work being done by hand. The chief importance of Bolivia lies in its vast mineral resources. The profusion of gold decoration found in the royal palaces and temples of the Incas at the Spanish Conquest, as well as the numerous instruments belonging to the period preceding that event which are found in the mines worked at present, indicate that the gold deposits of Bolivia were exploited by the Incas. After the Spanish Conquest the natives discontinued the mining of the metal, which was the chief cause of their downfall, and the work was subsequently taken up by the conquerors. The most important centre of gold-mining was the Tipuani River, in the Andes not far from La Paz. After Bolivia became independent gold-mining began to decline, and at present very few mines are worked by modern methods. Gold is supposed to exist in all the mountain streams of the northwestern as well as the southwestern parts of the country. At present silver, in the amount produced, ranks first among the minerals of Bolivia. This metal is worked chiefly in the Province of Potosí, though it is believed that deposits exist in many other parts of the Bolivian Andes. The total production of silver, as reported by the chief mining companies, averages annually over 10,000,000 troy ounces. Tin is next in importance to silver. The tin-mines are situated principally in the departments of Oruro, Potosí, La Paz, and Cochabamba, at an altitude of 14,000 feet, the most productive being in the departments of Oruro and Potosí. The output of tin has increased very rapidly, the methods employed being comparatively modern, and amounts at present to about 40,000 tons yearly. Rich copper deposits are located in the mountains near the Desaguadero River, in the Department of La Paz. The average annual production of copper aggregates about 2000 tons. There are also deposits of bismuth, antimony, borax, salt, lead, zinc, etc. In Bolivia, as in other South American countries, inadequate transportation facilities and the lack of modern machinery—obstacles removable only by the aid of foreign capital—are factors which militate against the development possible to the valuable mineral resources. That the Government is fully conscious of this fact is evidenced by its liberality in the granting of concessions and in the matter of appropriations for the surveying of new railroad lines. Manufacturing industries are practically of no importance.

COMMERCE, TRANSPORTATION, ETC. Bolivia is greatly hampered in the development of commercial interests by its inland situation. It exports chiefly metals, rubber, wool, hides and skins, and other raw products, the trade being carried on principally through the Chilean ports of Antofagasta, and Arica, the Peruvian port of Mollendo, and the river ports of Villa Bella and Puerto Suarez, on the eastern frontier. Estimates for the commerce of Bolivia since 1895 place the average annual imports at nearly 13,000,000 bolivianos (\$6,000,000), and the exports at about 24,000,000 bolivianos (\$11,000,000). The import trade is to a great extent controlled by Germany, which exports to Bolivia woollens and silks, machinery, furniture, and clothing. France controls the imports of wine, owing to the treaty by which French wines have been admitted free of duty.

The trade with the United States, which shows some increase of late, is confined mainly to imports of cotton fabrics. The leading position of Germany in the commerce of Bolivia is attributed largely to the predominance of German immigration and to the cheaper prices of German goods.

The surface formation of the country is not favorable to the development of a good system of communication. Most of the roads in the mountainous regions are intended only for pack-animals, by which the internal commerce is principally carried on, and wagon-roads are found only in the vicinity of the capitals of the provinces and other large cities. The principal roads of the country in 1900 had a total length of nearly 950 miles. Of railways Bolivia has only one narrow-gauge line from Oruro to the Chilean frontier (about 500 miles), with a small branch line (25 miles) to the mines of Huanchaca. Plans for new lines, however, are numerous, and concessions have been granted for railways to connect the city of La Paz with the Peruvian frontier, Oruro with Cochabamba, and Santa Cruz with Bahía Negra, on the eastern frontier. Bolivia is connected by telegraph-lines with Peru, Chile, and Argentina, and by cable with the United States and Europe. There are about 2300 miles of telegraph-lines.

GOVERNMENT, FINANCE, ETC. The government of Bolivia is a representative democracy, in which the executive power is vested in a President, elected directly for four years, who is assisted by two Vice-Presidents, similarly elected, and a responsible Ministry of five members. Neither the President nor the Vice-Presidents are eligible for two successive terms. The legislative authority is intrusted to a Congress consisting of a Senate of 18 members, elected for six years, and a Chamber of Deputies of 64 members, elected for four years. For administrative purposes Bolivia is divided into eight departments, which are subdivided into provinces and cantons. The governors of the departments and the prefects of provinces are appointed by the President, and they, in turn, appoint the administrative officers of the cantons. The two territories in the north-western part of the country have been administered since 1900 by separate officials called 'delegados nacionales.' Municipalities in each department are subject to supervision by the municipal council of the capital of the department. The Supreme Court, which constitutes the highest judicial authority of the republic, consists of judges nominated by the Senate and elected by the Chamber of Deputies. The republic has seven judicial districts, each containing a number of superior courts and inferior tribunals. Since 1892 military service has been compulsory for every able-bodied citizen between the ages of 21 and 50 years. The total strength of the Bolivian Army is over 80,000 men, of whom only about 2600 belong to the standing army, the remainder being composed of reserves and territorial guards. The revenue is derived chiefly from import and export duties, and internal revenue. The annual budget balances at nearly 10,000,000 bolivianos (\$4,500,000). The external debt of 6,550,000 bolivianos (\$2,700,000), dating from the Chilean War, has been nearly paid. The internal debt amounted in 1900 to about \$1,500,000.

EDUCATION. Theoretically, education is free and obligatory; but the number of public schools is very inadequate for the needs of the country. There are six universities, eight colleges, five theological seminaries, and a number of private high schools. The primary schools, mostly maintained by the municipalities, number some 700, with a total attendance of about 37,000. There are also a number of missionary schools for the natives.

POPULATION. No census has been taken in Bolivia since 1854, when the population was 2,326,126, of whom the whites and mestizos numbered only 634,000. The population has practically remained stationary since then, now being estimated at 2,500,000, including whites, mainly of Spanish origin, mestizos, and Indians. The last belong mostly to the Aymará and Quichua tribes, which have been partly converted to Christianity and are engaged in agricultural pursuits. In the eastern portion of the country are found a number of Indians of the Guarani tribe, who are still uncivilized. The capital of Bolivia and largest city is La Paz.

HISTORY. The territory of Bolivia, which was subdued by Hernando Pizarro in 1538, constituted, under the name of the Audiencia of Charcas, a part of the Viceroyalty of Peru till 1776, when it was annexed to the Government of La Plata. Within forty years after the Conquest, Spanish settlements were formed at Chuquisaca (Sucre), Potosí, La Paz, and Cochabamba, and numerous silver-mines were opened, in which the Indian population was compelled to labor. So thoroughly were the natives subjugated that no important rising occurred till 1780, when Tupac Amaru, a descendant of the ancient Incas, headed a formidable insurrection, which for a time threatened the destruction of the Spanish power in the region. The first revolutionary outbreak against the authority of Spain occurred at Chuquisaca (Sucre) in May, 1809, and was followed in August by a rising of the inhabitants of La Paz. In 1810 an army from Buenos Ayres came to the assistance of the patriots, but it was defeated at Huaqui by General Goyoneche, who put down the insurrection with great cruelty. For fifteen years the country was devastated by a sanguinary guerrilla warfare, with several pitched battles, in which victory changed from side to side. More than once fresh Argentinian armies invaded Upper Peru, but no definite result was attained till 1824, when the Spanish army in Peru was crushed by the Colombian force under General Sucre. On August 6, 1825, a Congress at Chuquisaca declared the independence of Upper Peru, and five days later the Republic of Bolivia was organized, embracing the provinces of Potosí, La Paz, Cochabamba, and Santa Cruz. A constitution drafted by Bolívar, the Código Boliviano, was adopted, and the Presidency for life was offered to General Sucre, who accepted the office for two years only. From the beginning, almost, of its national existence, Bolivia was plunged into a state of chronic revolution and civil war, from which it was relieved only at intervals by the absolute rule of some military leader. Access to the office of President was gained most often through force of arms, and in the struggle between factions the Constitution of the country was repeatedly tampered with, suspended, or totally disregarded. Of those Presidents who succeeded in giving Bolivia breathing-space for the development of its resources, mention may be

made of Santa Cruz (1820-39), who in 1836 usurped the chief power in Peru and constituted it, together with Bolivia, a federal republic under himself as protector; Generals Belzu and Córdova, who were in power from 1848 to 1857, and José María de Acha (1861-64), in whose time treaties were concluded with the United States and Belgium, and some attempts made to foster the foreign trade of the country. By arrangements made in 1866 and 1874, the joint possession of Chile and Bolivia had been established over the rich nitrate-fields of the desert coast of Atacama; but strife between the two could not be avoided, and in 1876 Chile declared war against Bolivia and its ally, Peru. The brunt of the fighting fell on the latter power. The leading ship of the Peruvian fleet was captured, the land forces of the allied republics were overthrown, the Bolivian port of Antofagasta was seized, and by the treaty of November 29, 1884, Bolivia gave its assent to the retention by Chile of its seaboard with the rich mineral-fields—a loss which proved a serious blow to the prosperity of the country. From 1884 to 1898 there was internal peace; but in the autumn of 1898 a military revolution broke out, which after a half-year's fighting resulted in the overthrow of President Severo Fernando Alonzo and the elevation of José Manuel Pando to the Presidency.

BOLKHOV, ból-kòf'. The capital of a district in the Government of Orel, Russia, about 36 miles north of the city of Orel, and 200 miles from Moscow. Bolkhov is situated on the steep banks of the Nugra, which empties into the Oka about 10 miles northeast of the town. Bolkhov proper is on the left bank, and on the right is the Zaretsky suburb. It is an active, thriving town, trading to the amount of 1,500,000 rubles (\$750,000) annually, in hemp, grain, tallow, rapeseed oil, etc. It has several mills and factories; the annual produce of its tanneries is estimated at 530,000 rubles (\$270,000). A peculiar feature of the town is the location of its harbor, which is 12 miles distant in the village of Krutogorye, on the Oka River. Population, in 1897, 20,700.

BOLLAN, WILLIAM (?-1776). An English-American lawyer and writer, born in England. He emigrated to Massachusetts about 1740, married a daughter of Governor Shirley, and through this connection obtained an appointment to the position of Advocate-General. As the agent of Massachusetts in England (1745-48), he secured from the British Government the repayment of the money advanced by that colony to defray the expenses of the Cape Breton Expedition. In 1769 he obtained and sent to Massachusetts a collection of letters written by Governor Bernard and General Gage, strongly criticising and abusing the colonists. On the approach of the Revolutionary War, he strove to effect a conciliation between the British Ministry and the American Colonies. Among the numerous pamphlets writ-

ten by him are: *The Ancient Right of the English Nation to the American Fishery Examined and Stated* (1764); *The Mutual Interests of Great Britain and the American Colonies Considered* (1765); *Freedom of Speech and Writing Upon Public Affairs Considered* (1766); *A Free Britain's Memorial in Defense of the Right of Election* (1769); and *A Petition to the King, with Illustrations Intended to Promote the Harmony of Great Britain and Her Colonies* (1774).

BOLLANDISTS. An association or succession of Jesuits by whom the *Acta Sanctorum* (q.v.) are collected and published. They derive their name from their head, Jean Bolland, who was born at Tirlemont, Belgium, August 13, 1596, joined the Jesuits in 1612, and was called to Antwerp in 1630 to edit and publish the materials for the lives of the saints which had been collected by the Jesuit Heribert Rosweyde, who had died the year before. Bolland chose as his collaborators Godfried Henschen and Daniel van Papenbroeck. The days of the saints, usually their days of death, were arranged chronologically, and so the lives follow this order, and several volumes are given to one month. The first volume appeared in 1643. Bolland died in Antwerp, September 12, 1665. The work was carried on by those associated with the original company. Some of them are: C. Janning (died 1723), P. Bosch (died 1736), C. Suyken (died 1771), I. Hubens (died 1782), A. Berthod (died 1788), and J. Ghesquière (died 1802). In 1773 the Jesuit order was suspended, and in 1775 the convent in which the Bollandists had lived was turned into a military school. It seemed as if their task must be abandoned; but in 1776 the Empress Maria Theresa came to their assistance, and secured for them the Caudenberg Monastery, in Brussels, and also for each Bollandist a modest pension. Her successor, the Emperor Joseph II., ordered that they should produce a volume yearly, and as it was impossible for them to do so, expressed such great dissatisfaction that in 1798 he forbade them to bring out another volume. In 1789 their library and all their materials were sold to the Premonstratensian Abbey of Tengerloo, not far from Antwerp, for 25,000 francs, and there the work was continued for a time. But in 1796, the French having invaded the country, the abbey was dissolved. The materials were not scattered, however. In 1825 they were removed to Brussels. In 1836 it was reported in Brussels that the work was to be continued in Paris. This so stirred the interest of the Belgians that the Government passed a yearly subsidy of 6000 francs to insure the continuance of the work on Belgian soil; a new company of Bollandists was formed, and ever since the volumes have been coming out.

In 1882 a supplement to the volumes already published, and preparatory studies for those not yet in press, began to appear under the title *Analecta Bollandiana*. The principal collaborators on this series are de Smedt, van Hooff, and de Backer.

BOLLES, bólz, ALBERT S. (1846—). An American lawyer, educator, and author. He was born in Montville, Ky. He studied law and was admitted to the Connecticut bar, and in 1870 was elected judge of the Probate Court. He afterwards edited successively the *Norwich Bulletin* and the *Bankers' Bulletin*, and for several years

was professor of mercantile law and banking in the University of Pennsylvania. He was then, for eight years, chief of the Pennsylvania Bureau of Industrial Statistics, and subsequently became lecturer at the University of Pennsylvania and at Haverford College. Among his publications are: *Financial History of the United States from 1774 to 1789* (1879); *Financial History of the United States from 1789 to 1860* (1883); *Financial History of the United States from 1860 to 1885* (1886); *Practical Banking* (1884); *Industrial History of the United States* (1878); *The Conflict Between Labor and Capital* (1876); *The History of Pennsylvania* (1899); and *American Finance* (1901).

BOLLES, FRANK (1856-94). An American author, born in Massachusetts. He received his law education in Washington, D. C., and at Harvard; gave himself up to literary work, became an editor of the *Boston Advertiser*, and finally secretary to Harvard University, where he labored successfully to aid poor students. He was also conspicuous as a writer of nature studies, somewhat in the manner of Thoreau. In prose he produced the following works: *The Land of the Lingering Snow* (1891); *At the North of Bear Camp Water* (1893); *From Blomidon to Smoky* (1894); and, in verse, *Chocurua Tenants* (1898).

BOLLWORM bôl'wûrm (bôll, the round pod or capsule of cotton + worm). The widely destructive caterpillar of a nocturnal moth (*Heliothis armigera*). "Of popular names," says C. V. Riley, who studied and wrote extensively upon it, "it has one for almost every plant upon which it feeds and for every country which it inhabits, and as it is almost cosmopolitan and a very general feeder, these names are many. Throughout cotton-growing States it is very generally known as the 'bollworm' when it occurs upon cotton; when it occurs upon corn it is called the 'cornworm' or 'earworm.' . . . In many Southern States it is known in the early part of the season as the 'cornbud-worm.' When found upon tomatoes it is the 'tomato-worm.'" It attacks a great variety of vegetables and flowers (gladiolus, etc.), and in Europe feeds upon maize, hemp, tobacco, lucerne, etc. It usually produces two to five broods in a season, and ranks among the most destructive and difficult to combat of all injurious insects. The moth has an expanse of about 1¾ inches; the general color of the upper surface varies from light greenish-gray to a rich yellow-gray, almost tawny, and the markings vary much in intensity and size. The moths fly in the evening dusk, seeking the flowers of some suitable plant of the season, and depositing their eggs upon the surface of, or more often near to, the flower-bud. When Indian corn is about to flower this plant seems preferred to anything else (save perhaps cotton) then available; and tomatoes with corn near them will be saved to a great extent by this preference. The egg hatches soon, and the young caterpillar begins to feed and to make its way steadily toward flower-bud or boll, searching patiently for it until found, when it begins at once to feed there, destroying the essential parts of the unfolded flower of corn or other plant, or ruining the cotton-boll, whether more or less advanced. "As the bollworms increase in size, a most wonderful diversity of color and marking becomes apparent. In color, different individuals will vary from a brilliant green to

a deep pink or a dark brown, exhibiting almost every conceivable intermediate stage, and from an immaculate, unstriped specimen to one with regular spots and many stripes." In addition to their feeding upon this vegetable matter, these caterpillars are carnivorous, seizing and devouring each other whenever opportunity offers, and invariably doing so when shut up together in a breeding-cage or traveling-cage, until only one remains. At the end of about three weeks the worms drop to the ground, work their way several inches into the soil, and, spinning a mantle of silk about them, become reddish-brown polished pupæ. In the warmer parts of the United States no less than five broods appear. It is the third or July brood which does most harm to the corn, and the fourth (August) brood that furnishes the bollworm proper and the greatest destruction to cotton, while 'budworms' are those of the spring hatching. The fifth brood winters as chrysalis and maintains the race.

BOLOGNA, bô-lô'nyâ (anciently, Lat. *Bononia*). A city of Italy, in Romagna, capital of the Province of Bologna, situated in a fertile plain at the foot of the Apennines, where the ancient Via Æmilia intersected the Reno (Map: Italy, F 3). Industrially Bologna is of great importance. The products for which the city is especially famous are macaroni, Bologna sausages, liquors, and canned fruit. There are also large manufactures of silk, linen, glass, leather, and machinery. The commerce is considerable, and is greatly facilitated by excellent railway connections. Bologna is the seat of a court of appeals and of an archbishop. It has a large garrison. The population of the city, including the suburbs, was 123,274 in 1881 and 152,009 in 1901.

The city was called in the early Middle Ages *La Dotta*, 'the Learned,' on account of its great university; or *La Libera*, from its democratic constitution; and later *La Grassa*, for the fertility of its soil and its wealth.

ARCHITECTURAL FEATURES. The town has not been generally rebuilt, and its narrow, irregular streets, numerous towers, and old palaces give it a mediæval aspect. In both the new and old quarters the façades of most of the houses overhang the second story, being supported on vaulted arcades. These arcades extend for miles in every direction, forming open galleries, protected from the weather, where all the shops are situated—an arrangement which never has been so thoroughly carried out in any other city. Many of these arcades date from the Thirteenth to the Sixteenth Century, when the city was most flourishing, and illustrate both Gothic and Renaissance civil architecture in brick and terracotta. The finest are the portico of the Banchi (Sixteenth Century), under buildings by Vignola, and the portico of the Servi, built in 1312 by Manfredi. The later colossal portico of the Scalzi is 1700 feet long, with 167 arches. The longest of all the arcades are those leading from the city to the pilgrimage Church of the Ma-

donna di San Luca, with 635 arches; the distance is about a mile and a half (1676-1739).

The city is also remarkable for its churches, of which there are about 130, dating in unbroken succession from the Eleventh Century to the present. The earliest are the group of seven churches called San Stefano, unique in Italy, and dating from the Eleventh and the Twelfth centuries, and examples of simple Lombard brick architecture. This group includes a small basilica of Saints Pietro and Paolo, with early groin vaulting, originally the cathedral; the circular, vaulted Church of San Sepolero, built in imitation of the Holy Sepulchre (Twelfth Century); a well-preserved cloister, remarkable for its second-story arcades, usually destroyed in mediæval cloisters; an interesting subterranean church, and several other small churches and chapels, with monastic buildings, the whole being connected by numerous passages. Remains of contemporary fortified feudal palaces are numerous, the most imposing being the leaning tower of the Asinelli family, built in 1109, and 320 feet high, and that of the Garisendi family, of 1110, 163 feet high. The latter is 10 feet out of the perpendicular and is mentioned by Dante (*Inferno*, xxxi. 136), who compared it to the giant Antæus. Bologna had 180 such towers in the Middle Ages.

There are also many quaint houses of the Thirteenth Century, combining wood and brick, and from this period date the two great palaces of the ancient republic, the Palazzo del Podestà, famous as the place where King Enzo, son of Emperor Frederick II., was imprisoned, and the Palazzo Pubblico, for the general popular assemblies; as well as such large private houses as and Palazzo Pepoli, with its great court; the Palazzo Malvasia, and the Loggia dei Mercanti, all of Gothic architecture. Bologna was then one of the foremost of the free communes. It was at the same time one of the important centres of the great religious revival emphasized by the two mendicant and preaching Orders of Saint Francis and Saint Dominic. The churches of San Domenico and San Francesco were among the first erected by these orders (c.1220-30), and among the earliest examples of Gothic architecture in Italy—earlier than their rivals in Venice and Florence. Other Gothic churches are the Madonna dei Servi, and, above all, the colossal church of the national patron, San Petronio, designed in 1390 to be the largest cathedral in Italy. It was never completed as planned, only the nave and aisles being built (337 × 171 feet), without the transept with its central dome, or the apse, which would have made a structure surpassing the Cathedral of Florence in size. The proportions of the details are on so large a scale, with only twelve piers to support the arches and vaulting, that the real size is not apparent. The Gothic tracery of the large windows is the finest in Italy, and the sculptures on the façade doorways, by Jacopo della Quercia, are among the most interesting works of the earliest Renaissance. The finest work of Gothic sculpture in the city is the shrine of San Domenico (1267), by Giovanni Agnelli, from the designs of Nicola Pisano. The churches are full of interesting Gothic sepulchral monuments of the old university professors, with reliefs representing them teaching their classes, while other monuments stand in the streets under stone canopies, and represent men of political note, in

the same style as that which prevailed in Padua, Verona, etc.

It is probable that most of the best mediæval works of art in Bologna were by artists from other cities; for Bologna was not creative artistically until the late Renaissance, but was given over to the pursuit of wealth. It was original, however, in its arcades and in its use of terracotta decorations of brick constructions. It was late in adopting the Renaissance, and then (c.1500) it used terra-cotta work most effectively in the new style. It is one of the most remarkable cities in Italy for its fine Renaissance palaces. Such are the Palazzi Fava, Bolognini, Malvezzi, Bevilacqua, and Bentivoglio, and the later part of the Palazzo del Podestà. More classic and later Renaissance buildings are the Malvezzi Medici Palace, and the old University (now library), by Terribiglia. San Giacomo Maggiore and San Michele in Bosco are examples of the Renaissance, and San Pietro of the Barocco style of church. In civil Barocco architecture, Tibaldi distinguished himself in the Magnani Palace and the present University building (1577).

HISTORY. According to legend, Bologna was founded about the Eighth Century B.C. by a colony of Etruscans. It was then called Felsina. Several necropolises, especially that called Villanova, have yielded testimony to this early occupation. Many of the objects found in the tombs are of archæological interest. They are exhibited at the Museo Civico. Felsina was long the most important Etruscan city north of the Apennines, and the earliest stage of Italian culture is called the Villanova Age. It was conquered by the Gallic tribe of the Boii and called by them Bononia, the name it has since retained. Having espoused the cause of Hannibal, it was conquered by the Romans, who made it a colony in B.C. 189. It remained a city of great importance under the Empire. After the fall of the Western Empire, Bologna was annexed, with its territory, to the Exarchate of Ravenna. It passed to the Lombards on the fall of the Byzantine Exarchate, but was soon made a free city by Charlemagne. The Imperial charter of 1112 recognized its right to elect its own magistrates, and from that time the city became noted for its strongly organized guilds and its thorough democratic spirit, which went so far as to exclude the nobility from office, as in Tuscany. Bologna acquired world-wide fame during the Middle Ages through its university, one of the oldest in the world. Under Imperial protection it became the greatest centre of learning in Italy, and the expounder of Roman law. It reestablished the text of the *Corpus juris civilis*. During the Twelfth and Thirteenth centuries, when it was especially flourishing, there were in attendance ordinarily anywhere from 3000 to 10,000 students from all parts of Europe. The faculties of medicine and theology were added later to that of law. There have been a number of women among its professors. Of the earliest the most famous was Novella d'Andrea, in the Fourteenth Century, and of the latest, Clotilda Tambroni. It was the pioneer in the study of anatomy (Fourteenth Century), and Galvani here discovered galvanism. The celebrated linguist Mezzofanti also taught here, and such men as Aldrovandi, Marsili, Lanza, Alessandrini, Basse. Its library now contains over 170,000 volumes and many important manuscripts.

There are at present about 1500 students. The Archæological Museum is one of the most important in the country. It is rich in treasures from the Etruscan Period, and in medals, illuminations, and sculptures of the Renaissance. The Academy of Fine Arts contains Raphael's famous "Saint Cecilia"; otherwise it is chiefly remarkable as illustrating the local Bolognese School, not only the earlier men, like Francia, but especially the school of the Caracci (q.v.). Bologna possesses also one masterpiece of Barocco sculpture in the colossal statue of Neptune by Giovanni Bologna on the Giant's Fountain. Earlier sculptures of considerable merit are scattered through the churches.

The political history of Bologna after the adoption, in the Twelfth Century, of its democratic communal institutions shows at first a predominance of the Imperial or Ghibelline Party; but after a long and sanguinary contest between democratic Guelphs and aristocratic Ghibellines the former triumphed. The city then fell into the arms of the Papacy. Direct Papal rule was imposed by Cardinal Albornoz and Julius II., resulting in the loss of the city's liberties and the decline of its prosperity (1506). Here Leo X. and Francis I. met in 1515; here Charles V. was crowned in 1530 by Clement VII. Bologna remained a part of the Papal territory until 1796, when it was taken by the French troops under Augereau and made by Napoleon the capital of the Cispadane Republic. It reverted to the Papal States in 1815, but became a hotbed of revolutionary and national movements, such as those of 1831 and 1849. In the latter year it was taken by the Austrians, who held it until the war of 1859, when the defeat of that power by France and Sardinia made an Italian kingdom possible. The Bolognese, by an overwhelming vote (1860), decided for annexation to the dominions of Victor Emmanuel.

Consult: Muzzi, *Compendio della storia di Bologna* (Bologna, 1875); Ricci, *Guida di Bologna* (Bologna, 1882); Burton, *Etruscan Bologna* (London, 1876); Taine, *Italy* (New York, 1877); Hare, *Cities of Italy* (London, 1884); Tuckerman, *Italian Sketches* (New York, 1891).

BOLOGNA, GIOVANNI, called by the French JEAN BOULOGNE (1524 or 1530-1608). A Flemish sculptor. He was born in Douai, but is numbered with the Italian sculptors of the Renaissance. He was educated in Florence, and the works that represent him in Bologna and other cities are classic in subject and boldly conceived, but treated with great poetic feeling. His "Flying Mercury," delicately poised and graceful, is in the Bargello Palace in Florence; its numerous copies in museums and private collections are familiar to all. A "Fountain of Neptune," in Bologna, a bronze "Venus," in Petraja, and "Hercules and the Centaur" are among his works. Especial interest is attached to his equestrian statue of Duke Ferdinand in Florence, because it inspired Browning's beautiful poem of "The Statue and the Bust." Consult: A. G. Radcliffe, *Schools and Masters of Sculpture* (New York, 1894); J. A. Symonds, *The Renaissance in Italy* (New York, 1885.)

BOLOGNA, UNIVERSITY OF. One of the oldest and most famous universities in the world, though Paris, if not older, rivals it in antiquity, and Salerno had a school of medicine at a very

early date. The origin of all these foundations is obscure. A school of law existed in Bologna in the Eleventh Century, and out of this the university grew, although the faculties of medicine and of the liberal arts did not come into prominence before the Fourteenth Century. Irnerius, the famous teacher of the Civil Law, brought great renown to Bologna in the early half of the Twelfth Century. This renown was augmented by the subsequent publication of the great Decretum or Digest of the Canon Law, compiled by Gratian, one of the doctors of the university. For the first time the Church now had its body of laws comparable with those of the State, and the *Corpus Juris Canonici* took its place by the side of the *Corpus Juris Civilis*, and both these epoch-making works are among the glories of the University of Bologna. Favored in its earlier years by the Emperors for its knowledge of the Civil Law, which was of great value to the Empire, it was favored by the Popes. In later times, for the service rendered to the Papacy by the Digest of the Canon Law. In 1360 Innocent VI. established here a school of theology. The University profited not less by private than by public benefactions, and rose to remarkable prosperity in the later Middle Ages. The number of students is said to have been about 10,000. Its organization was probably a guild of students or scholars as opposed to the other mediæval form, a guild of masters, such as prevailed in Paris. As early as 1158 these received a charter of privileges from Frederick I. known as the *Authentica Habita*. The students were divided according to nationalities, and these were again subdivided. At first, as elsewhere, four nations seem to have existed: but later, after much subdivision, two great organizations emerge—the Citramontani or Italians and the Ultramontani or foreigners—each with its own officers and administration. One of the notable features of the later history of Bologna was its admission of women as both students and instructors, among the latter being Novella d'Andrea, Laura Bassi, Mme. Mazzolini, and Clotilda Tambroni. The study of anatomy has been here promoted by many illustrious teachers—Vesalius among the number; and it was here that Luigi Galvani made the famous discovery which perpetuates his name. At present Bologna has about 1500 students, and comprises faculties of Philosophy and Letters, Mathematics and Science, Jurisprudence, Medicine and Surgery, Pharmacy, Veterinary Surgery, an Engineering School, a School of Drawing and Architecture, a School of Politics, and one of Criminal Law. The library (of which Cardinal Mezzofanti, the celebrated linguist, was once librarian), founded in 1605, contains 170,000 volumes, 48,000 pamphlets, 5000 MSS. and 880 incunabula. The University celebrated its eighth centenary in June, 1888. See GRATIAN; CANON LAW; CIVIL LAW, etc.

BOLOGNA VIAL, or FLASK (first made in Bologna). A short, thick, narrow glass vessel, closed at one end, and open at the other, which the glass-blower prepares from each pot of the melted mixture before employing it in the fashioning of tumblers, glasses, bottles, etc. (See GLASS.) It serves the purpose of enabling the glass manufacturer to judge of the color and other conditions of the fused glass or metal; and as the jar is not subjected to anneal-

ing, it is very friable, and a small angular fragment of any mineral allowed to drop into it at once causes it to fly in pieces. It will be noticed, however, that a Bologna flask will bear a very heavy blow on the outside without being fractured.

BOLOGNA STONE. A radiated or globular variety of the mineral barite. It was originally obtained from a bed of clay in Mount Paterno, near Bologna, Italy, and attracted considerable attention because of the phosphorescence which it exhibited when thrown into a fire in the presence of charcoal. The mineral, when heated with powdered charcoal, is partially reduced to barium sulphide, which, if sealed up in glass tubes after exposure to the sun's rays, will phosphoresce in the dark with a brilliant orange-colored light. This has been long known as *Bologna phosphorus*, and has been used as a luminous paint for coating clock-faces, match-boxes, etc. See LUMINOUS PAINT.

BOLOGNESE, IL, *él bô'lô-nyâ'zâ*. See GRIMALDI, G. F.

BOLOGNESE (*bô-lô'nyêz'* or *bô'lô-nêz'*) **SCHOOL OF PAINTING.** A school of the latter Fifteenth and Sixteenth centuries, which originated in and remained intimately connected with the Ferrarese School (q.v.). The school usually meant by this name, however, is the so-called Eclectic School, founded by the Caracci (q.v.) at Bologna about 1580. Like the contemporary Naturalist School (q.v.), it was a reaction against the Mannerist School (q.v.) of the Sixteenth Century, which imitated, in a meaningless manner, the forms of Michelangelo and Raphael. The Eclectic School of Bologna was the mother of modern schools of design. Its programme was to unite the best points of the principal schools of the Italian Renaissance: Michelangelo's form, Titian's color, Correggio's light and shade, and Raphael's symmetry and grace. The result of such training was great technical skill, but a lack of originality. The school also placed weight upon the study of nature, especially from the nude, but not to the same extent as the Naturalists, by whom it was much influenced. Its most important representatives will be found treated under the titles CARACCI; GUIDO RENI; DOMENICHINO; ALBANI, FRANCESCO; BARBIERI, FRANCESCO.

BIBLIOGRAPHY. The best modern treatise on the Bolognese School is "Die Malerschule von Bologna," in Dohme, *Kunst und Künstler Italiens*, Vol. III. (Leipzig, 1879). See also Bolognini-Amorini, *Vite dei pittori ed artisti Bolognesi* (Bologna, 1843). Contemporaneous accounts are those of Malvasia, *Felsina pittrice* (Bologna, 1678; new ed. 1841); Baglione, *Le vite dei pittori dal pontificato del Gregorio XIII.* (Rome, 1649).

BOLOMETER (Gk. *βολή*, *bolê*, a throw, sun-beam + *μετρον*, *metron*, measure). An instrument invented by Prof. S. P. Langley for the detection of minute changes in temperature, particularly those due to the absorption of radiant energy, and for a comparison of quantities of energy absorbed. It consists essentially of a balanced Wheatstone's bridge (q.v.), through which a feeble current is passing; one 'arm' of this bridge is composed of three strips of platinum blackened and exposed to the radiation, e.g. from the sun; the temperature of this arm rises, its electrical resistance increases,

and the balance of the bridge is thus destroyed, and there is a sudden deflection of the galvanometer-needle, varying with the amount of energy absorbed by the arm of the bridge. This instrument was used originally by Langley in his investigation on the radiation from the sun; and within recent years, particularly in Langley's Astrophysical Observatory at the Smithsonian Institution, Washington, the bolometer has proved to be one of the most useful and reliable instruments for the study of radiation. The instrument, is described in Vol. XVI. of the *Proceedings of the American Academy of Arts and Sciences*, p. 342 (Boston, 1881), and in the *Annals of the Astrophysical Observatory* of the Smithsonian Institution, Vol. I. (Washington, 1900).

BOLONDEON, *bô-lôn'drôn*. A town of Cuba, in the Province of Matanzas, about 35 miles southeast of Matanzas by rail (Map: Cuba, D 4). Population, in 1899, 9200.

BOLOR-TAGH, *bô-lôr' tâg'* (Turk. *bolur*, snow cloud + *dagh*, *tagh*, mountain; cf. *Ben-Nevis*). A name formerly given to a mountain range supposed to extend in a north and south direction along the eastern edge of the Pamir plateau connecting the Himalaya, Karakorum, Kuen-ben, and Tian-Shan ranges. The Kizil-Yart Range, attaining in the peak of Mustaghata an elevation of nearly 26,000 feet, may perhaps be taken to represent the Bolor-Tagh.

BOLSENA, *bôl-sâ'nâ* (anciently, *Volsinii*). An Italian town in the Province of Rome, situated on the north shore of the Lake of Bolsena (*Lacus Volsiniensis*), about 20 miles north-northwest of Viterbo. It was one of the twelve great cities of the Etruscans, but is now a town of little importance. The miraculous bleeding of the Host in the hands of a doubting priest at Bolsena caused the institution of the festival of the Corpus Domini, celebrated the Thursday following the first Sunday after Pentecost. The incident has been treated by Raphael. Half a mile from Bolsena are a few traces of the Etruscan city, and many fragments of the Roman one remain. The Lake of Bolsena is a fine expanse of water, about 10 miles long and 8 broad, and is supposed to be the crater of an extinct volcano. The Marta River carries its waters into the Mediterranean. It has two islands, Bisentina and Martana, which were favorite retreats of Pope Leo X. Martana is famous as the scene of the exile and murder of the Gothic Queen, Amalasuntha, by her husband, Theodatus.

BOLSTER (akin to Engl. *bole*, stem, *bowl*, hollow vessel). A piece of soft wood covered with canvas, placed on the trestletree of vessels for the eyes of the topmast rigging to rest upon, and thus prevent the injury to them which would result from being bent downward at a sharp angle. Pieces used for similar purposes elsewhere are also called bolsters; and the name is applied to cushions of tarred canvas and rope which are used to prevent the stays from being chafed when the ship pitches.

BOLSWARD, *bôl'svârt* (anciently, Lat. *Bolwerda*). An old town in the Netherlands, Province of Friesland, 20 miles southwest of Leeuwarden (Map: Holland, D 1). It is surrounded by a navigable canal. The Church of Saint Martin, in the Gothic style, is the largest and handsomest in Friesland. Bolsward's trade is con-

siderable, and its principal manufactures are bricks and pottery. The town was a member of the Hanseatic League in the Middle Ages. Population, 6500.

BOLSWERT, SCHELTE VAN (1586-1659). A Dutch engraver, born in Bolsward. He engraved chiefly after Rubens, who, it is said, by retouching his plates with the pencil, instructed him in the subtler matters of technique. His principal works include: "The Conversion of the Apostle Paul," "The Marvelous Draught of Fishes," "Landscape with Peasants," "The Vicinity of Mecheln," "The Resurrection," after Rubens, "The Crowning with Thorns," "The Elevation of the Cross," after Van Dyck.

BOLT. A specially constructed metallic pin for fastening together temporarily or permanently parts of structures or machines. Bolts for doors, windows, chests, drawers, etc., are employed to fasten temporarily the objects to which they are applied, and are thrown into and out of use by keys or by means of the hand. Bolts for permanent fastenings are of various kinds, and are given various names, according to their form or the use to which they are put; thus we have round, square, hook, and eye bolts as examples of bolts named according to their form, and we have foundation, rail, tire, shackle, and other bolts named from the use to which they are put. The most common form of bolt is that having a head at one end and a screw-thread at the other. The threaded end is sometimes screwed into the last of two or more parts, but more generally it projects through, and a suitably fitting nut is screwed on to the projecting end. This form of bolt is made by passing heated rods of iron into a machine which automatically cuts off the proper length for a single bolt, and forges a head on one end by pressure; and the blanks thus formed are then threaded in other machines, the heated rods are fed continuously, and the bolts are forged and threaded with astonishing rapidity. Bolts of complicated shape and bolts of larger size for special purposes are forged by ordinary blacksmith-work.

Metal bolts used on board ship are called *through bolts* if they extend completely through a part of the structure, and *blunt bolts* if only extending part way through. Bolts having a hole in the projecting end are called *eye-bolts*; *ring-bolts* have a ring through the eye. *Lewis bolts* consist of an eye with a tapered lug on one side which fits in a socket in the deck, where it is firmly held by a wedge or key inserted behind it; these bolts are used in the decks where an eye-bolt is needed, but where it is undesirable to have any projection extending permanently above the surface.

BOLT COURT. One of the odd retreats in London, just beyond Saint Bride's Church, off Fleet Street. Its association with Dr. Johnson, who lived there for several years, and with Cobbett, gives it additional interest.

BOLTI, bôl'ti, or **BULTEE** (Ar. *bolting*). A chichlid fish of the Nile (*Tilapia nilotica*), esteemed as food.

BOLTING-CLOTH (ME. *bulten*, OF. *bulter*, *buleter*, Fr. *bluter*, from LowL. *buletare*, to sift, from LowL. *burra*, a coarse cloth; cf. It. *buratto*, sieve). A fine fabric, usually made of unsized silk, and employed in separating the products of flour-mills. See GAUZE; also FLOUR.

BOLTON, bôl'ton, or **BOLTON-LE-MOORS** (from the moorlands where it is situated). An important manufacturing town in Lancashire, England, on the Croal, 10 miles northwest of Manchester (Map: England, D 3). It is one of the principal seats of the cotton manufacture in England, its spinning-factories alone employing over 20,000 workmen. In addition there are large foundries and iron-works, dye-works, paper-mills, soap-factories, and silk-weaving establishments and coal-mines in the vicinity. The municipal enterprise of the town in no way lags behind its industrial activity. Its water-works were municipalized as early as 1847; it owns and operates the gas-works, an electric plant, the electric street railways, and maintains ice-houses, markets, and slaughter-houses, all of which yield a substantial income after covering all expenses of maintenance, interest, and amortization, and saving immense sums of money to the citizens and the city treasury in lower charges. Even the sewage is utilized in connection with a sewage-farm maintained by the city for that purpose. The public baths, numerous recreation-grounds and parks, a higher-grade board school, technical and art schools, five public libraries, and two museums are the results of the city's efforts on behalf of its people. The city returns two members to Parliament. Population, in 1891, 146,487; in 1901, 168,205.

The history of Bolton since very early times is almost entirely industrial. Flemish immigrants in 1337 laid the foundations of the woolen manufactures, and this was further stimulated by the arrival of French Huguenots toward the end of the Seventeenth Century. The inventions of Arkwright and Crompton, who were natives of Bolton, naturally revolutionized industry there, though the new machines were met at first with great disfavor. During the Civil War the town was stormed by the Earl of Derby and Prince Rupert (1644).

BOLTON, HENRY CARRINGTON (1843—). An American chemist, born in New York City. He graduated at Columbia University in 1862, studied at Göttingen, and in 1872-77 was an assistant at the Columbia School of Mines. In 1877 he was appointed professor of chemistry and natural science at Trinity College. He was elected in 1900 president of the Chemical Society of Washington, D. C. His more important investigations have been made in connection with the action of organic acids on minerals. His publications include: *The Student's Guide in Quantitative Analysis* (1885); *The Scientific Correspondence of Joseph Priestley* (1892); *A Select Bibliography of Chemistry, 1492-1892* (1893; with supplements, 1899, 1900); *A Catalogue of Scientific and Technical Periodicals* (1897); and *The Evolution of the Thermometer, 1592-1743* (1900). Dr. Bolton has also pursued investigations in comparative folk-lore, on which topic he has published a number of monographs.

BOLTON, SARAH KNOWLES (1841—). An American author, born in Farmington, Conn. She was at various times associate editor of the *Congregationalist*, assistant corresponding secretary of the National Women's Christian Temperance Union, and vice-president of the American Humane Education Society. Her publications include: *Orlean Lamar and Other Poems* (1863); *The Present Problem* (1874); *How Success is*

Won (1884); *Poor Boys who Became Famous* (1885); *Social Studies in England* (1886); *Famous American Statesmen* (1888); *Famous English Statesmen* (1891); *Famous Givers and Their Gifts* (1896); and *Our Devoted Friend, the Dog* (1901).

BOLTRAFFIO, bôl-trăf'fyo, GIOVANNI ANTONIO. See BELTRAFFIO.

BOLT-ROPE. The rope sewed on the edges of sails to strengthen them and prevent them from tearing. When on the perpendicular edge of a sail, it is called the *leech-rope*; along the bottom of a sail, the *foot-rope*; along the top, the *head-rope*. Some sails, owing to their shape, have no head-rope. All cordage employed in furling, loosing, or setting a sail, if attached to it at all, is, except the burned whip, fastened to the bolt-rope.

BOLTZMANN, bôlts'mán, LUDWIG (1844—). An Austrian physicist, born in Vienna. He studied in Vienna, Heidelberg, and Berlin; was appointed professor of physico-mathematics at the University of Gratz in 1869, and in 1873 professor of mathematics in Vienna. From 1876 to 1890 he held the chair of experimental physics in Gratz, from 1890 to 1895 that of theoretical physics in Munich, and from 1895 to 1900 that of theoretical physics in Vienna. In 1900 he was appointed professor of physics at the University of Leipzig, and in 1902 was recalled to Vienna. He has made valuable researches in connection with thermo-dynamics, the kinetic theory of gases, and other physical problems, and has published *Vorlesungen über Maxwell's Theorie der Elektrizität und des Lichts* (1891-93); *Vorlesungen über kinetische Gastheorie* (1896); and *Vorlesungen über die Prinzipie der Mechanik* (1897, et seq.).

BOLUS, DR. A character in a humorous poem of the same name, by the younger Colman. It appeared in a volume entitled *Broad Grins*. His versified prescriptions, such as "When taken, to be well shaken," were sometimes disastrously misapplied.

BOLYAI, bôl'yô-ê, FARKAS (German, WOLFGANG) (1775-1856). A Hungarian mathematician. He was born in Bolya, spent his early years of study in Enged, Klausenburg, and Jena, and later studied three years (1796-99) in Göttingen. Here he formed an enduring friendship with Gauss, who was attracted to him by his profound thinking and excellent character. In 1804 he was made professor of mathematics in the Reformed College of Maros-Vásárhely, where he remained forty-seven years. In common with his friend Gauss, with Sacchrei, Lambert, and numerous other mathematicians, Bolyai made many efforts to prove Euclid's postulate of parallelism. But it was reserved for his son, János (John), to declare the *science absolute of space*, which assigns Euclidean geometry to a particular kind of space. The chief work of the older Bolyai, known as the *Tentamen*, contains an appendix of twenty-six pages to Volume I., entitled *Scientiam Spatii Absolute Veram Exhibens*. This little monograph, now so famous, is the work of János.

BOLYAI, JÁNOS (1802-60), was born in Klausenburg. He was a spirited boy; and, partaking of his father's mathematical genius, his progress was marvelous. He finished the Latin school at the age of twelve, passed the philosophic curriculum in two years, and entered the Academy

of Engineers in Vienna. In 1823 he was appointed lieutenant at Temesvár, from which place, November 3, 1823, he wrote to his father in positive terms of his conception of parallels: "From nothing I have created another wholly new world." This conception, as formulated by him, became the appendix of the *Tentamen*. His later works, mostly unfinished, as the *Principia Doctrinæ Novæ Quantitatum*, add little to his fame. Consult: Baltzer, *Elemente der Mathematik* (Dresden, 1866); Schmidt, in *Abhandlungen zur Geschichte der Mathematik*, Vol. VIII. (Leipzig, 1895); Halsted, *Bolyai—Non-Euclidean Geometry* (Austin, 1896).

BOLZANO, bôl-tsâ'nô, BERNHARD (1781-1848). A German theologian, philosopher, and mathematician. He was born in Prague, was ordained priest in 1805, and was appointed professor of the philosophy of religion at the university there. In 1820 he was removed on account of his liberal teachings, for which he had been denounced in Rome by the Jesuits, and henceforth devoted himself to his literary labors. As a philosopher he was a devoted adherent of Leibnitz, but was also influenced by Kant. He was a mathematician of remarkable ability, and was one of the formulators of the present theory of functions. His most important works are: *Wissenschaftslehre* (1842); *Versuch einer neuen Darstellung der Logik* (1837); and *Paradoxien des Unendlichen* (1851). Consult his *Autobiography*, ed. by Fesl (Vienna, 1875).

BOMA. The capital of the Congo Free State, Africa, situated on the Congo River, a short distance from the coast (Map: Africa, B 4). It has a well-built residential section, containing the Government buildings, and a business part situated along the coast. It is an important shipping centre, and is also the capital of the District of Boma. It was visited by Stanley in 1877.

BOMARSUND, bô'mär-sund. See ÅLAND ISLANDS.

BOMARSUND (Scand. *bomar*, rail, bar, bolt + *sund*, strait), STRAIT OF. A channel in the Baltic Sea, at the entrance to the Gulf of Bothnia, between Verde and the islands of Åland and Bardö (Map: Russia, B 2). The Russian fortress of Bomarsund, on the island of Åland, was taken in 1854 by the Allies, and its fortifications destroyed. By the Treaty of Paris, Russia must not rebuild the fortress.

BOMB, bôm or bûm (Fr. *bombe*, from Lat. *bombus*, Gk. βῆρυξ, *bombos*, a booming, humming; refers to the noise made by the projectile), BOMBSHELL and SHELL. A hollow ball of cast iron or steel filled with combustibles and shot, designed, on the explosion of the shell, to scatter in every direction. When first used, bombs were fired from mortars only; but since the invention of shell-guns and other modern artillery the name *shell* has been gradually substituted. See AMMUNITION; ARTILLERY; ORDNANCE; and PROJECTILES.

BOM'BA (It., bomb). A nickname given to Ferdinand II., King of the Two Sicilies, in consequence of his fierce bombardment of Messina, in September, 1848.

BOMBARD. See ARTILLERY and ORDNANCE.

BOM'BARDIER' (Fr. *bombardier*, It. *bombardiero*; for derivation, see BOMBARDMENT). A

military title used in the British artillery. Acting bombardier is the first rank above gunner or driver, and bombardier the rank immediately higher. It is an appointment of the major commanding the battery, and, unlike the rank of sergeant, which can only be taken away by a regimental court-martial, may be canceled at any time by the commanding officer.

BOMBARDIER BEETLES (for origin of name, see below). Ground-beetles, Carabidæ, of the genus *Brachinus*. They are black, green, or blue beetles, with reddish-yellow legs. They live on the surface of the ground, and when closely pursued by an enemy, such as a predatory beetle, they discharge from the anus, with an explosive sound, a drop of fluid which turns to visible smoke-like gas on contact with the air. By the time the pursuer has recovered from astonishment and the inconvenience of this gas, the bombardier has frequently made good its escape; but, if needful, the discharge can be quickly repeated several times. When the reservoir which contains it is opened by dissection, the liquid effervesces and evaporates instantaneously. It changes blue vegetable colors to red, and then to yellow; produces sharp pain when applied to the tongue, and leaves a yellow spot upon its surface like that produced by a drop of nitric acid. There are about twenty-five species in the United States. See **GROUND-BEETLE**.

BOMBARDINIAN, GENERAL. The name of a general in a burlesque play, *Chrononhotonthologos*, by Henry Carey (1874). He insults his monarch by inviting him to a dinner of hashed pork, and when the latter calls him 'traitor,' slays him in mortal combat.

BOMBARDIN'IO. The pen-name of William Maginn, founder of *Fraser's Magazine* in 1830.

BOMBARDMENT (Fr. *bombarde*, a cannon, a musical instrument; It. *bombarda*, a musical instrument, a cannon; from Lat. *bombus*, booming noise; cf. *bomb*). An attack upon the fortifications of an opponent by artillery, cannon, and other heavy ordnance. All modern battles begin, when possible, by a heavy bombardment of the enemy's position. (See **ATTACK**.) The bombardment of a fortified town is a much more difficult undertaking, owing to the practical impossibility of knowing what results are being accomplished, or with what degree of accuracy the aim is taken. With reasonably strong defenses and time for preparation, together with means speedily available for the suppression of conflagration, the modern bombardment is more formidable for its moral effect and usefulness in blockading than for the actual damage it does the enemy, great as that might possibly be. It is an established fact that few modern bombardments have been particularly destructive. At the siege of Paris by the Germans, in the War of 1870-71, an average of 500 shells daily actually fell within the city, but accomplished comparatively little damage. In the British-Boer War of 1899-1902 the bombardment of Ladysmith and Kimberley was of daily occurrence, the deadliest of modern ordnance and explosives being brought into use; but there also little damage was inflicted. Buildings under the flag of the Red Cross are required to be some distance away from the combatants, and are supposed to be exempt from bombardment.

According to international agreement, 24 hours' or more notice of bombardment is given for the protection of non-combatants and their property.

The attack of defensive positions by naval vessels is not generally regarded as likely to result in serious injury, but much depends on the character of attack. Moreover, permanent injury may not be sought. In many instances it has been found possible to smother the fire of a fort by rapid fire from the small and medium calibre guns of ships. Where the guns are mounted behind low parapets or breastworks, and the embrasures are large, this may easily be done, if the preponderance of fire of the ships is considerable. At the attack on the defenses of San Juan, Porto Rico, in May, 1898, by the fleet under Admiral Sampson, the Morro batteries, armed with very recently constructed six-inch guns, were silenced, though not much injured. Protected in this way by the fire of the fleet, the torpedo-boat *Porter* was able to go close under the guns of the fort and examine the harbor, in order to ascertain what Spanish ships were in the port. In the various bombardments of the batteries at Santiago, the men were driven from the works, but the damage done was of little account. The bombardment of the town by the vessels of the fleet was very successful, and was the leading immediate cause of the surrender. The guns used were of eight-inch calibre, the shells weighing 250 pounds. The naval vessels fired over an intervening rise of ground with a range of 4 miles, the fall of the projectiles being reported by the Army Signal Corps. For fear of striking in the American lines, the first shells were directed too far to the left, and fell into the water. The next lot—about 25 of them—all fell on the water-front street, in a space about 200 yards long and 30 yards wide. The third lot fell in a space of about the same area, about half way from the water-front to the palace, wrecking the interior of every house they struck, and in some cases destroying the exterior walls. The direction of the firing was again changed, and three shells fell just beyond the palace, passing close to its roof, when the signal to cease firing was seen. The Spaniards realized that the Americans were slowly feeling their way to the intrenchments, and that it was only a question of a very short time when they would be reached and made untenable. As the majority of the inhabitants had left Santiago at this time, no one was hurt by the bombardment. At the same time that the ships were bombarding, the army field-artillery was also throwing shells into the city; but they were too small (weighing less than 20 pounds) to injure buildings or to have much moral effect on the enemy. All other recent bombardments have taught the same lessons as may be learned from these; which are, that the damage done to fortifications is trifling compared to the expenditure of ammunition, but that, when the bombardment is directed against trenches or troops in the open, the actual and moral effects are considerable. It must not be assumed that because ships cannot successfully attack forts the latter can stop a fleet of modern armored ships from running by them. Of course some of the ships may be badly damaged, but if the channel is clear and not too close to the enemy's guns, the greater part of the vessels will probably get by without serious injury. In the *Report of the*

British Naval and Military Operations in Egypt in 1882, by Lieutenant-Commander Casper F. Goodrich, U.S.N. (published by the Office of Naval Intelligence, Washington, 1885), will be found a detailed account of the bombardment of the fortifications of Alexandria. The results and conclusions derived from them are similar to those hereinbefore mentioned. Compare, also, the attacks on Charleston by the Federal fleet during the Civil War, and the bombardment of Forts Jackson and Saint Philip, below New Orleans, and of Fort Fisher, near Wilmington.

During the Spanish War much fear was expressed that the Spanish squadron would bombard summer resorts and defenseless places on the Atlantic coast of the United States. Apart from other considerations, such a proceeding would have been a foolish waste of ammunition. It is possible that seaport cities may be forced to pay money to secure exemption from bombardment, but wanton destruction is unlikely to be attempted. Its cost is generally out of proportion to the damage inflicted, unless the conditions are very favorable to the attack. An inferior fleet, at a long distance from its base of supplies, cannot afford to use up its ammunition in operations which have no bearing upon the general course of the war, or which would not decrease the power of the enemy's fleet. See **COAST DEFENSE, SIEGE AND SIEGE WORKS, and FORTIFICATION**, under which titles are described the military tactics to be followed and means employed for defense against bombardment.

BOMBARDON. See **SAXHORN**.

BOMBASTES FURIOSO. The title of an opera (1790) by William Barnes Rhodes, a parody of *Orlando Furioso*. It narrates the mock-heroic adventures of Bombastes, a braggart, who becomes jealous of his beloved Distaffina, slays his king for a pair of jack-boots, and is finally killed himself by Fusbos, minister of state.

BOMBAX. See **ERIODENDRON**.

BOMBAY, bōm-bā'. A Presidency of British India, extending along the western coast of the Peninsula from about latitude 14° to about 18° 30' N. (Map: India, B 5). It is bounded by Baluchistan on the north, Rajputana, Central India, the Central Provinces, Berar, and Hyderabad on the east, Mysore and Madras on the south, and the Arabian Sea and Baluchistan on the west. Area, 184,235 square miles, of which 122,778 square miles is under direct British administration. The rest is under the administration of native chiefs, politically controlled by Great Britain. The western part of the Presidency is partly traversed by the range of the western Ghats, running either close to the coast or retreating about 50 miles inland. They have numerous offshoots into the interior, and their slopes are covered with thick forests. Physically, the Presidency is divided into four parts: Sind, the northern division, with a low surface, mostly unproductive; Gujerat, having a rich, alluvial soil, well watered; Konkan, a mountainous region, very little cultivated and the Deccan, in the south, suffering from insufficient rainfall. The chief rivers are the Indus, which drains only the Sind, the Tapti, and the Nerbudda. The climate, with a few exceptions, is hot and oppressive. A temperature of 130° is not rare, while in some places for about six

months in the year the temperature averages about 95° in the shade. In the lower portions the rainy season is sometimes followed by epidemics of fever.

The agricultural products of Bombay are of considerable importance. In the northern portion, where the surface is generally low and even swampy, much attention is paid to the cultivation of rice and wheat, while in the southern portion cotton is the chief crop. The latter is cultivated mostly in the black-soil regions of the southeastern part of the Presidency, and the area under cotton amounts to about 25 per cent. of the total cotton area of British India. Besides cotton, wheat, and rice, Bombay produces large quantities of millet, some oil-seed, and tobacco. Altogether, there are in Bombay over 27,000,000 acres under cultivation, out of a total of 196,000,000 acres for British India. The mineral production of the Presidency is insignificant. The manufacturing industries are chiefly confined to the production of cotton and silk fabrics, leather, and brassware. The cotton-manufacturing industry was started in 1854, and since then has had a rapid development, employing over 130,000 people in 1899. Besides exporting immense quantities of raw cotton to Great Britain, Bombay supplies a large portion of the domestic demand, and exports some to other parts of India. In regard to the volume of commerce, Bombay is exceeded only by Bengal. In 1885 the imports and exports amounted to Rs.340,093,729 (\$110,160,000) and Rs.379,602,960 (\$123,000,000), respectively. In 1900 they had increased to Rs. 453,042,205 (\$146,772,000) and Rs.439,868,383 (\$142,550,000), respectively. The chief exports are sugar, tea, wool, cotton, cotton fabrics and woollens, and drugs; the imports consist mostly of machinery, metals, and liquors.

In 1900 Bombay, including the native States, had over 6400 miles of railway lines, or 27 per cent. of the total railway mileage of British India. The lines belong either to the Imperial Government or to the native States, but they are mostly operated by private companies.

The administration of the Presidency is vested in a Governor and an Executive Council, whose members hold office by appointment; while the legislative power is in charge of a Legislative Council, made up of the Governor and the Executive Council, with the addition of a few appointed members representing the European residents and the natives. The native States are controlled by means of agents attached to the native courts. For administrative purposes the Presidency is divided into the four divisions of Northern, Central, Southern, and Sind. Justice is administered by the high court at Bombay and numerous district courts. The revenue is made up from land revenue, monopolies, taxes, and customs. The revenue and expenditures for the fiscal year 1900 amounted to Rs. 135,703,045 (about \$44,000,000) and Rs. 108,715,882 (\$35,224,000) respectively.

Instruction is furnished by 13 colleges, about 500 secondary public schools, over 9000 primary public schools, and 2650 private primary schools. The University of Bombay is only an examining body. Altogether, there are about 12,640 educational institutions, with a total attendance of over 600,000 children, of whom about 60 per cent. are Mohammedans. The population of the

British portion of the Presidency, including Aden (attached to the Bombay Presidency), was 18,873,342 in 1891, and 18,584,406 in 1901, while the population of the native States decreased during the same period from 8,050,298 to 6,891,091. Including the native States, the population of the Presidency is composed of the following elements: Hindus, 78 per cent.; Mohammedans, 16 per cent.; Jains, about 2 per cent.; the remainder comprising over 300,000 Animists, about 77,000 Parsees, over 170,000 Christians, and 13,000 Jews.

Consult: Drew, *Bombay and Its Feudatories* (Bombay, 1892); Douglas, *Glimpses of Old Bombay and Western India* (London, 1900).

BOMBAY (Hind. *Bambai*, Malay *Bambé*, after the goddess *Bambé Mumba*, through popular etymology turned by the Portuguese into *Bom bahia*; *bon*, Lat. *bonus*, good, fair + *bahia*, haven, port). The capital of the Presidency of the same name, British India, lies in latitude 18° 56' N., longitude 72° 54' E., on the former island of Bombay, now a peninsula artificially connected with Trombay, Salsette, and other adjacent islands, and with the mainland (Map: India, B 5). Bombay Island, 11½ miles long, from 3 to 4 miles broad, has an estimated area of 22 square miles, and with the city forms an administrative district. The city occupies the entire breadth of the south end of the island, and has two water-fronts, one on the outer Back Bay and the other on the splendid inner land-locked harbor, which has an area available for shipping purposes 14 miles long by 5 miles broad. It is defended by batteries equipped with modern armament, and by a small navy comprising torpedo-boats, torpedo-catchers, and two conspicuous monitors. Bombay vies with Calcutta as the commercial capital of India, surpassing the former as a centre of distribution and having double the coasting trade. It is the terminus and departing point of various European steamship and mail lines, and of the Great Indian Peninsula Railway, and of the Bombay, Baroda and Central India Railway. It possesses one of the finest railway depots in the world, extensive docks, basins, graving-docks, and ship-building slips; the Government dock-yard covers about 200 acres. The principal portion of the city, with long, wide streets, traversed by street railways and lined by fine commercial establishments of every description, presents a thoroughly European aspect. The objects most worthy of note are the town hall, the library of the Asiatic Society, the mint, cathedral and various churches, the University Library, University Hall, custom-house, post-office, public-works office, missionary houses, the Elphinstone Institution, the Grant Medical College, Sassoon's High School, the Jamsetjee Hospital, and the Jamsetjee Obstetric Hospital. The city possesses a chamber of commerce, two English theatres and a native theatre, and besides those especially noted, numerous other educational, benevolent, and charitable institutions. Since 1892 the city has owned a modern system of water-works, supplied from Lake Tansa, 65 miles north. It is lighted by gas and electricity, and owns and maintains abattoirs, markets, public swimming and other baths, gardens, with weekly band concerts, and the esplanade, a favorite promenade. The streets of the native quarter are narrow and winding, but marked by cleanli-

ness; and the well-stocked bazars, temples, and curiously painted houses, thronged by polyglot Oriental crowds, present a most picturesque appearance. Besides several native newspapers, there are three published in the English language.

Always favorably situated for foreign trade, Bombay profited largely by the opening of the Suez Canal, as saving more distance in proportion than any other emporium in the East, and also as being on the direct line between Madras and Calcutta on the one side and Aden on the other. When the Civil War in the United States caused a sudden cessation of American supplies, cotton began to be exported from Bombay in vast quantities, and although the re-opening of the Southern ports soon checked the extraordinary activity of trade, Bombay was permanently benefited by the stimulus its commerce received. The chief articles of export are cotton, shawls, opium, coffee, pepper, ivory, and gums. The local industries include the manufacture of yarn, cotton cloth, copper and brass utensils, wood-carving, lacquer-work, pottery, gold and silver thread, leather, and dyeing. More than seventy steam mills are in operation. The chief imports are piece goods, thread, yarn, metals, wine, beer, tea, and silk. Bombay is the seat of various foreign representatives, including a United States consul. The average temperature is 79.2° F., and the average rainfall 70.30 inches. The population, which is exceedingly heterogeneous and dense, amounted in 1891 to 821,800; in 1901 to 770,800. The bubonic plague, in the fall of 1896, proved most destructive among the poorer classes. The Hindus form the largest section of the population, the Parsees number about 50,000, and the rest re Mussulmans, native Christians, Europeans, Indo-Portuguese, Jews, etc. Amid these various classes, the Parsees, or Persians, descendants of fire-worshippers driven from their homes by Mohammedan bigotry, rank next to the English in respectability and influence. The late Sir Jamsetjee Jeejeebhoy and Sir Dinshaw Manojkjee Petit stand forth as models of merchant princes in enterprise and integrity, in munificence and patriotism; and ever since the ship-building business was established in 1735, the Lowji family, assisted chiefly by operatives of the same race, has been at the very head of this, one of the most important interests of the city—not merely the Indian Navy, but several Imperial men-of-war, both frigates and line-of-battle ships, having been almost exclusively the work of Parsees. Rudyard Kipling is numbered among the celebrities born in Bombay.

The Portuguese visited Bombay in 1509, about a year before the capture of Goa, and by 1530 it had passed into their possession. In 1661 the island was ceded to Charles II. of England, as part of the dowry of his bride, the Infanta Catharine. He granted it to the East India Company in 1685, who then transferred their presidency from Surat to Bombay. Consult: Windham, "The Town and Isles of Bombay, Past and Present," in Vol. XLIX. of *Society of Arts Journal* (London, 1901); Eastwick, *Handbook to Bombay* (London, 1881); Hunter, *Bombay, 1885-90* (London, 1890).

BOMBAY DUCK. See RUMMALOTT.

BOMBAY ISLAND. See BOMBAY, city.

BOMBAZINE, būm'ba-zēn' or bōm'. (Lat. *bombycinum*, silk texture, from Gk. *βούβη*, *bombyx*, silkworm; through Fr. *bombasin*). A cloth for dresses, in which the distinguishing characteristic is that the warp is silk and the filling worsted. The cloth has thus a bare look. It is rather fine and light in the make, and may be of any color. The fabric is now little used. It was extensively made, chiefly in Norwich, England, from about 1816.

BOMBPROOF. A military structure capable of resisting artillery shot and shell, particularly that alighting over-head. In permanent fortifications and defenses they are either cut out of solid rock, as at Gibraltar, or constructed of massive masonry, as at Malta, or at Helsingfors, Finland, a position which is considered impregnable. Temporary bombproofs are constructed out of timber and earth, or any other available and suitable material. Galleries are frequently run underground or in hillsides for the protection of the sick, women and children, and non-combatants generally. See BLINDAGE and FORTIFICATION.

BOMB-VESSEL. See MORTAR-VESSEL.

BOMBYCIDÆ, bōm-bis'ī-dē (Gk. *βούβη*, Lat. *bombyx*, a silkworm). A family of Lepidoptera with stout, hairy bodies, including the silkworm moths and their allies. They have no frenulum, the first maxillæ are vestigial, and the palpi of the second maxillæ are greatly reduced. "The feelers are bipectinate in both sexes. The fore wings are usually pointed at the tip, and the lower radial nervures bend downward; the hind wings have two or three anal nervures. The caterpillars, with ten fore legs, are elongate, not hairy, but furnished with dorsal humps on some of the segments, often with a spine on the hindmost. The pupa is inclosed in a cocoon of fine silk." (Carpenter.) The Bombycidæ are fairly numerous in southeastern Asia, but less common elsewhere. Several North American forms are known, such as the great cecropia, polyphemus, and luna moths, and the smaller puss-moths, tussock-moths, and tent-caterpillars. These moths have long been noted for the strong attractive power which the virgin females exert on the males, drawing them from long distances, and sometimes in large numbers; collectors utilize this trait to capture specimens, by exposing the females in cages about which males will soon assemble. Consult: Packard, "Monograph of the Bombycine Moths of America," *Memoirs National Academy of Sciences*, VII. (Washington, 1896); Beutenmüller, "Descriptive Catalogue of the Bombycine Moths Within Fifty Miles of New York City," *Bulletin American Museum of Natural History*, X. (New York, 1898); Neumögen and Dyar, "Revision of the Bombyces of North America," *Journal New York Entomological Society*, 1893 and 1894. See MOTHS; SILKWORM, etc.

BOMFIM, bōn-fēn', JOSÉ LUCIO TRAVASSOR VALDES, Count (1787-1862). A Portuguese soldier, born at Peniche (Estremadura). In 1828 he fought with the rank of colonel against Dom Miguel, and in 1832, when Dom Pedro landed in Portugal, continued under him the struggle against the usurper. He entered the Cabinet as Minister of War and Marine in 1841; in 1842 took the field against the Absolutists, who had set aside the Constitution of 1837, and in 1844

was compelled to surrender and made his escape to Spain. He was prominent in the insurrection of 1846, and having been routed at Torres-Vedras, was sentenced to banishment to Africa. He returned under the amnesty of 1847.

BOMFORD, būm'fērd, GEORGE (1780-1848). An American soldier, born in New York City. He graduated at West Point in 1805, served as an engineer in the construction of fortifications until 1812, and, as an ordnance officer during the War of 1812, rendered valuable services to the Government. Among other things, he invented and introduced the bomb-cannon, called the 'Columbiad,' which was superseded by the Rodman gun at the beginning of the Civil War. He became colonel in 1832, and was chief of ordnance from 1832 until 1842, when he became inspector of arsenals, ordnance, arms, and munitions of war.

BOM JARDIM, bōn zhār-dēn' (Portug., 'Good Garden'). A city in the State of Ceará, Brazil, 20 miles south of Crato, in a rich and beautiful mountain valley (Map: Brazil, J 6). It is the centre of an extensive district, yielding manioc, sugar, etc. Population, 6000.

BOMMELERWAARD, bōm'mel-vārt. An island of the Netherlands, Province of Gelderland, formed by the Waal and Meuse. It is 16 miles in length, with a maximum breadth of six miles. The district is extremely fertile, and raises, besides other farm produce, considerable flax and hops. The town of Bommel is situated on the island. Fort Saint Andries defends the island on the east, and Fort Loevestein on the west.

BONA (plur. of Lat. *bonum*, something good, neut. of *bonus*, good). A general legal term denoting property of any kind, whether real or personal. In the Roman law it was chiefly applied to real estate; in the later civil law it corresponds to the French term '*biens*,' comprising real as well as personal chattels; but in the common law it is confined generally to movables. It is employed in phrases of varied significance used in the English law and, derivatively, though less commonly, in American legal phraseology; as, *bona confiscata*, goods confiscated or forfeited to the crown; *bona notabilia*, property of sufficient value to be noted in an account (formerly in England this was fixed at £5 or upwards, and in London at £10; but by the acts creating the courts of probate this distinction was abolished); *bona paraphernalia*, goods above dower; *bona vacantia*, unclaimed property, as wrecks, treasure trove, waifs, and estrays, which, contrary to the general rule, did not go to the finder, but rested in the Crown; *bona waviata*, property thrown away, as by a thief in flight, by common law going to the King; *nulla bona*, the return of an execution without property found, or the plea of a garnishee without property belonging to or money due the debtor.

BONA (Fr. *Bône*, Ar. *Beled-el-Areb*). A fortified seaport town in the Department of Constantine, Algeria, situated on a bay of the Mediterranean, in latitude 36° 54' N., longitude 7° 46' E. (Map: Africa, E 1). The town, divided into two parts, Upper and Lower Bona, is situated in a beautiful district, at the foot of a hill near the embouchure of the Sebus. It has been

much improved since the occupation by the French in 1832 and beautified by means of the quays and promenades encircling it, and the numerous fountains and gardens to be found all over the city. It is surrounded by walls flanked with square towers, and further defended by Fort Cigogne, on the top of the hill. The fortress built by Charles V. in 1535 stands on a hill over 340 feet high, and has been used as a prison since 1850 for persons sentenced to deportation from France. Among the other public buildings, the Catholic cathedral and the convent of the Sisters of Mercy are most remarkable. Bona has good bazars, shops, markets, reading-rooms, etc.; manufactures of tapestry, saddlery, and native clothing; and a trade in cattle, sheep, wool, hides, corn, coral, fish, olive-oil, tobacco, and wax. In the vicinity are valuable iron-mines, marble-quarries, and cork-woods. There is telegraphic communication with Marseilles and regular steam communication with France, Algiers, and Tunis. A fine harbor of 195 acres with an inner basin of 25 acres dates from 1870. It is visited annually by nearly 3000 ships of more than a million net tonnage. Since the construction of the railroad connecting the city with Algiers, Constantine, and Biskra, Bona has left Tunis behind as a port. The neighboring hills yield a fine water-supply, and the former marshy and unhealthy condition of the surrounding districts has been improved by drainage. The United States is represented by an agent. Population, in 1896, 34,498, of whom over 12,000 were Frenchmen and more than 10,000 were Italians, the rest being mostly natives. Near Bona are remains of the once famous city Hippo Regius, the favorite residence of the Numidian kings, and the episcopal see of Saint Augustine, who died here in 430. Hippo Regius, in early Christian times, was the central station of commerce and civilization in North Africa, and was celebrated for its schools, theatre, aqueducts, palaces, and temples, afterwards changed into churches and monasteries. It was destroyed by the Mohammedans under Caliph Othman in 646. This city was connected with its seaport, the ancient *Aphrodisium* (the present Bona), by a canal, of which the outline may still be seen in a morass.

BONA, GIOVANNI (1609-74). An Italian cardinal, author of *De Principiis Vitæ Christianæ*, and *Manductio ad cælum*. The latter was translated into English (London, 1672, 6th ed., 1712); and parts of his *Via Compendii ad Deum, The Easy Way to God* (1876). His complete works, in Latin, appeared, Antwerp, 1677, 2 vols. His work on the Mass appeared in French (Paris, 1854-55, 2 vols.). He also contributed to the *Acta Sanctorum*. For his biography, consult A. Ighina (Mondovi, Italy, 1874).

BONACI, bô'nâ-sê' (Sp. *bonasí*, from the native name). A grouper of the genus *Mycteroperca*, specifically *Mycteroperca bonaci*. See **GROUPE**.

BONACIEUX, bô'nâ'syê'. The name of a de-based wretch in *Les Trois Mousquetaires*, by the elder Dumas (1844).

BONA DE'A (Lat., 'the good goddess'). A mysterious Roman divinity, sometimes identified with Fauna, Ops, or Maia. She was worshipped in Rome from the most ancient times, but only by women, even her name being concealed from men. Her sanctuary was a grotto

on Mons Aventinus, which had been consecrated to her by the virgin Claudia; her festival, however (the 1st of May), was not celebrated there, but in the house of the consul, inasmuch as the sacrifices were then offered up for the whole Roman nation. The solemnities were performed generally by aristocratic vestals. At this celebration no males were allowed to be present; even portraits of men were veiled. The wine consumed was called milk, in order that its name might not be discovered, and the vessel in which it was served, *mellarium*. The symbol of the goddess was a serpent, indicating her healing powers, and certain herbs were sold in her temple. In B.C. 62 the notorious Clodius committed the sacrilege of appearing disguised as a woman at the mysteries of Bona Dea.

BONA FIDE, fr'dê (Lat. abl. of *bona fides*, good faith). Literally, 'in good faith.' It is not a technical term of English law; yet it is often used in connection with the transfer or possession of property. If a person takes possession of another's property, honestly believing it to be his own, and, without notice of the other's title, adds to its value, his liability to the owner is for the value of the property when originally taken; but if the taking is in bad faith, he is held liable, generally, for the whole value of the improved property, without any allowance for his enhancement of its worth. A *bona fide* purchaser is one who buys property for a valuable consideration, without notice of any defect in his vendor's title and believing that the vendor has a good right to sell and convey a good title. By the civil-law rule, which prevails on the Continent of Europe and in Scotland, such a purchaser from a trader in the course of his business acquires a perfect title, though his vendor had none. According to the English common law, however, his title is no better than his vendor's. If the vendor had title, but one which was voidable by a third person for fraud (q.v.), the *bona fide* purchaser would be able to hold the property. So a *bona fide* purchaser of property from a trustee (q.v.) clothed with the legal title can hold it as against the *cestui que trust* (q.v.). Again, the *bona fide* purchaser of a negotiable instrument (q.v.) holds it free from any defect of title between prior parties, and free from defenses available to prior parties among themselves. This rule had its origin in the customs of merchants, and received the sanction of common-law courts because it was necessary to enable negotiable paper to discharge the functions of currency.

BONAINI, bô-nî'nê, FRANCESCO (1806-74). An Italian historian, born in Leghorn. He studied in Pisa, and was appointed professor of ecclesiastical law there in 1827 and professor of the history of law in 1840. In 1852 he was appointed general superintendent of the State archives of Tuscany. He was successful as an archivist, and was also exceedingly active as an author and editor. His works include *Storie Pisane* (1844-45); the *Cronache e storie di Perugia* (1850-51); and the posthumous *Acta Henrici VII.* (1878).

BONALD, bô'nâl', LOUIS GABRIEL AMBROISE, Vicomte de (1754-1840). A French publicist and statesman, born at Mouna, in Aveyron. An ardent adherent of the old monarchy, he was com-

pelled to emigrate during the French Revolution and went to Heidelberg, where he wrote politico-philosophic works in support of monarchy. His first important work, *Théorie du pouvoir politique et religieux* (3 vols., 1796), was seized by the Directory. It prophesied the restoration of the Bourbons. He returned to France about 1806, won the favor of Napoleon, and in 1808 was appointed Minister of Instruction. In 1815 he was elected to the Chamber of Deputies, and there, as well as afterwards in the Chamber of Peers, was conspicuous by his opposition to all liberal projects, notably the freedom of the press. In 1823 he was elevated to the peerage by Louis XVIII. The July Revolution brought his public career to a close, as he refused to take the oath of allegiance to the new dynasty. His most important writings are: *Législation primitive* (3 vols., 1802), and *Recherches philosophiques sur les premiers objets des connaissances morales* (2 vols., 1818).

BONAN'ZA (Sp., fair wind or weather, prosperity, from Lat. *bonus*, good). A term applied in the mining districts of the United States to the discovery of a rich vein or body of ore. When a vein of rich ore has been struck, the mine is said to be a 'bonanza.' In the celebrated Comstock Lode in Nevada some ten bonanzas were found, the most famous of which, known as the 'Big Bonanza,' was discovered in 1876. The word bonanza has a popular application also to a successful enterprise or to any piece of good luck.

BONAPARTE, bō'nā-pärt; in Ital., **BUONAPARTE**, bō'nā-pärtā, FAMILY OF. The Bonaparte family originated in Italy, and may be traced in the records of Florence, San Miniato, and elsewhere. The Corsican branch, the only one of historical importance, went to Corsica from Sarzana, in Genoese territory, about 1610, and its representatives took up their residence at Ajaccio, where they occupied a respectable position as patricians, *padri del commune* or *cittadini*, without especial prominence until the rise of the great Napoleon. The Grand Duke of Tuscany in 1757 issued a formal patent of nobility to Joseph, the grandfather of Napoleon, and a coat of arms described as: "A count's coronet, the escutcheon with two bends sinister and two stars bearing the letters B. P., signifying Buona Parte, the field of the arms red, the bend and stars blue, the letters and coronet yellow." The title of patrician was also granted by the Grand Duke two years later. In the Eighteenth Century the following representatives of the family resided at Ajaccio: the archdeacon, Lucien Bonaparte; his brother, Napoleon Bonaparte; and their nephew, Carlo.—CARLO BONAPARTE, father of the Emperor Napoleon, was born March 29, 1746; studied law in Pisa, and married, in 1767, a beautiful young patrician, named Letizia Ramolino. In 1768, with his uncle Napoleon, he joined General Paoli in defending the island against the French invaders. When resistance was shown to be useless, Carlo Bonaparte attached himself to the French interest, and in 1771 was included by Louis XV. in the list of 400 Corsican families chosen to form a nobility. In 1773, through the influence of Marbœuf, Governor of Corsica, Carlo Bonaparte was appointed royal counselor and assessor of the town and Province of Ajaccio. In 1777 he was a member of the deputation of

Corsican nobles to the Court of France. In this capacity he resided for some time in Paris, where he gained for his son, Napoleon, through the interest of Count Marbœuf, admission into the military school at Brienne. In 1779 he returned to Corsica, and in 1785 went to Montpellier, for the benefit of his health, but died there February 24, 1785. He was a man of prepossessing exterior and amiable character. By his marriage with Letizia, he left eight children; Joseph, King of Spain; Napoleon, Emperor of the French; Lucien, Prince of Canino; Maria Anna (afterwards named Elisa), Princess of Lucca and Piombino, Grand Duchess of Tuscany, Countess of Campignano, wife of Prince Bacciocchi; Louis, King of Holland; Carlotta (afterwards named Marie Pauline), Princess Borghese; Annunziata (afterwards named Caroline), wife of Murat, King of Naples; Jerome, King of Westphalia. By a decree of the French Senate, November 6, 1804, the right of succession to the Imperial throne was restricted to Napoleon and his brothers Joseph and Louis, with their offspring. Lucien and Jerome were excluded on account of their unsuitable marriages. Napoleon intended to give the right of succession also to Lucien, by the additional act of April 22, 1815; but this never took effect. As Joseph, the eldest brother of the Emperor, had no son, the descendants of Louis became nearest heirs to the throne.—MARIA LETIZIA RAMOLINO, mother of Napoleon I., lived to see the rise and decline of power of her family, and met them with equanimity and dignity. She was born at Ajaccio, August 24, 1750. After the death of her husband, she lived for some time in Corsica, and in 1793, when the island came under British rule, removed with her family to Marseilles, where she lived in poverty, mainly supported by the pension given to Corsican refugees. After her son became First Consul she removed to Paris, and when he was crowned Emperor, in 1804, received the title of Madame Mère. She never cared for the brilliant surroundings of the Imperial Court, and, remembering former adversities, she was prepared for all that followed. After the downfall of Napoleon Letizia lived with her stepbrother, Cardinal Fesch, in winter in Rome, and in summer in Albano. She died February 2, 1836, leaving considerable property, the result of saving habits during prosperity. Professor Sloane, Napoleon's latest American biographer, describes her as "of peasant nature to the last day of her long life—hardy, unsentimental, frugal, and sometimes unscrupulous."

JOSEPH, the eldest brother of Napoleon, was born at Corte, in Corsica, January 7, 1768, and was educated at Autun. On the death of his father he returned to Corsica, exerted himself to support the younger members of the family, and removed with them to Marseilles in 1793. In 1797 he was elected a member of the Council of Five Hundred, and in the same year was sent as ambassador from the Republic to Rome. In 1800 he was chosen by the First Consul as plenipotentiary to conclude a treaty of friendship with the United States of North America. He signed the treaty of Lunéville, February 9, 1801, and that of Amiens, 1802; and with Cretet and Bernier conducted the negotiations relative to the Concordat. After the coronation of Napoleon Joseph was made commander-in-chief of the Army of Naples, and in 1806 King of Naples. He

effected many beneficial changes—such as the abolition of feudalism, the suppression of convents, the building of roads, the repression of banditti, and the codification of laws—but these reforms were not managed judiciously; and his humane endeavors frequently came into collision with the ambitions of his Imperial brother, who looked upon Naples simply as a province of the French Empire. He was a lover of the fine arts and a man of progressive ideas, but not a vigorous ruler for stormy times; and he is accused of having left affairs too much in the hands of his minister, Salicetti. In 1808 Joseph was summarily transferred by his brother to the throne of Spain, and Murat took his place as King of Naples. Joseph was not able to cope with the Spanish insurgents, backed by the power of England, and after the defeat of the French at Vittoria, in 1813, he returned to his estate at Morfontaine, in France. When Napoleon recognized Ferdinand VII. as King of Spain, Joseph refused, at first, to abdicate, though he had many times before implored his brother to release him from his royal chains; but he soon submitted, as in all other matters, to the Emperor's will. After the battle of Waterloo he accompanied Napoleon to Rochefort, whence they intended to sail separately for North America. In his last interview with Napoleon Joseph generously offered to give up the vessel hired for his own escape, but meanwhile Napoleon had determined to surrender himself into the hands of the English. After a residence of many years in the United States at Bordentown, N. J., where, as the Count de Survilliers, he employed himself in agriculture, Joseph went to England in 1832, having previously addressed a letter to the French Chamber of Deputies, in which he advocated the claims of his nephew, Charles Louis Napoleon. In 1841 he was allowed to return to his wife, who had remained in Italy since 1815. He died in Florence, July 28, 1844. Joseph was the only one of his brothers for whom Napoleon professed any liking. He was a handsome, intellectual-looking man, of distinguished manners and polished speech. His wife, Julia Marie Clary, born December 20, 1777, was the daughter of a wealthy citizen of Marseilles, and the sister-in-law of Bernadotte, King of Sweden. She was a quiet, unambitious woman, with no taste for the splendors of royalty, which fell to her share during the few weeks only in Naples, for she never went to Spain. Ill health appears to have prevented her accompanying her husband to America. She died in Florence, April 7, 1845. By her marriage with Joseph she had two daughters: (1) Zénaïde Charlotte Julie (1801-54), who became the wife of Lucien Bonaparte's son, the Prince of Canino; (2) Charlotte Napoléone (1802-39), who married Louis Napoleon (who died March 17, 1831), second son of Louis Bonaparte, King of Holland.

BONAPARTE, LUCIEN, Prince of Canino, and brother of Napoleon, was born March 21, 1775, and received his education at the College of Autun, the military school at Brienne, and the seminary at Aix. Rising gradually from one office to another, he was elected to the Council of Five Hundred, spoke against the wasteful distribution of State property, and formed a party favorable to the views of his brother Napoleon. Shortly before the 18th Brumaire (1799), he was elected president of the Council of Five Hundred,

and was the hero of that day. Afterwards appointed Minister of the Interior, he was active in the encouragement of education, art, and science, and organized the prefectures. As ambassador to Madrid, 1800, he contrived to gain the confidence of King Charles IV. and his favorite Godoy, thus putting aside the British influence which had until then been exercised at the Court of Spain. It is said that for his services in the treaty of peace concluded between Spain and Portugal, September 29, 1801, he received 5,000,000 francs. His constant opposition to Napoleon's progress toward monarchy involved Lucien in several misunderstandings with his brother; and their quarrel was brought to an issue by Lucien's second marriage against the wishes of Napoleon. The crowns of Italy and Spain were offered to Lucien on condition that he would divorce his wife; but he refused them, and preferred living in retirement at his estate of Canino, in the Province of Viterbo, near the frontier of Tuscany, where he devoted his time to art and science. Here he enjoyed the friendship of the Pope, who created him Prince of Canino; but having denounced in his private capacity the arrogant and cruel policy of his brother toward the Court of Rome, he was 'advised' to leave the city in which he was at that period residing. In 1810 he took ship for America, but fell into the hands of the English; was taken to England, and after a debate in Parliament was declared to be a prisoner, but treated with distinction. Upon his brother's downfall he returned to Rome. After the defeat of Waterloo Lucien maintained his presence of mind, advising his brother to dissolve the chambers and assume the place of absolute dictator. After the Restoration of Louis XVII. Lucien lived for some time in and near Rome. In 1830 he went to England, visited Germany in 1838, and died at Viterbo, June 29, 1840. Lucien possessed considerable talents and firmness of character. He was in his early years an ardent republican, but the weakness of the Directory convinced him that a military consulship was necessary to allay the social anarchy of France. He consequently threw himself eagerly into the designs of his brother, but protested against the establishment of a hereditary monarchy. As a writer he was by no means successful. His long and tedious epic poem, *Charlemagne, ou l'Eglise délivrée*, in 23 cantos, was written and published in London, and was dedicated to the Pope (1814). Another heroic poem, *La Cynécide, ou la Corse saucée*, followed in 1810. The *Mémoires secrets sur la vie privée politique et littéraire de Lucien Bonaparte* (2 vols., London, 1819), of which Alphonse de Beauchamp is supposed to be the author, is an untrustworthy book. Lucien was the father of a numerous family. In 1794 he married Christine Boyer, the daughter of a citizen of Saint Maximin. After her death he married, in 1802, the widow of a stock-broker, Madame Jouberton, who survived him. By his first marriage he had two daughters—Charlotte (1796-1865), who married Prince Gabrielli of Rome; and Christine (1798-1847), who married first a Swedish count named Posse, and then Lord Dudley-Stuart. By his second marriage Lucien had nine children. Charles Lucien Jules Laurent (eldest son of Lucien), Prince of Canino and Musignano, was born in Paris in 1803. He never exhibited any inclination for political life,

preferring the pursuits of literature and science. He resided in Philadelphia from 1822 to 1828, during which time he studied the birds of the United States and wrote many technical papers published by scientific societies. He published *American Ornithology, or History of Birds Inhabiting the United States Not Given by Wilson* (Philadelphia, 1824-33), which came to be known as "Wilson and Bonaparte's Ornithology," and formed the basis for numerous subsequent editions of Alexander Wilson's great work. After his return to Europe he wrote extensively on American birds in German, French, Italian, and English. Among his works is *Iconografia della fauna italica*. The second son, Paul Marie, born in 1808, took a part in the Greek War of Liberation, and died by the accidental discharge of a pistol, 1827. The third son, Louis Lucien (1813-91), distinguished himself by his studies in chemistry, mineralogy, and languages. Pierre Napoleon Bonaparte, the fourth son, born September 12, 1815, passed through many changes of fortune in America, Italy, and Belgium, returning to France after the Revolution of 1848. In 1870 he shot a journalist, Victor Noir, for which he was tried at Tours, and acquitted of murder, but condemned to pay 25,000 francs to Noir's relatives. He died April 8, 1881. The youngest son, Antoine, born October 31, 1816, fled to America after an affair with the Papal troops in 1836, and returned to France in 1848, where he was elected to the National Assembly, 1849, but retired from politics in 1851. He died in 1877. The eldest daughter, Letizia (1804-71), married, in 1824, Mr. (afterwards Sir) T. Wyse, an Irish gentleman; but a separation took place in a few years. The second daughter, Jeanne (1807-28), distinguished by her beauty and taste for poetry, died soon after her marriage with the Marchese Honorati. The third daughter, Alexandrine Marie, born in 1818, married, in 1836, Count Vincenzo Valentini de Canino, and gave birth to two sons and one daughter. Constanze, the youngest daughter of Lucien, was born in 1823, became a nun, and died in Rome in 1876.

BONAPARTE, LOUIS, third brother of the Emperor Napoleon, was born September 2, 1778, and was educated in the artillery school at Châlons, where he imbibed anti-republican principles. Rising from place to place, he was made King of Holland, 1806; but, in fact, he was never more than a French Governor of Holland, subordinate to the will of his brother. He endeavored, however, to resist some of the demands of the Emperor and replied to one requisition by saying that, since he had been placed on the throne of Holland, he had "become a Dutchman." In 1810 his realm was incorporated with the French Empire. After the restoration of the House of Orange Louis considered himself free from all responsibility, and returned to Paris, January 1, 1814, where he was coldly received by the Emperor. Louis was married, in 1802, to Hortense Beauharnais, daughter of General Beauharnais (q.v.) and Josephine, afterwards Empress of the French. As this marriage was wholly a matter of submission to his brother's will, it naturally ended in unhappiness and separation. After living for some years in Rome—where he separated from his wife—he removed, in 1826, to Florence, where he lived in retirement. On the escape of his son, Louis Napoleon, from the prison

of Ham, the ex-King of Holland was removed as an invalid to Leghorn, where he died July 15, 1846. Louis Bonaparte was the writer of several works: *Marie, ou les Hollandaises*, 1814, a novel, giving some sketches of Dutch manners; *Documents historiques, etc., sur le gouvernement de la Hollande*, 3 vols. (London, 1821); *Histoire du parlement anglais* (1820); and a critique on M. de Norvin's *History of Napoleon*.—The amiable and accomplished HORTENSE EUGÈNE BEAUHARNAIS, the adopted daughter of Napoleon, Queen of Holland, and Countess Saint Leu, was born in Paris, April 10, 1783. After the execution of her father she lived for some time in humble circumstances, until Napoleon's marriage with Josephine. In obedience to the plans of her stepfather, she rejected her intended husband, General Desaix, and married Louis Bonaparte in 1802. After the Hundred Days she visited Augsburg and Italy, and then fixed her residence at Arenenberg, a mansion in the Canton of Thurgau, where she lived in retirement, sometimes spending a winter in Italy. In 1831, when her two sons had implicated themselves in the Italian insurrection, the Countess traveled in search of them through many dangers, and found the elder deceased, and the younger, afterwards Emperor of the French, ill at a place near Ancona. Returning with her son to Paris, she was pleasantly received by Louis Philippe and by Casimir Périer, but was obliged, in the course of a few weeks, to remove with her son to England. Thence she removed to her country-seat, Arenenberg, where she died, after severe suffering, October 3, 1837, and was buried near the remains of her mother, Josephine, at Ruel, near Paris. She was the author of *La Reine Hortense en Italie, en France et en Angleterre, pendant l'année 1831*, and wrote several excellent songs. She likewise composed some deservedly popular airs, among others the well-known "Partant pour la Syrie," which the second Emperor of the French made a national air. Of her three sons, the eldest, Napoleon Louis Charles, born 1802, died in childhood, March 5, 1807. The second, Louis Napoleon, born 1804, Crown Prince of Holland, married his cousin Charlotte, daughter of Joseph Bonaparte, and died at Forlì, March 17, 1831. The third, Charles Louis Napoleon, became Emperor of the French. See NAPOLEON III.

BONAPARTE, JEROME, the youngest brother of Napoleon, was born at Ajaccio, November 15, 1784. After receiving his education in the college of Juilly, he served as naval lieutenant in the expedition to Haiti. When war broke out between France and England in 1803, Jerome was cruising off the West Indies, but he was soon compelled to take refuge in the port of New York. He married Elizabeth Patterson, daughter of a Baltimore merchant, December 27, 1803, after which he remained in the United States more than two years. His marriage was declared null and void by Napoleon. The wife was not allowed to set foot on French territory and was obliged to go to England. Jerome vainly pleaded with Napoleon. In the meanwhile he had been permitted to reënter the naval service and was employed by Napoleon in the liberation of French and Genoese prisoners who had been captured by the Dey of Algiers. In the war with Prussia, he commanded, with General Vandamme, the Tenth Corps in Silesia, and was made King of Westphalia in 1807. He lived in great splen-

dor at Cassel, the capital of the new kingdom, caring very little for government, not even taking the pains to acquire the language of the country. At the time when he was invested with the crown he was forced to marry Catharine, the daughter of King Frederick I. of Württemberg. After the war with Austria the finances of Westphalia, through mismanagement, plunder, and extravagance, as well as war expenditure, were found in an exhausted condition. The battle of Leipzig brought the reign of Jerome to a close. After the peace of 1814 he left France, and resided first in Switzerland, then at Gratz, and in the beginning of 1815 at Triest. He was made a peer when Napoleon returned from Elba, and fought by the side of the Emperor at Ligny and at Waterloo. After his brother's abdication he left Paris, June 27, and visited Switzerland and Austria, but ultimately settled in Florence. His request to be allowed to return to France was rejected in 1847, by the Chamber of Peers, but was afterwards granted, and at the outbreak of the February Revolution he was in Paris, where he was appointed Governor of the Invalides in 1848, and in 1850 was made a French marshal. He died in 1860. After the battle of Waterloo the King of Württemberg wished to annul the marriage of his daughter Catharine, but she resolved to share through life the fortunes of her husband. Jerome left in America one son, Jerome Napoleon (1805-70), whose descendants reside in Baltimore, and had three children by his second wife. Jerome, born August 24, 1814, died May 12, 1847; Mathilde Letitia Wilhelmine, Princess of Montfort, who was born at Triest, May 27, 1820, married the Russian Count Anatol Demidoff, and lived with her husband at the Court of Napoleon III.; Napoleon Joseph Charles Paul (commonly called Prince Napoleon), who was born at Triest, September 9, 1822, passed his youth in Italy; entered the military service of Württemberg, 1837; afterwards traveled in several countries of Europe, and was banished from France, 1845, on account of his intercourse with the Republican Party. He returned to Paris with his father, 1847, and after February, 1848, was elected to the National Assembly. He commanded an infantry division of reserve at the battles of the Alma and of Inkerman in the Crimean War. In 1859 he married the Princess Clotilde, daughter of Victor Emmanuel, by whom he had two sons and a daughter. When war with Prussia was declared in 1870, Prince Napoleon proceeded on a diplomatic mission to his father-in-law, at Florence, but failed to obtain the coöperation of Italy with his cousin. After the fall of the Empire he took up his residence in England, but returned to France in 1872. On the death of the Prince Imperial, son of the Emperor Louis Napoleon, in Zululand in 1879, the eldest son of Prince Napoleon became the heir of the Bonapartist hopes. When, in 1886, the chiefs of the Bourbon family were, by a vote of both chambers, expelled from France, Prince Napoleon and his eldest son were exiled also. He died in 1891.

BONAPARTE, LETITIA MARIE WYSE, Mme. de Solms-Rattazzi-de Rute (1829-1902). A French author, born at Waterford, Ireland. She is supposed to have been a granddaughter of Lucien Bonaparte by his second wife, through the marriage of his daughter Letizia to Thomas Wyse, an Irishman. In 1850 she was married to Frédéric de Solms, but after four years separated from him, and, taking the title of Princesse de Solms, settled in Savoy, not then a part of France. Here she founded *Les Matinées d'Aix* (1853), and gathered about her nearly all the celebrities of the day. Among her friends there were Victor Hugo, with whom she kept up a correspondence, Kossuth, Eugène Sue, Lamartine, Lamennais, Dumas, Rochefort, and Tony Revillon. She contributed to the *Constitutionnel*, through Sainte-Beuve, under the pen-name of Baron Stock. After Savoy was annexed to France she went back to Paris and again kept open house, playing a prominent part in the literary and social events of the time. In 1863, de Solms having died, she married Urbain Rattazzi, a well-known Italian statesman, and lived with him in Italy. After his death she returned to Paris. She outlived her third husband, Señor de Rute, a Spaniard, whom she married a few years after Rattazzi's death. Her writings consist of miscellaneous sketches, verses, plays, and novels. Among the latter are *Si j'étais reine* (1866), said to be autobiographical, and *Les mariages de la oréole* (1866), reprinted under the title *La chanteuse* (1870).

BONAPARTE, PRINCE NAPOLEON JOSEPH PAUL. See NAPOLEON, PRINCE.

BON'AB, HORATIUS (1808-89). An English Free Church clergyman and writer of hymns. He was born in Edinburgh, and was educated at the university there. In 1837 he was ordained to the ministry at Kelso, where he remained nearly thirty years, when he was called to the Chalmers Memorial Free Church, Edinburgh. He edited several religious journals and published more than twenty volumes of a religious character, among them *Hymns of Faith and Hope* (3 series, 1857-66) and *Selected Hymns* (1879). He was author of the hymns "What a Friend we Have in Jesus," "I Heard the Voice of Jesus Say," and "I Was a Wandering Sheep."

BONAB, JAMES (1852—). A Scottish educator and political economist, born at Collace (Perthshire). He studied at Glasgow University and Balliol College, Oxford, and in 1881 was appointed junior examiner in the English civil service commission. In 1895 he became senior examiner. He was in 1898 president of Section

F of the British Association. Among his publications may be mentioned a translation (1877) of J. T. Beck's *Umriss der biblischen Seelenlehre*, a *Catalogue of Adam Smith's Library* (1894), *Parson Malthus* (1881), *Malthus and his Work* (1885), and *Philosophy and Political Economy* (1893).

BONASONE, bō'nā-sō'nā, GIULIO (1510-74). An Italian painter and engraver. He was born in Bologna, and was a pupil of Marcantonio Raimondi (q.v.). Some of his paintings are to be seen in the churches of Bologna, but he is best known for his engravings. These, which are after Michelangelo, Raphael, Giulio Romano, and others, although inferior to the work of Raimondi, and often marred by careless or incorrect execution, nevertheless display much ability.

BONA'SUS. The aurochs. See BISON.

BO'NAVENTURA (1221-74). A saint and doctor of the Roman Catholic Church. His real name was Giovanni Fidanza. He was born in 1221 at Bagnorea, in Tuscany. In 1238 he became a Franciscan monk; was a theological teacher in Paris, where he had studied, 1248-55; and in 1257 became General of his order, which he governed strictly, but affectionately. The influence of his character now began to penetrate the Church; and it was mainly through his eloquent persuasion that the differences which had sprung up among the cardinals on the death of Clement IV., in 1268; were reconciled, and all induced to unite (1271) in electing to the Papal dignity Tedaldus Visconti (Gregory X.). The new Pope created Bonaventura Bishop of Albano and cardinal in 1273, when he accompanied Gregory to the council at Lyons, where he died, July 15, 1274, from sheer ascetic exhaustion. He was honored with a splendid funeral, which was attended by the Pope, the King, and all the cardinals.

On account of his unspotted character from earliest youth, as well as the miracles ascribed to him, he enjoyed, even during his lifetime, especial veneration. Dante, who wrote shortly after, places him among the saints of his Paradiso; in 1482 he was formally canonized by Sixtus IV. and in 1587 was ranked by Sixtus V. as the sixth of the great doctors of the Church. The religious fervor of his style procured for him the title of *doctor seraphicus*, and his own order, the Franciscans, are as proud of him as the Dominicans are of Thomas Aquinas. A great part of his writings is devoted to the praise of his order, and to the defense of mariolatry, celibacy, transubstantiation, communion in one kind, and other doctrines and practices of the Middle Ages, which he attempts to deal with in a philosophical manner. His most important works, the *Breviloquium* (Tübingen, 1845; Venice, 1874, 2 vols.), and *Soliloquium*, are properly text-books on dogmatics. Unfortunately, his efforts to philosophize the Church creed, and that deep mysticism in which his spirit reveled, make him often obscure and unintelligible even in his most popular treatises. With Bonaventura theology is the goal of all art and science; and in his *Itinerarium Mentis in Deum*, as also in his *Reductio Artium in Theologiam*, he represents union with God, to which the soul attains through six stages, as the highest good. He did more than any other of the early theologians to give a scientific form

to the mystical theology. The *Biblia Pauperum*, or 'poor man's Bible,' attributed to him, is a mystico-allegoric explanation of the plain contents of the sacred books for the benefit of the laity. In warmth of religious feeling, however, and in the practical tendency of his ethics, he far excels the hair-splitting scholastics. In his commentary on the *Sententiæ* of Peter the Lombard, he acutely argued against the eternity of the world, and also advanced some original proofs of the immortality of the soul. The most complete edition of his works appeared at Paris (1864-71, 15 vols.). In modern English have appeared his *Life of Saint Francis of Assisi* (London, 1868, 2d ed. 1876); *The Month of Jesus Christ* (1882); and *Instructions for the Season of Lent* (1884). *The Life of Christ* (1881); *The Psalter of the Blessed Virgin* (1852); *The Mirror of the Blessed Virgin Mary* (Dublin, 1849), are works attributed to him. His *Itinerarium* is translated *Journal Speculative Philosophy*, xxi. Consult: *Lexicon Bonaventuranum philosophico-theologicum* (Venice, 1880); and for his life, A. M. Vicenza (from the Italian Paderborn, 1874); *Sixieme centenaire* 15. Juillet, 1874 (Lyons, 1874).

BONAVENTURA, FATHER. A pseudonym of Charles Edward Stuart, adopted on his secret visit to England in 1753; mentioned in Scott's *Redgauntlet*.

BONAVENTURE. A prose pastoral of Acadian Louisiana, by G. W. Cable (1888), containing "Caranero," "Grand Point," and "Au Large."

BONAVINO, bônâ-vê'nô, CHRIST. See FRANCHI, ANSONIO.

BONAVISITA (It., Good View). The capital of Bonavista District, on a bay of the same name, on the east coast of Newfoundland, 73 miles north by west of Saint John's (Map: Newfoundland, G 4). It is a thriving port of entry and one of the oldest fishing stations on the island. The surrounding land is well cultivated. Islands and rocks make the navigation of the bay dangerous. The entrance is marked by a lighthouse on Cape Bonavista, 150 feet above the sea. Population, 3550.

BONBRIGHT, DANIEL (1831—). An American educator, born in Youngstown, Pa. He graduated at Yale in 1850, was tutor there in 1854-56, and in 1858 was appointed professor of Latin language and literature in the Northwestern University. In 1899 he was appointed dean of the university, and in 1900-01 was acting president.

BONCHAMP, bôn'shân', CHARLES MELCHIOR ARTUS, Marquis de (1760-93). A Vendean chief. He was born at Jouverdeil, in the old Province of Anjou; took part in the American Revolution; and when he returned to France was made captain. Of strong Royalist principles, he looked with disfavor on the Revolution. After living for some eighteen months in solitude, he allowed himself to be chosen leader of the Anjou insurgents. The Army of the Vendée would have been more formidable if Bonchamp's tactics had been adopted, but this was not done until it was too late. He fought at Bressuire and Thouars, and in the sanguinary encounter at Chollet, October 18, 1793, received a fatal shot in the breast. He was generous and merciful in his warfare, and

the lives of 5000 Republican prisoners are said to have been spared at his dying request. Consult Chauveau et Dussieux, *Vie de Bonchamp* (Paris, 1817).

BONCOMPAGNI, bôn'kôm-pâ'nyê, PRINCE RALDASSARE (1821-94). An Italian mathematician. He was born in Rome. His noted critical and historical work, *Scritti di Leonardo Pisano*, appeared in 1857-62. In 1857 he found at the Cambridge library a Latin translation of the famous arithmetic of Al Khowarazmi, which he published in Rome under the title, *Algoritmi, de Numero Indorum*. All traces of this work had disappeared for 250 years. His numerous historical monographs were published, for the most part in the *Bulletino di Bibliografia*, in 20 volumes, edited by him (Rome, 1868-88).

BOND. See MASONRY and BUILDING.

BOND (same word as *band*, a fastening, from the verb to bind; for the meaning compare obligation, similarly used). In a legal sense, an obligation in writing and under seal by which one party, termed the obligor, binds himself to pay a sum of money to another, termed the obligee. At the present day a contract under seal to perform any other act or duty is generally called a covenant. Bonds belong to the class of specialty contracts and are of two kinds, *simple* and *conditional*, the former where provision is made for the payment of a sum of money only, the latter where a clause is added, in the nature of a defeasance, upon the performance of which the obligation is void, but upon the breach of which the obligation, regarded in the nature of a penalty, is payable. The latter is the class to which the term bond is generally applied in modern usage. In form it consists of: (1) The obligation by which the obligor binds himself his heirs, executors, and administrators, to pay a certain sum of money; (2) any recitals necessary to explain the transaction; (3) the conditions, defining the acts on the performance or breach of which the obligation terminates. In an ordinary surety's bond, or one for the payment of a debt, the obligation is for a sum double the amount of the debt, hence called a 'penalty,' but terminates on the payment of the debt with interest by the debtor. Formerly, the condition was often stated in a separate instrument called the 'defeasance.' Under the old common-law rule on non-performance of the condition of a bond on the day fixed, the penalty was absolutely forfeited and recoverable by the obligee in full, but equity intervened to give relief against such penalty on the payment of the sum or damages actually due with interest sustained, and later statutes confined the recovery at law to the debt or damages actually suffered, so that now a bond amounts merely to the promise of payment of a sum of money, its form being sanctioned by antiquity. One of the great advantages of a bond over an ordinary contract to pay money is that the period fixed by the statute of limitations, in most jurisdictions, in which to bring action is 20 instead of 6 years. Where the obligation runs to more than one obligee, all should join in a suit, unless their rights are expressly declared to be several.

In the United States a bond or like obligation to pay money is usually accompanied by an instrument of security or mortgage upon the property of the debtor or obligor. On default

the obligee may either sue upon the bond or enforce the payment from the security. A similar usage prevails in the Scotch and English law; in the former, the mortgage of real estate being commonly termed a *bond*. See MORTGAGE.

Bonds issued by corporations and by governments are evidences of indebtedness which differ in form but little from those used in legal transactions by individuals. Corporations are generally empowered by their charters to borrow money by the issue of bonds. These bonds have a definite period to run and bear a fixed rate of interest. The entire bond issue is frequently reinforced by a mortgage upon the property of the corporation, under which the bondholders may, upon default of payment of principal or interest, foreclose upon the property in satisfaction of their claims. This right greatly enhances the value of the security in the case of first mortgage bonds, but is of little practical value in the second and subsequent mortgage bonds so frequently issued by railroad corporations. The number of bonds issued by certain corporations is bewildering. Some depart very widely from the first mortgage bond, and are bonds only in name, and in the fixed rate of interest which they bear. Any obligations issued in a group by corporations are called bonds when they bear a fixed rate of interest. The entire bond issue is divided into part obligations each of which is a bond. They are usually issued in sums of \$1000 each, though bonds of \$500 and \$100 are sometimes issued. In form they are either registered or coupon bonds. In the former case they are issued to individual owners, who in case of sale must authorize the transfer on the books of the corporation or its trustee to the purchaser. Coupon bonds are payable to bearer, and provide for the payment of interest by a series of notes (coupons) attached to the bond, which promise the payment of the interest, usually expressed as a specific sum of money, at the several interest periods. As they fall due they are cut from the bond and presented directly or through a bank for payment. They may be payable at the company's offices or at banking institutions named on the coupons.

Bonds issued by governments are in form similar to those issued by corporations, being registered or coupon bonds. They are not, however, supported by any mortgage, as no citizen can enforce a claim against the State. For their security they rest, therefore, upon the confidence of the purchaser in the ability and good intentions of the issuing government to meet its obligations. In the case of some of the minor governments this confidence has been sometimes sadly misplaced. In the case of refusal by the government to pay the debt or interest the holder is without redress. In some of the States of the Union the issue of bonds by the State governments is hedged about by constitutional restrictions, which have a certain value in preventing excessive bond issues. The same is true of the bonds issued by the minor civil subdivisions of the States, counties, school districts, towns, and cities. See articles DEBT, NATIONAL; REPUTATION.

Consult: Cook, *Treatise on Stock and Stockholders* (3 ed., Chicago, 1894); Short, *Law of Railway Bonds and Mortgage* (Boston, 1897); Hainer, *Modern Law of Municipal Securities*

(Indianapolis, 1898); Dillon, *Law of Municipal Bonds* (Saint Louis, 1876); Throop, *Treatise on the Law Relating to Public Officers and Sureties in Official Bonds* (New York, 1892). Also the authorities referred to under FORECLOSURE; MORTGAGE; TRUST; MUNICIPAL CORPORATION.

BOND, EDWARD AUGUSTUS, Sir (1815-98). An English librarian and scholar, born at Hanwell. In 1867 he became Keeper of the Manuscript Department of the British Museum, and from 1878 to 1888 he was principal librarian of the Museum. In 1870 he founded (with E. M. Thompson) the Palæographical Society, of which he was long president. It was he who brought about the printing of the British Museum catalogue. He edited *Statutes of the Colleges of Oxford* (1853); *Speeches in the Trial of Warren Hastings* (1859-61); the *Travels of Jerome Horsey* (for the Hakluyt Society), and *Facsimiles of Ancient Manuscripts* for the Palæographical Society, 5 vols. (1873-88).

BOND, GEORGE PHILLIPS (1825-65). An American astronomer, the son of William Cranch Bond (q.v.). He was his father's assistant in the Harvard Observatory, succeeding to full charge in 1859. He published a *Treatise on the Construction of the Rings of Saturn; Elements of the Orbits of Hyperion and the Satellite of Neptune; The Method of Least Squares; and Mathematical Memoirs upon Mechanical Quadrations*. For a work on Donati's comet he received a gold medal from the Royal Astronomical Society.

BOND, WILLIAM CRANCH (1789-1859). An American astronomer, born in Portland, Maine. He was self-educated, and had a private observatory at Dorchester, Mass., where his discoveries attracted much attention. In 1838 he was chosen by the United States Government to make observations for the use of the Wilkes exploring expedition to the South Pacific, and in 1839 he supervised the construction of the observatory at Harvard, and became its director. He was the inventor of a method of measuring time to a very small fraction of a second, and among the first to employ photography in stellar observations.

BONDAGE (LLat. *bondagium*, inferior tenure, held by a husbandman, from *bondus*, AS. *bonda*, householder, husbandman). A form of rural tenure which obtains in Scotland, based upon an obligation of the tenant, called a *bondager*, to render agricultural services to his landlord. It is a survival, in modified form, of the base tenure of villeinage (q.v.), which prevailed in the early history of the feudal system (q.v.). See COPYHOLD.

BONDER, bönd'ër (Norw. *bonde*). In Norway and Sweden, the landowners or farmers. Under the ancient kings of Norway they were a powerful class, and often forced important concessions from their rulers, or deposed them. They correspond nearly to burgesses and barons in England.

BONDI, bön'dè, CLEMENTE (1742-1821). An Italian poet, born at Mezzano, near Parma. He was educated by the Jesuits and when still very young was appointed to deliver lectures in rhetoric in the royal seminary at Parma. Here he produced his first work, *Giornata vil-*

Ierectia (1773), intended to be a humorous picture of the rural pleasures of the brotherhood. Having celebrated in verse the abolition of the Jesuit Order, he was subjected to a priestly persecution, and compelled to conceal himself in the Tyrol; but ultimately he found a patron in the Austrian Archduke Ferdinand, who made him librarian at Brünn. Later he fixed his residence in Vienna, where he died. His poems are lyrical, descriptive, satirical, and elegiac, and are chiefly distinguished by the elegance of their versification and the purity of their style. Among his longer works may be mentioned *La conversazione*, *La felicità*, and *Il governo pacifico*. Italians consider Bondi's translation of the *Æneid* to possess remarkable excellence. His entire works were published in Vienna in 1808.

BONDMAN, THE. A tragedy by Massinger (1623); a minor opera by Balfe (1846); a novel by Hall Caine (1890), the scene of which is laid in the Isle of Man and Iceland.

BONDU, *bôn-doo'*, or **BONDou**. One of the constituent States of the French colony of Senegal, between latitudes 14° and 15° N., separated from Bambuk by the river Faleme. The soil is very fertile and well watered, and yields millet, indigo, corn, rice, and cotton. Gold and iron are found in considerable quantities. Cotton fabrics are woven by the natives, who belong to the Fulah race and number about 30,000. The predominant religion is Mohammedanism. The King resides in Bulibani, the capital, with a population of over 2000.

BONDUCA. The title of a tragedy by Fletcher, acted before 1619, but not printed until 1647. It was several times altered, one of the alterations bearing a new title, *Caractacus*. It deals with the unsuccessful defense of Britain by Boadicea against the Romans under Suetonius Paulinus. The same title was used for plays by Charles Hopkins (1697) and Richard Glover (1753).

BONE (AS. *bân*, Ger. *Bein*, bone, leg; cf. Icel. *beinn*, straight). The hard material of the skeletons or frameworks of mammalian animals, reptiles, most fishes, and birds. In the embryo, it is preceded by cartilage (q.v.), which consists of cells massed together, except in the flat bones, as those of the skull and shoulder-blade, of which the primary foundations are to a great extent of fibrous tissue. Points or centres of ossification form, the cells alter their form and arrangement, and a deposit of earthy materials, phosphate and carbonate of lime, takes place, rendering the former flexible substance rigid. By soaking a bone in dilute mineral acid, we can dissolve these earthy matters and render it again flexible, ossein, or bone cartilage, alone remaining. On the other hand, if we expose it to intense heat, the animal matter (gelatin) is burned, and though the bone retains at first its form, a slight touch will cause its now unsupported earthy matter to crumble away. We see, in the ill-nourished children of large towns, too many examples of how necessary is a proper relation of these two elements of bone to each other. In the disease called rickets (q.v.), the earthy matter is deficient, and the too flexible leg-bones bend under the weight of the trunk. In the aged person, again, the bone-substance becomes more densely packed with

earthy matter and becomes brittle, rendering the bones peculiarly liable to fractures. Animals lower in the scale than vertebrates have, in place of bone, mineral concretions or incrustations, principally consisting of carbonate of lime. Besides constituting the skeleton, bone occurs in plates in certain animals, as in turtles' integument, the heart of certain ruminants, the tongue of certain fishes, etc.

The specific gravity of bone is between 1.87 and 1.97. It is twice as strong as oak, and a cubic inch of it will support 5000 pounds.

The bones of the skeleton are classified according to their shapes—viz., as long bones (e.g. the thigh-bone and arm-bone), flat bones (as the shoulder-blade and skull-bones), short and irregular bones (as those of the wrist or vertebrae). The substance of bones is arranged differently in different parts—either hard and close, which is called the condensed substance, or loose and reticulated, called the cancellated structure. *Long bones* have a shaft of hard substance, terminating at each end in soft or cancellated structure; in the latter situations, the bone is more expanded and rounded off to enter into the formation of a joint. *Irregular bones* consist of a shell of condensed tissue, inclosing a mass of cancellated structure, and are smoothed off into surfaces adapted to those of the adjoining bones. *Flat bones* consist of two layers of hard tissue, with an intermediate cancellated structure. Anatomists class as *mixed bones* those which are both long and flat, as the ribs, the breast-bone, and the lower jaw.

HISTOLOGY. Bone belongs under the general histological classification of connective tissue, its hardness being due to the deposition in its intercellular substance of calcareous matter. Bone may be divided into two varieties—compact and spongy. The former makes up the hard outer shell of the various bones, while the latter is found in the interior. Bones are covered externally by the periosteum (q.v.). They are largely supplied with blood-vessels, which are carried into them from the periosteum, the largest being those which enter the cancellated ends of the long bones. The long bones are hollow, the central portion being filled with marrow. This central canal is lined by a membrane which receives a special artery for the supply of the adjacent compact tissue. This vessel enters the bone rather above the mid-point, and divides into two branches—an ascending and a descending—which subdivide and anastomose with the vessels already mentioned as entering the cancellated bone. After the arteries enter the compact tissue of bone they run in small capillary canals, which permeate the bone and anastomose, forming oblong loops or meshes. The veins of bone are also contained in these canals, and are larger than the arteries. These capillary canals in which the vessels run are named 'Haversian,' after their discoverer, Clopton Havers, an old English anatomist. They vary in diameter from $\frac{1}{100}$ to $\frac{1}{20}$ of an inch. They take a longitudinal direction, and if a transverse section is examined under a microscope it appears pierced with holes, which are the Haversian canals cut across. Each canal is surrounded by its own layers of bone, forming a sort of thick-walled cylinder with the Haversian canal as the centre. Between the layers are seen numbers of minute spaces arranged concentrically around the Ha-

versian canal. These spaces are known as *lacunæ*, and each one has passing off from it, in a radiate manner, numerous small canals or *canaliculi*, which anastomose with canaliculi from other lacunæ belonging to the same system, and probably serve as lymph-channels for the nutrition of the bone. The lacunæ are not empty, but contain bone cells or corpuscles, which are nucleated bodies and send out fine processes into the canaliculi. In addition to the Haversian systems are irregular *lamellæ*, or layers of bone, which fill in the spaces left between the systems, and are known as *interstitial lamellæ*. Along the surface of the bone, and also along the side of the central canal, the *lamellæ* are arranged parallel to the surface, and are known as *circumferential lamellæ*. The cavities of bones and the various nutrient channels which run through them are filled with a substance called *marrow*. In all bones of young animals the marrow is red in color, and is known as red marrow. As the bone grows older the marrow becomes lighter in color from the accumulation of fat, and is known as yellow marrow. Marrow consists of a delicate connective-tissue network, in which ramify numerous small blood-vessels. In the meshes of this network are found various kinds of cells—marrow-cells, or rather large oval cells; giant cells, or myeloplaxæ; large cells containing several nuclei; red-blood cells; nucleated red-blood cells; white-blood cells; connective-tissue cells; and fat-cells. The periosteum is a connective-tissue membrane, rich in blood-vessels, which invests the surface of all bones except where they articulate with other bones. Connective-tissue fibres ('Sharpey's fibres') extend from the periosteum into the superficial layers of the bone.

With the exception of the flat bones of the head, all bones are first represented by masses of hyaline cartilage which resemble in shape the future bone. The cartilage is covered over with the primitive periosteum, or perichondrium. From this membrane blood-vessels extend into the cartilage at some point, usually near the centre of a long bone, and a rearrangement of the cartilage-cells occurs. This point is known as the *centre of ossification*. New cells, probably derived from the white-blood cells, appear and are known as osteoblasts. Each osteoblast surrounds itself with a little layer of bone, and is then known as a bone-cell. In compact bone the formation of the Haversian systems is due to the laying down of the bone in concentric layers around the blood-vessels. During the development of bone within the cartilage (intra-cartilaginous development), bone is also being formed under the periosteum (subperiosteal development). Here, also, the bone is formed by the osteoblasts surrounding themselves by bone. The flat bones like those of the skull are not laid down in cartilage like the long bones, but develop in a membranous connective-tissue matrix (intramembranous development). Except for the absence of the preëxisting cartilage, the process is quite similar to that which occurs in intracartilaginous development.

Nerves may be seen entering bone, and the acute pain felt in some of its diseased conditions proves their existence; but they have not yet been actually demonstrated in the osseous tissue; neither have *lymphatics*, though we suppose, from analogy, that bones are supplied with

them. The several bones composing the animal frame will be treated of under the head **SKELETON**; any important peculiarities in the bones of different classes of animals, under the heads of these classes.

CHEMICAL COMPOSITION OF BONE. The principal chemical ingredients present in bone are gelatin and phosphate of lime; and the following table represents the composition in 100 parts of bone of average quality:

CONSTITUENTS	Human Bones	Ox-bones
Gelatin.....	33.30	33.30
Phosphate of lime.....	53.04	57.35
Carbonate of lime.....	11.30	3.85
Phosphate of magnesia.....	1.16	2.06
Carbonate and chloride of sodium	1.20	3.45
	100.00	100.00

The gelatin of bones remaining behind after treatment with dilute hydrochloric acid has the size and shape of the original bone, but is, of course, soft, somewhat transparent, flexible, and even elastic. If this soft, gelatinous residue of bone be boiled with water, it dissolves in great part therein, and yields a solution which *sets*, or gelatinizes, on cooling. A more common way of extracting the gelatin from bone is to heat the bones covered with water in a digester to a temperature of 270° to 280° F., when much of the gelatin dissolves out and leaves the earthy salts with the remainder of the gelatin. Besides the marrow (q.v.), a little fat is generally found permeating the entire structure of the bone, which can be extracted by throwing the bones into hot water, when the grease or fat exudes and floats to the surface. In some of the larger bones of man and other mammalia, there is a central cavity containing a considerable amount of fatty matter, popularly known as *marrow*. These cavities are not found in the bones of the young animal, but gradually form as the animal approaches maturity. In the sloth, cetacea, seals, and a few other animals, the cavities are not found. Occasionally, as in man, the elephant, giraffe, etc., the bones in the head have cavities filled with air instead of marrow. The uses to which a bone may be put are various. In the cooking of soups, bones form a constant ingredient, and become useful in supplying gelatin, which gives a *body* to the soup it would not otherwise possess. How far gelatin is of itself nutritious is a disputed question. (See **GELATIN and NUTRITION**.) Animals, however, like the dog, which masticate, devour, and digest the entire bone, do derive benefit therefrom, in part from the gelatin and in other part from the earthy substances; and the same remark applies to the use sometimes made of small fish, where, after being thoroughly browned, they are entirely eaten. In times of scarcity in Norway and Sweden, the poorer people even eat the bones of mackerel and other fish.

Bone is largely used in making the handles of small brushes, the more common table knives and forks, and penknives, and in the manufacture of the cheaper sort of combs (q.v.). Our forefathers, before the metals were known, fashioned fish-hooks out of bone, and used the spines

in the tail and back fin of certain fishes for pointing arrows. These uses of bone, coupled with the employment of the serrated teeth of sharks as a war weapon, are still practiced by many uncivilized tribes. The fatty and other organic matters in bone allow of its being employed as a fuel where coal or wood cannot be obtained, as in the pampas of South America and the steppes of Russia. In these regions it is considered that the heat evolved during the combustion of the bones of an ox suffices to cook the flesh. See also BONE FERTILIZERS.

BONE, HENRY (1755-1834). An English enamel painter. He was born at Truro, in Cornwall, February 6, 1755. He was apprenticed to a manufacturer of china, but in 1799 moved to London, where he made designs in enamel for jewelers. His merits as an artist were soon recognized; the beauty of his work attracted the notice of the Royal Academy; and he was admitted to that institution, first as an associate, afterwards, in 1811, as a full academician. His copies of the "Sleeping Girl," by Sir Joshua Reynolds, brought him early fame, but his most beautiful examples were the execution of eighty-five portraits of illustrious men and women of Queen Elizabeth's time. All were reproduced in enamel, and were of sizes varying from 5 by 4 to 13 by 8 inches. These exquisite portraits, so greatly admired in the time of Bone, were disposed of by public sale after his death, and are now in the hands of private collectors. Bone was enamel painter to their Majesties George III., George IV., and William IV. He executed miniatures after Raphael, Titian, and Murillo. He died December 17, 1834. See J. H. Wilmot-Buxton, *English and American Painters* (New York, 1883); C. E. Clement, *Painters, Sculptors, Architects, and Engravers* (Boston, 1899).

BONE-ASH. See BONE FERTILIZERS.

BONEBLACK, ANIMAL CHARCOAL, or CHAR. A substance prepared from carefully selected, clean, hard bones made by heating them in retorts, out of contact with air, until they are carbonized. In this process combustible gases and water, together with oil and the vapors of various salts of ammonia, are given off, and boneblack is left in the retort. It is generally reduced to coarse grains from about the size of small peas, down to large pinheads, and is extensively used in the arts for decolorizing liquids, such as the sirup of sugar, and solutions of argol (impure cream of tartar). It is capable of removing various mineral substances from their solutions, and is therefore used in filters for separating chemical impurities from water. The general mode of using the boneblack for the purpose of decolorizing liquids is to allow the liquid to percolate through a layer of the charcoal, when all color is arrested, and the sirup of sugar runs through clear and colorless. This power of absorbing coloring matters is possessed also by vegetable (peat or wood) charcoal, but not to such an extent as by boneblack. The application of heat to the liquids before filtration greatly facilitates the decolorization, and where the volume of liquid to be operated upon is not great, the most expeditious method is to boil the liquid and boneblack together, and then strain through filtering-paper or cloth. The power of absorbing colors appears to be due to the porosity of the substance;

it is extremely improbable that the absorption of color is due to a chemical process. When sirup of sugar and other liquids have been run through boneblack for some time, the pores of the latter appear to get clogged with the color, and the clarifying influence ceases; then the boneblack requires to undergo a process of *revivification*, which usually consists in reheating it carefully in ovens, or iron pipes inclosed in a furnace, when the absorbed color is charred, and the boneblack can be of service once again as an arrester of color. After several reburnings, the boneblack becomes of very inferior absorptive quality, and is disposed of for the manufacture of fertilizers. Boneblack has also the power of absorbing odors, especially those of a disagreeable nature, and can be employed to deodorize apartments, clothing, outhouses, etc. See BONE FERTILIZERS.

BONEBREAKER (for derivation see below). The giant fulmar petrel (*Ossifraga gigantea*), which is nearly as large as an albatross, and belongs in the South Pacific. It breeds upon Kerguelen and neighboring islands, and feeds mainly upon the carcasses of dead seals and cetaceans, the bones of which it is able to smash with its powerful vulture-like beak. It is called 'Nelly' by the sealers. See FULMAR, and Plate of FISHING SEA-BIRDS.

BONE CAVE. See CAVE.

BONE COAL. A term used in the anthracite regions to designate lumps of coal containing shaly matter. In the sizing and sorting of anthracite the bone coal has to be separated by hand or by machinery. See ANTHRACITE.

BONE-DOG. The bone-shark. See DOGFISH.

BONE FERTILIZERS. Bones have long been used and are highly valued as a fertilizer. Sir John Lawes, of England, early in his career, recognized their value for this purpose and established a factory for treating them with sulphuric acid to increase their effectiveness, according to the process suggested by Liebig. Bones are valuable as a fertilizer on account of the nitrogen and phosphoric acid they contain. The proportions of these depend upon the kind of bones, and the method of treatment to which they are subjected. Untreated bone consists chiefly of tricalcium phosphate bound together by gelatinous matter rich in nitrogen. If raw bone is soaked in dilute hydrochloric acid the calcium phosphate is dissolved, leaving a tough, elastic, gelatinous mass behind; if it is burned, a friable earthy mass—bone-ash—is obtained. If subjected to the action of superheated steam, more or less of the gelatinous matter is removed, leaving a product richer in phosphoric acid and poorer in nitrogen than the original.

RAW BONES. According to Voofhees, raw bones free from meat and excess of fat should contain a considerable amount of phosphoric acid and 4 per cent. of nitrogen. They are highly valued as a fertilizer, although they often contain a considerable amount of fat which interferes with their decomposition in the soil. Bones from which the fat has been removed by extraction with solvents, such as benzine or petroleum, contain a high percentage of nitrogen (sometimes 6 per cent.) and about 20 per cent. of phosphoric acid, are easily ground, and decompose readily in the soil.

BONE-MEAL, BONE-DUST. These are different names applied to the same thing, viz., very finely ground bone. The product may be finely ground raw bones, but it usually consists of bones which have been boiled, steamed, or extracted with solvents previous to grinding.

STEAMED BONE. A large part of the bone used for fertilizing is either boiled or steamed. This treatment removes the fat, which interferes with the action of the bone as a fertilizer, but is valuable for other purposes, and the larger part of the nitrogenous matter, which is valuable as a fertilizer and also for the preparation of gelatin and glue. Bones degelatinized by steaming contain from 28 to 30 per cent. of phosphoric acid and 1.25 to 1.75 per cent. of nitrogen. Steaming at a high temperature improves the mechanical condition of bones.

DISSOLVED BONES. This is the term applied to the product resulting from the action of strong sulphuric acid upon bones. The acid converts the insoluble (tricalcium) phosphate into soluble (monocalcium) phosphate, and calcium sulphate, or gypsum:

The product is a dark-colored, coarse, soft powder. This method of treating bones is little used at present, because soluble phosphates are more easily and satisfactorily prepared from mineral phosphates and because bones are sufficiently effective as a fertilizer without such treatment.

BONE-TANKAGE. This is a product which consists of bone mixed with meat-scrap and blood or other slaughter-house refuse in a fine state of division, and is usually richer in nitrogen and poorer in phosphoric acid than pure bone. Several different grades are recognized in the trade, in which the phosphoric acid varies from 7 per cent. (tankage, q.v.) to 19 per cent. (nearly pure bone).

BONE-ASH, the product resulting from the burning of bones, is imported in considerable quantities from South America. It contains no nitrogen, and its fertilizing value depends entirely upon the phosphoric acid present. This is quite variable; but good samples should contain, according to Voorhees, from 27 to 36 per cent. Bone-ash is applied as a fertilizer, either directly or after being converted into superphosphate (q.v.) by treatment with sulphuric acid, as in case of dissolved bone.

BONEBLACK. This is the product resulting from the carbonization of bones by heating in closed vessels. It is used for clarifying solutions, especially sirups, as a pigment, and as a fertilizer, either directly or after treatment with sulphuric acid. It is usually the spent boneblack from refineries that is used in the manufacture of fertilizers. The boneblack from this source is somewhat variable in composition, but usually contains from 32 to 36 per cent. of phosphoric acid. Dissolved boneblack, the form in which it usually appears as a fertilizer, contains about 16 per cent. of phosphoric acid soluble in water and in ammonia citrate (reverted). This is one of the most important sources of superphosphates in fertilizers. See article **BONEBLACK**.

The nature and composition of bone is such that it gradually yields its nitrogen and phosphoric acid for the use of the plant in the

soil; and while it is sometimes treated with acid, as described above, to render its phosphoric acid more available, it is probably most effective when applied in the fine-ground condition and to slow-growing crops. It is the only one of the phosphatic materials, except phosphatic slag (q.v.), which is so used with advantage.

BONEFISH. See **LADYFISH**.

BONELLI, bô-nèl'le, FRANÇOIS ANDRÉ (1784-1830). An Italian zoölogist. He was born at Cuneo (Piedmont), became a professor in the University of Turin, a director of the Museum in Turin, and a member of the Academy of Sciences there. He made extensive scientific journeys in Europe, and published a number of highly esteemed works on entomology, such as *Specimen Faunæ Subalpinæ* (1807).

BONER, bôn'er, CHARLES (1815-70). An English author, born at Weston. He was a special correspondent of the London *Daily News*, and also wrote for the New York *Tribune* and other well-known newspapers. Many notable translations from the German were made by him, including particularly Hans Andersen's *Danish Story-Book* (1846), and *Dream of Little Tuck* (1848). His other works include *Chamois-Hunting* (1853); *Verses* (1858); *Forest Creatures* (1861); and *Pennsylvania: Its Products and Its People* (London, 1865).

BO'NER, JOHN HENRY (1845—). An American poet, born at Salem, N. C. He learned the printer's trade, and in 1867 was editor of the *Salem Observer* and the *Asheville Pioneer*. He was chief clerk of the North Carolina House of Representatives from 1869 to 1870, and was in the civil service at Washington from 1871 to 1887. He removed to New York in 1887, and was a member of the staffs of the *Century Dictionary*, the *Literary Digest*, *A Library of American Literature*, and the *Standard Dictionary*. In 1901 he again undertook bureau work at Washington. He has published *Whispering Pines* (1883), a volume of verse. His best-known poem is *Poe's Cottage at Fordham*, first published in the *Century Magazine*.

BONER, bôn'ér, ULRICH. One of the oldest German fabulists. He was a preaching friar of Bern, and is frequently mentioned in documents of the years 1324-49. His collection of 100 fables, entitled *Der Edelstein*, was published at Bamberg, 1461, and was one of the first German books printed. It is marked by purity of style and by clear and vivid delineation. This book is one of the greatest of bibliographical rarities, not more than two copies being known to exist. Bodmer and Breitinger published a complete edition of the work at Zurich, in 1757, under the title *Fabeln aus den Zeiten der Minnesinger*. Recent years have seen frequent reprints, notably in Reclam's *Universal-Bibliothek* (Leipzig, 1895).

BONES. Originally four pieces of the ribs of horses, or oxen, held in the hands and rapped together to mark time and rhythm. In early times the bones were called 'knicky-knackers,' a word originating in the old English *nakerers*, mentioned in Chaucer's *Knight's Tale*. The fact that Bottom speaks of the 'tongs and the bones' in *Midsummer Night's Dream* is proof that they formed part of the rustic music in Shakespeare's time. They are still played by negro minstrels. See **CASTANETS**.

BONESET, or THOROUGHWOERT (so named from its medicinal properties), *Eupatorium perfoliatum*. A perennial herb, native of the United States, and growing in moist soil. The leaves and flowering tops are used as a tonic. They have a strong, bitter taste, and are taken in the form of hot tea to produce perspiration. If very strong, it operates as an emetic. To make boneset tea, steep an ounce of dried leaves in a pint of water; let it stand two hours, and strain. Boneset is a domestic remedy for influenza, muscular rheumatism, etc. See EUPATORIUM.

BONET, bó-nét', JUAN PABLO. A Seventeenth-Century Spanish instructor of deaf-mutes, born in Aragon. Pablo Ponce de Leon (died 1584), a Spanish monk, and Pasch, clergyman of Brandenburg, were earlier teachers, but Bonet was the first to publish a manual of method. This is his *Reducción de las letras y artes para enseñar á hablar á los mudos* (1620).

BONE-TUMOR. See ACTINOMYCOSIS.

BONFIGLIO, bôn-fē'lyô, or **BUONFIGLIO**, bwôn-fē'lyô, BENEDETTO (c.1425-c.96). An Italian painter of the Umbrian School. He lived at Perugia, where he painted the frescoes in the Palazzo Comunale (1454-61). These frescoes prove him superior to any of the Umbrians of his time, except Piero della Francesca. It has been said that he afterwards followed Pinturicchio to Rome and assisted in the decorations of the Vatican.

BONFIRE (originally *bone-fire*, as in a gloss of 1483; "*bonefyre*, ignis ossium," i.e. fire of bones). In its earliest usage, a funeral pyre; a fire lighted to consume heretical or forbidden books, etc.; in the early superstitions of Germany (where it was also called *Notfeuer* or need-fire) and most other European nations, a fire kindled in time of pestilence among men or cattle to drive away the disease. Later, the kindling of such fires, with many traditional ceremonies, became a regular part of the observances on the night before the festival of Saint John the Baptist or Midsummer Day—still with the ancient idea of driving away plagues and evil spirits. The casting of effigies into the flames, still observed in some places, seems to point to a survival of ancient propitiatory sacrifices. It is quite likely that all these ceremonial observances are relics of pagan worship of the heavenly bodies, modified by the introduction of Christianity. The Church, as in many other instances, preferred to adopt and consecrate what would have been almost impossible to suppress: thus the inclusion in the Catholic Easter ceremonies of the blessing of the new fire, and the custom in the Russian Church of carrying lighted tapers on that festival, may be related to the custom of the *Osterfeuer* among the Teutonic nations, which originally was probably celebrated on the 1st of May. Consult: Jahn, *Die deutschen Opfergebräuche bei Ackerbau und Viehzucht* (Breslau, 1884); Brand, *Popular Antiquities*, Vol. I., edited by Ellis (London, 1849). For the customs more particularly associated with the Celtic races, see BELTANE.

BONGAR, bôn'gâr (native name). A serpent; genus *Bungarus*. See KRAIT.

BON GAULTIER, bôn gô'tyâ', BALLADS OF. The title of a witty, satirical volume of

verse by Professor William Aytoun and Theodore Martin, published in 1854. The ballads originally appeared in *Blackwood's Magazine*, and were mostly on the topics of the day, including some excellent parodies.

BONGHI, bôn'gê, RUGGERO (1828-95). An Italian man of letters and politician. He was born in Naples, March 20, 1828. His literary activity began at the age of 20, with a translation of Plato's *Philebus*. His active share in the political events of 1848 forced him into temporary exile; and a chance meeting at Lake Maggiore with Manzoni and Rosmini-Serbati soon bore fruit in his much-discussed *Critical Letters on the Reason Why Italian Literature is Not Popular* (3d ed., 1873). In 1853 appeared his translation of Plato, *Opere di Platone*, and of the *Metaphysics* of Aristotle; and the following year he refused to receive from Austria a chair of philosophy in the University of Pavia, but afterwards accepted it from his own country, when Pavia had reverted to Italy. Thereafter he was connected successively with the universities of Turin, Florence, Milan, and finally (1870) Rome, where he was professor emeritus of ancient history at the time of his death. Bonghi was a man of great activity and many interests. From 1860 he sat almost continuously in the Chamber of Deputies, where he supported the Conservative Party. In 1874-76 he was Minister of Public Instruction. In journalism he was equally active, editing successively the *Perseveranza* of Milan, and the *Unità Nazionale* of Naples, and founding the *Stampa*, which is still the leading journal of Turin, and the magazine *Cultura*, which he edited until his death in 1895. He was for many years president of the Italian Press Association. Among his many published works may be mentioned: *Pius IX. and the Future Pope* (1877); *Leo XIII. and Italy* (1878); *Contemporaneous Portraits: Cavour, Bismarck, Thiers* (1879); *Disraeli and Gladstone* (1882); *History of Rome* (1884-88); *Arnoldo da Brescia* (1884); *The Roman Festivals* (1891).

BONGO, bôn'gô. A name applied to a negro people dwelling in the Upper Nile basin, between the Dinka and the Zandeh. They are slightly blended with Hamites. They are of reddish skin and medium stature, and are vigorous and fleshy, with crisp hair. They subsist by the chase, upon their flocks, and by agriculture. They are skilled in the working of iron. Their neatly thatched houses and granaries are conoid in shape, and the former are surmounted with lookouts. Little costume is worn, but the Bongo are fond of adornment. The women tattoo the upper part of the body, and wear labrets in the upper lip, straws through the alæ of the nostrils, and rings through the septum of the nose.

BONGO. A large West African bushbuck (q.v.).

BONHAM, bôn'am. A town and the county-seat of Fannin County, Tex., about 75 miles northeast of Dallas, on the Texas and Pacific and the Denison, Bonham and New Orleans railroads (Map: Texas, F 3). It is the seat of Carleton College (Christian), opened in 1867. The city is the centre of a fertile agricultural district, and has a large export trade in cotton, grain, flour, and live stock. The industrial establishments comprise flouring-mills, cotton-gins,

BONESET, ETC.

1. BONESET (*Eupatorium perfoliatum*).
2. CLIMBING FUMITORY (*Adium cirrhoosa*).

3. BURDOCK (*Arctium lappa*).
4. VIRGIN'S BOWER (*Clematis virginiana*).
5. HEDGE BINDWEED (*Convolvulus sepium*).

cotton and cottonseed-oil mills, railroad machine-shops, carriage and wagon works, planing-mills, etc. Population, in 1890, 3361; in 1900, 5042.

BONHAM, MILLEDGE L. (1815-90). An American soldier and statesman. He was born in South Carolina, and in 1834 graduated at the South Carolina College. He served in the Mexican War, and was a State-Rights Democrat in Congress from 1856 to 1860, but withdrew when his State passed the ordinance of secession, and was made a major-general in the Provisional Army of South Carolina. In 1861 he entered the Confederate Army as brigadier-general, and led a brigade at the battles of Blackburn's Ford and Bull Run, but resigned his commission (1862) to take a seat in the Confederate Congress. He was Governor of South Carolina from 1862 to 1864, when he returned to the army, and served until the close of the war.

BONHEUR, bô'nêr', FRANÇOIS AUGUSTE (1824-84). A French painter, brother of Rosa Bonheur. He was born in Bordeaux, November 4, 1824. His landscapes are noted for their softness and beauty. He was honored with numerous medals, and in 1867 was made Chevalier of the Legion of Honor. He died February 23, 1884.

BONHEUR, JULES ISIDORE (1827—). A French painter and sculptor of animals, younger brother of Rosa Bonheur. He was born in Bordeaux, May 15, 1827. He was represented in the Salon of 1848 by both painting and sculpture, but afterwards abandoned painting. He received medals in 1865 and in 1867. Among his works are "The Tiger-Hunter" and "The Zebra and Panther."

BONHEUR, MARIE ROSA (1822-99). A French artist, deemed the most eminent woman painter of animals. She was born in Bordeaux on October 22, 1822, the eldest of four children. Her father, Raymond Bonheur, who was a drawing-teacher, gave her careful training at an early age; but it was mainly her own study of animals in their natural environments that developed her genius. The family moved to Paris when Rosa Bonheur was eleven years old, and here she copied industriously in the Louvre and the Luxembourg, and also studied from nature. The studio in the Rue Rumford, where the family lived, has been described as a kind of Noah's Ark. Birds, hens, ducks, sheep, dogs, shared the apartments, and every day Mademoiselle Bonheur's two brothers took the quadrupeds down six flights of stairs and out to pasture. At the age of nineteen Mademoiselle Bonheur first exhibited at the Salon a picture of "Rabbits Eating Carrots." Thereafter, until 1855, she was represented annually in the Exhibition. In 1845 she received a gold medal of the third class, and in 1848 a first-class medal. Her first great picture, deemed by some her best, "Ploughing in the Nivernais," was exhibited in 1849, and was bought for the Luxembourg. Meanwhile the studio in the Rue Rumford had been given up, and the artist was studying at abattoirs on the outskirts of Paris. Finding the attentions of the workmen disagreeable, she adopted trousers, and as she had short hair, she easily passed for a man. In 1849, on the death of her brother Raymond, she assumed charge of a school of drawing for young ladies, which he had been directing. In 1853 she exhibited the famous

"Horse Fair." This picture attracted widespread admiration. She offered it to her native town of Bordeaux for 12,000 francs, but the offer was not accepted, so she sold it in England for 40,000 francs, and it was exhibited there and afterwards in America. It was finally purchased by Mr. Cornelius Vanderbilt for the Metropolitan Museum of Arts in New York City for \$55,500. The artist made a replica, a quarter size of the original, from which the engravings of the picture were taken. This replica is in the National Gallery in London; there is also a smaller replica in London and a water-color.

Rosa Bonheur bought a Gothic château at By, near Fontainebleau, and in 1850 went there to live. Here, in 1864, Napoleon III. and the Empress Eugénie visited her studio. The Empress requested the Cross of the Legion of Honor for her; but there was opposition on the ground that the decoration had never been given to a woman except for some deed of bravery and charity, so the Emperor withheld it. The next year, however, while he was in Algeria, the Empress, who was Regent in his place, visited Mademoiselle Bonheur and conferred the Cross. During the latter part of her life she lived quietly at By. She died May 25, 1899. As a painter she showed a sound and wholesome feeling for nature, not only in the modeling of her animals and in her spirited representations of action, but also in the truthful landscape setting in which she placed her subjects. This is notable in the "Ploughing in the Nivernais," in which the sky and upturned earth are rendered with great truth of relative values. Among her best-known paintings are: "The Haymaking Season in Auvergne" (1865); "On the Alert;" "A Foraging Party;" and "A Combat Between Two Stallions." In the Metropolitan Museum of Arts in New York is her "Deer in the Forest," and in the Lenox Library is her "Deer Drinking." For a more extended account of her life and works, consult: Laruelle, *Rosa Bonheur, sa vie et ses œuvres* (Paris, 1885); René Peyrol, *Rosa Bonheur: Her Life and Works*; Richard Muther, *History of Modern Painting* (London, 1896); and C. H. Stranahan, *A History of French Painting* (New York, 1899).

BONHOMME, bô'nôm', JACQUES (Fr., James Goodman). A term of depreciation applied by the French nobility and others to one of the masses, more narrowly to the peasant.

BONHOMME RICHARD, rê'shâr', THE. See JONES, JOHN PAUL.

BONI, bô'nê. A former kingdom occupying the southwestern part of Celebes (q.v.), and covering an area of about 1000 square miles (Map: East India, F 5). Boni was once one of the most important kingdoms of Celebes, and it was only with considerable difficulty that the Dutch succeeded in establishing their authority there in 1860. At the beginning of the century the British were compelled to send several punitive expeditions against the Bonese for interfering with the British sea trade. The population of Boni, which consists mainly of Bugis, is estimated at from 200,000 to 300,000. Capital, Boni, on the eastern coast.

BONIFACE. The name of nine Popes, most of whom are of no historic note. **BONIFACE I.** (Pope, 418-422), on account of prevailing party divisions, was opposed by a rival bishop, but was

recognized by Honorius as proper successor. His letters are in Migne, *Patrol. Lat.*, XX.—BONIFACE II. (Pope, 530-532). His letters are in Migne, LXV.—BONIFACE III., who was Pope for only ten months in the year 607, was the first to whom the title of Universal Bishop of Christendom was conceded by the Greek Emperor (Phocas).—BONIFACE IV. (Pope, 608-615).—BONIFACE V. (Pope, 619-625).—BONIFACE VI. (Pope, 896).—BONIFACE VII. (Pope, 974-984-985).—BONIFACE VIII. (Benedetto Gaetano, Pope, 1294-1303). He was born at Anagni, and was elected Pope on December 24, 1294. His inauguration was distinguished by great pomp: the kings of Hungary and Sicily held the reins of his horse as he proceeded to the Lateran, and, with their crowns on their heads, served him at table. In 1296 Boniface issued his bull *Clericis Laicos*, forbidding the payment or collection of taxes on ecclesiastical property without the consent of the Holy See. He failed in his attempts to assert a feudal superiority over Sicily, and to exercise his Papal authority in the disputes between France and England. Philip the Fair, of France, supported by the estates and clergy, maintained the independence of the kingdom, disregarding many bulls and briefs, and even the sentence of excommunication to which the Pope proceeded. Philip at last, with the aid of Italian enemies of Boniface, made him prisoner at Anagni, whither he had fled; and although he was liberated by the people of Anagni after two days' imprisonment, he died within about a month (October 11, 1303), in consequence of having refused food during those two days, through fear of poison. He instituted the Roman Jubilee in the year 1300, and in 1302 issued the bull *Unam Sanctam*, which maintained that the subjection of the temporal to the spiritual power was an article of faith necessary to salvation. For his life, consult: Luigi Tosti, 2d ed. (Milan, 1848, French trans. Paris, 1854); W. Druncann (Königsberg, 1852).—BONIFACE IX. (Pietro Tomacelli, Pope, 1389-1404). He was a native of Naples, and succeeded Urban VI. as Pope at Rome, while Clement VII. was Pope at Avignon. He exceeded all his predecessors in the continued sale of ecclesiastical offices and benefices and of dispensations and indulgences. He acquired, after a struggle, a most absolute power in Rome, which he kept in awe by fortresses; but to secure himself against external enemies, particularly Louis of Anjou, whose claim to the crown of Naples he had opposed, he was obliged to give away part of his territory in fiefs, as Ferrara to the house of Este.

BONIFACE. The name of a rascally landlord of Lichfield, in Farquhar's *Beaux' Strata-gen*.

BONIFACE, ABBOT. The abbot of Saint Mary's, in Scott's *The Monastery*. He is vain and self-indulgent, but charitable, hospitable, and lenient. Despite the troublous times in which he lives, he is enabled at the close of the story to preserve his convent. He resigns, in the sequel, in favor of the more zealous Abbot Ambrosius.

BONIFACE, SAINT (680-755). The Apostle of Germany, whose original name was Winfrid. He was born at Crediton, in Devonshire, England, 680. He first entered a monastery in Exeter at the age of 13, and afterwards removed to that of Nutshalling, where he learned rhetoric, history, and theology, and became a priest at the age of

30. At that time a movement, proceeding from England and Ireland, was going on for the conversion of the still heathen peoples of Europe: in 614 Gallus and Emmeran had been sent to Alemannia, Kilian (murdered 689) to Bavaria, Willibrord (died 738) to the country of the Franks, Swidvert to Friesland, and Siegfried to Sweden. Winfrid also took the resolution (715) of preaching Christianity to the Frisians, among whom it had as yet found no entrance. But a war broke out between Charles Martel and the King of the Frisians, and Winfrid returned from Utrecht to his convent, of which he was elected abbot. He declined the election, repaired to Rome in 718, and received the authorization of Pope Gregory II. to preach the Gospel to all the tribes of Germany in 719. He first went to Bavaria and Thuringia, then labored three years in Friesland, and traveled through Hesse, everywhere baptizing multitudes, and consecrating their idolatrous groves as churches. In 721 Gregory II. called him to Rome; made him bishop (722), with the name of Bonifacius; furnished him with new instructions or canons, and with letters to Charles Martel and all princes and bishops, requesting their aid in his pious work. Returning to Hesse and Thuringia (723), he destroyed the objects of heathen worship (among which are mentioned an oak at Geismar, near Cassel, sacred to Thor, and an idol named Stufio, on a summit of the Harz still called Stufenberg), founded churches and convents, and called to his aid priests, monks, and nuns from England, whom he distributed through the various countries. In recognition of his eminent services, Gregory III. sent him (732) the pallium, and named him Archbishop and Primate of all Germany, with power to establish bishoprics wherever he saw fit. Boniface now made a third journey to Rome (738), and was appointed Papal Legate for Germany. The bishoprics of Ratisbon, Erfurt, Paderborn, Würzburg, Eichstätt, Salzburg, and several others owe their establishment to Saint Boniface. The famous Abbey of Fulda is also one of his foundations (742-44). He was named Archbishop of Mainz by Pepin (744), whom he consecrated as King of the Franks at Soissons (752), and he presided in the council held at that place. In 754 he resigned his archbishopric at Mainz, and resumed anew his apostolic labors among the Frisians: and at Dokkum, near Leeuwarden, in West Friesland, this venerable Christian hero was set upon by a mob of armed heathens and killed, along with the congregation of converts that were with him (June 5, 755). His remains were taken first to Utrecht, then to Mainz, and finally to Fulda. In the abbey there is still shown a copy of the Gospels written by him, and a leaf stained with blood. A collection of his letters, and the canons he promulgated for the discipline of the newly established churches, have been preserved, and are instructive as to the state of Germany at the time. The best edition of his *Letters* (Epistolæ) is that of Dümmler (1892). In 1811 a monument was erected to Saint Boniface on a hill near Altenberga, in the Principality of Gotha, where, according to tradition, he erected (724) the first Christian church in North Germany. A statue by Henschel of Cassel was also erected to him in Fulda in 1842. His works are in Migne (*Pat. Lat.*, LXXXIX.); also ed. Giles (London, 1844, 2 vols.); for his *Life*, con-

sult: G. W. Cox (London, 1853); A. Werner (Leipzig, 1875); *Life Saint Winifrid*—the traditional life (London, 1878); O. Fischer (1880); A. Ebrard (Gatersloh, 1882).

BONIFACE II., Margrave of Montferrat (?-1207). An Italian soldier, prominent in the Fourth Crusade. He participated in the war against Saladin, and was taken prisoner at Hittin (1187). In 1201 he joined the Fourth Crusade. He became ruler of Macedonia and Greece, under the title of King of Thessalonica, in 1204. He was killed near Mosynopolis in a battle with the Bulgarian invaders.

BONIFACIO, bō'ně-fā'chō, STRAIT OF. The ancient Fretum Gallicum, between Corsica and Sardinia; it took its modern name from the little fishing-town of Bonifacio, which is at the southern extremity of Corsica (Map: Italy, D 6). The strait, which is seven miles wide at its narrowest part, is dangerous to navigate on account of the swift current and the rocks, and at times tempestuous winds. Oyster, tunny, and coral fisheries are prosecuted in its waters.

BONIFACIO VENEZIANO (c.1525-c.1579). An Italian painter, born in Venice. He was a member of the Venetian School, and painted "Saint Jerome and Saint Margaret;" "Saint Barnabas and Saint Sylvester;" and "Saint Anthony and Saint Mark"—all in the Venice Academy—and other works.

BONIFACIUS, bō'n'fā'shī-ūs. A Roman general of the Fifth Century A.D. He fought against the Goths at Massilia in A.D. 413, and against the Vandals in Spain, in A.D. 422. He was subsequently Governor of Africa under Valentinian III., and appears to have been successful in his administration. Having been maliciously advised by Aëtius (q.v.) that the Regent Placidia purposed his death, he unwisely invited the Vandals under Genseric to settle in Africa. Afterwards, when he perceived that he had been duped, he endeavored to expel the barbarians, but was himself besieged at Hippo, whence he escaped to Italy. Here he regained the favor of the Regent, but was challenged by Aëtius to single combat, and died of his wounds soon afterwards.

BONIFAZIO VERONESE, bō'ně-fā'tsē-ō vā'rō'nā'sā, THE ELDER (1490-1540). An Italian painter, born at Verona, and perhaps a brother to Bonifazio Veronese the Younger. He studied under Palma Vecchio, and imitated Titian, to whom, as well as to Giorgione, many of his works have been attributed. He was a member of the Venetian School, in which he excelled for color. His authenticated works include "The Finding of Moses" (Dresden Gallery) and "Dives and Lazarus" (Venice Academy).

BONIN, bō-nēn', EDUARD VON (1793-1865). A Prussian general, born at Stolp (Farther Pomerania). In 1806 he entered the infantry regiment of Brunswick-Oel, was at Jena and Lübeck, and rose in 1820 to be major. Promoted in 1842 to be colonel, he commanded a Prussian brigade in the War of 1848-49, and having served as commandant of Berlin, was appointed Prussian Minister of War in 1852. He retired in 1854, was again appointed in 1858, but a second time retired in 1859 and was appointed general commanding the Eighth Army Corps at Coblenz. He published a military work entitled *Grundzüge für das zerstreute Gefecht* (Berlin, 1839).

BONIN (bō-nēn') ISLANDS (Jap. *Ogasawara-shima*). A group of small islands in the Pacific, situated between Japan and the Ladrone Islands, in about latitude 27° N. and longitude 142° 20' E. (Map: World, Eastern Hemisphere, G 35). The entire archipelago occupies an area of about 28 square miles, and is divided into three groups—the Parry Islands on the north, Bonin proper in the centre, and Coffin Islands in the south. The largest are Hillsborough and Buckland. They are of volcanic origin, and but few of them are inhabited. The chief products are sugar and indigo. The main port is Port Lloyd, on Peel Island. The population is about 1400. The group was discovered by the Japanese in 1593, and being uninhabited it was named Bunin ('no man's'), whence Bonin. In 1823 Captain Coffin, of the American whaler *Transit*, landed on the most southern island and named it after himself, which fact Captain Beechey knew when he arrived in 1826. In 1828 it was taken possession of by Russia, but no attempt was made toward its colonization. Since 1876 it has been in the possession of Japan.

BONINGTON, or **BON'NINGTON**, RICHARD PARKES (1801-28). An English painter. He was born October 25, 1801, at Arnold, a village near Nottingham. His father was a painter, of little merit and of a disorderly disposition. Bonington went to Paris with his parents when 15 years old, entered the art school, and also drew in the atelier of Baron Gros. In 1822 he went to Italy. In 1826 he exhibited at the British Institution. His work had been unknown in England, although in Paris his reputation was already established. He worked in both oils and water-colors, and his method was fresh and vigorous; for he went directly to nature for his effects, and recorded faithfully what he saw out of doors. He was, in a sense, an innovator in landscape art in France, although probably influenced by the works of Constable; hence his success in Paris, where new ideas are always welcome. Bonington was noted for his spirited marine and landscape work, as well as figure and genre subjects. He died in London, September 23, 1828, of rapid consumption, the result of a fever caught while sketching from nature in France. He was buried at Saint James's Church, Pentonville. Consult: H. J. N. Buxton, *English and American Painters* (New York, 1883); Richard Muther, *History of Modern Painting* (London, 1896).

BONITO, bō-ně'tō (Sp., Portug. from Ar. *bainīt*, *bainīth*). Any of several species of fishes of the mackerel family. One of these (*Gymnosarda pelamys*) is well known to the sailors as one of the fishes most commonly seen pursuing the flying fishes. It is pelagic, and occurs in all tropical seas, coming north to Cape Cod on the coast of America, and is rarely taken in English waters. The back is bluish, belly silvery, with four brownish stripes on each side parallel with the lower curve of the body. It grows to a length of 2½ feet. The albicore (*Sarda sarda*), another species reaching about the same length, occurs on both shores of the North Atlantic. It is a food-fish of rather low grade. The California bonito (*Sarda Chilensis*) occurs on the west coast of both Americas and in the waters of Japan. It, too, is a poor food-fish.

BONITZ, bô-nîts', HERMANN (1814-88). A German classical philologist. He was born at Langensalza, and studied at the universities of Leipzig and Berlin. In 1836-38 he was an instructor in the Blochmann Institute in Dresden. Subsequently he was a professor in the University of Vienna (1849-67), and from 1867 was director of a gymnasium in Berlin, and member of the Academy of Sciences. While in Vienna he devised, with Exner, a system, in force since 1854, for the reorganization of the Austrian gymnasia. He was deeply versed in the philosophies of both Plato and Aristotle, and wrote several expository works, such as *Ueber die Kategorien des Aristoteles* (Vienna, 1853); *Platonische Studien* (Vienna, 1858-60); and *Aristotelische Studien* (Vienna, 1862-67); and edited (Bonn, 1848-49) the *Metaphysica*. See the biography by Gomperz (Berlin, 1889).

BON MARCHÉ, bôn mâr'shâ'. One of the largest department stores of Paris, noted for its low prices, and interesting on account of its successful application of the principles of coöperation. The business is conducted by a board of managers selected from its employés, who receive a share of the profits in addition to salary.

BONN. A city in the Rhine Province, Prussia, and capital of the Circle of Bonn, advantageously situated on the left bank of the Rhine, about 15 miles southeast of Cologne. The pleasant villas with their gardens on the river, the fine promenades, the picturesque church-towers, and the graceful bridge across the Rhine (completed in 1898), all combine to make Bonn an unusually attractive place. The surroundings also are pleasing and interesting. Of its churches, five Catholic and two Evangelical, the imposing Münster is the most important, a notable example of the late Romanesque style. It is a cruciform building with two choirs, four small towers, and a great octagonal tower. The church dates from the Eleventh Century, and has recently been carefully restored. The interior is without special interest. The neighboring ancient cloisters, with pillars possessing beautiful capitals, are worthy of notice. Among the secular buildings should be mentioned the Rahauss, with its lofty flight of steps, completed in 1782; the famous Beethoven House, where the composer was born in 1770, and now containing the Beethoven Museum; and the buildings of the university for which Bonn is celebrated. The last-named buildings, originally the Electoral Palace, occupy the south side of the old town. The central portion, with its four towers, was completed in 1723. The lecture-room and the library are adorned with busts of Niebuhr, Arndt, A. W. von Schlegel, and many others of Bonn's celebrated professors. The *aula*, or hall, is embellished with interesting frescoes by Cornelius and his pupils.

The Provincial Museum, near the modern railway station, is a handsome building of red sandstone in the Italian Renaissance style. It was erected in 1889-93. It contains a large collection of Roman and mediæval stone monuments and prehistoric antiquities. At the Academic Museum of Art there is a noble collection of casts; among the ancient Greek works are marble Hermæ, bearing heads of Sophocles, Euripides, Aristophanes, and Menander. In the Poppelsdorfer Schloss are the natural history col-

lections of the University. The Observatory is situated near the Poppelsdorfer Allée—a beautiful avenue shaded with horse-chestnuts. Bonn possesses several interesting monuments, among them the statue of Beethoven, executed by Hanel; a fountain column, in honor of Maximilian Frederick; and a bronze monument to Arndt, who died here in 1860. From an old bastion on the edge of the Rhine, known as the Alte Zoll, there is a beautiful view of the river. In the cemetery are the graves of Niebuhr, Schumann, and Arndt. Bonn has long been a favorite residence of English and other visitors.

Bonn is governed by an Over-Burgomaster with three salaried assistants, and by thirty councilmen. It has water-works, a municipal gas plant, and a volunteer fire department. The city, in recent years has become very prosperous commercially. Besides having an active trade, it manufactures machinery, earthenware, chemicals, jute, pianos and organs, porcelain-ware, artificial flowers, falence, cement, and many other articles. Wessel's porcelain and stoneware factory employs a thousand men. It dates from 1755. The city is well provided with railway and river communications, and with all the modern conveniences connected with manufacturing and commerce. In the village of Beuel, on the other side of the Rhine, are several important spinning and weaving mills. Bonn is the seat of a superior mining court, of a natural history union and agricultural union of Rhenish Prussia, and many other educational and industrial organizations.

In 1900 Bonn had 50,737 inhabitants. Well equipped with schools for elementary education, Bonn offers superior educational advantages. The university (q.v.), with its numerous laboratories and institutes, provides all the facilities of a modern seat of higher learning. Its several charitable organizations include two orphan homes, two hospitals, and two private insane asylums.

Bonn, the *Bonna* or *Castra Bonnensia* of the Romans, is frequently mentioned by Tacitus, and was one of the first Roman fortresses on the Rhine. Investigations show that the *Castrum* here was very extensive. The town was destroyed by the Normans in the Ninth Century. Having been rebuilt, it acquired some importance when, in 1267, the Archbishop of Cologne transferred his residence and seat of government hither. Two German kings were crowned in its Münster in the Fourteenth Century. Bonn suffered from its Protestant tendencies, and was repeatedly besieged by the Catholics. In 1794 the French marched into the town. They closed its university in 1797, and under their rule Bonn's population decreased. It began to revive as soon as the city was recovered by Prussia in 1814.

BONN, UNIVERSITY OF. Next to Berlin, the leading Prussian university. It owes its origin to Maximilian Frederick, Archbishop of Cologne, who established an academy here in 1777. Seven years later this was made a university by the Emperor Joseph II., which was extinguished by the French invasion. In 1815 the King of Prussia, Frederick William III., decided to establish in the Rhine Provinces a university as an outpost of German thought and influence. After some contest, Bonn was chosen for the site, and in 1818 the university was formally organized.

While the archiepiscopal residence remains the central building of the university, many others have been added. It had in 1901 over 2400 students, divided among the faculties of evangelical theology, Catholic theology, law, medicine, and philosophy. Its income is nearly 1,300,000 marks, and its library contains 275,000 volumes, 1235 incunabula, and 1376 MSS. There are buildings for the medical department, laboratories, a physiological institute, clinics, and an observatory. Among the great names connected with the faculties are those of Arndt, Niebuhr, and A. W. von Schlegel. Bonn has always been a favorite place for the education of Prussian royalty, and is socially, as well as in scholarship, one of the leading German universities.

BONNASSIEUX, bô'nâ'syê', JEAN (1810-92). A French sculptor, born at Pannissières (Loire). He studied in Paris, under Dumont, and received the Prix de Rome in 1836. In 1837 he was ordered to model a colossal statue of Notre Dame de France, for the valley of the Puy, from the bronze of the cannon taken at Sebastopol. Among his works are: "Amour se coupant ses ailes," in the Luxembourg, and "David Berger, 1814." In 1866 he became a member of the Société des Beaux-Arts. For his "Meditation" (1855) he received a medal of the first class and the cross of the Legion of Honor. Ordered to model a statue of Voltaire for the façade of the Louvre, Bonnassieux, a firm Catholic, refused, and in its place a statue of Fénelon was erected. This caused him to become a kind of official sculptor to the French clergy, and much of his work was done for the churches of France.

BONNAT, bô'nâ', LÉON JOSEPH FLORENTIN (1833—). An eminent French portrait painter. He was born in Bayonne, June 20, 1833; was a pupil of Léon Cogniet, and studied also in Madrid with Madrazo. In Madrid he was much influenced by the works of Velazquez and Ribera. The deep shadows and strong lights of the latter are often recalled by Bonnat's vigorous method of painting. It is his practice, in producing a portrait, to light the sitter vividly, and to relieve him by the simplest of backgrounds, usually dark, thus isolating the subject so that nothing is in proximity to disturb the effect of concentrated light upon him. Bonnat's portraits are astonishing in their characterization and realism—notably those of Thiers and Don Carlos. He builds up his figures with the plastic sense of a sculptor; he gives them the projection of life itself. Although lacking in æsthetic charm, they suggest the physical presence of the sitter to a degree almost bordering on deception. Strongly drawn and faithfully constructed, they are also powerful in coloring. Among his notable works are the "Martyrdom of Saint Denis," in the Panthéon; "Saint Vincent de Paul Freeing a Galley Slave," and "Neapolitan Peasants Before the Farnese Palace" (1866). Bonnat was chosen chief professor of painting in the Ecole des Beaux-Arts in 1888, and was made a commander of the Legion of Honor in 1882. He took the medal of honor in 1869. Consult: C. H. Stranahan, *A History of French Painting* (New York, 1890); Jules Claretie, *Peintres et sculpteurs contemporains* (Paris, 1884); *Modern*

French Masters, ed. Van Dyke (New York, 1896).

BONNECHOSE, bôn'shôz', FRANÇOIS PAUL EMILE BOISNORMAND de (1801-75). A French author. He was born at Leyerdorp, Holland, entered the French Army, served until after the Revolution of 1830, and subsequently was appointed librarian of the Palace of Saint Cloud. From 1850 to 1853 he was librarian of several of the libraries of the civil list. He published: *Histoire de France* (1834); *Les Réformateurs avant la réforme* (1844); *Les Quatres Conquêtes de l'Angleterre* (1851); and *Bertrand du Guesclin* (1866).

BON'NER, EDMUND (c.1500-69). Bishop of London. He was born of obscure and doubtful parentage about 1500. He was educated at Oxford, and there admitted doctor of civil law in 1525. The reputation he gained at Oxford by his knowledge of the canon law recommended him to the notice of Wolsey, who made him his chaplain in 1539. After the fall of Wolsey (1530) Bonner took an active share in the endeavor to have Henry VIII. divorced, and received due promotion from that King. In 1533 he was deputed to appear before Clement VII. in Marseilles to appeal for the excommunicated monarch to a general council; but the story that the violence of his threats on this occasion suggested to his Holiness the counter-threats of having him burned alive, or thrown into a caldron of melted lead, may be dismissed as fabrications. In 1540 he was made Bishop of London. The death of Henry cooled his Protestant zeal; and having given proofs of his lukewarmness in the cause of Reformation, he was at length, in 1549, in the name of Henry's successor, Edward VI., committed to the Marshalsea and deprived of his bishopric. The accession of Queen Mary restored him to office (1553), and as vicegerent and president of the Convocation, he was the principal agent in that bloody persecution which has given unhappy notoriety to Mary's reign. On the accession of Elizabeth, in 1558, Bonner accompanied his episcopal brethren to salute her at Highgate, but was, on account of his unpopularity, which antedated his career as persecutor, refused the honor of kissing her hand. On May 30, 1559, he was summoned before the Privy Council, and there refused, with a consistency worthy of due respect, to take the oath of supremacy. He was accordingly deposed from his bishopric and shut up in the Marshalsea, where he died, September 5, 1569.

BONNER, ROBERT (1824-99). An American editor. He was born in Londonderry, Ireland, but while very young emigrated to the United States, learned the trade of a printer, and in 1839 became a compositor on the Hartford *Courant*. He removed to New York City in 1844, and in 1851 bought the *Ledger*, which soon attained an unprecedented circulation on account of its serial stories and its articles by popular contributors, such as "Fanny Fern," Edward Everett, Henry Ward Beecher, Longfellow, Tennyson, William Cullen Bryant, Sylvanus Cobb, and Charles Dickens. In 1887 Bonner handed over the management of the paper to his three sons.

BONNET. See SAIL.

BONNET (OF. *bon[n]et*, Fr. *bonnet*, from Low Lat. *boneta*, from *bon[n]etus*, the stuff of

which the article was made, possibly Hind. *bānāt*, woolen cloth; broadcloth). A covering for the head, distinguished from the *hat* (q.v.) by being brimless.

Since the distinction between bonnets, hats, and caps has, in all periods, been to a great extent arbitrary, the history of bonnets is of necessity involved in that of the head-covering in general, and especially the cap. Just as the hat is the direct descendant of the roomy *petasos* of the ancient Greeks, with its broad brim for protection from the sun, the bonnet, in its original significance, is a descendant of the *pileos*, the conical, close-fitting cap of the Greek soldier, seaman, and mechanic. It was made of cloth, leather, or felt, and resembled the modern fez. This same cap was worn by the Roman artisan. It differed from the modern Phrygian bonnet or liberty cap (q.v.) in not having the top bent or drooping forward. The *mitra* was a tall cap worn by the Persians and the neighboring nations during the Græco-Roman epoch. One form was alluded to as the Phrygian cap. Persons of dignity wore another style, which ended in an ornament, and frequently resembled our modern conventional crown. This cap was in general use in Western Asia from the time of the Assyrian Empire to the time of the Parthian wars against Rome. In this connection may be mentioned the 'bonnets' in Ex. xxix. 9, and Lev. viii. 13, the round mitres worn by ordinary Jewish priests as distinguished from the headdress like half an egg in shape, peculiar to the high priests. 'Mitre' in Ex. xxviii. 4, and 'diadem' in Ezek. xvi. 26, translate the same Hebrew word. A closely related headgear was the tiara-shaped cap worn by priests and married men and women. It is commonly supposed that the bishop's mitre and the tiara of the Pope are derived from the Asiatic headdresses.

The European bonnet of the Middle Ages was of cloth, silk, or velvet, according to the taste of the wearer, and varied greatly in shape at different periods. Among women it frequently adopted such grotesque proportions as the *hen-wig*, worn in the Fifteenth Century—an absurdly high bonnet, mounted on cardboard. In the Sixteenth Century, hats, too, began to be generally worn. The Scotch clung to their old bonnet, celebrated by stories and songs. The braid bonnet of the Lowland peasantry, broad, round, and flat in shape, overshadowing the face and neck, resembled the *bonnet Béarnais* or *béret Basque* of the south of France. It was dark blue in color, except the red tuft on the top. The fabric was of wool, without seam or lining, and exceedingly durable. From having been worn until comparatively recent times by small rural proprietors, it gave to the local notabilities the distinctive appellation of 'bonnet-lairds.' The Highlanders have long worn bonnets of the same fabric, but of different shape. The Balmoral is flat, and resembles the Lowland bonnet. The Glengarry rises to a point in front and is without any brim. The Glengarry was the undress fatigue-cap of the British infantry, but has now been superseded by what is known the 'field-cap,' provided with flaps to cover the ears. See **COSTUME**.

BONNET, bō'nā', ALFRED MAXIMILIEN (1841—). A classical philologist, born in Frankfurt-on-the-Main in 1841. He studied at Bonn, and became professor of the Latin language and

literature at Montpellier. He is the author of *De Claudii Galeni Subfiguratione Empirica* (1872); *Le latin de Grégoire de Tours* (1890); *La philologie classique* (1892).

BONNET, CHARLES (1720-93). A Swiss naturalist and philosopher, born in Geneva. He was educated for the law, but devoted himself to science. A dissertation on aphids, in which is described for the first time parthenogenetic reproduction, procured for him, at the age of 20, the honor of being made corresponding member of the French Academy of Sciences, and in 1743 he was elected a Fellow of the Royal Society. In 1745 he published *Traité d'insectologie*, and in 1754 *Recherches sur l'usage des feuilles dans les plantes*. Failing eyesight compelled him to abandon investigation, and he devoted himself to philosophical speculation. He wrote *Considérations sur les corps organisés* (1762-68), in which he expounded the theory of *emboîtement*, or the preformation of germs; *Contemplation de la nature* (1764-65); *Palingénésie philosophique, ou idées sur l'état passé et sur l'état des êtres vivants*; *Recherches philosophiques sur les preuves du Christianisme* (1773). Bonnet enjoyed a wide reputation and influence as a naturalist and philosopher; he originated the term 'evolution' to apply to the successive unfolding of preformed germs, a meaning quite different from its present one.

BONNET FLUKE, SHARK, etc. See **FLUKE**; **SHARK**, etc.

BONNETHEAD. A small shark of the genus *Reniceps*, as *Reniceps tiburo*, the shovel-head, related to the hammer-head, and frequenting warm seas.

BONNET-MONKEY. See **MACAQUE**.

BONNET-PIECE. A gold coin of James V. of Scotland, so called on account of the King's head being decorated with a bonnet instead of a crown, as was usual. James V. was the first Scottish sovereign who placed dates on his money, and the first who diminished the size of the gold coins by "increasing their thickness." The most remarkable are those commonly called the 'bonnet-pieces,' which were struck of native gold. In beauty and elegance of workmanship, they approach the Roman coins. These 'bonnet-pieces' are among the most valued curiosities of the antiquary.

BONNET ROUGE, bō-nā' rōōzh. The Liberty Cap of the French Revolution. The name was also transferred to the revolutionists.

BONNEVAL, bōn'vāl', CLAUDE ALEXANDRE, Count de (1675-1747). A French adventurer, also called Achmet Pasha. He was born of a noble family at Coussac, in Limousin, proved unmanageable at the Jesuit college, and was placed in the Royal Marine Corps in his thirteenth year. He was transferred to the Guards, and served with great distinction in Italy and the Netherlands under Catinat, Villeroy, and Luxembourg; but having behaved with great insolence to the Minister of War, he was condemned to death by a court-martial. He fled to Germany, where, upon the recommendation of Prince Eugene, he obtained employment in the Austrian service. He now bore arms against his native country, was present at the battle of Malplaquet, distinguished himself by many daring exploits, was raised to the rank of lieutenant

field-marshal, and fought under Prince Eugene in the war between Turkey and Austria, at Peterwardein and Belgrade. At Vienna, after the peace of Passarowitz, he made himself very disagreeable to the Prince, and was therefore sent, in 1723, as master-general of ordnance, to the Netherlands, where he soon got into a quarrel with the Governor, was brought to trial, and condemned to death. The Emperor commuted the sentence to one year's imprisonment and banishment from German soil. Bonneval went to Constantinople, where he was cordially welcomed, became a Mohammedan, taking the name of Achmet, and was made a pasha of three tails. He was employed in organizing the Turkish artillery and achieved successes as general of a division of 20,000 men in the war of the Porte with Russia. For his services the Sultan appointed him Governor of Chios; but his own imprudence and the envy of others caused his removal from this office. He died in Constantinople. He vainly attempted to stir up the Sultan against Austria. His remarkable energy and great military talents were offset by a boorish and quarrelsome disposition, which always made him enemies on every side. Consult: *Memoirs of the Bashaw Count Bonneval* (London, 1750); Vandal, *Le Pacha Bonneval* (Paris, 1885).

BONNEVILLE, bôn'vil, LAKE. See LAKE.

BONNEVILLE, BENJAMIN L. E. (1795-1878). An American army engineer and explorer. He was born in France; emigrated to the United States, and graduated at West Point. In 1820 he was constructing a military road in Mississippi, and in 1831 started on an exploring expedition to the Rocky Mountains and was not heard from for several years. He served in the Florida and Mexican wars, rising to the grade of colonel, and in 1861 was retired on account of disability, but served during the Civil War as superintendent of the recruiting service in Missouri, and was raised to the rank of brigadier-general in 1865. Washington Irving edited and amplified the *Adventures of Captain Bonneville, U.S.A., in the Rocky Mountains and the Far West* (1837).

BONNEVILLE, bôn'vêl', NICOLAS DE (1760-1828). A French author and publicist, born in Evreux. Upon the outbreak of the Revolution he was appointed an elector and a district president of Paris, and devised, it is said, the idea of the National Guard. He was the founder of a society known as the Cercle Social, from whose press there appeared several patriotic journals, such as the *Bouche de Fer*, the *Chronique du Jour*, and the *Bien-Informé*. He was imprisoned as a Girondist in 1793, and also suffered persecution under the Empire for his advanced views. Among his works are: *Nouveau théâtre allemand* (1782); *Histoire de l'Europe moderne* (1789-92); *Le vieux tribune* (1791) and *Poésies* (1793).

BON'NEY, CHARLES CARROLL (1831—). An American lawyer, president of the World's Congress Auxiliary of the Columbian Exposition. He was born at Hamilton, N. Y.; studied at Colgate University, and was a teacher in 1848-52. He was admitted to the Illinois bar in 1852, and from 1890 to 1893 was president of the International Law and Order League. He organized and was president of the World's Congresses, in-

cluding the Parliament of Religions, held in connection with the exposition at Chicago in 1893.

BONNEY, THOMAS GEORGE (1833—). An English geologist, born at Rugeley. He studied at Saint John's College, Cambridge, where he was tutor from 1868 until 1876. Subsequently he became professor of geology at the University of London. In 1884 he was Hulsean lecturer, and in 1892 Rede lecturer, at Cambridge. He was president of the Geological Society of London in 1884-86, and in 1899 was elected vice-president of the Royal Society. His publications include *The Alpine Regions* (1868); *Charles Lyell and Modern Geology* (1895); and *Volcanoes* (1898), besides four volumes of sermons.

BON'NIBEL (Fr. *bonne et belle*, good and beautiful). A stock name employed for the heroine in the old pastorals.

BONNIE BLUE FLAG, THE. A popular Confederate song, the authorship of which is disputed. It has been attributed to Henry McCarthy and to Annie C. Ketchum. The song was first given in 1861 at the Varieties Theatre in New Orleans.

BONNIER, bô'nyâ', GASTON (1853—). A French botanist, born in Paris. He studied at the Normal School there, and was appointed a professor at the Normal School, and subsequently (1887) at the Sorbonne. He founded the laboratory for botanical researches at the Sorbonne, and the laboratory for the study of vegetable biology at Fontainebleau. The *Revue Générale de Botanique* is edited by him, and he has published useful *Floræ—Les plantes des champs et des bois: excursions botaniques* (1887), and other works.

BONNIVARD, bô'nê'vâr', FRANÇOIS DE (1496-c.1570). A Swiss patriot, Byron's "Prisoner of Chillon." Educated at Turin, he became in 1510 prior to Saint Victor, near Geneva, and aided the Genevese against the Duke of Savoy, who captured and imprisoned him for two years. Later he was taken by robbers and offered to the Duke, who imprisoned him from 1530 to 1536 at Chillon. The Genevese and Bernese liberated him. He returned to Geneva, where he was rewarded with a pension, and died in honor. His *Chroniques de Genève*, written at municipal request, were published there in 1831. Consult Gribble, *Lake Geneva and Its Literary Landmarks* (1901).

BON'NYCLAB'BER. An old provincial name for milk that in the process of souring has become thick and clotted. The word is a compound of Ir. *dainne*, milk, and *claba*, thick mud. The word *clabber* alone is sometimes used in the same sense as the compound.

BONO, bô'nô, **BON**, bôn, or **BUONO**, bwô'nô. A family of Venetian architects and sculptors. Its founder, GIOVANNI BONO (1400?-42?), and his son BARTOLOMMEO BONO (1421-42), were the greatest artists of the late Gothic period in Venice, the authors of the famous Palace Ca' d'Oro (1421) and the Porta della Carta (1438), between the Doge's Palace and Saint Mark's. See VENETIAN ART.

BONOMI, bô-nô'mê, GIUSEPPE (1739-1808). An Italian architect, who in 1767 settled in England. He was well known in Italy, having been appointed an architect of Saint Peter's, and in England aided greatly in the revival of Greek

architecture. His most celebrated work was a villa erected for the Duke of Argyle at Roseneath, Dumbartonshire. He was elected an associate of the Royal Academy in 1789, and his subsequent failing to obtain election to full membership was the cause of the withdrawal of Reynolds from the presidency. Between 1783 and 1806 he exhibited numerous drawings at the Academy.

BONONCINI, bō'nōn-chē'nē, or **BUONONCINI**, bwō'nōn-chē'nē, GIOVANNI BATTISTA (1660-1750). An Italian operatic composer and violoncellist. He was a pupil of his father, Giovanni Maria Bononcini, and of Paolo Colonna. He became violoncellist to the Court at Vienna in 1691. In 1716 he visited London, where he soon acquired a popularity which made him a formidable rival of Handel, the respective merits of the two musicians being for a time hotly contested. In 1731 it was discovered that he had plagiarized an anthem by Antonio Lotti, and soon afterwards he left London in disgrace, and went to Paris, where he became interested in alchemy, in the pursuit of which he impoverished himself. He was invited to Vienna in 1748 to compose the festival music in celebration of the Peace of Aix-la-Chapelle. He died in Venice at the age of 90, and is said to have preserved his power of productivity unimpaired to the last. His principal compositions include the operas *Tullo Ostilio* (Rome, 1694); *La fede pubblica* (Vienna, 1699); *Polifemo* (Berlin, 1703); *Asartie* (London, 1720); the *Funeral Anthem for the Duke of Marlborough* (ib. 1722); the oratorio *Il Gionatà*, also several symphonies, and some chamber music.

BONONCINI, or **BUONONCINI**, GIOVANNI MARIA (1640-78). An Italian composer. He was born in Modena, and studied in Bologna. He early entered the service of the Duke of Modena, and became *maestro di capella* of San Giovanni in Monti. He wrote a great number of instrumental and vocal compositions, and a theoretical work entitled *Musico pratico* (1773).

BONONE, bō-nō'nā, CARLO (1569-1632). An Italian painter, born in Ferrara. He studied under Giuseppe Mazzuoli, and made careful examination of the works of the Caracci in Bologna and Rome, and of those of Paolo Veronese and Correggio in Venice and Parma. His smaller paintings are in the style of the Caracci, his larger in that of Veronese. Some of the most prominent painters of Ferrara were his pupils. His works, many of which are in the churches of Ferrara, include "Patriarchs and Prophets" and "Arisen Christ with Saints."

BONPLAND, bōn'plān', AIMÉ JACQUES ALEXANDRE—his real name was Goujand—(1773-1858). An eminent French botanist. He studied medicine and botany in Paris, and in 1799 accompanied Alexander von Humboldt to America, and with him traveled extensively in Mexico and the Andes (1799-1804), where Bonpland collected 6000 new species of plants. After his return he was appointed director of the gardens at Navarre and Malmaison in 1804, and published several splendid and valuable botanical works, such as *Plantes équinoxiales récoltées au Mexique* (2 vols., Paris, 1808-16); *Monographie des mélastomacées* (2 vols., Paris, 1809-16); and *Description des plantes rares cultivées à Navarre et à Malmaison* (Paris, 1813-17). He went to Buenos

Ayres in 1816, with a collection of European plants and fruit-trees, and was there appointed professor of natural sciences. In 1821 he undertook an expedition of scientific discovery up the Parana, with the view of prosecuting his investigations to the Andes, across the Gran Chaco Desert; but Dr. Francia, then Dictator of Paraguay, believing him to be a spy, arrested him, and kept him prisoner for eight years. In 1829 Bonpland obtained his liberty, went to Brazil, and resided at Santa Borja till 1850. He then removed to Corrientes, where he practiced medicine till his death. His remarks on the herbarium collected in his travels with Humboldt have been published by Kunth in his *Nora Genera et Species Plantarum* (12 vols., Paris, 1815-25). For his biography, consult Brunel (Paris, 1872).

BONSTETTEN, bōn'stēt'en, CHARLES VICTOR DE (1745-1832). A Swiss author. He was born in Bern, and studied in Leyden, Cambridge, and Paris. He was a member of the Grand Council of Bern in 1775, and subsequently bailiff at Sarnen and Nyon. He became superior judge at Lugano; but in 1796, to escape the Revolution, withdrew to Italy, and thence to Denmark, where he remained until 1802. His works include: *Kleine Schriften* (1799-1801); *Voyage sur la scène des dix derniers livres de l'Énéide* (1895); *L'homme du Midi et l'homme du Nord* (1824); and *Souvenirs écrits en 1831* (1833). For his life, consult Morell (Winterthur, 1861).

BONTEBOK, bōn'tē-bōk. One of the hartbeests. See HARTBEEST.

BONTEMPS, bōn'tān', ROGER. The pen-name used by Roger de Collerye, a jolly Parisian of the Fifteenth Century. The name has passed into the language for a 'good fellow.'

BON TON, *Fr. pron.* bōn' tōn' (Fr., good tone or manner). A comedy by Burgoyne (1760), altered and produced by Garrick (1775) with a sub-title *High Life Above Stairs*. It was designed as a satire against the contemporary introduction of French customs. Lord Menekin affects an ardent passion for Miss Tittup; Lady Menekin pretends to be in love with Colonel Tivy. Miss Tittup and Colonel Tivy really love each other, and are engaged, but do not feel it good form to confess to it.

BONTOUX, bōn'tōō', EUGÈNE (1824—). A French financier. He studied at the Ecole Polytechnique, and was by profession an engineer, but subsequently was appointed general director of the Southern Railway of Austria. With the support of the Rothschilds he made large speculations. Later, having lost much of his fortune and quarreled with the Rothschilds, he founded in Paris, in 1878, chiefly with the aid of clerical and Legitimist capital, the Union Générale, whose success was marked and extensive. A severe decline in prices in 1882 bankrupted the Union, whose projector escaped five years' imprisonment by flight. He published *L'Union générale, sa vie, sa mort, son programme* (1888).

BONTUKU, bōn-tōō'kōō, or **BONDUKU**. An important commercial town in French Sudan, situated close to the English boundary. It lies at an altitude of nearly 800 feet, on the caravan route connecting Kong and Timbuktu with the Western Sudan, and has a large trade in gold-

dust, salt, and cotton goods. The houses have flat roofs, and are inclosed by high clay walls interspersed with buttresses. The architecture suggests a higher state of civilization than is found in the surrounding country. The population is estimated at from 7000 to 8000, and is chiefly immigrant.

BONVALOT, bôn'vâlô', PIERRE GABRIEL (1853—). A French traveler and explorer. He was born at Epagne (Aube), studied at the lyceum of Troyes, in 1880 accompanied Ujfalvy on a journey of exploration to the interior of Asia, and in 1886-87, accompanied by G. Capus and the painter Pepin, undertook a second journey thither. In 1889-90, with Prince Henri d'Orleans (q.v.), he traversed Asia from Siberia to Tonkin. He was sent in 1897 on a Government mission to Antoto, Abyssinia. His principal works include: *De Moscou en Bactriane* (1884); *Du Caucase aux Indes à travers le Pamir* (1888); *De Paris au Tonkin* (1892); and *L'Asie inconnue* (1896).

BONUS (Lat. *bonus*, good). A special allowance beyond what is formally due. It is applied (a) to a special dividend. If the previous dividend has been 4 per cent. on the capital, and if the profits of the current year admit of 5 per cent., a formal dividend of that amount would commit the company to a like dividend in future; and to prevent such a precedent, 4 per cent. is declared, and a bonus of 1 per cent. It is also used (b) to designate the inducement offered to security-holders to part with their securities in exchange for others. Thus, in industrial combinations, it is not infrequent that stockholders of the older corporations receive, in addition to the nominal value of their holdings in the new securities, a bonus, either in cash or in securities of the new organization. The term also designates (c) the payment to the Government for the privileges which the act of incorporation confers upon a company.

BONVIN, bôn'vân', FRANÇOIS SAINT- (1817-87). A French painter, born at Vaugirard. He was self-instructed, and painted chiefly genre pictures on motives derived from the workaday phases of humble life. His drawing is true and his color harmonious. He also executed several effective etchings. His pictures include the following: "Charity" (1852); "Regimental School" (1853); "The Gossip" (1859); "Grandmother's Coffee" (1866); "Pious Persons Distributing Alms" (1867); "Morning in the Pasture" (1870); "The Pig" (1875); and "Corner in a Church" (1880).

BONY PIKE. A gar-pike (*Lepidosteus*). See GAR.

BONZE, bôn'zè. A word corrupted from the Japanese *bo-dzu*, which in southwestern Japan is nasalized and softened. Correctly applied in general to members of the Buddhist fraternities, by natives, it is used also by foreigners for the priests and monks in other countries of Asia. The Chinese characters *fu-tu*, in the Sixth Century, spelled Buddh, but crossing the water the spoken word became 'bonze.' The term is general, referring to the Buddhist religious members of the community, rather than to the rank or priestly character of one who professes the Buddhist religion, the special term for priest being *osho* or *so*. Popularly, it has especial reference to

the shaven head, the old term being also applied to former retainers of the daimios.

BOOBY. Any of various of the lesser and more tropical species of gannets (genus *Sula*). The name is said by Newton (*Dictionary of Birds*, London, 1896, p. 48) to be a corruption of the Portuguese *bobo*, a fool, derived from the Latin *balbus*, stuttering or inarticulate; and to have been "applied, most likely by our [British] seamen, originally, to certain birds from their stupidity in alighting upon ships and allowing themselves to be taken easily by the hand," instances of which have been mentioned in many accounts of early voyages. There is no reason to suppose that these birds are any more stupid than other sea-fowl little accustomed to man. All boobies differ from gannets in having the whole lower jaw, chin, and throat naked. Several species are known, one confined to the Peruvian coast, and the others ranging throughout the warmer seas of the whole world, and coming north on American shores to Georgia and Lower California. Their habits are those of the gannet (q.v.), with the important exception that they make their nests, as a rule, on bushes and trees instead of on rocks. The site is always near the seashore. It is a rude platform of sticks and dry seaweed, and contains one or two eggs, "chalk-white superficially, but beneath the calcareous crust pale greenish-blue." The commonest and typical species is *Sula sula*, which is dark sooty-brown (often tawny), with the naked skin of the face and throat yellowish and the feet dull-green. The blue-faced booby (*Sula cyanops*) is white, with wings and tail sooty-brown, the naked skin about the face and throat bluish, and the feet reddish. The red-footed booby (*Sula piscator*) is yellowish-white, with the wing-quills slate-colored and the feet red.

BOOBY, LADY. The suggestive name of a character in *Joseph Andrews*, a novel by Fielding. Attempting the virtue of the title character, her footman, and failing, she turns him out.

BOOBY ISLAND. A level rock in Torres Strait, in latitude 10° 36' S. and longitude 141° 53' E., 3 feet in height, and one-fourth of a mile in diameter. As it is highly dangerous to navigators, and destitute of natural resources, it is regularly supplied with provisions and water by passing vessels, for the benefit of such as may be cast ashore on it.

BOOG, hōōg. See BUG.

BOOK. The aim of the first scribes in the choice of the material for their work was to give durable form to the production. Accordingly, the earliest inscriptions which have been preserved were placed on stone or baked brick or metal, rather than a more flexible but more perishable material. The Ten Commandments, for instance, were written on slabs of stone. Josephus records that the columns on which the children of Seth placed the records of their inventions were of stone and brick. The Laws of Solon (about 594 B.C.) were inscribed on wooden planks. The earliest productions answering to our modern books of which we have any record were the tiles covered with inscriptions in the soft clay by the Chaldean scribes, and rendered permanent by being baked in ovens. The excavations carried on in Lower Mesopotamia (1895-1901) by Dr. John P. Peters and others have

brought to light, from the ruins of the Temple of Nippur, tablets believed to have been produced about B.C. 6000. The text inscribed on these is, with few exceptions, devoted to the hymns and invocations used in the temple services. The larger of these Chaldean tablets are flat, and measure 9 inches by $6\frac{1}{2}$ inches; the smaller are slightly convex, and in some cases are not more than 1 inch long, bearing but one or two lines of cuneiform characters. These characters are impressed on the soft clay by a little iron rod (the equivalent of the Roman stylus), not pointed, but triangular, at the end. The impression bears, therefore, the shape of a wedge. In the literature of Egypt, the earliest examples (apart from certain inscriptions on the tombs) are copies of what was known as the *Book of the Dead*. The text of this varied with the different copies, as these were prepared for placing in the tombs or in the cases with the mummies, and while all contained invocations to the deities, together with prayers and psalms, differed in including special records referring to the life of the deceased and to his personal expectations for the world to come. The Chinese speak of their own literature as having originated many thousand years back; but its earliest known work of which any copies have been preserved dates from B.C. 1150, or some 200 years earlier than the generally accepted date of the Homeric poems. The book in question bears the title *Y-king*, the Book of the Metamorphoses or Developments. The material next in importance to the baked clay, and probably also next in point of antiquity, was the skin of goats. In the earlier form in which this was utilized by the Hebrews, Greeks, and others, the skin was dressed only on one side, and did not present any thoroughly finished surface. These dressed skins were called by the Greeks *diphtherai*, and writings upon them came to be known by the same name. Ctesias speaks of the *diphtherai basilikai*, royal books (or writings or documents) of the Persians, and Herodotus says that such skins were used in the earlier ages even in Egypt. It was, however, not until the production of parchment (q.v.) (*membrana* or *pergamena*), that the value of skins for literary purposes began to be properly understood; and even parchment made its way but slowly among writers in competition with the long-established papyrus, which it was, however, destined to outlast for many centuries. The name parchment (*pergamena*) is derived from the city of Pergamum, where, according to the tradition, it was first prepared under the direction of King Eumenes II. about B.C. 190.

It is probable that parchment had actually been produced considerably before this date; but great impetus was undoubtedly given to its use and its manufacture was improved, owing to the embargo placed by the Egyptian King, Ptolemy Philadelphus, on the exportation from Egypt of papyrus. The papyrus is a species of reed which in ancient times abounded on the banks of the Nile. According to Wilkinson, the plant has now entirely disappeared from Egypt, recalling the prophecy of Isaiah (xix. 7): "The paper reeds by the brooks, by the mouth of the brooks, . . . shall wither, shall be driven away and be no more." The material used from the papyrus-plant was the pith of the stem, which was rolled out into a tissue. Pliny speaks of the layers of the pith being soaked in water of the Nile and woven

into a sheet (*plagula* or net). An evidence of the early use, in various countries, of vegetable tissue for writing is found in the etymology of Greek and Latin names for books (*βιβλος*, *liber*, *codex*), all of which refer originally to parts of trees or reeds. The writing on the sheet of papyrus was done with a split reed; for ink, different colored pigments were utilized. The oldest Egyptian papyrus known to have been preserved has been assigned to a date about A.C. 2000, or 4000 years later than the baked tiles of Chaldea. The papyrus book, whether Egyptian, Greek, or Roman, was arranged very much like a modern mounted map. The length of the material, written on one side only, was wound upon a wooden roller. Such rolls were found often 20, 30, or even 40 yards long. Herodotus tells us of a copy of the *Odyssey* written on one such roll. With the increasing scarcity of papyrus, the improved parchment came into general use, superseding papyrus by the beginning of the Seventh Century. But from the Fourth Century A.C. to the close of the Sixth Century A.D., by far the larger proportion of the literature of the world was recorded on sheets of papyrus. The perishability of the papyrus is responsible for the loss of a very large proportion of this literature of antiquity. Bearing in mind the fragile character of the material itself and its liability to destruction through damp, dry-rot, mice, and insects, and recalling also that the mere handling by the most careful readers of a papyrus roll destroyed in a very brief period the outside sheets (that is to say, the beginning and the end of the manuscript), one is surprised, not that the literature of Greece and Rome has come to us in such fragmentary condition, but that so many important works have been preserved.

When there came to be, as in Rome, in the First and Second centuries A.D., a continued and increasing demand for copies of a work, the booksellers organized methods for speedier multiplication of copies than had been possible when each copy was produced by a single scribe. By using readers who dictated at one time to a group of from a dozen to fifty scribes, they secured a very considerable speed in the multiplication of copies. Nearly all of these scribes were slaves, but they were well-educated slaves. Accuracy was, however, sacrificed to speed; there was often no proper collation, and many of the deficiencies in the texts of classical works are to be charged to the carelessness of these copyists. The scribes who prepared the manuscripts were known as *librarii*. This name came afterwards to be applied to the booksellers through whom the manifold copies were sold. The smaller dealers had themselves given the manual labor for the production of their wares; the larger *librarii* hired for the purpose the work of the slaves.

With the institution of the first Christian monasteries, with their *scriptoria* or writing-rooms, the business of book-making takes on a new phase. The material is parchment. The stylus is developed into a reed pen. The scribes are no longer slaves working under hire, or booksellers preparing copies for sale, but monks manufacturing sacred writings for the glory of God. We have thus at once a higher standard of work, both for accuracy and for beauty. The classic texts that exist to-day have come down to us in these parchment copies prepared by the monastic copyists. The texts from which the first of these

scribes worked were the papyrus sheets, which shortly thereafter disappeared altogether. Fortunately for the literature of the world, the labor of these earlier generations of monks was not confined exclusively to the duplication of the Scripture or of the sermons of the Fathers. At the instance of Cassiodorus, who in 567 organized in his own monastery at Vivarium the first of these *scriptoria*, a portion of the working time was given to selections of the classics, though the books which were multiplied most frequently were the Scriptures in the Latin version of Saint Jerome, Saint Augustine's *City of God*, and the *Consolations of Philosophy*, by Boëthius. In fact, it was to the monastic scribes that the first printers owed the existence of the classical texts from which their own work was done. See BENEDICTINE.

The next period in the making of books comes with the organization of the oldest universities, Bologna and Paris, all of which date, as far as their effective work is concerned, from the beginning of the Thirteenth Century. In these universities the making of books became part of the educational work. The book-makers, that is to say, the scribes who had charge of the multiplication of the texts, were appointed by the university authorities. They were held strictly responsible for the accuracy of their manuscripts, which were to be used as texts for the lecturers and for their students. The first scholarly editorial work in the collation and correction of the classic texts dates from this period. The name given to the officials who were charged with the duty of providing texts for the universities was *stationarii*. The work of these men comprised, in addition to the preparation of the texts, the renting at specified rates of the manuscripts so prepared to the students and instructors. During the earlier years of book-making in the universities the sale of manuscripts by the *stationarii* was not permitted.

Paper (q.v.) was introduced into Europe about the beginning of the Tenth Century. This earliest paper (*charta bombacina*) was made from cotton. Paper made of linen first came into use, according to Mabillon, in the Twelfth Century, although Montfaucon asserts that no specimens have been identified earlier than 1270.

According to tradition, the University of Bologna owed its foundation to Charlemagne. This connection is now held to be but a legend. It is true, however, that before the close of the Eighth Century Charlemagne rendered an important service to the making of books. In 782 the monk Alcuin was called by Charlemagne from his home monastery in York to the Court at Tours. Alcuin established a series of royal schools. In these schools was instituted a uniform system of script, which was prescribed for the educational and for the official documents of the realm. Fortunately for the work of the latter scribes and for the interests of literature, Alcuin selected for his standard of form not the Gothic, but the Latin script. It was this script of Alcuin's which was accepted as the model for the *scriptoria* of the monasteries, and later for the working-rooms of the universities. It was this same script, as developed through the centuries of book-writing in the universities, that became the model for the type-founders after 1472, who shaped the fonts of the Latin alpha-

bets; that is, of all the Western alphabets other than the Gothic or German.

It was the practice of the manuscript copyists to place at the close of the text information in regard to the date and place of production, and occasionally, although by no means uniformly, the name of the writer. Such a record at the close of the work is known as a 'colophon.' Even after the introduction of printing, we find in a number of books of the last half of the Fifteenth Century such records presented at the end of the volume in a colophon. It is an inconvenient peculiarity, however, of a large number of the earlier printed books that they fail to present either the name of the printer or the date of their production.

An instance of the price of a manuscript work of the Ninth Century is given in the life of King Alfred, who bought in 880 from Ceolfried, Bishop of Wearmouth, a work on cosmography, for which he paid in land sufficient to support eight families. It is not safe, however, to deduce an average market value for written books from this or from similar instances of exceptional prices paid for manuscripts. It happened not infrequently that the manuscript contained, in addition to the work of the scribe, designs and illuminations contributed by artists who may have given to this additional labor years of time; and certain manuscripts were inclosed in very elaborate and costly covers. Finally, in case the manuscript happened to be the only copy of that particular text that was within reach, it would possess what might be called a competition value, irrespective of the actual cost of the labor of its production. If the owner forbade any copying, its unique value would remain. We have, therefore, instances through the manuscript period of single works being purchased at exceptional prices, while other works, which called for no less labor on the part of the scribes, could be secured at moderate cost. For additional information in regard to books produced in the manuscript period, see PALEOGRAPHY.

With the invention of printing we come to what may be called the modern period of the making of books. The press of Gutenberg was brought to completion in Mainz by the year 1450. For a century prior to this date, books of a special character, made up mainly of pictures with an inconsiderable interpolation of text, had been printed from blocks of solid wood, and later of zinc. These books were chiefly devotional in character. The printing of these block books is termed *xylography*, as contrasted with the printing from movable type, which is classed as *typography*. It is certain that the more important part of Gutenberg's invention was not the mechanism of his press, which differed in detail rather than in principle from the presses previously in use, but the use of movable type. It may be recalled here that movable wooden type had been utilized by the Chinese as early as the beginning of the Eleventh Century. The first work produced by the movable metal type of Gutenberg was a Latin Bible. Prior to the invention of the printing-press, the book had been something with which the scholarly class (chiefly the clerical or ecclesiastical class) alone was concerned. With the distribution of printed copies, first of religious works, then editions of the classics, later writings addressed directly to the understanding of the general public, the

book becomes an influence for directing public opinion. It is through the printed sheet that the thought of a Luther or a Calvin becomes a means of revolutionizing the opinions of a large proportion of his generation.

The chief difference in the external appearance of books since the Sixteenth Century is the general abandonment of the large sizes which were common in the days when books were not supposed to appeal to such a large and varied class as at present. The folio and quarto have almost entirely gone out of use, except for very elaborate and costly books. The technical names of the various sizes are based upon the number of times the old-fashioned large sheet of paper was folded for the binding. The sheet folded once, to make two leaves or four pages, constitutes a folio; folded into four leaves, a quarto; into eight, an octavo; into twelve, a duodecimo, and so on through the smaller sizes. It is usual to write the Arabic numeral with the Latin termination, as 4to, 8vo, 16mo, etc. The old sizes are not so strictly followed nowadays, though the names are retained for convenience.

See also PRINTING; BOOKSELLING; BIBLIOGRAPHY; BOOKBINDING; LITERARY PROPERTY.

BOOKBINDING. The history of bookbinding is chiefly the history of the ornamentation of book-covers. The mechanical work of sewing and covering a book, described below, might indeed be studied chronologically as regards the changes in the processes employed; but this is of little general interest. When strips of vellum were replaced by cords at the back of the book, though perhaps discoverable, is a less attractive question than that as to the place and time when gold tooling was introduced. Thus in the Twelfth Century there appear in England the earliest stamped leather bindings, and for our present purpose this is the beginning of the history of the art. The workmen of that time were familiar with the arts of softening leather and then shaping it into the most complicated forms. Under the name of *cuir-bouilli*, corrupted in England into quirkboily and the like, the material was used for much of the war equipment of man and horse, as well as for decorative arts in peace. It was, therefore, easy to take the further step of drawing the soft leather tight on a thin oak board, impressing upon it stamps most commonly of wood and engraved in relief. In this way designs in the taste of the epoch, Romanesque or semi-Byzantine scrolls and conventional birds, are found stamped in leather. In the Thirteenth Century the design becomes more notably Gothic; in the Fourteenth Century the emblems of lions, fleurs-de-lys, roses, castles, and all the other devices of heraldry, divide the field with religious emblems. All this is in what is called 'blind' tooling; that is to say, in patterns impressed but not colored nor gilded.

Gold tooling seems to have come into Europe from the East, probably in the Fifteenth Century. The custom of coloring the impressed pattern seems to have been introduced about the same time. The art of inlaying was the natural result of this taste for colored patterns, and is probably of the Sixteenth Century. It was for many years chiefly confined to Italy, where it was used with the greatest freedom, the color patterns being partly in inlaid leather, partly in painting, and everywhere bordered and touched with gold.

According to tradition, oak boards were first abandoned in favor of paper by the workmen who covered the books of the famous printer Aldus of Venice, in the Sixteenth Century. Previous to this time even small books had their stiff covers a quarter of an inch thick, and often beveled to a sharp edge to disguise this disproportionate thickness. The 'half-binding' of the time was, then, that with leather back, this cover extending not more than an inch over the oak boards, which were otherwise exposed with no decorative effect except the grain in the wood. The cheaper kind of full binding was of brown leather stamped sometimes with separate though not very small tools and with letters put on by separate type, so as to form inscriptions, and sometimes with larger stamps, as where a Christ bearing His Cross and a David with his harp are on the two flats of a cover, dated 1568, each stamp measuring $1\frac{1}{2} \times 2\frac{1}{2}$ inches; these and the inscriptions around being gilded in a singular way by a process of lacquering, probably Oriental in its origin. Vellum, parchment, and white pigskin were used, replacing the brown leather, and these light-colored materials were often covered all over with minute patterns, in which apparently metal stamps were freely used.

Jean Grolier de Servier was treasurer of Francis I., King of France, and for him were prepared bindings of great richness and beauty. It appears that the volumes of a library, large for its epoch, were bound for him in this sumptuous way, the characteristic ornamentation being interlacing bands, dark, and edged with gold upon a lighter ground, or scrolls of gold lines only; the name of the book being lettered in the centre panel of one or both of the sides, and the familiar motto, *Portio mea domine in terra viventium*, alternating with or accompanying the phrase, *Io. Grolierii et amicorum* "[the property] of John Grolier and his friends." The decoration and the friendly legend were both rather closely imitated by Maioli, an Italian, of whom but little is known.

In the Seventeenth Century the use of coats of arms fully displayed in gold, and occasionally in all the colors of the different bearings, became the most common adornment, though indeed such ornamentation dates from an earlier epoch. The tendency of design in the Seventeenth and Eighteenth centuries was away from polychromatic effects and toward insistence upon the beauty of the grained leather set off by the slightly impressed points and lines of gold. It is during the last quarter of the Nineteenth Century that effects of color, generally procured by means of inlay, have been restored to favor.

Metal mountings of all sorts are adjuncts whose principal object is dignity and sumptuousness. When books are very heavy and very precious, clasps have their utility, and bosses, four or five on each side, keep the leather and its

ornamentation from being rubbed. Still, however, these mountings, like the far more elaborate covers of wrought silver-gilt set with enameled plaques and *cabochon* jewels, are chiefly ornamental in their purpose. Europe has never made so great a use as might have been expected of binding in rich stuffs beautiful in themselves.

The term bookbinding should properly be confined to the process of covering a folded and sewed book by stiff side-pieces of paper, board, or wood, which are secured to the package of folded leaves by flexible strips running across it at the back; which side-pieces are afterwards covered by material such as leather of some kind, cloth, or paper, pasted or glued to the stiff sides and to the back. The mounting of a book which is issued in a roll like the Roman *volumen*, or the Japanese scroll of similar character, is hardly bookbinding, although the very delicate use of decorative paper and rich stuffs, and the mounting of the scroll upon a cylindrical roller with ivory or other knobs at the ends, may provide the medium for much decorative treatment; and the modern so-called binding in pasteboard covered by muslin or silk and issued in large quantities by publishers should not be called bookbinding at all. For this the entirely appropriate name 'casing' may be used.

Considering now the art of binding as it is commonly understood, and as it has been practiced in Europe since the Fifteenth Century, the first process is collating, that is to say, examining the book to see if it is complete. In close connection with this is, of course, the folding of the sheets, if they have not been folded, or the pulling of the book to pieces if it has been bound or cased or stitched before. In the course of this preparation all plates or maps that have been put in with glue or paste are soaked off and their folding or placing considered with a view to the new binding. The sheets to be folded are indicated by special marks called 'signatures.' These are the letters such as A, A₂, and so on through the alphabet, which one sees at the bottom of some pages in almost any book. The folding of the sheets is the important matter, but it can never be neatly done unless the sheets have been so printed that the letterpress on one side comes exactly over that on the opposite side. Other sheets, similarly folded, but of plain paper, unprinted, are added at beginning and end for 'end-papers' or 'fly-leaves.'

The sheets once folded have to be sewn, but before the sewing is done the plates which are 'guarded,' or mounted upon guards (French, *onglets*), must be set into their places. Also before the sewing, the edges may be marbled or gilded or painted or sprinkled. It is to be noted that if the gilding is to be very effective it must be done on the rounded front edge, the leaves being deliberately hammered back until they reach the curve intended to be given to the book. This has to be done after the sewing; but if it is desired to avoid the look of a solid, smooth surface, and to let the leaves show individually at the edge, the gilding or coloring had better be done first. After the sewing is done the leaves may be considered as a solid block, and sometimes landscapes and the like are painted on the edges, which are afterwards gilded; the picture showing only when the mass of leaves is bent or rolled. Sometimes, too, the smooth surfaces made

by the edges are stamped before gilding, producing impressed patterns.

The leaves of the book are secured together by sewing either to cords or tapes or slips of vellum; and these are, in modern practice, often let into the book by means of a saw-cut carefully made across the whole pile of sheets. This is not conducive to first-rate binding. It is far better to let the bands of cords or tape project from the back, and then to let the covering leather adapt itself to these. This, indeed, is the origin of those raised bands which are common on the backs of leather-bound books; but the modern custom leads to the making of wholly false bands, which have nothing to do with the actual sewing of the book. The projecting ends of the cords or strips are the means of securing the whole back to its covers, and therefore their length and the treatment of them is of extreme importance. If cord is used, it is raveled or frayed at the two ends in such a way that it will afford a good opportunity for glueing to the covers.

When the sewing is done and the cords are prepared for the covers, what are called the headbands are put in, the only purpose of which is to save the top edge of the binding a little when the book is tilted by one finger from the shelf where it stands. The ideal way of putting this in is to sew the sheets to them as well as to the other bands, and at the same time; but in modern work they are generally additions intended rather for show than for utility.

The covering of the book is done by simply glueing or pasting the material to be used upon the boards of the sides and upon the back. There is, however, this difference between different kinds of back. Thus, the hollow back, so called, which allows the mass of folded sheets forming the book proper to leave the back and to hinge itself at any point, while the back remains independent and rounded out with an open space between it and the book, is made by a piece of pasteboard put in between so that the leather or silk of the cover is glued to it. The 'fast back' or 'tight back' is made by glueing the covering directly to the back-folded edges of the sheets. As this covering material is added to the completely made book, to the stiff covers and the back after they are put together, it is evident that a great deal of care must be used in stretching it to cover the bands, the corners, and the edge where it is turned under and has its edges covered by the lining paper or *doublure*. This *doublure* is commonly a piece of marbled or colored and glazed paper, half of which is pasted to the inside of the cover, while the other half forms an additional end-paper; but sometimes the cover is lined with a piece of leather.

Finally, the book is ornamented by stamping or tooling. These terms are used generally to imply, in the one case, large plates from which a stamp is taken covering the whole or a large part of the cover at one impression, while tooling is the putting on of the impressed or gilded lines, dots, leaves, and the like, separately, one by one, with a number of tools, the impressions of which are combined together so as to produce the patterns desired. The French term *fer* (iron) is used for one of these tools; hence the phrase *à petits fers*, meaning that the ornamentation is applied by hand, with little tools, one by one, making separate points, short bars, single leaves or flowers, which are combined in

patterns. Rollers are used, by means of which indefinitely long lines, zigzags, or simple scroll-patterns are applied.

For a still more elaborate adornment, different-colored leathers are combined by 'inlaying.' Very rarely this is done by a mosaic process of the full thickness of the leather; most commonly the background is lowered or cut away very slightly, and the piece to be inlaid is a mere film. The lines of junction are generally concealed by broader lines of gold, impressed by means of a tool.

As to casing, the two stiff sides and the more flexible back are put together exactly as a paper box is made. The sheets of the book having been stitched together, as if to make a pamphlet, are then glued or pasted into the case by means of a piece of canvas glued fast to the back of the folded book and having loose strips projecting to be pasted to the covers; or in some very similar way.

Casing is made decorative chiefly in two ways—first, by the use of a textile material which is in itself decorative, and secondly, by printing upon the surface of the boards, whether covered with silk or cotton cloth or with paper, a pattern which may be 'blind,' that is to say, merely impressed without color, or in one or several colors. The first method, that by the use of stuff which of itself is ornamental, may be very rich if a brocade is used; and it is noticeable that the large and carefully made books of the Japanese, made to contain water-colors, pieces of old drawings, or rare old stuffs and the like, have sometimes for their sole decoration a beautiful piece of brocade for covering material, and sometimes this with the addition of richly worked metal corners. So, a private person, wishing to bind a lot of novels cheaply, may select printed calico or other inexpensive material and have all the volumes of one author bound uniformly; such work costing in Paris not more than one franc twenty centimes per volume, and in the American cities not over sixty cents a volume, even when the title is in gold letters on an attached leather label. Such work, if properly done, is, in a way, satisfactory. Thirty years of rather constant use, as of a popular book in a reading family, does not seem to injure it except by slightly loosening or 'spreading' the back. This, however, is for small books only; those weighing two pounds, or a kilogramme, can hardly remain firm more than two or three years. The 'decorative bindings' of modern English and especially American popular books are sometimes adorned in a very effective way either by stamped gold patterns rather deeply impressed upon the cloth sides, or by surface printing without deep incision, which printing may be in one or many colors. It is not hard to combine the two processes. Thus, in one rather pretty book, each cover, about $5\frac{1}{2} \times 8\frac{1}{2}$ inches, has a conventionalized landscape in two dull colors; and above this picture, which occupies two-thirds of the surface, the title, consisting of seven words, is impressed in gold. Some admirable designs are prepared for English publishing houses in which the almost lost art of designing patterns of conventional leafage and the like has been revived. American work runs more often, as in the case mentioned above, toward descriptive and suggestive art, landscapes, emblematic compositions, even figure subjects of some pretension.

Books that are cased in this way need not necessarily be injured for future permanent binding; but it often happens that they are injured, as by the pasting of the edges of inserted plates to the folded sheets of the letterpress, or by sewing the sheets together in such a way that while the same sewing will not be found sufficient for the permanent binding, it has still injured the backs for better work. Of course, where any such device as the 'stabbing' of the sheets with tinned wire is used, the book is ruined as a permanent possession. It is much to be regretted that our valuable illustrated magazines are sold in that condition.

BOOK CLUB. A convenient title for private associations which print books for distribution among a limited circle of subscribers. Such clubs, being usually composed of scholarly men, and endowed with sufficient means, have rendered no slight services to literature and learning by rendering accessible a number of valuable works which had existed only in manuscript or in very rare printed copies. While associations like the Dilettanti Society (q.v.) accomplished some work in publishing, yet books as such were not their primary care. The Roxburghe Club (q.v.), founded in 1812, was the earliest English book club, properly so called; its system imposed on each member the reprinting of one book, and its work was not specially important. The Bannatyne Club, originated by Scott in 1823, was more practical. The Camden Society (1838) began the modern method of publishing by the society instead of leaving it to individual members; it has produced a long series of most useful historical publications. Among many English societies of the kind, the following are specially worthy of note: The Parker Society (1840-55), the Percy Society (1840-52), the Hakluyt Society (1846—), and the Early English Text Society (1864—).

During the Colonial Period in America, and that which immediately followed the Revolution, there were a number of literary associations whose members jointly published their writings, after the fashion of the time, in periodical form. The earliest and most famous of these was the Junto, founded by Benjamin Franklin in 1726. To its efforts the Philadelphia Library (1731), the University of Pennsylvania (1749), and the American Philosophical Society (1768) owe their small beginnings; and it published at different times ten periodicals of a literary and historical nature, most of which lasted for only a few numbers. The Drone Club, founded in 1792 by Charles Brockden Brown and others, and the Literary Confederacy, formed in 1817 by William Cullen Bryant, Robert C. Sands, James M. Eastburn, and Gulian C. Verplanck, were of the same nature. The first book club in the full sense, however, was the Seventy-six Society, originated in Philadelphia in 1854 by Edward D. Ingraham, stating its object as "the publication and republication of books and papers relating to the American Revolution." It lasted only three years, and was immediately succeeded in New York by 'The Club,' as it was called—it never received any specific name—and two years later by the Bradford Club, an offshoot from the former. In 1858 began the longer career of the Prince Society in Boston, which is still in existence, and has a list of twenty-six publications,

made or in preparation. In the sixties there was a veritable mania for club publication, and absurd ventures were numerous, charging extravagant prices for their subscription books. The revival of club publication dates from about 1876, since when it has been carried forward in a dignified and rational manner. The Historical Printing Club of Brooklyn deserves a foremost place in this period. Founded in 1876, it has published, chiefly under the editorship of Paul Leicester Ford, over seventy valuable historical documents. But the best-known and most important of all is the Grolier Club, founded in New York in 1884 by a number of well-known makers and collectors of books. It has been very successful, not only in its distinctive purpose, but also in drawing together men of scholarly culture in the delightful home which it built for itself in 1889. Its membership was originally limited to fifty, but has now been extended to nearly four hundred. It has published in elaborate and beautiful form thirty important literary and bibliographical works, besides catalogues of the valuable exhibitions given by it at frequent intervals. Consult: Hume and Evans, *Learned Societies and Printing Clubs of the United Kingdom* (London, 1853); Growoll, *American Book Clubs* (New York, 1897).

BOOKKEEPING. The application of the general principles of debit and credit, and of classification of accounts, to the details of business. The object of bookkeeping is to furnish a complete and systematic record which may enable the proprietor readily to ascertain any desired facts regarding the progress and condition of his business and his financial relations with others. Without the knowledge thus gained, business cannot safely be carried on, and success or failure is often very closely related to the character of the work done at the bookkeeper's desk. In order that it may meet all the demands which are likely to be made upon it, bookkeeping must be practiced in such a way as to be intelligible, not only to the one who performs the work, but also to others. For if a dispute arises and it becomes necessary to place the books in evidence, suspicion naturally attaches to methods that can be understood and explained only by the interested party. There are two systems of bookkeeping which satisfy the requirements named, and which are accepted and used by practically the entire commercial world. They are known respectively as single-entry bookkeeping and double-entry bookkeeping.

Business records of some form or other were doubtless employed in the earliest times in the history of trade and credit. Of the early forms of bookkeeping, however, practically nothing is known. From the works of Leonardo of Pisa (q.v.) it appears certain that the merchants of Italy, France, and Spain practiced systematic bookkeeping for some time prior to the Thirteenth Century. It is, however, to the Italian traders of the Fourteenth and Fifteenth centuries, the enterprising merchants of Genoa, Florence, and Venice, that we owe the system of bookkeeping which takes the lead at the present time. In the year 1495 Luca Pacioli (q.v.), or Luca di Burgo, a Tuscan friar, published a work which contained a treatise upon double-entry bookkeeping. This is the first systematic treatment of the subject of which we have any record. From Italy the system spread to the Netherlands,

thence to England, and from there to all parts of the world. And it is worthy of remark that the more complete system of double entry was perfected and brought into general use considerably before the system of single entry.

DOUBLE ENTRY. In double-entry bookkeeping, sometimes called the Italian method on account of its origin, every transaction requires equal entries on both sides of the ledger. The number of entries on the two sides need not correspond, but the amounts must. This representation of every transaction on both sides of the ledger arises from keeping account, not with persons alone, but also with property and allowances. It is this feature which gives the system its name and constitutes its essential characteristic. Property is conceived of as debtor or creditor, according as it has required outlay or has brought in value or discharged indebtedness.

The simplest combination of books suited to double-entry bookkeeping consists of a daybook, journal, and ledger, ruled in accordance with the forms given below. Daybook and journal may be combined to form the daybook-journal. The *daybook* is the one in which are entered the details of each transaction at the time it occurs. This is the original entry, and should be made with the greatest care. It is this which must be brought into court in case of legal dispute. In this book, therefore, as in all original entry, erasures should be avoided, and all changes, for whatever reason made, should be so managed that their nature can readily be determined. In the *journal* are entered the names or titles of the ledger which are to be debited and credited, together with the proper dates and amounts. These are determined from the daybook record, and the process is termed journalizing. This is a very important part of the bookkeeper's work, and makes the largest demands upon his ability to think correctly. The remainder of his work, with the exception of making out the balance-sheet, is to a large extent mechanical. The *ledger* is the book of accounts. From the journal the various items are carried to the ledger, items having the same name or title being gathered together under that title, each on its proper side, debits to debit side, credits to credit side; the left-hand side in this, as in all other books, being debit, and the right credit. The ledger, on account of the classified and summarized nature of its contents, is the business man's principal book of reference. If he wishes to find out how much John Doe owes him, it is to his ledger that he goes for information. Should he wish to pay Richard Roe the balance due him, it is from the ledger he will determine the amount which he must remit. In short, when he desires full, up-to-date information regarding any matter connected with his business, it is generally the ledger which is called into requisition. Toward the perfection of the contents of this book, therefore, all the bookkeeper's work is aimed. The process of carrying the items of the journal to the ledger is termed 'posting.' In performing this work, the careful bookkeeper will follow an invariable order, that the process may be made as nearly mechanical as possible. First, the year should appear in the column at the left on the side to which the item is to be posted; the year need not be entered again until it changes. Next come month, day, explanation, the page of the journal from which the entry is brought,

and the amount of the entry. The page of the ledger to which the item has been posted is then immediately entered in the column at the left of the journal, on a line with the item transferred. The last step is taken to leave evidence that the posting has been done.

To open a set of books by double entry, the bookkeeper states in the opening entry of the daybook the kind or name of the business in which the proprietor is to engage. He then enumerates in detail the items which are to constitute his investment, such as cash, real estate, accounts due him, etc., and the debts, if any, which are to be paid out of the business. These two sets of items represent, respectively, his resources and liabilities. The difference between them will be his net investment. When this entry is journalized, each of the items which will make up the resources will be debited, and each of the titles entering into the liabilities will be correspondingly credited, and the proprietor's name or stock will be credited for the net investment, or the difference between the sums of the two. When this journal entry has been posted, the books are properly opened. When the posting for any period has been completed, the debit and credit sides of the ledger should be equal. To determine whether this is the case or not, the *trial balance* is taken—that is, all the headings of the ledger, excluding those which are in balance or ruled up, are entered on a suitable sheet, together with the debit and credit footings of each in their proper columns; the two columns are then footed and ought to give equal amounts. If the results are not equal, there is certainly some error which must be found. On the other hand, should the trial balance prove, it would not be certain that no mistakes had been made. For the trial balance will not discover errors of computation, omission of transactions, posting to wrong accounts, etc. The trial balance should be taken, as a rule, at least once a month. The *balance sheet*, which is to be distinguished from the trial balance, involves a classification and analysis of accounts in such a way as to exhibit in detail the resources, liabilities, losses, gains, net gain or loss, and present capital of the business. The balance sheet is of great importance to the business man, and should be made at least once a year, or whenever the business is closed out or otherwise disposed of. It involves the taking of an inventory of all the property on hand, which, in some lines of business, is quite a laborious process. A form of balance sheet is presented below.

When accounts balance, when they become crowded for space, or when they show a loss or gain at the time of making a balance sheet, they are ruled up or closed. The form of closing varies somewhat in accordance with individual taste. The foregoing example of ledger accounts furnishes also an illustration of a simple and convenient form of closing. When red ink is used in the process, it indicates that the entries distinguished by it have been made upon the wrong side of the ledger for the purpose of balancing, and before the work can be regarded as complete, they must be transferred to the opposite side of the ledger, either below the rulings of the account just closed, or below some other heading of the ledger, which is indicated in the red-ink entry.

Aside from the purpose of eliminating from an account the element of loss or gain, or of preventing crowding, an account is closed in order to condense it into a single item, thus simplifying and making intelligible at a glance all the information which the account can give. After a general closing of the ledger it is usually advisable to take off a trial balance of the ledger balances to make sure that all have been correctly transferred; as a mistake in this matter may cause great trouble at the time of the next trial balance.

In the simple combination of books for double-entry bookkeeping, which has been explained, practically all the principles of the system are exemplified. In addition to the books named, however, there are generally found in use one or more such books as the following: Cash-book, sales-book, invoice-book, bill-book, order-book, check-book, inventory-book, etc. It is unnecessary to enter upon an explanation of the purpose of these books, it being sufficiently indicated by the name. Of the ways in which they may be combined, there is great variety, every business and every establishment introducing some peculiarities of its own. The general principles, however, are the same in all. They may be used either as principal or auxiliary books. A principal book may be defined as one from which or to which posting is done; an auxiliary book, one kept for convenience of reference, but from which no posting is done. When these books are used purely as auxiliary books, they do not affect the work in the other books. When, however, they are used as principal books, all entries found in them are omitted from the journal. No account is kept in the ledger of the property with which such books respectively deal; or if kept, only the footings are posted at regular intervals. The latter plan is followed by some in order that a trial balance of the business accounts may be taken without reference to any other book than the ledger. When this is not done, the footings or balances from such books must be properly entered in the trial balance before it can be expected to prove. The ledger titles found on the debit side of these books must be credited in the ledger with the amounts set opposite them and those on the credit side similarly debited. These books are often ruled with special columns for items of frequent occurrence, and when this is done the footings of such columns only are posted to the title which heads the column in accordance with the principle stated below. A form of the cash-book is given below and the method of posting and ruling the same is illustrated.

SINGLE ENTRY. Single-entry bookkeeping, in its pure form, which, however, is rarely used, keeps no account of property. Only personal accounts appear in the ledger, which as a consequence will not be in balance except when the business is closed out. It therefore involves less labor than double entry, and, on the other hand, furnishes fewer checks for detecting errors. It is, however, well adapted to some forms of business, and its results are as intelligible and significant as in the more complete system. It fails, of course, to give detailed information in regard to the sources of gain or loss, and this, for some kinds of business, is a fatal objection, for it is this information, clearly set forth by the double-

entry balance-sheet, which the merchant needs to keep him within the lines of safety and profit.

In single-entry bookkeeping, in its pure form, the only book needed, besides the ledger, is a day-book or journal, in which are made all entries involving debit or credit of persons. The cash-book, sales-book, etc., are combined with the books first named as in double entry, but when so used the method becomes no longer pure single entry, but a mixed form. To determine the proprietor's capital at any time, when the books are kept by single entry, an inventory of resources and liabilities is taken, the difference between the totals representing the capital. The loss or gain is found by comparing the present with the former capital. So great is the importance to a concern of its books, and so great the calamity of their loss by theft or fire, that they are usually guarded with great care and kept in a fireproof safe when not in use.

DETAILS. The principles of bookkeeping remain to-day practically as set forth by Luca Pacioli. In details, appliances, and forms, however, there have been many changes. Most of the important changes in the forms of books are of recent date and consist largely in the introduction or extension of the use of special columns. One or two ledger forms which are now in use may be mentioned in this connection. The *centre-ruled ledger*, as it is termed, has the credit amount column arranged alongside of the debit in the centre of the page. It is followed by the *folio column*, the *explanation* and *date columns*, in the order named. The advantages claimed for it are that, being brought close together, comparison of the two columns is made easier, the trial balance can be more readily taken, and in ruling the account no trouble arises because of the rolling of the page. The *card system*, which has become indispensable in so many lines of work, is also being introduced. Large numbers of firms are now using either the detachable or loose-leafed ledger, or have adopted the card ledger. The advantages claimed for these forms over the ordinary ledger are the saving in indexing, the removal of dead accounts, escape from the continual transfer of accounts which have become crowded, the elasticity which permits new accounts to be introduced indefinitely, ease of classification, etc.

In no part of the actual practice of bookkeeping has there been a greater advance than in that which deals with the orders sent to the home office by the traveling salesman. Instead of sending these orders, as formerly, illegibly written on any scrap of paper that came to hand, and leaving it for the home office to make the proper entries in the regular sales-book, the sales-agent is now furnished with a book with perforated leaves properly ruled and corresponding with a book kept in the office. In this book the agent enters his orders, giving prices, terms, etc., and making extensions and footings complete. The leaves containing the orders are then torn out along the perforated line, sent to the home office, and there by a simple contrivance bound into the book devoted to this particular agent. From this book of original entry, posting is made directly to the ledger. The agent is thus made a part of the working force of the home office, and by the saving thus accomplished the office expenses have been decreased without

loss of accuracy or efficiency, and with an actual increase in business.

EXPERT WORK. An expert bookkeeper is sometimes called upon to clear up difficulties brought about by slovenly methods of work, or by dishonest practices. It need hardly be remarked that the expert reaches his conclusions not through any mysterious or extraordinary insight, but by systematically taking the original entries and determining whether they have been correctly handled or not. If fraud is present, it may be necessary to correspond with the various firms represented in order to discover to what extent fictitious and fraudulent entries have been made. This takes time, but is entirely simple and makes it impossible to escape from the conclusions to which the method leads. If proper entries were not made, or have been lost, the discovery of this will be in some measure accidental, determined through correspondence and settlement with the firms with which the concern in question has had dealings. As in every other department of the bookkeeper's work, so in this, system, care, and attention to details finally secure the result sought.

BOOKKEEPING FORMS.

DAYBOOK			
JANUARY 2, 1902			
Bela M. Wilson began to-day the grain, flour, and feed business with the following investment:			
RESOURCES			
Cash per cash-book.....	5,000.00		
William Jones, note due Jan. 5.....	300.00		
Joseph Call, on account.....	400.00		
George Randolph, on account.....	300.00	6,000.00	
LIABILITIES			
Note favor Thomas Wall.....	200.00		
Charles Johnson, due him on account.....	550.00		
Nathan Barlow, due him on account.....	250.00	1,000.00	
Bought of Hanley Bros., on account:			
100 bushels beans.....@ \$1.50	150.00		
200 " wheat.....@ .70	140.00		
500 " corn.....@ .35	175.00		
100 barrels flour.....@ 4.00	400.00	865.00	
Sold F. E. Thomas, on account:			
2 bushels beans.....@ \$2.00	4.00		
25 " wheat.....@ .90	22.50		
1 barrel flour.....@ 5.00	5.00	31.50	
3			
Gave Hanley Bros. my note at 30 days for \$265.00 on account.....		265.00

All rulings and balancing entries should be made with red ink.

BOOK-LICE. Small, pale, wingless insects of the family Psocidæ. To the casual observer they closely resemble plant-lice. Some of them are very destructive of books and insect collections, while other forms live in the open on lichens, maple and willow trunks, etc. One of the commonest of the book-eaters is *Atropos divinatoria*. The minute pseudoscorpions (Chelifer) sometimes found in old books are called 'book-scorpions.' See **BOOKWORM**.

BOOK OF COMMON ORDER, THE. The name of the Church of Scotland service, evidently suggested by the familiar Anglican title. Its source was that used by the Genevan English Church, and, tentatively used in 1562, it became general throughout Scotland in 1564.

BOOK OF COMMON PRAYER. See **PRAYER-BOOK**.

BOOK OF MARTYRS, THE. One of the most famous books in religious history. Written in Latin, by John Foxe, in 1559, it appeared in his own English translation, under the title of *Actes and Monuments*, in 1563, though from the first popularly called the *Book of Martyrs*. It relates the history of persecution down to about the end of Mary's reign.

BOOK OF MORMON. A book issued in 1830 by Joseph Smith, who professed to have been led to its discovery by an angel. The gold plates inscribed with Egyptian characters, and accompanied by magic spectacles to assist in their interpretation, disappeared, but Smith published a professed translation, which became the sacred book of the Latter Day Saints. The work was, in reality, simply an adaptation of the manuscript work of 1809 by a Presbyterian clergyman, Spalding, who in it attempted to identify the American Indians with the Lost Tribes. In style the book is an imitation of the Bible, from which it has borrowed many passages. It is divided into sixteen sections, supposed to have been written at various times, and giving a history of America from the days of the confusion of tongues at Babel until the time of Moroni, the last survivor of his race who, in 420 A.D., buried the plates in the hill where Smith found them. While a small colony had settled in America, according to the Book of Mormon, after the dispersion at Babel, the important immigration took place in the reign of Zedekiah, about B.C. 600. In obedience to a divine command a company of sixteen people, led by Lehi, reached America. Preserving their ancient religion in its purity, they received Christianity from Christ himself, who spent the forty days after his resurrection among them. In 384 this Christian nation was destroyed after a long series of wars.

BOOK OF SAINT ALBANS. The title of a rhymed book on certain sports, wholly or partly written or translated by Dame Juliana Berners, and first printed in 1486. It consisted of four parts: "Hawking," "Hunting," "Lynoge of Coate Armiris," and "Blasyng of Armys." Consult Blades, *Introduction to the Boke of Saint Albans* (London, 1881).

BOOK OF SENTENCES. A theological treatise belonging to the Twelfth Century, discussing various questions relating to God, Christ, the universe, and the virtuous conduct of life. Its author was Peter Lombard, Bishop of Paris, later known as Magister Sententiarum, on account of this work.

BOOK OF SNOBS. Under this title appeared in 1848 *The Snob Papers*, by Thackeray, a collection of papers contributed to *Punch* (1843).

BOOK OF SPORTS. See **SPORTS, BOOK OF**.

BOOK OF THE DEAD. See **DEAD, BOOK OF THE**.

BOOK OF THE DUCHESS. The title of a poem by Chaucer, written to console John of Gaunt for the loss of his Duchess in 1369. It is conventional, artificial, imitative, and is drawn from Machault's *Dit du lion* and *Dit de la fontaine amoureuse*.

BOOK-PLATE. A typographical or pictorial label, used to denote the ownership of a book. Book-plates are considered to have had their origin in Germany; though an unsupported claim has been made that they were used in Japan in the Tenth Century, and certain small clay tablets are believed to have performed in Babylonia and Assyria an office similar to that of the book-plate of to-day. The earliest printed book-plate we know to-day was used about 1480. It is a hand-colored heraldic design, and recorded a gift of books and manuscripts to the Carthusian monastery of Buxheim in Swabia. Until Albrecht Dürer gave his attention to the designing and engraving of book-plates, they were rude wood-cuts utterly lacking artistic form. Dürer is sometimes called 'the father of book-plates,' because under his hand they became works of art. Several undoubted book-plates of his workmanship are known. The earliest of these bearing a date (1516) was the property of Hieronymus Ebner of Nuremberg. Dürer made a book-plate for Bilibald Pirckheimer of the same city which is believed to be earlier than 1503. Among the famous early German artists who engraved book-plates on wood or copper were Lucas Cranach, Hans Holbein, Jost Amman, and Virgil Solis. In the Eighteenth Century Daniel Chodowiecki engraved several very charming designs. Ever since Dürer put his impress upon them, the ornamentation of book-plates has been an important feature, and while their first purpose is to indicate the ownership of the book in which they are pasted or bound, they may, by perfection of design and execution, give pleasure as works of art. Allegory, quotations from the classics, the name of the owner, and his coat of arms are the prominent and customary features.

From Germany the use of the book-plate spread to France, and finally to all Continental countries. There is considerable similarity between the early book-plates of Germany and France, but the former are more numerous. The French engravers, as time went on, tended to over-ornament their designs, and the later examples suffer a great loss of dignity for which the delicacy and exquisiteness of their workmanship is no compensation. There are a few very charming bits by such artists as Collin, Durand, and Eisen.

England was apparently a little slow in adopting the book-plate, as her first ones seem to have been made toward the end of the Sixteenth Century; but once fairly started, the idea spread rapidly, with the result of making English book-plates outnumber those of all other countries. Up to the beginning of the Eighteenth Century most English book-plates are in the style known, by the universally accepted nomenclature of Warren, as early armorial. This shows the coat of

arms and the name and motto of the owner, with surrounding foliations originally intended to represent the slashed mantle of the helmet. The Jacobean style, extending approximately from 1700 to 1750, is very formal and heavy; its ornamentation resembles carved wood, and the right and left sides of the design usually coincide with precision. About 1750 came in the Chippendale style, so called from the well-known designer and upholsterer of furniture. Light, graceful effects took the place of the sombre designs; fruit and flowers, even pictures of meadows and streams with shepherdesses and swains were introduced. This was succeeded by the ribbon and wreath style, whose simple, chaste manner well expressed contemporaneous changes of manners and forms. At a date difficult to give, but toward the middle of the Eighteenth Century, bookmen and engravers began to show more individuality in their book-plate designs; the portrait and the pictorial plate came in; library interiors and many allusions to classical allegory and to the feats of arms or peaceful pleasures of the owners are frequently found; while landscapes and rivers, castles and ruined abbeys contribute to the variety of the pictured scenes. Such names as Hogarth, Marshall, Veretue, Bartolozzi, and Bewick are signed on English book-plates.

The book-plates first used in America were of English make, brought over by the wealthy colonists. They possess great interest as memorials of the old families; but the plates engraved by the hands of our first American engravers, Nathaniel Hurd and Paul Revere, of Boston, Ainos Doolittle, of Connecticut, and Alexander Anderson, of New York (the last of more recent date but the first to engrave on wood), easily surpass them in value. The earliest date on an American book-plate by an American engraver is 1749, on the Thomas Dering plate engraved by Hurd. There were numerous early engravers through the New England Colonies and States, and in and around New York, Philadelphia, and Baltimore, whose work is highly prized by the collector and student. All of these followed in the main the English styles, though some crude designs, incorrect heraldry, and clumsy engraving mark certain efforts as the work of untrained hands who had no good models to work from. The book-plate of George Washington, though engraved in England, is the most highly valued American book-plate of the early period. The few plates known to be the work of Paul Revere rank next, and high prices have been paid for them.

The present revival of interest in the book-plate dates from the foundation of the Ex Libris Society in 1890. Though the headquarters are in London, the membership is thoroughly cosmopolitan. An illustrated monthly journal is issued to members. France and Germany also have societies which issue publications at stated intervals. All these club journals are of the utmost value and importance to those who wish to keep in touch with the progress of book-plate affairs. There is no organization of book-plate collectors in the United States. Book-plates have become of sufficient importance to be listed by the sellers of old books and to have an occasional catalogue devoted to them entirely. Auction sales of book-plates are not uncommon, and their recognition as interesting items of literary prop-

erty is widespread. The late Sir Augustus Wolaston Franks, of London, had a collection which is said to have numbered toward 200,000. It is now in the British Museum. The late Dr. Joseph Jackson Howard (who acquired the first collection of book-plates known to have been made) possessed more than 100,000 specimens. The Count Karl Emich zu Leiningen-Westerburg has a very large and valuable collection. Several important collections exist in the United States, notably those of John P. Woodbury, Henry S. Rowe, and Fred. J. Libbie, of Boston, W. E. Baillie, of Bridgeport, Conn., and the Grolier Club, of New York, which gave, in 1894, the first public exhibition of book-plates in America. At the present day the black-and-white reproductions of drawings form the greater number of book-plates, but the copper-plate engraver has found in the renewed interest in these marks of book-possession an increasing demand for his art. Edwin Davis French, of Saranac Lake, N. Y., Sidney L. Smith, of Boston, W. F. Hopson, of New Haven, Conn., Charles W. Sherborn and George W. Eve, of London, have international reputations as engravers on copper.

Book-plate literature has increased rapidly in the last decade. Very numerous contributions to periodicals and many monographs of permanent interest, but which deal with subdivisions of the subject, have been published. These would swell a complete bibliography to the dimensions of a book. The following list comprises the authoritative works relied upon by the serious student of book-plates: Poulet-Malassia, *Les Ex Libris français* (Paris, 1875); Warren, *A Guide to the Study of Book-Plates* (London, 1880); Carlander, *Svenska Bibliotek och Ex Libris anteckningar* (Stockholm, 1889); Warnecke, *Die deutschen Bücherzeichen* (Berlin, 1890); Guigard, *Nouvel armorial du bibliophile* (Paris, 1890); Bouchot, *Les Ex Libris et les marques de possession du livre* (Paris, 1891); Castle, *English Book-Plates* (London, 1892); Hamilton, *French Book-Plates* (London, 1892); Hardy, *Book-Plates* (London, 1893); Allen, *American Book-Plates* (New York and London, 1894); Labouchere, *Ladies' Book-Plates* (London and New York, 1895); Hamilton, *Dated Book-Plates* (London, 1896); Fincham, *The Artists and Engravers of British and American Book-Plates* (London, 1897); Count Karl Emich zu Leiningen-Westerburg, *Deutsche und österreichische Bibliothek-Zeichen, Ex Libris* (Stuttgart, 1901); Stone, *Women Designers of Book-Plates* (New York, 1902).

BOOK-SELLING. The earliest history of the production and sale of books is so obscure that little can be added to what is told in the article *Book of the Chaldean tablets of baked clay*, the *Egyptian Book of the Dead*, and other similar productions. We find, however, in Athens, something approaching to an organized trade in books about the middle of the Sixth Century B.C., when Pisistratus paid scholars from the municipal treasury for preparing an authorized text of Homer and Hesiod for the use of copyists. Through the Museum of Alexandria and the publishers of Rome, whose work was largely carried on by Greek scribes from Alexandria and Athens, this text has brought down to us the poems of Homer and Hesiod. It is probable that the first regular sales of literature in Athens, and, therefore, the first in Greece, were carried on by students of philosophy. Diogenes

BOOKPLATE OF THE GROGLIER CLUB

Laërtius says that the hearers of Plato interested themselves in the work of circulating the written reports of his lectures, sometimes selling them, but more frequently in the first place lending them out for hire. The facilities for the work of scribes in Athens were evidently, however, during the most important period of Athenian literature, inadequate to supply the demand of the scholars. Books continued to be very costly and their ownership was limited to the wealthy. Diogenes Laërtius is the authority for the statement that Plato paid for three books of Philolaus which Dionysius had secured for him in Sicily three Attic talents, equal in currency to \$3240, when money was worth much more than it is now. Aristotle says that Gellias paid a similar sum for some few books of Speusippus. Böckh is of opinion that some kind of a book trade was carried on in the orchestra of the Athenian theatre, during the time, of course, when no performance was going on.

By the time of Xenophon (about B.C. 400) Athens was the centre not only of the literary activities of Greece, but of any book trade that existed. The first booksellers prepared with their own labor the scrolls, mainly papyrus, that constituted their stock in trade. The next step in the development of the business was the introduction of the capitalist, who, instead of working with his own hands, employed a staff of copyists and sold the products of their labor. A comedy by Aristomenes refers to a dealer in books. Eupolis speaks, in B.C. 430, of the 'place where books are sold,' the inference being that a special place in the market was reserved for the book trade. Nicophon, in the next century, gives a list of men who support themselves with the labor of their hands, and groups the bookseller with the dealers in food and household utensils. It would appear that the Athenian booksellers derived receipts not only from the sale or from the hire of manuscripts, but from the reading of these aloud in their shops to hearers who paid for the privilege. After the conquest of Greece by the Romans there was a revival in Athens of the trade in books owing to the increased demand from the scholars of Rome, where Greek was accepted as the language of refined literature and its authors were diligently studied.

About B.C. 250 the literary activity encouraged by Ptolemy Philadelphus caused Alexandria to become one of the great book marts of the world. Its first publishing and bookselling were done in connection with the great museum founded by Ptolemy. This comprised in one organization a lending and reference library, a series of art collections, a group of colleges endowed for research, a university for instruction, an academy with functions like those of the French Academy, and a series of work-rooms where the scribes prepared from authenticated texts the papyrus manuscripts to be distributed throughout the civilized world. Ptolemy Soter gave authority to traveling scholars to collect for the museum in Alexandria all the authenticated manuscripts they could find. He is said to have supplied food to the Athenians during a famine only on condition that they would sell to his representatives authenticated copies of the tragedies of Æschylus, Sophocles, and Euripides. For these, in addition to the promised shipment of corn, the sum of fifteen talents was paid. Through their enter-

prise in training numbers of skilled scribes (including now not only educated slaves, but many of the impecunious scholars of the university), and by means of the distributing facilities afforded by the commercial connections of their capital, the Alexandrian publishers retained in their hands for more than two centuries the control of the greater part of the book production of the world. The publishers of Athens disappeared, while those who, in the last century B.C. and the first century A.D., were carrying on book businesses in Rome were obliged to have done in Alexandria the work of transcribing such of their issues as were in the Greek language, these forming, until the time of Trajan, a very large portion of their total production. The earlier Roman publisher found it usually to his advantage to send to Alexandria his original texts and to contract with some Alexandrian correspondent who controlled a book-manufacturing establishment for the production of the editions required.

It is in Rome that we find the first records of publishers whose names have been preserved. During the Second Century B.C. a number of important and costly literary enterprises were undertaken; and the continued production of books addressed to a general public implies the existence of machinery for their distribution. Here, as in Athens, those who first interested themselves in publishing undertakings were men who combined with literary tastes the control of sufficient means to pay for the production of the editions. Their aim was not at the securing of profits, but the service of literature and of the State, and these earlier publishing enterprises must frequently have resulted in a deficiency. As the size of the editions could easily be limited to the probable demand, and as further copies could always be secured when called for, one would imagine that the expense need not have been considerable. The high prices, however, which under the competition of a literary fashion it became necessary to pay for the educated slaves trained as scribes, constituted a serious item of outlay. Horace speaks of slaves competent to write Greek as costing 8000 sesterces, about \$400. Calvisius, a rich *dilettante*, paid for each of his *servi literati* as much as 10,000 sesterces. In one of the laws of Justinian in which the relative price of slaves is fixed for the division of estates, *notarii* or scribes are rated fifty per cent. higher than artisans.

The man whose name is most intimately connected with the work of publishing in the time of Cicero was his friend Titus Pomponius Atticus, who organized, about B.C. 65, a great book-manufacturing establishment in Rome with connections in Athens and Alexandria. The editions issued by him came to be known as the *Ἀττικανὰ*, *Attikiana*, and secured wide repute for their accuracy. Atticus did not confine his book business to his publishing house, but established retail dealers, *tabernarii*, in different quarters of Rome, and also in one or two of the provincial capitals. The publishers of Horace were the brothers Sosii. Their shop was in the Vicus Tuscus, near the entrance to the Temple of Janus. It was in a book-shop that Clodius hid himself (B.C. 58) from his pursuers. Later we find the stalls of the bibliopoles placed in the most frequented quarters of the city, by the Janus gate of the Forum, by the Temple of Peace, on the Argiletum, in the Vicus Sandalarius, and on the

Sigillaria. Martial speaks of the street *Argiletum* as being chiefly occupied by the booksellers, with whom were associated the fashionable tailors. Both Horace and Martial describe the book-shops as places of resort where the more active-minded citizens were in the habit of meeting to look over the literary novelties and to discuss the latest gossip, literary and social.

By the close of the First Century the book trade in Rome and in other larger cities of the Empire had developed into large proportions. The packets from Alexandria brought into Rome great cargoes of papyrus from Egypt, which speedily found their way into the work-rooms of the publishers. Here a hundred skilled slaves followed with swift pens the rapid dictation of the readers, who from time to time relieved each other; others occupied themselves with the work of comparison and revision, while a third group covered the completed manuscripts with proper bindings. In the book-shop, *taberna*, collections of the accepted classics and of the latest literary novelties are attractively presented. Here a cheap edition of the *Æneid* for school use is sold for a few pennies; there, great sums are expended for a veritable 'original' text of some work by Demosthenes, Thucydides, Cato, or Lucilius, while a third buyer is placing a wholesale order for a 'proper assortment' of literature to serve as an adornment for a new villa. From the Roman shops large shipments of books were made to other cities, even as far as Gaul. The average editions of works addressed to the general public are estimated by Birt to have comprised from 300 to 1000 copies.

By the time of the accession of Constantine (A.D. 306) the Roman book trade had very much decreased, and with the removal (in 328) of the capital to Byzantium the activities of Rome in connection with general literature came very much to an end. Under the rule of Theodoric the Goth there was, mainly owing to the influence of his minister Cassiodorus, some continued interest in literature, which manifested itself in the preservation and extension of libraries and in the maintenance of the schools. There was, however, during the time of the Gothic rule in Italy, no such demand for books as to render practicable the continued existence of booksellers.

The next bookselling undertakings were carried on from the *scriptoria* of the monasteries. For some centuries, however, the books written in these *scriptoria* were produced for the use only of the monks or of the pupils under their charge. Later there came into vogue a practice of exchanging manuscripts between monasteries, a practice which developed in a measure into a trade in books. There would be in one *scriptorium* a manuscript of special antiquity and authority; from this the scribes would prepare copies which would carry with them a varying value, depending first upon the record (the pedigree, so to speak) of the original manuscript, and secondly upon the repute that had been secured by that particular *scriptorium* for accurate and scholarly work. See BENEDICTINE.

For centuries the knowledge of reading and writing was so far confined to the clerics that there was no demand for such manuscripts outside of the monasteries. Later, under the influence of such monarchs as Alfred in England, and through the developed interest of certain other princes who had owed their early education to monas-

tery schools, the fashion arose of collecting in the libraries of kings and nobles manuscripts containing specimens of the world's literature. Such a taste could advantageously be cultivated by the abbots and their scribes. A nobleman desiring, as a matter of scholarly interest or honorable ambition, to possess a certain manuscript, was willing to pay a high price for it. Not a few of the landed estates connected with the literary monasteries, and more particularly with those of England and Burgundy, were largely secured in exchange for noteworthy manuscripts.

The next important work in the production, exchange, and sale of books was carried on in the universities. The term *stationarii*, which stands for the official bookmakers of the university, first appears in Bologna in 1250 and in Paris some years later, but the work of preparing books for the use of instructors and students had already been carried on for a number of years. In Paris, as in Bologna, the *stationarii* were university officials, and, in the majority of cases, graduates. The conditions of their trade, closely controlled by the regulations of the university, were peculiar. During the Thirteenth and part of the Fourteenth Century, the books supplied to the students were not sold, but rented, and the amount of the hire was fixed by university regulation. The *bidelli* of the university published from term to term a list of the authoritative university texts which the booksellers were ordered to prepare, to keep in stock, and to hire out. The statutes of the University of Padua of the year 1283 provided that two *stationarii* should be employed. The rental for a term of a fortnight of a *pecia* (a division of from 16 to 32 pages) of the prescribed text was four *denarii*, of the *glossarii* (the commentaries on the text) five *denarii*, and of texts not on the official list six *denarii*. In the year 1289 the list of texts which must be kept in stock in Bologna comprised 117 works. In Padua, as in Bologna, the *stationarii*, in entering upon their business, had to make a deposit of 400 *libræ*, and go through an examination. Toward the close of the Thirteenth Century the statutes of Bologna permitted the sale of manuscripts for a commission of 2½ per cent.

The authorities of the University of Paris exercised from the beginning a very complete control over all the details of making, renting, and selling books. Two centuries and a half before the introduction of the printing-press the book trade of the university had become in great measure the book trade of the city. The scribes and their masters who were manifolding manuscripts in the Latin Quarter were not only supplying text-books to the students of the university, but preparing literature for the scholarly readers of France and of Europe. The book-dealers of Paris constituted for centuries a guild organized within the university. Its members, the *libraires jurés*, were members of the university, and its operations were under the direct control of the academic authorities. It was essential not only to secure for the members of the university, at a fixed and moderate charge, a sufficient supply of correct and complete texts of the prescribed works, but also to protect these students from the contamination of heretical writings or of heretical comments on books of accepted orthodoxy. (See CENSORSHIP.) In the univer-

sities of Oxford and Cambridge the *stationarii* began their work some years later than in Paris or Bologna. They had, however, the advantage of freedom from the greater portion of the restrictions which hampered the work of the French and Italian scribes, and their business developed so actively that they soon became the booksellers of the university towns and in large part of the scholarly public of the whole country. It was, of course, from the university term that the name 'stationers' came at the outset to be applied to the organized book-dealers of Great Britain. The first guild of the British book-dealers (the forerunner of the Stationers' Company of 1556) completed its organization in 1403, nearly sixty years before the introduction into England of the printing-press.

Outside of the universities, an important trade in manuscripts came into being with the close of the Fourteenth and beginning of the Fifteenth Century. The headquarters, not only for Italy, but for Europe, of the trade in Greek manuscripts was for a number of years in Venice, whose close relations with the East gave it an early advantage in connection with this particular class of Eastern products. Among the great manuscript dealers of Italy of the Fourteenth Century may be noted the name of Auretinus and Vespasiano of Florence, of Aurispa of Venice, and Galiotti of Milan. The trade in manuscript books in the Low Countries was distinguished by the beauty of the art work which was associated with the text of the scribes. The manuscripts from Bruges secured, chiefly on this ground, a larger price in the market than is noted for the productions of any other book centre of Europe. The Dukes of Burgundy, during the first half of the Fifteenth Century, were noted for their literary interests, and did much to further the book trade of Ghent, Antwerp, and Bruges. The first publishers' guild of the Low Countries was organized in 1424 at Ghent.

The invention of printing (c.1450) revolutionized the methods of bookselling, but the revolution extended over a period of nearly half a century. For years after the first printers began their work in Germany, in France, and in Italy, the production of manuscripts went on, and even as late as the beginning of the Fifteenth Century certain of the noble book collectors in Italy took the ground that the printed book was for the use of the vulgar reader only, and that the libraries of gentlemen must be devoted exclusively to the manuscript form of literature. Gutenberg's first partner, Fust, and his associate, Schöffer, were the first printers who acted also as publishers and booksellers. Notwithstanding the many difficulties with which they had to contend, they were able to offer their books at prices which to the old dealers in manuscripts seemed so astounding as to give some pretext for the charge of magic. Madden says that a copy of the 'forty-eight line Bible,' printed on parchment, could be bought in Paris in 1470 for 2000 francs, while the cost of the same text a few years earlier in the manuscript form would have been five times as great. One of the earlier of the important publishing centres of Europe was Basel. Its most famous name for our purpose is that of Froben, in later years the publisher and friend of Erasmus. The publisher whose work was, between 1475 and 1512, the most important in Germany was Ko-

burger of Nuremberg, who by the year 1500 was utilizing no less than twenty-four presses, and sending out annually more books than any other publisher of his time. He had branches or agencies in Frankfort, Paris, and Lyons, and business correspondence in the Netherlands, Italy, Austria, Hungary, and Poland, as well as throughout Germany. In respect to the bulk of the business done by him and of the commercial success secured, he was a greater publisher than either Aldus or Froben, his two most famous contemporaries. The greatest publisher of this period, however, taking into account not simply the commercial returns of his business, but his influence upon the literature and, one may say, upon the civilization of his time, was Aldus Manutius of Venice. It was to the high scholarly ideals and courageous and unselfish labors of Aldus and his immediate successors, no less than to the imagination, ingenuity, and persistency of Gutenberg and Fust, that the Europe of 1495 was indebted for the great gift of the poetry and of the philosophy of Greece. Mainz and Venice joined hands to place at the service of the scholarly world the literary heritage of Athens. The work of Aldus as a printer-publisher (his earlier years had been devoted to teaching) began in the noteworthy year 1492. His first publication was the Greek and Latin grammar of Lascaris. This was followed shortly by the works of Aristotle, a Greek grammar, and a Greek-Latin dictionary. From 1480 to 1500, when the Republic came to be harassed by the war inaugurated by the League of Cambrai, Venice was the most active literature-producing centre in Europe. In the organization of his printing and publishing business, Aldus had special obstacles to overcome. A large proportion of his undertakings were issued in Greek; and while he could secure the service of Greek editors, his compositors were of necessity Italians. He was obliged, after supervising the founding of the type, to watch typesetting and proof-reading. To the text his contributions as an editor were often important. When the book was printed, the copies had to be disposed of by personal correspondence with scholars throughout Europe, to whom the knowledge that Greek classics were obtainable in printed form came but slowly, and with whom grew still more slowly the interest in such classics and the knowledge needed for their study. The delivery of books from Venice to different points of the Continent, particularly during the years of war (and these years were the most numerous), and the securing of the remittances in payment, was by no means an easy matter. It is not surprising that Aldus died poor, or that he writes plaintively in 1510 that "for seven years books had had to contend against arms." His most famous editorial associate was Erasmus, for whom also he published the first editions of the famous *Colloquies* and *Praise of Folly*. A serious difficulty with which the books of Aldus had to contend was the competition of the piratical copies of his editions which promptly appeared in Cologne, in Tübingen, in Lyons, and even so close at home as Florence.

In 1589 the guild of the printers, publishers, and booksellers of Milan was organized. The Stationers' Company in England had secured its

charter from Queen Mary in 1556, 33 years earlier. Like most of these trade guilds, its object was to restrict the trade to a certain privileged class, the professed aim being "the removal of great and detestable heresies," and the charter ordering "that no man should exercise the mystery of printing, except he was of the stationers' company, or had a license." The guild of the Venetian printers dated from 1548, and was the earliest association of the kind in Europe. The guild of Milan was, however, in certain ways the most important of these earlier organizations. It gave an important incentive to printing and to publishing; it secured a high standard for the quality of the work done, and its regulations tended to keep the business in the hands of a good class of men. The guild of printers and publishers in Paris was a direct development of the earlier guild of manuscript dealers, and, as has been stated, constituted a division of the university. The regulations which had controlled the work of the manuscript dealers, and the supervision and censorship of this work, were continued in France for the productions of the Paris printing-presses. The first publishing office in Paris was founded in 1469, at the request of two of the instructors of the Sorbonne, by Gerring, Krantz, and Friberger, from Constance, at that time an imperial city of Germany. The work of these bookmakers was carried on in one of the halls of the Sorbonne. Printed books had, however, been sold in Paris 7 years earlier. It was in 1462 that Fust brought from Mainz a supply of his folio Bible, copies of which he was able to sell for 50 crowns, while the usual price for manuscript work of this compass had been from 400 to 600 crowns. By the close of the century there were in Paris over fifty printing concerns. After Paris, Lyons was the city of France in which the production of printed books secured the earliest introduction and the most rapid development. The printer-publishers of Lyons showed themselves enterprising in more ways than one. They were free from the immediate supervision and control of the authorities of the University of Paris, and, as the history of the Paris press shows, the difficulties placed in the way of publishing undertakings by the bigoted and ignorant censorship of the theologians must have more than offset the advantages usually to be secured in the production of scholarly publications through the facilities of the university and the editorial service rendered by its members. Paris was, however, fortunate in having among its earlier publishers a number of men whose interest in literature was that of scholars as well as of merchants. Gourmont (who established, in 1507, the first Greek press in Paris) and Badius Ascensius had produced before 1530 a long series of important classical works. The printer-publishers whose undertakings were, however, of the largest importance for the world of scholarship were the Estiennes or Stephani. They contributed no less than four generations to the publishing business. The work of the Stephani was carried on under exceptional difficulties—commercial, literary, theological, and political. Their books were, with a few exceptions, edited and supervised by the publishers themselves. No publisher except Aldus has ever contributed

to the issues of his press as much original scholarly work as is to be found in the books bearing the imprint of Robert Stephanus. Willem Janszoon Blaeu (q.v.) (1571-1638), his sons and grandsons, also deserve honorable mention among the Netherland publishers.

The name of William Caxton holds an honorable place in the early publishing undertakings, not only of England, but of Europe. The list of the books issued from his press was not very great, and the books themselves were much less important for scholarship or for permanent literature than the first publications of certain of the printer-publishers of the Continent. The fact, however, that through Caxton printing was introduced into England, and that he was the means of first utilizing for English readers the publishing, training, and scholarly interests which had been developed for him in the Low Countries, gave his work a distinctive importance. Caxton's first printing-press was set up in Bruges, and his first seven publications were there issued. The earliest volume printed in Europe in the French language was Caxton's edition of the Burgundian romance *Le Recueil des Histoires de Troye*. It was in 1476 that Caxton migrated to Westminster. His list of publications there was largely devoted to romances more or less similar in character to the book first issued from his press in Bruges. The demand at that time in England, as indicated by the lists of Caxton and of his immediate successors, for the classical and theological works which constituted so important a portion of the earlier publications of Venice, Paris, Mainz, and Cologne must have been much less considerable than abroad. The period of the beginning of Caxton's publishing business in London was one of political excitement and of civil war, and the times were not favorable for the selling of literature.

A publishing business which, while of no great moment from the commercial point of view, exercised an enormous influence on public opinion in Europe, was that instituted in Wittenberg in 1517, at the instance of Luther and Melancthon. Luther's first publisher was Johann Weissenberger, from Nuremberg, who printed a tract by him at Lanschott, in Bavaria, in 1517, and later in the same year the treatise on the Seven Penitential Psalms. Issues of the Lutheran press in Wittenberg followed each other with rapidity. The pamphlets that went out from this press, reprinted in other places by printers who were in sympathy with Luther's work, secured an enormous circulation. It is difficult at this time to understand how, with all the obstacles which existed at that time in making announcement of publications issued, it proved to be possible to bring these pamphlets into the hands of so many thousands of interested readers. The question was also not merely one of making known their existence, but of overcoming the impediments placed by the Church authorities in the way of their distribution. Thousands of copies were sold in the market-places, not only by booksellers, but by dealers of all kinds, many of whom had never before handled books. Large supplies were distributed by traveling peddlers among readers out of reach of the book-shops and the market-places. These popular tracts met the needs of

all classes, educated and uneducated, and secured a wider circulation than had heretofore been achieved by any religious works—or, for that matter, by any writings whatever. Luther made no profit from these sales. Every gulden that was paid for the books, every pfennig that came in for the fly-leaves or pamphlets, was at once expended in further printings and in instituting further distributing machinery.

One of the most noteworthy of the printing houses of the Sixteenth Century was that established in 1555 by Christopher Plantin, in Antwerp. His publications were distinguished not only for the perfection of their typography, but for the beauty of the illustrations, chiefly produced by engraving on copper plates. The books produced in the Low Countries, even during the manuscript period, had always been distinguished by their artistic effectiveness. The illuminations in the manuscripts prepared in Bruges and in Liège were the finest that the world had as yet seen. The same interest in the ornamentation of literature persisted in the Low Countries after the printing-press had replaced the work of the *scriptorium*. For a quarter of a century after 1555, Plantin's publishing house was the most considerable in Europe. In 1557 his consignment to the Frankfort Fair comprised no less than 1200 volumes, together with a large assortment of prints from copper plates. The publishing business founded by him continued in the hands of his descendants until 1867, and had thus a continuous existence of nearly three centuries. In 1867 the 'plant' was purchased by the city of Antwerp, and the Plantin Museum was instituted.

The Elzevirs of Leyden and Amsterdam, whose work continued during the century between 1587 and 1688, were the most noteworthy publishers of Holland, and the repute of the books issued from the Elzevir Press has continued to the present day. While the fame of Plantin had rested chiefly on his illustrated volumes, the reputation of the Elzevirs was connected more particularly with the classical publications produced by their press. They had the advantage of a community of scholars whose services could be secured at moderate cost for the editing of the long series of classical texts which bear the Elzevir imprint. Their catalogues presented also the names of a number of contemporary writers whose works have achieved an abiding fame, among them Descartes, Galileo, Grotius, Salmasius, Heinsius, Hobbes, Spinoza, and Molière.

The book trade of Germany was first organized by the institution, in 1480, of a division of the Frankfort Fair for the sale of printed books. For many years before this date, this fair had been the centre of an active trade in many classes of goods, including not only manuscripts produced in Germany, but also those from the Low Countries, France, and Italy. After 1480 the printer-publishers secured an apportionment of space in the buildings assigned for the fair, which was utilized for semi-annual gatherings. It was not only the German booksellers who made use of this machinery. The Estiennes and the other leading publishers of France, Plantin and his associates of Antwerp, the Elzevirs of Holland, and the leading dealers from Italy, all found it to their advantage to

be represented there at least once, and frequently twice, a year. From the beginning of the Sixteenth Century Leipzig came into importance as a book-producing and bookselling centre, and the rulers of Saxony took an early interest, through the encouragement of the book trade, and through liberal regulations concerning censorship of the press and a recognition of property rights in the books produced, to further the undertakings of the printer-publishers of Saxony.

In the beginning of the bookmaking industry, it was understood without further specification that the printer was also the publisher of the works coming from his press. Soon, however, we find associated with his undertakings the names of partners, who had nothing directly to do with the book-manufacturing, but who contributed their aid, either for the sake of literary development or for some other motives apart from that of business profit; and in the list of such associates occurred the names of nobles, ecclesiastics, and wealthy scholars. The period of 1650-1764 witnessed the growth of the system of book exchange under which publishers, in disposing of their productions, were obliged to accept in payment the stock of other publishers, so that the market value of books came to be measured in other books. This method, if it did not add very promptly to the receipts of the dealers, had at least the advantage of facilitating the distribution of books and of furthering the organization of the book trade. The first general catalogue of the books offered at the Frankfort Fair was printed in 1564; of the Leipzig Fair, in 1595. Catalogues of individual dealers, however, were published soon after the invention of printing, and more than a score from the Fifteenth Century are still extant, the oldest of which is that of Johann Mentelin (Strassburg, 1460). The operations and results of the Thirty Years' War (1618-1648) had much to do with the transfer of the centre of the book trade from Frankfort to Leipzig, but a large factor in the matter was the increasing intellectual activity of the Protestant States of north Germany, as compared with the southern, which remained under the restrictions imposed by the Catholic authorities. The German publishers and booksellers have all along had the advantage of a more effective organization than that of any other country, under which there has been, with the smallest possible tax on readers, a larger return than elsewhere for the work of writers, and more stable and less speculative conditions for both sellers and purchasers of books. The Leipzig 'fairs' are still held annually; after they ceased to be actual occasions for exposing the books for sale, they were long the scene of the settlement of the year's business, and are still important reunions of all the publishing interests. Every bookseller in Germany, Austria, and Switzerland has a representative in Leipzig, as the centre of the trade for those countries, and an official organ has been published there since 1834; daily since 1867. Other smaller gatherings similar to the Leipzig Fair occur in Stuttgart, for south Germany, and in Vienna, for Austria-Hungary. While the modern trade is nowhere so elaborately organized as in Germany, all the principal European countries have their associations. In England there are

the Associated Booksellers of Great Britain (1874), the London Foreign Booksellers' Association (1895), and the Publishers' Association (1896). Stationers' Hall, in London, is the headquarters of the business, and the *Publishers' Circular* and the *Bookseller* are its recognized organs. The *English Catalogue* has, since 1835, furnished an annual list of all books published in the United Kingdom. The principal French association is the *Cercle de la Librairie*, whose organ is the *Bibliographie de la France* (1811). Italy has its *Associazione Tipografico-libreria Italiana*, publishing the *Bibliografia Italiana*.

The English book trade was finally released from the earlier restrictions in 1738, and began to develop rapidly. A number of Eighteenth Century booksellers have left behind them a reputation for literary as well as business ability. Michael Johnson (1656-1731), father of the great lexicographer, used to travel from town to town with a stock of books which he sold at auction. Andrew Millar (1707-68) was the publisher of Thomson and Fielding, and had a large share in Johnson's Dictionary. Dibdin calls Thomas Osborne (fl. 1738-67) "the most celebrated bookseller of his day." Some idea of the profits of the business in this period may be gained from the statement which in his old age he used to make with pride, that he had been in business more than forty years and was worth more than £40,000. That these profits were not always easily made, is recalled by the story of Osborne's being knocked down by Dr. Johnson with a folio *Biblia Græca Septuaginta* (Frankfort, 1594). His name appears on a number of title-pages as a shareholder with several other publishers, according to the sociable custom of those days, which gradually died out as the spirit of competition gained ground. A late analogy to this method may be found in the history of the 'Friends of Literature,' an association of booksellers which existed from 1805 to 1811, and during that time published a number of large editions, which were for the most part divided among the members, though sometimes other booksellers were allowed to hold shares in these undertakings. Bernard Lintot (1674-1735), the publisher of Pope's Homer, and Robert Dodsley (q.v., 1703-64), with his brother James (1724-97), are also conspicuous figures in this era. The novelist Richardson (q.v.), as a printer, and in 1754 master of the Stationers' Company, has a place here. Charles Rivington (1688-1742) founded the famous house to which he left his name, and gave it the somewhat theological character which it long retained. (See also RIVINGTON, JAMES, and consult Rivington, *The Publishing House of Rivington*, London, 1894.) Thomas Longman (q.v., 1699-1745) founded another business, which, like that of the Elzevirs and Stephani, was continued from generation to generation; and a third dynasty was begun by John Murray (q.v., 1778-1843). The great university presses, the Clarendon (q.v.) at Oxford, and the Pitt (q.v.) at Cambridge, have published a vast number of books, largely classical texts, in a uniformly scholarly manner.

There is some controversy as to the placing of the honor of producing the first book published on the American Continent. It is asserted that a printer subsidized by Mendoza printed the *Spiritual Ladder* of Saint John Climacus in Mex-

ico, in 1532; but a counterclaim is put in for another Mexican publication of seven years later. a *Compendium of Christian Doctrine* in Spanish. A hundred years after the publication of this latter work, we come to the beginning of printing in the English colonies in America. In 1639 Stephen Daye printed the *Freeman's Oath* and an *Almanack* at Cambridge, Mass.; and in the following year appeared the famous Bay Psalm-Book (q.v.), which is now worth more than its weight in gold. This Cambridge Press turned out one book a year for the next twenty-one years. Apart from these origins, the history of publishing and bookselling in America may be divided into four periods: (a) the Colonial period; (b) from the Revolution to 1820; (c) from 1820 to 1860; (d) from 1860 to the present time. The selling of books, mostly imported, was usually combined with that of other wares; thus Benedict Arnold sold books and drugs. The early publishers were all primarily printers, and book-publishing was merely an incident in their business. Most of them published newspapers; a thorough account of their work is given in North, *History and Present Condition of the Newspaper and Periodical Press of the United States*, a part of the report of the Tenth Census (Washington, 1884). The second period was the real beginning of the American publishing business in any modern sense. The first book-trade organization was effected through the efforts of Mathew Carey. The principal object was to introduce annual gatherings similar to the Leipzig book-fairs. Several such meetings were held, the last one in Elizabethport, N. J., this place being selected for the meeting on account of its central position in the inadequate traveling facilities of the time. These book-fairs were succeeded by the 'trade sale,' held twice a year, first in Philadelphia and later in New York; the heads of publishing houses themselves stood on the platform and sold their books only to members of the trade. The system decayed when people who were not legitimate booksellers gained admission, and indulged in reckless underselling and speculation. A final attempt to go back to the 'book-fair' arrangement was made in 1877, but it was too late, and the system quietly died out in the eighties. Throughout the second period, whose production Sydney Smith characterized in his famous question, "Who reads an American book?" the greater part of the business done in the United States consisted in the importation of English books; and in the third, probably more than half the titles comprised in the American catalogues were the works of English authors, reprinted usually (in spite of honorable exceptions) without compensation. This period, however, was really the golden age of American publishing, and witnessed the foundation of a number of the famous houses. The following dates may be given for the foundation of some of the more famous: Methodist Book Concern, 1789; Harper & Brothers, 1817; D. Appleton & Co., 1825; J. B. Lippincott & Co., 1835; G. P. Putnam's Sons, 1836; Little, Brown & Co., 1837; Dodd, Mead & Co., 1839; Charles Scribner's Sons, 1846. Stereotyping was introduced into the United States in 1813, and lithography in 1819. These mechanical improvements, together with the gradual development of transportation facilities, gave a great impetus to the American book

trade, which, since 1860, has reached enormous proportions. Editions running to several hundred thousand are familiar phenomena of the present day, and may be accounted for not only by the immense increase in the numbers of the reading public, but also by the improvements in advertising methods. See ADVERTISING.

Among the later developments the most notable is the formation, in 1901, of the American Publishers' Association and the American Booksellers' Association, two organizations that co-operate in maintaining the advertised retail price of copyright books, which are now put out at a price about 20 per cent. less than before the formation of these societies.

A large increase in the volume of the English book trade followed upon the foundation of Mudie's Circulating Library, in 1842, its orders frequently amounting to several thousand copies of a single work, and the total number of volumes in it being counted by millions, although the surplus copies of popular books are usually disposed of to smaller libraries when the first demand is over. In this connection it is natural to speak of the practice (common in England throughout the latter half of the Nineteenth Century, and generally abandoned at its close) of publishing nearly all novels originally in three volumes, which largely increased the number of volumes published. The railway bookstall business, conducted for so many years all over England by W. H. Smith & Sons, was another characteristic feature of book distribution in England during the Nineteenth Century. Statistics show a steady increase in the number of works annually published. In 1901 this reached the large total, in the United States, of 5496 new books and 2645 new editions; in England, of 4955 new books and 1089 new editions. The English figures, probably owing to temporary causes, are the lowest for several years: thus the number of new books was 5760 in 1900, and reached 6244 in 1897.

The business of selling books at second hand is a special branch, requiring a large amount of bibliographical knowledge, and bringing in profits frequently out of all proportion to the original investment. It developed to large proportions in the Nineteenth Century, owing to the growth of systematic collection of books, especially first editions. The famous sale of the Duke of Roxburghe's library occurred in 1812. Among the treasures which that library contained was the only known perfect copy of the earliest dated edition of Boccaccio's *Decameron* (Christ. Valdarfer, Venice, 1471). After a spirited competition with Lord Spencer, Lord Blandford purchased it for £2260, a higher price than had ever been paid for a single book. Books of the first printers, especially Gutenberg and Fust, bring enormous prices. One of their Bibles (called Mazarin, from the discovery of the first copy in Cardinal Mazarin's library) brought £2690 in 1873; and eleven years later a splendid copy on vellum was sold for £3900. At the same sale a beautiful Psalter (*Psalmorum Codex*), printed by Fust and Schoeffer in 1459, brought £4950. Caxtons also run high, the *Eneydos* going at £2350 in 1885. Many collectors are, however, satisfied with first editions of comparatively recent writers; the first obscure publications of authors afterwards famous are also in great demand. In 1900 Poe's *Tamerlane and Other Poems* (Boston, 1827), of which only three copies

are known to exist, sold for \$2050. Other recent noteworthy sales are those of the Pickering edition of Walton's *Compleat Angler*, at \$2870; of *The Troublesome Raigne of John, King of England* (1591), at £510; a first folio Shakespeare (1623), at £1720, the record price for this book; and Bunyan's *Pilgrim's Progress*, Part I., first edition, at £1475. The beautiful books from William Morris's Kelmscott Press, usually reproductions of the old masters, are much sought after. In 1901 a Chaucer on vellum (1896) sold for £510.

BOOKWORM. A name given to the larva or grub of several beetles closely related to the death-watch (q.v.). These grubs may feed on the paste, paper, and binding of books. M. Peignot, the French bibliophile, relates that he once found twenty-seven volumes pierced completely through by a single bookworm. See Blades's *Enemies of Books*, chap. vi. Books are liable also to be injured by other insects that do not have a grub stage—for example, the imported cockroach (*Blatta*) called the crotonbug, a pest introduced from Europe to the United States; the book-lice (*Psocidæ*); and the silver-fish (*Lepisma*).

BOOKLAK. See BULAK.

BOOLE, BOOL, GEORGE (1815-64). An English mathematician and writer on logic, born in Lincoln. At the age of 16 he became assistant master in a Doncaster private school, and subsequently established a school of his own in Lincoln. In 1849 he was made professor of mathematics at Queen's College, Cork, where he died. He is best known, perhaps, for his contributions to logic. His first publication on this subject appeared in 1847, under the title, *Mathematical Analysis of Logic*, and was followed in 1854 by a more extensive work bearing the title, *An Investigation of the Laws of Thought on which are Founded the Mathematical Theories of Logic and Probabilities*. The latter work forms a complete exposition of his original method of applying mathematics to logic. According to this method, classes of objects and ideas are denoted by mathematical symbols, to which are applied the ordinary rules of algebra,

so that the results of logical reasoning may be arrived at by an almost purely mechanical process. Much more valuable, however, are Boole's contributions to mathematics. The modern theory of invariants may be said to date from a memoir published by him in the *Cambridge Mathematical Journal* in 1841, and he was among the first to contribute to the general theory of covariants. His two larger mathematical works, the *Treatise on Differential Equations* (1859) and the *Treatise on the Calculus of Finite Differences* (1860), are standards on their respective subjects. His special contributions were published in several scientific periodicals. A list of these papers may be found in the Royal Society's *Catalogue of Scientific Memoirs*.

BOOM, bôm. A town of the Province of Antwerp, Belgium, about 10 miles south of the city of Antwerp (Map: Belgium, C 3). Its situation at the junction of the Brussels Canal with the river Rupel makes it a place of considerable commercial importance. It has numerous and extensive brick and tile works, breweries, tanneries, ship-building yards, rope-works, sail-cloth manufactures, salt-works, etc. Population, in 1890, 14,100; in 1900, 15,700.

BOOM (Dutch *boom*, Ger. *Baum*, tree, beam). A long pole or spar used to extend the foot of certain sails of a ship; as the *main-boom*, *jib-boom*, *studdingsail-boom*. Some of the booms are stationary; others are pivoted at one end, the other being controlled by guys or sheets, and others like the studdingsail-booms which are only occasionally used, rig in and out by means of tackles. The space in the waist of a vessel of old type and used for stowing boats and spare spars is called the *booms*. To *boom off* a vessel or boat is to shove it away with spars. The term boom is applied also to a chain of floating logs fastened together at the ends and stretched across a river, etc., to stop floating timber. Hence, the name is adopted in military usage to denote a strong barrier, as of beams, or an iron chain or cable fastened to spars, extended across a river or the mouth of a harbor to prevent an enemy's ships from passing. Such a boom should be protected by a battery or batteries, and the approaches thickly planted with submarine mines. It is considered best to have booms made double, one to stop the way of ships that have penetrated the first. A chain for this purpose was stretched across the Hudson River at West Point during the American Revolution. The Russians effectually closed the harbor of Sebastopol with a boom defense in 1854, thereby preventing the entrance of the English and French ships. This was done partly by sinking some of their own ships, and partly by the laying of booms. Some of the most gallant and daring pieces of work that have been done by seamen have been in connection with blowing up or cutting away booms in order to make a free passage for the vessels of the fleet. During the American Civil War, when Farragut's fleet attacked New Orleans, formidable chains stretched across the river, and buoyed up by bulks, were first encountered and destroyed. The torpedo-netting of steel wire or rings used to protect a ship from torpedoes which may be discharged toward it, is held

suspended 20 or more feet from the ship by means of a series of hinged booms.

BOOMERANG (native name in New South Wales; *bumarin*, *womurrang*, among the designations for a club). A curved missile of the Australians made of the green wood of the acacia or some other hard tree treated with fire. The

BOOMERANGS AND BOOMERANG-SHAPED CLUBS
(In the British and Berlin Museums).

boomerang averages $2\frac{1}{2}$ feet in length and 2½ inches in width, is convex on one side and flat on the other, with a sharp edge along the curve convex. When thrown with a certain movement of the hand (the grasping end is marked by incised lines, etc.), flat side down, convex side forward, this weapon will, after traveling some distance, return in a sort of ellipse almost to the feet of the thrower, who is also able to vary its course considerably. In Australia the shape, use, and power of the boomerang vary greatly—it ranges all the way from a mere toy to a large and powerful war weapon. It is sometimes ornamented in simple fashion. Boomerang-like objects are claimed by some to have existed in ancient Assyria, Egypt, and elsewhere far outside of the Australian area, and Schoetensack (1901) has even claimed certain bone objects belonging to prehistoric man in western Europe as boomerangs; but all this remains to be proved. Of late years the boomerang has been the subject of mathematical and physical experimentation, and an excellent paper by Mr. G. T. Walker, "On Boomerangs," is to be found in the *Philosophical Transactions of the Royal Society* (London, 1897).

BOOMSLANGE, bôm'släng-e (Dutch *boom*, tree + *slang*, Ger. *Schlange*, snake). A beautiful South African tree-snake (*Bucephalus capensis*), so variable that it has furnished several supposed species to zoölogy, and regarded as poisonous, though possessing no venom-glands.

BOONE. A city and the county-seat of Boone County, Iowa, 43 miles north by west of Des Moines; on the Chicago and Northwestern and Chicago, Milwaukee and Saint Paul railroads (Map: Ohio, D 2). It is in a region which abounds in coal, clay, and timber; and has an extensive trade in coal, grain, agricultural produce, live stock, and lumber. The industrial establishments include flour-mills, brick and tile works, potteries, etc. There are also extensive shops of the Chicago and Northwestern

Railroad. The city has a public library of over 5500 volumes, an opera house, and a hospital. Population, in 1890, 6520; in 1900, 8880.

BOONE, DANIEL (1735-1820). A famous backwoodsman and pioneer. He was born in Bucks County, Pa. About 1752 his family moved to Holman's Ford, on the Yadkin, in North Carolina, where Daniel Boone became remarkably proficient as a hunter and trapper, and, for a time, attended school. He soon became restive under the restraints of civilized society, and, fired by the tales of John Finley, a trapper who had visited the Kentucky River in 1767, entered the wilderness with five companions and spent two years (1769-71) roaming through the unknown forests. His companions were soon captured or killed by the Indians and he himself, together with a brother who had joined him in January, 1770, had many narrow escapes. In 1773 he started for eastern Kentucky with five families besides his own, but was forced to turn back by an Indian attack, and in 1774 served on the frontier during Lord Dunmore's War. In 1775, as agent of a North Carolina company, he built a fort on the site of the present Boonesboro, Ky., whither, soon afterwards, he brought his family. This fort was twice attacked, in 1777, by a large force of Indians, who, however, failed to capture it. Early in 1778 Boone led a party of 30 to the Lower Blue Licks on the Licking River to secure a supply of salt. Here, February 7, he was captured by a band of Indians, who, after taking him to Detroit, finally adopted him and allowed him such freedom that he managed to escape (June 16), and reached the fort at Boonesboro five days later, in time to help defend it (August 8) against an Indian attack. (See **BOONESBORO**.) He then went to North Carolina, but in 1780 returned, and in 1782 took a prominent part in the 'Battle of Blue Licks.' He lost his Kentucky land through defective titles and moved, about 1790, to the Kanawha River, near Point Pleasant, Va., where he lived until 1795, when he again moved, this time to the Femme Osage settlement, in Spanish territory, about 45 miles west of Saint Louis. From 1800 to 1804, under a commission from the Spanish authorities, he was commandant of the Femme Osage District. After the purchase of Louisiana by the United States he was again involved in litigation, and ultimately lost nearly all his Missouri land. He died, and was buried in Missouri, but in 1845 his remains were re-interred near Frankfort, Ky. Boone has come to be regarded as the typical pioneer. He was bold and venturesome, insensible to fear, remarkably skilled in woodcraft, a fine marksman, and a successful trapper. Personally, he was mild-mannered, quiet, and unassuming. An account of his life, based on his own relation, was written by Filson in 1784. Consult also lives, by J. M. Peck, in Sparks's *American Biography* (New York, 1856); and by W. H. Bogart, *Boone and Kentucky Hunters* (Auburn, 1854).

BOONE, WILLIAM JONES (1811-64) An American clergyman, first missionary bishop to China of the Protestant Episcopal Church. He was born at Walterborough, S. C., graduated at the College of South Carolina in 1829, was admitted to the bar, but relinquished law, and in 1837 was ordained priest of the Protestant Episcopal Church. In 1844 he was consecrated missionary bishop. He was a profound scholar

in the Chinese language and literature, translated the Prayer-Book, and was prominent in the revision of the Chinese scriptures.

BOONESBORO, böönz'bör'ö. A village in Madison County, Ky., on the Kentucky River, about 18 miles southeast of Lexington (Map: Kentucky, G 2). In 1775 Daniel Boone built his first fort here, and later in the year a land office was opened and the first legislature which ever assembled beyond the Alleghanies met here. In April and July, 1777, and in August, 1778, the fort was unsuccessfully attacked by the Indians.

BOONTON, böön'ton. A town in Morris County, N. J., 10 miles northeast of Morristown; on the Rockaway River, the Morris Canal, and the Lackawanna Railroad (Map: New Jersey, D 2). It is picturesquely situated among high hills, is popular as a suburban place of residence and a summer resort. The town has large iron-works, rolling-mills, drop-forge works, etc., and there are also important manufactures of agricultural implements, paper, paints, varnish, silk, and rubber. The Jersey City water-works, forming a large lake three miles long by a mile or more in width, are located here. Boonton was started by the establishment of a large factory, in 1831, by the New Jersey Iron Company. In Old Boonton, one mile distant, first settled about 1700, one of the first iron-works and the first slitting-mill in America were built, the latter in 1770. Population, in 1900, 3901.

BOONVILLE. A town and the county-seat of Warrick County, Ind., 17 miles east by north of Evansville; on the Southern Railway (Map: Indiana, B 4). It is the centre of an agricultural region, in which timber abounds and which contains also valuable mineral deposits, including coal, fire and pottery clay, and some gold. Population, in 1890, 1881; in 1900, 2849.

BOONVILLE. A city and the county-seat of Cooper County, Mo., about 40 miles northwest of Jefferson City; on the Missouri River, here crossed by a fine railroad bridge, and on the Missouri Pacific and the Missouri, Kansas and Texas railroads (Map: Missouri, E 3). It has an important river commerce, and there are manufactures of shoes, flour, carriages, etc. The city has some reputation as a summer resort; is the seat of the State Reform School for Boys; and contains Harley Park, comprising 15 acres. Founded in 1818, Boonville was incorporated in 1839, and is now governed under a charter of 1896, which provides for a mayor, elected every two years, and a city council. Here, on June 17, 1861, the Union General Lyon, with 2000 men, defeated the Confederates under Marmaduke, commanding a somewhat larger force of ill-organized volunteers. Population, in 1890, 4141; in 1900, 4377.

BOORDE, börd, **ANDREW** (c.1490-1549). An English traveler and physician, born near Cuckfield. He was educated at Oxford, and was early received into the order of Carthusian monks at the London Charterhouse. Disliking this rigid life, he went over to France, about 1528, to study medicine. He traveled extensively on the Continent, visiting the leading universities, and eventually reaching the Holy Land. His works comprise mainly the *Introduction of Knowledge* (c.1547), said to be the first printed hand-book of Europe, and to contain the first printed specimens of the Gypsy lan-

guage; the *Dyetary* (c.1542); *Breuyary of Health* (1547); *Book of Beards* (lost); and *Itinerary of England* (1735). He also issued prognostications, or almanacs. He was known as a wit and merry fellow, and for this reason he had fathered upon him the famous *Scogins Jest*s. Consult ed. Furnivall (for Early English Text Society), *The Introduction*, and *Dyetary* (London, 1870).

BOO'SA. See BUSSANG.

BOOSTER. See DYNAMO ELECTRIC MACHINERY.

BOOT. A lengthened variety of shoe, which is among the most ancient articles of attire. Shoes, extending a certain height up the leg, laced, ornamented, and of fanciful colors, were in use by the ancient Egyptians, Greeks, and Romans. A description of these and other varieties of shoes, as well as an account of the trade and manufacture of shoes and boots generally, will be found in the article SHOES, and below will be given a few historical particulars respecting what properly are called boots, meaning by the term leather coverings for both the legs and feet. Different kinds of half-boots were worn by the Anglo-Saxons and Anglo-Normans; and in the reign of Edward IV., if not earlier, the boot proper, with tops and spurs, was established as an article of knightly dress. In the reign of Charles I., a species of boot, exceedingly wide at the top, made of Spanish leather, came into use; and with Charles II. the highly decorated French boot was introduced as an article of Court attire. Meanwhile, the jack-boot, as it is called, had become indispensable in the costume of cavalry soldiers and horsemen generally; and it was regularly adopted in England by William III. and his followers. Strongly made, the jack-boot extended in length above the knee, was wide at the top, had a very high heel, and around the ankle had a flat leather band, by which a powerful spur was attached.

The jack-boot, a form of which is still used in the British Horse Guards and other European cavalry regiments, is almost entitled to be called the parent of the top-boot and other more or less similar styles. Boots with tops of yellow were so commonly worn by English gentlemen in the Eighteenth Century as to become a peculiarity in the national costume. When Philip, Duke of Orleans, and other revolutionists of note affected to imitate English sentiments and manners, they ostentatiously wore top-boots. Early in the Nineteenth Century English gentlemen habitually wore top-boots; but at the present time they characterize the apparel of coachmen, grooms, jockeys, and fox-hunters. The introduction of the Hessian boot as an article of walking-dress tended to break up the general use of top-boots, and, worn over tight trousers, it had an attractive and ornamental appearance. Boots of this shape, as may be seen from engravings, were worn by English general officers in the early part of the Napoleonic wars and somewhat later. At length they were superseded by the well-known Wellington boot, which, as its name signifies, was introduced by the great Duke to be worn under the loose military trousers. This species of boot has, in its turn, been almost entirely abandoned in consequence of the universal use of short ankle-boots or shoes. Boots are worn by cavalry and horsemen generally, and also are often to be seen in the rural districts of America and

Europe. They may be made of rubber and cloth, and in such form are used extensively by men working in water or damp places.

The word 'boot' is also used to indicate a leather flap fastened to the front or dashboard of a carriage to be drawn up over the lap of the rider as a protection from the rain.

BOOT, BOOTS, or BOOTIKIN. A Scottish instrument of judicial torture, formerly used to force confessions from persons accused of crimes, or answers from unwilling or suspected witnesses. Bishop Burnet, in the *History of his Own Time*, and Sir Walter Scott, in his *Old Mortality*, speak of the boot as made of iron: but the Rev. Thomas Morer, in his *Short Account of Scotland*, written from personal observation of the country at a time when the boot was still in use, describes it as "made of four pieces of narrow boards nailed together, of a competent length for the leg, not unlike those short cases we use to guard young trees from the rabbits." One or both legs of the person to be tortured having been placed in this case, wedges were inserted between the limb and the sides of the case, and these wedges were driven down by the executioner with a mallet or hammer, questions being at intervals put to the sufferer, until either he gave the desired information, or fainted away, or showed such endurance as satisfied the judges that no answer could be extorted from him. The wedges were commonly placed against the calf of the leg, but Bishop Burnet says he had heard that they were sometimes placed against the shin-bone. When the boot was first used is unknown. After 1630 it is said to have fallen into disuse for about 30 years. It was revived after the insurrection of the Westland Covenanters in 1666, and continued to be used throughout the reigns of Charles II., James II., and during the first years of William III. In 1600 Neville Payne, an English gentleman who was supposed to have entered Scotland on a treasonable mission, was put to this torture under a warrant superscribed by King William, and still shown in the register house in Edinburgh. This is believed to be the last time that the boot was used. Its further use was prohibited by act of Parliament. Under the name of 'Spanish boots,' a similar instrument was used in Germany. Iron boots, which were heated to an unbearable degree, are shown in some museums. Consult Bingham, *Bastille* (London, 1888), for the boot in France.

BOOTAN, bū'tān. See BHUTAN.

BOÖTES, bó-ō'tēz (Gk. *βοώτης*, ox-driver). A constellation near the Great Bear, also called by the ancients Arcturus, although this name is usually applied to the brightest star in it. Boötes is the driver of the Wagon (another name for the Bear), and was said to be the translated Icarus of Attica. As Arcturus, the constellation is regarded as the watcher of the Bear, and the son of Zeus and Callisto (q.v.), who, with his mother, was transferred to the stars.

BOOTH (Icel. *būf*, MHG. *buode*, Ger. *Bude*, AS. *būan*, to dwell). An unpretentious or temporary structure, either a dwelling or hut of boughs or canvas, or a tent. The name came to be used especially of the stalls or tents at fairs for the installation and sale of wares, for shows, or refreshments. Throughout Europe, in mediæval and later times, trade was carried on

chiefly by fairs, as is still the case in many regions. Then booths were set up in the main square of the town, or just outside the walls, in improvised streets. The term was afterwards applied to a fixed stand or shop in the marketplace for the weekly market day, and also to the permanent shops or warehouses. The religious and civil authorities gained considerable revenue from leasing the right to put up such booths. They must be distinguished from the shops that form a part of regular buildings. The porticoes and approaches of churches, the areas of ancient buildings, the spaces in public squares, and on bridges, were in time overcrowded with such booths, which, from being small, one-storied affairs, grew into real houses, with cellar storeroom, with rear workshop, and second-story bedroom. Thus a single apartment with a broad, unglazed show front, closed at night by a double wooden shutter, became the workshop and dwelling of the craftsmen. They sometimes began as 'squatters,' and efforts to dislodge them often led to trouble (e.g. at Bury Saint Edmunds, in 1192). In old London the most famous line of booths was on Cheapside, in Edinburgh on High Street ('the Boothrow'). As in the bazars (q.v.) of the East, the various trades were usually grouped together. In Italy this devoting of special streets to single trades still survives. The *Ponte Vecchio* at Florence has been given over to goldsmiths' booths ever since the Fourteenth Century.

BOOTH. The name of the heroine's husband in *Amelia*, a novel by Fielding. The character is vicious and petty, though somewhat autobiographic.

BOOTH, AGNES (1843—). An American actress. She was born in Sydney, Australia, and first appeared there as a ballet-dancer, but came to California when she was about 14 years old (1858). Her maiden name was Marion Agnes Land Rookes. In 1861 she became Mrs. Perry, in San Francisco, where she continued till 1865, attracting attention especially for her Hermione in *A Winter's Tale*. She came to New York in 1865, and appeared at the Winter Garden. The same autumn, at Niblo's Garden, she played with Edwin Forrest in a series of important rôles, including those of Julie to his Richelieu, and Desdemona and Ophelia. In 1866 she joined the Boston Theatre Company, of which she was a member for several years. In 1867 she was married to Junius Brutus Booth, Jr., its manager. Touring in 1874-76, she became well known as a star. In the spring of 1877 she made a great success as Cleopatra. From 1881 to 1891 she was with the Madison Square Company, among her popular parts being those of Nora in *Esmeralda* and Mrs. Ralston in *Jim the Penman*. Mr. Booth died in 1883, and in 1885 she became Mrs. John B. Schoeffel. After 1891 she left the stage and went to Europe, but upon her return resumed her work for a time, appearing from 1895 to 1897 in *The Sporting Duchess* and other pieces. Consult: Strang, in McKay and Wingate, *Famous American Actors of To-day* (New York, 1896), and Clapp and Edgett, "Players of the Present," *Dunlap Society Publication* (New York, 1899).

BOOTH, BALLINGTON (1845—). The organizer and leader of the 'Volunteers of America' (q.v.). He was born in London, the second son

of William Booth (q.v.), founder of the Salvation Army. In 1887 he was sent to the United States with his wife, Maud (born near London, in 1865), and had charge of the work in this country till 1896, when, disagreeing with his father's plan of operations in the United States and Canada, he withdrew from the Salvation Army and organized a similar body under the name of the Volunteers of America. In order to bring the work of the new organization into closer harmony with that of the various churches, he obtained ordination as a presbyter of the Evangelical Church in Chicago. Both he and his wife are fluent writers and eloquent speakers. He published *From Ocean to Ocean* (1890). See SALVATION ARMY; VOLUNTEERS.

BOOTH, BARTON (1681-1733). A celebrated English tragedian. He was of a Lancashire family, nearly related to Henry Booth, Earl of Warrington, and received a good education under the well-known Dr. Busby at Westminster, where he attracted notice by his acting in a Latin comedy (Terence's *Andria*). He was expected to enter the Church, but on being sent to Trinity College, Cambridge, he ran away in order to go upon the stage. Betterton (q.v.), to whom he applied, refused at first to help him, for fear of offending his family, and he went to Dublin, where he secured an engagement. Returning after some success to London, he was now received by Betterton, and appeared in Lincoln's Inn Fields as Maximus in *Valentinian*. He won immediate recognition. At Drury Lane, in 1708, he received immense applause as the ghost in *Hamlet*, a part in which he is said never to have had an equal. April 14, 1713, he acted Cato in Addison's tragedy, upon which he became quite the rage among the nobility, who vied with each other in placing their carriages at his disposal; and he frequently stayed over night at Windsor, where the Court was then held. This seems to have been in some degree due to the political conditions of the time, since Whigs and Tories both professed the most complete approval of the character of Cato; yet Booth won high critical commendation. Among his greatest parts were Brutus, Othello, and Henry VIII. In 1716 he published *The Death of Dido: A Masque*, and was the author of other poems. In 1728 he retired from the stage. He died at Hampstead, leaving a widow—his second wife, Hester Santlow, herself an actress of reputation. Consult: Victor, *Memoirs of the Life of Barton Booth* (London, 1733); Genest, *History of the Stage* (Bath, 1832); Cibber, "Life and Character of Barton Booth," in *Lives and Characters of the Most Eminent Actors and Actresses* (London, 1753); and Galt, *Lives of the Players* (London, 1831).

BOOTH, CHARLES (1840—). An English statistician and writer on social questions. He was born in Liverpool, March 30, 1840, and now resides in London, though a member of the business firm of Alfred Booth & Co., Liverpool. His work entitled, *Life and Labour of the People of London*, published in 10 volumes (1891-97), is a storehouse of accurate social facts, dealing chiefly with the people of East London, and has won for him world-wide renown from men of science as well as from practical legislators. Mr. Booth is a Fellow of the Royal Society (F.R.S.), and was president of the Royal Sta-

tistical Society, 1892-94. He has taken an active part in the agitation in England for old-age pensions, in the support of which he has written three very useful books: *Pauperism: A Picture: and the Endowment of Old Age* (1892); *The Aged Poor, Condition* (1894); *Old-age Pensions* (1899). See OLD-AGE PENSIONS; STATISTICS.

BOOTH, EDWIN THOMAS (1833-93). A distinguished American actor, the son of Junius Brutus Booth. He was born at Belair, Md., November 13, 1833, and early showed his studious temperament. Brought up to the stage by his father, he made his debut in Boston in 1849. In 1851 he took his father's place as Richard III. at the Chatham Square Theatre, New York. The next season they went to California, and after his father's return he remained in the West for several years, visiting also the Sandwich Islands and Australia (1854). He returned from California late in 1856, and after a tour in the South made, in Boston (April, 1857), an immense success as Sir Giles Overreach. Shortly afterwards he repeated his triumph in New York. There, also, he became acquainted with Mary Devlin, whom he married in 1860. She died in 1863. It was in 1861 that he first appeared in London, where, after playing Shylock and Sir Giles, he won great popularity as Riche-lieu. In 1863 he took control of the Winter Garden, New York, and there his productions of *Hamlet* and other Shakespearean plays were famously successful. After the assassination of Lincoln by his brother, John Wilkes Booth, he retired temporarily from the stage, but reappeared in New York in January, 1866. He married, in 1869, Mary McVicker, who lived till 1881. In 1860 "Booth's Theatre" was built, where his success for a time was both artistic and financial; but the panic of 1873 made him a bankrupt. His tours in the years that followed, however, amply restored his fortunes. In 1880, and again in 1882, he visited Europe, and was received with the most flattering distinction. Some time after his return he formed a partnership with Lawrence Barrett, with whom he continued to appear till the death of Barrett in 1891. He himself then retired from the stage. He was generally regarded as the leading American tragedian, and in a few great characters he was without a rival. His *Hamlet* was probably his most popular rôle, but his *Lear* and *Othello* were especially admired, besides other parts already mentioned. He was not a man of imposing bodily appearance, being rather below the medium stature; but his frame was compact, his carriage at once dignified and graceful, his eye piercing, his features grave. He was thoroughly absorbed in his parts, and his voice was under such complete control as to express, upon occasion, any shade of feeling, sentiment, or conviction. His rendering of familiar Shakespearean passages displayed a fine appreciation of their substance, and of the lights and shades of manner and expression by which their full meaning may be brought out. In his private life he was greatly esteemed. He was the founder and first president of the Players' Club, of New York, in the home of which, given by himself, he died, June 7, 1893. Consult: William Winter, *The Life and Art of Edwin Booth* (New York, 1894); Edwina Booth Grossman, *Edwin Booth; Recollections by His Daughter, and Let-*

ters to Her and to His Friends (New York, 1894); Asia Booth Clarke, *The Elder and the Younger Booth* (Boston, 1882).

BOOTH, JAMES CURTIS (1810-88). An American chemist. He was born in Philadelphia, and graduated at the University of Pennsylvania in 1829. He then remained one year at the Rensselaer Polytechnic Institute, and in 1832 went abroad. There were at this time no regular organized student laboratories at German universities, and Booth combined his studies of chemistry at Wöhler's private laboratory at Cassel. After further studies at Berlin, Vienna, and in England, he returned to Philadelphia, where, in 1836, he established a laboratory for instruction in analytical chemistry, the first of its kind in the United States. Many distinguished chemists, such as Campbell Morfit, R. E. Rogers, J. F. Frazer, Thomas H. Garrett, and R. T. McCulloh, were educated at this institution. Mr. Booth was professor of applied chemistry at the Franklin Institute from 1836 to 1845, and was superintendent of smelting and refining in the United States Mint at Philadelphia from 1849 to 1888, in which capacity he experimented with the nickel ores of Pennsylvania, introducing the fusion of that metal with other alloys in the coinage of cents during the year 1857. Among his principal works may be mentioned: *Annual Reports of the Delaware Geological Survey* (1839); *Encyclopædia of Chemistry* (in collaboration with Campbell Morfit, 1850); *On Recent Improvements in the Chemical Arts* (jointly with Campbell Morfit, 1852).

BOOTH, JOHN WILKES (1830-65). The assassin of President Lincoln. For several years he was an actor, but met with indifferent success and abandoned the stage in 1863. During the Civil War, he was a violent secessionist, and toward its close organized a conspiracy first for abducting the President, and later, for assassinating not only the President, but also the Vice-President and the members of the Cabinet. On the night of April 14, 1865, the President attended Ford's Theatre with his wife and several friends. About 10 P.M. Booth approached him unseen, and shot him through the head. Leaping from the box upon the stage, crying out "Sic semper tyrannis! The South is avenged!" he escaped by the stage door, where a horse was held for him. He had reached Bowling Green, near Fredericksburg, Va., before he was overtaken (April 26). Here he took refuge in a barn, and, refusing to surrender, was shot after the barn had been fired. Most of his accomplices were subsequently captured, and four of them, Powell, Atzerodt, Herold, and Mrs. Surratt, were hanged. He was the son of Junius Brutus Booth, and the brother of Edwin Booth.

BOOTH, JUNIUS BRUTUS (1796-1852). An English actor, on his mother's side a relation of John Wilkes, the English statesman. When a boy in London, where he was born, he learned printing, and after studying law, painting, and sculpture, received a commission as midshipman in the navy, but instead of going to sea he turned to the drama. He appeared on the provincial stage, December 13, 1813, and in London, in October, 1815, at the Covent Garden Theatre. Here, within two years, he became a rival of Edmund Kean, whom he greatly resembled,

though he more than once played Iago to Kean's Othello at Drury Lane. Booth gained great celebrity in Richard III. and Sir Giles Overreach; but he was taken with a fancy for travel, and, in 1821, arrived at Norfolk, Va. He spent most of the remainder of his life in the United States, where he was exceptionally popular, and esteemed by many critics to be the greatest tragedian of his time. Though his range of characters was not wide, the people never tired of the best of them, such as Richard III., Sir Giles, Lear, Shylock, Hamlet, and Iago. He was noted for his eccentricities, which, at times, verged upon insanity; and in acting he was so intensely carried away that the fencing in *Hamlet* and *Richard III.* became duels in which Richmond and Laertes were sometimes compelled to defend themselves in earnest. Consult: Clark, *The Elder and the Younger Booth* (Boston, 1882); and Gould, *The Tragedian: an Essay on the Histrionic Genius of Junius Brutus Booth* (New York, 1868).

BOOTH, MARY LOUISE (1831-89). An American journalist, translator, and miscellaneous writer. She early devoted herself to writing tales and numerous translations, among the most important of which were About's *King of the Mountains*; Cousin's *Secret History of the French Court* (1859); Pascal's *Provincial Letters*; Gasparin's *Uprising of a Great People* (1861); and *America Before Europe* (1861); Laboulaye's *Paris in America* (1865); and Cochin's *Results of Emancipation* (1862); and *Results of Slavery* (1862). All this work was done before the close of the Civil War, and, in the meantime, she had published a *History of the City of New York* (1859). During the war she maintained a vigorous correspondence with French friends of the Union cause and received encouraging praise from Lincoln, Sumner, and others. She translated also some fairy tales of Laboulaye and Macé, Martin's abridgment of his *History of France* (1880), and part of the original work. An enlarged edition of her *History of New York* appeared in 1861, and a second revision in 1880. Miss Booth was editor of *Harper's Bazar* from its beginning till her death.

BOOTH, MAUD BALLINGTON (CHARLESWORTH) (1865—). A leader of the Volunteers of America, wife of Ballington Booth (q.v.). She was born near London in 1865, the daughter of a wealthy clergyman, early became interested in the work of the Salvation Army, and, at the age of 17, left home and became a companion of Miss Catherine Booth in organizing a branch of the Army in Paris. There she remained two years, then went with a party of Salvationists to Switzerland, where, after suffering vicissitudes and even imprisonment, she finally succeeded in establishing a Salvation Army corps. In 1887 she married Ballington Booth, and, in accordance with the custom of the Army, assumed her husband's rank as marshal. In 1896 she withdrew with her husband from the Salvation Army and founded the Volunteers of America, of which he and she are directors.

BOOTH, WILLIAM (1829—). General of the Salvation Army. He was born in Nottingham, England, April 10, 1829. He became a minister of the Methodist New Connection, 1850; was appointed to hold special evangelistic services until 1861, when, being required to settle in the ordinary circuit work, he resigned and began his

labors among the churches as an evangelist. Finding that most of the inhabitants of London attended no place of worship, he began the 'Christian Mission,' 1805, which soon grew to be a large organization formed on military lines, and was in 1878 re-christened the 'Salvation Army' (q.v.). Under this name it has become widely known, and has grown to immense proportions. A weekly gazette, the *War Cry*, established in 1880, has a very large circulation throughout the world. General Booth has published several hymn and music books, *Salvation Soldierly*, and *In Darkest England and the Way Out* (1890), a work proposing ambitious yet practical schemes for alleviating poverty and suppressing vice; and his six eldest sons and daughters are all actively engaged in some branch of the service, while his younger children are in training for similar duties. (See SALVATION ARMY.) His wife, an enthusiastic coöperator (born 1829, died 1890), wrote *Practical Religion, Aggressive Christianity, Godliness, and The Salvation Army in Relation to Church and State*. For her biography, consult: Booth-Tucker (London, 1892) and W. T. Stead (New York, 1900).

BOOTHBY, GUY NEWELL (1867—). An English novelist. He was born at Adelaide, South Australia, October 13, 1867. He was educated in England, and has traveled through Australia and in the East. His novels, mostly tales of adventure, have been exceedingly popular. Among them are *Beautiful White Devil* (1896); *Dr. Nikola* (1896); *Billy Binks, Hero, and Other Stories* (1898); *Across the World for a Wife* (1898); *Pharos the Egyptian* (1899); *Love Made Manifest* (1899); *Dr. Nikola's Experiment* (1899); *A Sailor's Bride* (1899); *Long Live the King* (1900); and *The Viceroy's Protégé* (1901). See AUSTRALIAN LITERATURE.

BOOTHIA (booth'ia) **FELIX**. A peninsula about 150 miles long and with a greatest width of about 50 miles, forming the most northern part of the American continent (Map: Canada, M 2). Toward the south it contracts to a narrow isthmus, while on the north Belot Strait (q.v.) separates it from North Somerset Island. It was discovered by Sir John Ross during the most famous of his voyages (1829-33), and named after his friend, Sir Felix Booth, the chief contributor to the expedition. It was supposed at the time to reach as far north as Barrow Strait. Near Cape Adelaide, on the west coast, Sir John's nephew, Lieutenant, afterwards Sir, James Clark Ross, first located the northern magnetic pole on June 1, 1831. Consult Ross, *Narrative of a Second Voyage in Search of a Northwest Passage* (London, 1860).

BOOTHIA, GULF OF. An inlet of the Arctic Ocean separating Boothia Felix, in northern Canada, from Cockburn Island and Melville Peninsula (Map: North America, K 3).

BOOTH-TUCKER, EMMA MOSS (1860—). An officer in the Salvation Army. She was born at Gateshead, England, and is a daughter of Gen. William Booth (q.v.), and the wife of Commander Booth-Tucker. She holds the rank of consul in the organization, and exercises joint jurisdiction with her husband in the direction of the Army in the United States. She was in charge of the 'International Training Homes' of the Army from 1880 to 1888.

BOOTH-TUCKER, FREDERICK ST. GEORGE DE LATOUR (1853—). Commander of the Salvation Army in the United States. He was born at Monghyr, Bengal, India, and passed the Indian civil-service examination in 1874. After studying in London (1874-76), he was appointed to an official position in the Punjab, from which, however, he resigned in 1881 to join the Salvation Army. He inaugurated the Indian branch of that organization in 1882 and conducted it till 1891, when he went to London as secretary for the international work. Since March, 1896, he has been in charge of the United States division of the service, with headquarters in New York City. His works include: *Life of Gen. William Booth* (1898); *In Darkest India and the Way Out*; *Favorite Songs of the Salvation Army*. Commander Booth-Tucker has shown a remarkable executive ability, rare good sense, and tireless energy in his management of the affairs of the Salvation Army in the United States.

BOOTLE. A town in Lancashire, England, on the Mersey, and the Leeds-Liverpool Canal. Although an independent municipality, it is practically a suburb of Liverpool, which it adjoins on the north. About 110 acres of the Liverpool dock system, including some of the most important docks, are within the boundaries of Bootle. The town was incorporated in 1868. It obtains its water-supply from Liverpool. It owns an electric plant which supplies the current for lighting purposes and for motive power for street railways, which the corporation owns, but leases to the Liverpool corporation. The town maintains numerous parks, public baths, a gymnasium, and an isolation hospital. Among its educational institutions are a technical school, a public library, and a museum. It has foundries and grain-mills. Its increase in population has been very rapid. In 1881 it was about 27,000; in 1891, 49,200; and in 1901, 58,600.

BOOTS AND SADDLES. The bugle or trumpet call for cavalry or light artillery drill or other mounted duties. See **BUGLE AND TRUMPET CALLS**.

BOOTT, FRANCIS (1813—). An American composer, born in Boston, Mass., of English parentage. He studied music in Florence, and became honorary professor in the Academy of Fine Arts. His first work appeared under the name of Telford. Among his songs are Tennyson's *Break, Break, Break*; Longfellow's *Kyrie Eleison*; and Thackeray's *Rose upon the Balcony*. He has also composed a *Mass* for voices and orchestra; *Te Deum*; *Miserere*; *Maria Mater*; *The Sands o' Dee* (Kingsley's poem); and *We Two* to words of Jean Ingelow.

BOOT-TOPPING. In wooden ships not sheathed with copper it was the custom when far away from a dock—particularly in warm climates—to occasionally scrape off the grass, barnacles, and other matter adhering to the side in the vicinity of the water-line and apply a mixture of grease, sulphur, and tar as a temporary protection against worms. This operation was called *boot-topping*. The name is now applied to that portion of the hull of iron and steel ships which is below the load water-line, but above water under ordinary circumstances. It is commonly painted red. The frequent painting of this part of a vessel is not done

merely for the sake of appearance, but for preservation as well, the portion of the side which is sometimes wet and sometimes dry being much more liable to corrosion than the plating above or below it.

BOOTY (Ger. *Beute*, Dutch *buit*; cf. Icel. *byti*, exchange, barter, Sw. *byte*, barter, booty). In military usage, the property captured from the enemy. Booty is not recognized officially in the Army of the United States; though prize-money, its naval equivalent, is, anomalously enough, still a prominent feature of naval warfare, the naval blockade in the Spanish-American War (1898) and the battle of Santiago furnishing notable examples. The regulations concerning booty in the British Army are clearly defined, such booty being apportioned as the King, through his advisers, may direct. There are few regiments in the British service that have not among their regimental effects articles of more or less value, such as bric-à-brac, mess-plate, heathen deities, etc., taken from enemies. Booty of a more concrete and valuable description is collected, and afterwards sold, and the proceeds divided. By law, all booty is the property of the sovereign, and may, at his discretion or pleasure, be returned to the enemy or given to the captors. Similar laws obtain with all other European countries. The siege of Peking (Boxer uprising in China, 1900) may be cited as the best illustration of modern booty. After the defenses were rushed, and the city taken, civilians as well as the international troops seized anything and everything worth their while, and carried it away as booty. The peculiar nature of the campaign, however, and the world-wide criticism of the wholesale looting, induced most of the Powers concerned to return the booty to the Chinese Government. See **LOOT** and **PRIZE-MONEY**.

BO-PEEP, LITTLE. The little shepherdess whose story is a never-failing source of interest to the nursery world. The origin of the name and its application are unknown, but Halliwell, in his *Nursery Rhymes*, quotes from a ballad of the Seventeenth Century, which has the couplet:
 "Halle Englande ys nowght now but shepe,
 In everye corner they playe a boe-pepe."

BOPP, FRANZ (1791-1867). A German philologist. He was born in Mainz, September 14, 1791, began the study of Oriental languages in Aschaffenburg, and in 1812 went to Paris, where he was encouraged in his labors by Chézy, Silvestre de Sacy, and August Wilhelm von Schlegel. He afterwards visited London, to pursue further the study of Sanskrit, and in 1824 was appointed professor of philology and Oriental literature in the University of Berlin. His first publication, *Ueber das Konjugationssystem der Sanskritsprache* (Frankfort, 1816), proved epoch-making. This was followed by a Sanskrit grammar, a *Glossarium Sanscritum*, and editions of *Mahabharata*, in the original text, with a translation. His most important labors centred in several fragments of the great Indian epic, the analysis of the grammatical forms of the different languages of the Indo-Germanic family, through which he became the founder of the science of comparative philology. His great work is a comparative grammar of the Sanskrit, Zend, Armenian, Greek, Latin, Lithuanian, Old Slavic, Gothic, and German (*Vergleichende Grammatik*, etc., Berlin, 1833-52—a second edition, entirely

recast, was published in 1857, and a third was published after his death in 1868-71). An English translation by Eastwick was published in 3 vols., 1845-50. In his honor the *Bopp-Stiftung*, for the promotion of the study of comparative philology, was founded in Berlin in 1866. His library was purchased by Cornell University. He died October 23, 1867.

BOPPARD, bōp'pärt (ancient Bodobriga). A town in the District of Saint Goar, Prussia, on the left bank of the Rhine, 9 miles south of Coblenz. It is an ancient and picturesque walled town with dark, narrow streets and mediæval timbered houses. Among its notable buildings are the old castle of the Archbishops of Trèves, the tower of which is now utilized for the law courts; the Pfarrkirche in late Romanesque, dating from the Twelfth Century; the Gothic Carmeliterkirche of the Thirteenth Century containing interesting sculpture and paintings, and the famous hydropathic establishment, the Marienberg, occupying a former Benedictine nunnery. Boppard is of Celtic origin; it was fortified by the Romans as a depot for their slingers, "Balistarii Bodobricæ," and important remains of Roman walls and fortifications exist. Boppard was a free Imperial city in the Twelfth Century, and many councils were held there. Population, in 1900, 5806.

BOB, bōr, PIETER CHRISTIAENZON (1559-1635). A Dutch historian, born in Utrecht. He studied history extensively, and in 1615 was appointed historiographer of Holland and West Friesland. His most important work is the *Oorsprong, begin, ende vervolg der nederlandsche oorlogen* (The Causes, Beginning, and Course of the Wars of the Netherlands, 1679), in the preparation of most of which he had access to the archives of the Dutch States. In style, the work is little more than a monotonous chronicle, but as a source-book it is highly valued.

BORA. The north wind of Southern Europe.

BORA, KATHARINA VON (1499-1552). The wife of Luther, daughter of Anna, of the Haugwitz family. She was born at Klein-Laussig, near Bitterfeld, Saxony, on January 29, 1499. When 10 years old, she entered the Cistercian Convent of Nimptsch or Nimbschen, near Grimma. Becoming acquainted with Luther's doctrines, she found herself very unhappy in her monastic life; and finally, along with eight other nuns, whose relatives, like her own, refused to listen to them, she fled from the convent, with the knowledge of Luther and the active assistance of Leonard Koppe, a member of the city council of Torgau on the nights of April 4 and 5, 1523. They arrived in Wittenberg on April 7. Luther took up a collection for them and wrote to their relatives, who declined to receive them. He then arranged for them to live with honorable people. Katharina became an inmate in the house of the burgomaster Reichenbach. Luther, through his friend, Nicholas von Amsdorf, minister in Wittenberg, offered her the hand of Dr. Kaspar Glaz, pastor in Orlamünde. She declined this proposal, but declared herself ready to marry Von Amsdorf, or Luther himself, who had already laid aside his monastic dress, and was living by himself in the deserted Augustinian monastery. There her marriage with Luther took place on June 13, 1525. The ceremony was performed by Bugenhagen, the city pastor, in the

presence of a few friends. There was a wedding breakfast the next morning, also, with a small company; but on June 27 there was a more formal celebration of the event, to which Luther's parents, Katharina's companions in flight, and other friends of both parties, were present. In his wife Luther found an affectionate and faithful helpmeet. Six children were born to them: (1) Hans, or Johannes, born June 7, 1526; (2) Elizabeth, born December 10, 1527, died August 3, 1528; (3) Magdalena, born May 4, 1529, died October 20, 1542; (4) Martin, born November 7, 1531; (5) Paulus, born January 28, 1533; (6) Margareta, born December 17, 1534. After Luther's death the Elector of Saxony and Christian III. of Denmark contributed from time to time to Katharina's support. She was involved in the losses and disasters of the Schmalkald War, and was for a while very poor. She fled from Wittenberg to Torgau to avoid the plague, but on the way met with an accident, and sickened and died at Torgau, on December 20, 1552. For her life, consult: F. G. Hofmann (Leipzig, 1845); A. Stein, pseudonym for H. Nietschmann (Halle, 1879; 3d ed., 1886); A. Thoma (Berlin, 1900).

BORACHIO, bō-rā'chō. A base character in Shakespeare's *Much Ado About Nothing*. He is a follower of Don John, and gives the slanderous evidence against the Lady Hero, on which part of the plot hinges. He is the lover of Margaret, the latter's waiting-woman.

BORACIC (bō-rās'ik) **ACID**. See BORIC ACID.

BORACITE (from *borax*). A magnesium chloroborate that crystallizes both in the isometric and the tetrahedral systems. It is usually white, although sometimes found in gray, yellow, or green shades, due probably to slight impurities. The principal localities in which it is obtained are in the vicinity of Lüneburg, Hanover, in Holstein, several places in France, and in Stassfurt, Prussia, where a massive variety occurs. It has been prepared artificially by Heintz.

BORAGE, bū'āj (Low Lat. *borrago*, from *borra*, *burra*, rough hair), *Borago*. A genus of plants of the natural order Boraginaceæ, having a wheel-shaped corolla, the mouth of which is closed with five teeth, and forked filaments, of which the inner arm bears the anther, the anthers connivent around the style, in the form of a cone. The species are few, chiefly natives of the countries around the Mediterranean Sea. The common borage (*Borago officinalis*) is found in waste places in many parts of Europe, and is pretty frequent—perhaps naturalized—in Great Britain, and introduced into various parts of the United States. It is a plant of rather coarse appearance, with a stout, erect herbaceous stem, one to two feet high, somewhat branched; the lower leaves elliptical, obtuse, tapering to the base; the stem, leaves, flower-stalks, and calyx rough with hairs. The flowers are more than half an inch broad, of a beautiful blue color. Borage was formerly much cultivated and highly esteemed, being reckoned among the 'cordial' flowers, and supposed to possess exhilarating qualities, for which it no longer receives credit. The belief in its virtues was at one time extremely prevalent in England, and its use accordingly universal. The flowers were put into

salads, Gerarde tells us (1597), "to make the mind glad"; and he adds: "There be also many things made of them, used everywhere for the comfort of the heart, for the driving away of sorrow, and increasing the joy of the mind." Like some other plants of the same order, borage contains nitrate of potash (nitre), and is slightly febrifuge. It is mucilaginous and emollient, and has been used in pectoral affections; its leaves impart a coolness to beverages in which they are steeped; and with wine, water, lemon, and sugar, enter into the composition of an English drink called 'cool tankard.' The young leaves and tender tops are pickled, and occasionally used for salad in parts of Europe. The flowers bear an abundance of nectar, and borage has quite a reputation as a bee plant.

BORAG'INA'CEÆ (Neo Lat. *Boraginaceæ*, pertaining to Borage; see BORAGE). A natural order of dicotyledonous plants, consisting chiefly of herbs, but also containing a few shrubs and trees. The leaves are generally rough, with hairs which proceed from a thick, hard base, and the whole plant is mucilaginous and emollient. On account of the harshness and roughness of the plant, the name *Asperifoliæ* has been given to the order. The leaves are alternate and without stipules. The flowers are in spikes, racemes, or panicles which are almost always coiled up, and gradually uncoil and elongate themselves, the flowers expanding in succession. The calyx is 4- to 5-partite, and remains till the fruit is ripe; the corolla, is generally regular, 4- to 5-cleft, imbricated in bud; the stamens rise from the corolla, and are equal in number to its divisions, generally five, and alternate with them. The ovary is 4-partite, 4-celled; the style simple, arising from the base of the lobes of the ovary. The fruit consists of 4, or sometimes of 2, distinct achenia in some cases; the nutlets are often covered with hooked spines. Some botanists have divided the order into several groups, of which *Ehretioideæ*, with a succulent drupe-like fruit, and *Boraginoideæ*, with dry nutlets, are the most important. These are usually grouped together as sections of the one genus. There are about 1200 known species of *Boraginaceæ* embraced in 85 genera. They are natives principally of temperate and tropical climates, and are particularly abundant in the south of Europe and in the temperate part of Asia; Borage, Alkanet, Comfrey, Forget-me-not, and the exquisitely fragrant *Heliotrope* (qq.v.) are familiar examples. The drupes of some species of *Ehretia* are eatable. Among the best known genera of this family are *Cordia*, *Borago*, *Heliotropium*, *Cynoglossum*, *Echinosperrum*, *Anchusa*, *Alkanna*, *Symphytum*, *Lithospermum*, *Echium*, etc.

BORÅS, bō'rās. A town of Sweden, situated on the Wiskan River, 36 miles east of Gothenburg. The town has a technical institute and school for weavers, and is a textile centre (Map: Sweden, E 8). Population, in 1901, 15,837. It was founded in 1622 by Gustavus Adolphus.

BORAS'SUS PALM. See PALMYRA PALM.

BORAUEN, bō'rou-ān'. A town of Leyte, Philippines, situated 26 miles from Tacloban. Population, in 1898, 21,290.

BOR'AX (Ar. *bōraq*, *būraq*, Pers. *būrah*), or SODIUM BIBORATE. A substance crystallizing in

the monoclinic system. It occurs native as a saline efflorescence on the shores of a series of lakes, covering a large extent of country, in Ladak, Ceylon, Transylvania, Peru, Chile, in Borax Lake, and other places in the vicinity of Clear County, Cal., and in various localities in Nevada. Borax is a clear, white, translucent crystalline compound, soluble in water, and having a pleasant, sweetish taste. It is prepared for commerce as follows: The crude material called *tincal*, from Tibet, Asia, is sent on sheeps' backs over the Himalaya Mountains to Calcutta, and thence to Europe, where it is purified by washing with a solution of sodium hydroxide, dissolving in water, again treating with the caustic alkali to precipitate the earths, then evaporating the solution and allowing the borax to crystallize out. According to some authorities, *tincal* was brought by caravan beyond China by way of Babylon, Palmyra, to the Mediterranean ports, before the Christian Era. An important source of commercial borax is found in the volcanic rocks of Tuscany, Italy, where the process, invented in 1818, is as follows: Boric acid, either as vapor or solution, is added to a solution of sodium carbonate, which is dissolved in a covered lead-lined vessel, and heated with steam. The solution of borax thus obtained is evaporated until crystals form. The product on the Pacific Coast, which was discovered in 1864 at Clear Lake, and subsequently extended to other localities, is refined in Alameda, where the crude material is dissolved in water, and heated with sodium carbonate in a digester; the resulting solution is drawn into cooling and crystallizing tanks, where the borax forms on steel rods which are suspended in the vats. The product thus obtained is refined by successive crystallizations until the desired degree of purity is reached. The wholesale price in New York, which was 39 cents in 1864, has, in consequence of the production on the Pacific Slope, fallen to 7 cents, the consumption during this period having increased more than 500 per cent. Borax is extensively used for household purposes. It is also employed as a solvent for resins, albumens, fatty acids, and certain organic bodies; also as a detergent, loosening dirt without injury to the finest laces, and as an antiseptic and disinfectant. It also finds extensive application as a flux for the glazing of pottery and chinaware, and in the making of enamels. Its property of dissolving metallic oxides makes it useful in soldering metals. It is used as a flux in certain chemical processes, and as a reagent in chemical analysis. Finally, it is often used in medicine. In 1899, 40,714,000 pounds of borax, valued at \$1,139,882, were produced in the United States.

BORCHARDT, bōrk'härt, KARL WILHELM (1817-80). A German mathematician, born in Berlin. He studied at the University of Berlin and at that of Königsberg, under Jacobi, and in 1848 became a lecturer in the University of Berlin. In 1856 he was made a member of the Academy of Sciences, and assumed the editorship of the *Journal für die Reine und Unge wandte Mathematik*. His studies regarding determinants were particularly valuable. His complete works have been edited by G. Hettner under the auspices of the Academy of Sciences (Berlin, 1888).

BORCHGREVINK, bōrk'gre-vīnk, CARSTEN EGEBERG (1864—). A Norwegian scientist and

explorer, born in Christiania. He studied there and at the Royal Saxon School of Forestry, Tharandt, and in 1888 emigrated to Australia, where he was a surveyor in New South Wales and Queensland, and an instructor in languages at Coorwell College, New South Wales. In 1894-95 he accompanied a whaling expedition to the South Seas, and in 1895 presented to the Sixth International Geographical Congress, assembled in London, the results of his observations within the Antarctic Circle. On August 22, 1898, he set sail from London for the South Pole, in command of the *Southern Cross* expedition, organized by Sir George Newnes, proprietor of the *Westminster Gazette* and the *Strand Magazine*. He effected a landing at Camp Adare, South Victoria Land, on February 17, 1899, erected a station, and spent nearly a year there in exploration and scientific investigation. (The *Southern Cross* was sent to New Zealand on March 2, 1899, and returned on January 28, 1900.) The expedition mapped the coast about Robertson Bay; discovered a new island, which was named after the Duke of York; studied Antarctic flora and fauna; found the south magnetic pole to be in (approximately) latitude 73° 20' S., and longitude 146° E., and with sledges reached the 'furthest south'—latitude 78° 50'. Consult: Borchgrevink, *First on the Antarctic Continent* (1901).

BORDA, bôr'da', JEAN CHARLES (1733-99). A French mathematician, born in Dax, France. In 1756 he was made associate member of the Academy of Sciences for a paper on the movement of projectiles. In 1771 he was associated with Verdun de la Crenne and Pingré in proving the accuracy of chronometers. He also devoted much attention to the subject of ship-building, and suggested important improvements in the form of vessels. Along with Delambre and Méchain, he was a leading member of the French commission intrusted with the measurement of the meridian arc comprised between Dunkirk and Barcelona. He rendered essential service in the commission on the new system of weights and measures. He invented a new instrument for measuring the inclination of the magnetic needle; and his corrections of the seconds pendulum are still in use. He is best remembered, however, for his improvement of the reflecting circle, on which instrument he published a work in two volumes, *Description et usage du cercle à réflexion* (Paris, 1787).

BORDE, bôr'de, ANDREW. See BOORDE, ANDREW.

BORDEAUX, bôr'dô' (anciently, Lat. *Burdigala*, from, perhaps, a Celtic or Iberian source). One of the most important seaports of France, seat of an archbishop, and capital of the Department of Gironde (Map: France, F 7). It is beautifully situated in a plain on the left bank of the Garonne, about 60 miles from its mouth in the Atlantic. Ships of more than 1000 tons burden can easily ascend the river at high water to Bordeaux, which is accessible at all times to vessels of 600 tons. Its harbor is capacious, and counts a floating dock among its many facilities. Next to Havre, it is the chief port for the transatlantic trade, and is an important centre of the French cod-fishing ships for Newfoundland and elsewhere. The river is crossed by a noble bridge of 17 arches, 532 yards

in length, erected by the elder Deschamps in 1811-21. The old town, consisting partly of high wooden houses of the Fifteenth Century, has narrow, crooked streets; but the newer parts of the city and the suburbs have wide streets, fine squares, and pleasant promenades lined with trees. The Cathedral of Saint André, which was consecrated in 1096, is remarkable for its beautiful towers, 160 feet high. The Church of Sainte Croix is a Romanesque basilica of the Tenth Century; that of Saint Seurin is also very old. The former archiepiscopal palace is used as a town hall. The university numbers 100 professors and 2000 students. The city possesses a public library of about 200,000 volumes and 1384 MSS., including a MS. copy of Montaigne's essays.

The principal branches of industry include the production or manufacture of sugar, brandy, liquors, vinegar, nitric acid, printed calicoes, woolen goods, carpets, hats, paper, earthenware, glass bottles, metallic wares, and resinous articles. The rope works, cooperages, and dockyards are extensive and full of activity. The Canal du Midi, connecting Bordeaux with the Mediterranean, enables it to supply the whole south of France with the colonial produce which it imports; and also with English tin, lead, copper, coal, dyestuffs, herrings, etc. Wine, brandy, vinegar, dried fruits, hams, turpentine, and glass bottles are among its principal exports.

Except the wines of Champagne, no French wines are so much exported to foreign countries as those grown in the district of Bordeaux and known as Bordeaux Wines. Some of them are red (known in England as *claret*), others white. Of the red wines, Médoc is one of the best known. The red wines produced by the vineyards of Château-Lafitte, Château-Latour, Château-Margaux, and Haut-Brion are particularly celebrated for their quality. The white wines of Graves and those of Sauternes, Barsac, Preignac, and Langon are in highest repute. Population, in 1896, 256,906.

In ancient times Bordeaux was called *Burdigala*, and was the capital of the Bituriges Vivisci. It was a very prosperous town in the time of the Romans; was made by Hadrian the capital of Aquitania Secunda; and was both the principal emporium of the southwest of Gaul and the seat of its best educational institutions. It was taken by Charles Martel in 735, and was plundered by the Northmen in the Ninth Century. It became the capital of the Duchy of Guienne, and in 1152 passed, by the marriage of Eleanor of Guienne with Henry of Normandy (afterwards Henry II. of England), under the dominion of England. Bordeaux was for a considerable time the seat of the splendid Court of Edward the Black Prince. During the Revolution Bordeaux was the principal seat of the Girondists, and suffered fearfully at the hands of the Terrorists. Its inhabitants were the first to declare for the Bourbons in 1814. During the Franco-Prussian War a delegation of the Government of National Defense, retreating before the advancing German Army, stationed itself, December, 1870, at Bordeaux, and the first sittings of the National Assembly were held there in 1871. Rosa Bonheur was born in Bordeaux. See: Lourget, *Documents relatifs au port de Bordeaux* (Bordeaux, 1889); Julian, *Histoire de Bordeaux depuis les origines jusqu'en*

1895 (Bordeaux, 1895); Mauriac, *L'assainissement de Bordeaux* (Bordeaux, 1890).

BORDEAUX, DUC DE. See **CHAMBORD**, COMTE DE.

BORDEAUX, UNIVERSITY OF. A university founded in 1441, while Bordeaux was under British rule, by combining earlier convent and cathedral schools and a school of medicine. Its privileges, confirmed by Louis XI., made it self-governing till the time of Francis I. Thenceforward it was under State control. At the Napoleonic reform of the universities, in 1808, it received faculties of science and of letters, in 1870 a faculty of law, and in 1878 a faculty of medicine and pharmacy. It has a budget of over 1,000,000 francs, and had, in 1901, 2088 students, of whom over 800 were in medicine and over 700 in law. In the library there are about 85,000 volumes. Connected with the university is the Marine Zoological Laboratory of Archachon.

BORDEAUX MIXTURE. See **FUNGICIDES**.

BORDENTOWN. A city in Burlington County, N. J., 6 miles southeast of Trenton, the terminus of the Delaware and Raritan Canal, and on the Delaware River and the Pennsylvania Railroad (Map: New Jersey, C 3). It contains the Bordentown Military Institute, Saint Joseph's Convent, and the Priscilla Braislín School for Girls. The city is the market and shipping point for a tributary agricultural district, and has extensive manufacturing interests, represented by worsted-mills, machine-shops, and iron-works of various kinds, ship-yards, brick-yards, and other industrial plants. Bordentown was incorporated first in 1849. The government, under a charter of 1876, is vested in a mayor, elected every two years, and a municipal council. Population, in 1890, 4232; in 1900, 4110. Near Bordentown Joseph Bonaparte (q.v.) lived 1817-32, and 1837-39; his fine park, and "Iron-sides," the home of Rear-Admiral Charles Stewart (q.v.), are among the city's more notable points of interest. Prince Murat, the son of Marshal Joachim Murat (q.v.), also lived here for many years prior to 1848. See E. M. Woodward, *Bonaparte's Park and the Murats* (Trenton, 1879).

BORDER (Fr. *bordure*, edge, of Teutonic origin; cf. MHG. *borte*, border), THE. A term employed in historical as well as popular phraseology to signify the common frontier of England and Scotland. The Border shifted to and fro frequently in former times. At present the dividing boundary of the two countries consists of natural and imaginary outlines. It is customary to speak of Scotland as a country 'north of the Tweed'; but the Tweed is the boundary only for about 16 to 18 miles. At Carham Burn the line proceeds toward the Cheviot Mountains, which form the boundary for about 25 miles; thence it strikes Kershope Water, a tributary of the Esk. That river is the boundary for a number of miles, to a point above Longtown, where the line quits the Esk abruptly in a northern direction, and taking into England part of what was known as the 'Debatable Land' (q.v.), strikes on the small river Sark, which is the boundary to the Solway Firth, the great natural division on the west. Such, in general terms, is the entire boundary, extending from sea to sea for about 100 miles. The counties lying on the English side of the border are

Northumberland and Cumberland; on the Scottish side, Berwickshire, Roxburghshire, and Dumfriesshire.

From the Eleventh till the end of the Seventeenth Century, there was almost constant disturbance on the Border. Ruthless wars on a great scale between English and Scots sometimes caused the most frightful devastation, and became the source of lasting ill-will on both sides. History abounds in events of this kind, and the feuds and forays of clans and families are commemorated in a series of ballads, immortalized in the *Minstrelsy of the Scottish Border*, by Sir Walter Scott.

In the present day there is nothing to distinguish the Border from other districts of the country, unless it be the prevalence of picturesque ruins of old castles, which are generally roofless, but whose walls, of vast thickness and strength, are still in a good state of preservation. The Border strongholds were of three kinds—regular fortresses, large baronial castles, and the lesser kinds of towers. For an account of these and other architectural remains on the Border, see *Border Antiquities of England and Scotland*, by Sir Walter Scott (2 vols., folio, illustrated with plates); also Billings's *Baronial and Ecclesiastical Antiquities of Scotland* (4 vols., 4to), illustrated with plates (Edinburgh and London, 1848-52).

The great channels of communication across the Border are two railway routes, one by way of Berwick and the other by Carlisle. There are also good roads in various directions for those who wish to explore this extremely interesting district. Besides the books already referred to, there are works of local note, among which the most comprehensive are: Richardson, *Romance of English and Scottish Border* (Newcastle-on-Tyne, 1846); Jeffrey's *History and Antiquities of Roxburghshire*, 3 vols. (London, 1857-64); Ridpath's *Border History*, 1 vol., 4to (London, 1776); Veitch's *History and Poetry of the Scottish Border* (Glasgow, 1877); Craig-Brown's *History of Selkirkshire* (Edinburgh, 1886); Oliver's *Upper Teviotdale and the Scots of Buccleugh* (Edinburgh, 1887).

BORDER MIN'STREL, THE. See **SCOTT**, SIR WALTER.

BORDER RUFFIANS. In American history, a name applied to the pro-slavery residents of Missouri, who, in 1854 and thereafter, crossed over into Kansas for the purpose of turning the elections and of committing depredations on the 'Free-State' settlers. See **KANSAS**.

BORDER STATES. In American history, the name applied to those slave States which, at the outbreak of the Civil War, were contiguous to the more southerly of the free States. They were Delaware, Maryland, Virginia, Kentucky, Missouri, while North Carolina, Tennessee, and Arkansas were also frequently so designated. Of these, Virginia, North Carolina, Tennessee, and Arkansas seceded and joined the Confederacy.

BORDER WAR. The war in Kansas between the 'Sons of the South,' or pro-slavery men, mostly from Missouri, and the 'Free-State Men,' mostly from the New England States, who had emigrated to Kansas for the purpose of excluding slavery therefrom. It continued for several years after the passage of the Kansas-

Nebraska Act (q.v.) in 1854. See article on KANSAS. Consult, also, Thayer, *The Kansas Crusade* (New York, 1898).

BORDIGHERA, bôr-dê-gâ'ra. A winter resort in the Province of Porto Maurizio, Liguria, north Italy, on the Riviera, overlooking the Mediterranean, 91 miles southwest of Genoa and 7 miles from the French border (Map: Italy, A 4). It was first brought into general notice by Ruffini's novel, *Dr. Antonio*, and has beautiful villas, good hotels, and a splendid promenade, the Strada Romana, which runs through pine and olive groves on the high ground back from the sea. The situation is picturesque, the drinking-water excellent, and the climate agreeable. Snow falls only quadrennially, the average number of rainy days in the year is 45, of cloudy days 100, and the average winter temperature is 53° F. Bordighera is famous for its roses, carnations, anemones, etc., and for the palm branches with which it supplies churches on Palm Sunday. The new museum contains a small library and a unique collection of Riviera flora and of minerals. There are English physicians, an English church, and a theatre that produces operettas and comedies. The popularity of Bordighera with the English is heightened by the fact that members of the English royal family have visited it often. It suffered severely in the earthquakes of 1887. Population, in 1881 (commune), 2556; in 1901, 4673. Consult Miller, "Bordighera, Past and Present," in the *Westminster Review*, Vol. CLIV. (London, 1900).

BORDONE, bôr-dô'nâ, PARIS (1500-71). A Venetian painter, born in Treviso. He was a pupil of Titian, whom he imitated so successfully that their works have sometimes been confused. He is ranked next to Titian among Italian portrait painters, and was especially successful in female portraits. At the invitation of Francis I., he went to France in 1538, and there painted the portraits of the King and of the most distinguished members of the Court, returning to Venice in 1540, via Augsburg, where he painted in the Fugger Palace. His chief work is the decoration of the dome of the Church of San Vincenzo in Treviso. Among his noteworthy pictures are: "A Fisherman Presenting the Ring of Saint Mark to the Doge," in the Venice Academy, which in composition and brilliancy of color ranks among the greatest masterpieces of the Venetian school; "Prophecy of the Tiburtine Sibyl," in the Palazzo Pitti, Florence; "Combat of Gladiators," in the Vienna Museum; and "The Chess Players," in the Berlin Museum.

BORDURE, or **BORDER**. See **HERALDRY**.

BORE (AS. *bôr*, Ger. *Bohr*, auger, gimlet; ME. *bore*, Icel. *bora*, hole). The interior of a gun. In the case of breech-loading guns, the length of the bore is from the front face of the breech-plug to the muzzle. It is also used in place of calibre; but, except in regard to shot-guns, this is not now very common. See **ORDNANCE**; **GUNS**, **NAVAL**; and **SMALL ARMS**.

BORE (Icel. *bora*, a billow caused by wind, Sw. dial. *bôr*, a mound), or **EAGRE**. Names applied to the advancing wall of water caused by the incoming tidal wave in funnel-shaped bays and in the estuaries of certain rivers. The height of this rolling mass of surf increases toward the narrower part of the bay, and the wave is converted into a mass of roaring break-

ers that are the more pronounced in proportion as the bay is shallower. When the water has reached the head of the bay, and its onward movement has been stopped by the resistance of the land, it remains for a short time as a high tide, and then slowly and smoothly returns to the sea. The tidal range at the head of the Bay of Fundy is said sometimes to exceed 50 feet. The tidal wave causes an advancing breaker in almost every river. The bore in the estuary of the Tsien-Tang-Kiang may be mentioned as the most remarkable example of the phenomenon. The bore of the Amazon occasionally reaches a height of 16 feet. The rivers in India, especially the Ganges, are also celebrated for their bores. (See **TIDES**.) Consult Darwin, *The Tides* (Boston, 1898).

BOREAS (Gk. *Βορέας*, cf. It. *bora*, Russ. *burya*, Bulg., Serv. *bura*, storm). The north or northeast wind, blowing toward Hellas from the Thracian Mountains, and personified in mythology as the son of Astræus and of Eos, or Aurora, and the brother of Notus, Zephyrus, and Eurus. Boreas was said to dwell in a cave of the Thracian Hæmus, to which he carried Orithyia, the daughter of the Athenian King Erechtheus, who bore him Zetes and Calais—employed as the symbols of swiftness—and Cleopatra, the wife of Phineus. According to Homeric fable, he begat, with the mares of Erichthonius, twelve horses of extraordinary fleetness. The rape of Orithyia is said to have been represented on the chest of Cypselus at Olympia, and is found on a number of red-figured vases and on an Acroterion of the Temple of Athena at Delos. Boreas had a sanctuary in Athens for his help in wrecking the ships of Xerxes off Eubœa, and for similar reasons he was worshiped in Thurii and Megalopolis. His cult, however, was general, for Achilles prayed to him, and sacrifices were offered to him by the Ten Thousand Greeks, to say nothing of other allusions in the Greek writers. In art he usually appears as a winged man of wild appearance, with rough, disordered hair and beard.

BORELLI, bô-rêl'lê, GIOVANNI ALFONSO (1608-79). An Italian physician and mathematician, the founder of the iatro-physical school. He was educated in Florence, and was a professor of mathematics in Pisa and afterwards in Messina. Having taken part in a revolt, he was obliged to leave Messina, and spent the remainder of his life in Rome. He carefully observed the motions of the satellites of Jupiter, then little known, and seems to have been the first to discover the parabolic paths of comets. In his epoch-making work, *De Motu Animalium* (Rome, 1680-81), we find the first attempt to apply the principles of mechanics to the movements of animals. Regarding the bones as levers, in which the power acts between the weight and the fulcrum, he endeavors to calculate the power of muscles from a consideration of their fibrous structure, and the manner in which they are united to the tendons.

BORER. The hagfish (q.v.).

BORER. An animal that bores into the hard parts of other animals, or makes tubular burrows. A tiny sponge of the genus *Clione* perforates an oyster-shell, one of these minute organisms inhabiting each perforation. The method of their action is yet a mystery; it is

thought, however, to be both chemical and mechanical—i.e. by secretion and by spinules. Many worms are borers, working not only into the soil, but into sponges and like organisms. The crustaceans are said to bore, but this is an error; they burrow rather—e.g. the crayfish in search of water. One of the marine isopods, the gribble (*Limnoria lignorum*), however, is remarkable for the damage it does to wharves and other wooden structures in northern American harbors. But the most important borers are the mollusks, particularly the teredo (q.v.) and the family Pholadidae. A closely allied family (*Gastrochaenidae*) have the same habit, the most important being the genera *Aspergillum* and *Gastrochæna*. *Lithodomus* (see DATE-SHELL) is another powerful borer. Lyell, in alluding to the alternate upheaval and submergence of the land on the coast, gives us the following fact: On the coast of the Gulf of Naples, near the ancient town of Puzzuoli, are three marble pillars rising 40 feet above the water, the remains of an ancient temple whose marble pavement still exists many feet below the surface of the bay. For a distance of 12 feet from the water these pillars are smooth and free from blemish. Then comes a distance of 9 feet, throughout which the marble is perforated with innumerable holes. At the end of each of these perforations may be found the remains of the tiny *Lithodomus*. The adjacent waters are still filled with the same species. There is a difference of opinion as to the precise manner in which bivalve mollusks bore, but there is little doubt that the foot and adductor muscles afford the motor power and the anterior part of the shell the cutting instrument. Among gastropod mollusks several small species are known as 'borers' along the northern American coast, because of their method of perforating the shells of clams, oysters (resulting in serious annual loss to the oysterculturists), and similar victims. This boring of the shell is made with their rasp-like tongue ribbons, and through the perforation the juice of the victim is sucked out. The chief offender in Long Island Sound and New York Bay is *Urosalpinx cinerea*, commonly called drill. Many worms are borers, perforating sponges, etc. Insects of similar habits are described under BARK-BEETLE; CARPENTER-BEE; and similar titles.

BOREGAT, bôr'ê-gât. A name given to several rock-trouts of the Pacific coast of the United States, especially *Hexagrammus Stelleri*. See ROCK-TROUT.

BORGERHOUT, bôr'gêr-hout (Dutch *borg*, safety, security + *hout*, wood). An eastern suburb of Antwerp, containing a number of manufacturing establishments and a church noted for its architectural beauty (Map: Belgium, C 3). Population, in 1900, 37,300.

BORGHESE, bôr-gâ'zâ. A family of great distinction in the Republic of Siena, and afterwards in Rome. CAMILLO BORGHESE (1552-1621) ascended the Papal throne in 1605 as Paul V., and by him other members of the family were advanced to high positions. A marriage with the heiress of the Aldobrandini brought the family into the possession of great wealth.—CAMILLO FILIPPO LUDOVICO, Prince Borghese (1775-1832), joined the French Army when it invaded Italy; and, in 1803, married Pauline, the sister of

Napoleon Bonaparte, and widow of General Leclerc. His wife subsequently received the principality of Guastalla, and he was created Duke of Guastalla, and under the French Empire he was for some time Governor-General of the provinces beyond the Alps. He held his court in Turin, and was very popular among the Piedmontese. He sold the Borghese collection of artistic treasures to Napoleon for 13,000,000 francs, receiving in part payment the Piedmontese national domains; but when these were reclaimed by the King of Sardinia, in 1815, he received back some of the works of ancient art. The remainder are in the Louvre. After the overthrow of Napoleon he separated from his wife and broke off all connection with the Bonaparte family. He lost Guastalla, but retained the principalities of Sulmona and Rossano, his hereditary possessions. His heir was his brother, Francesco Borghese, Prince Aldobrandini (1776-1839), a general in the French service, who was succeeded by his eldest son, Marco Antonio (1814-86). Of the latter's two sons, the elder, Prince Paolo, born in 1845, lost through unlucky speculations the greater part of his fortune, in consequence of which most of the precious collections of the family had to be sold at auction in 1891-92. The valuable family archives were acquired by Pope Leo XIII. for the Vatican. The Borghese Palace is one of the most magnificent in Rome. The noble portico of the inner court is composed of 96 granite columns; the collection of paintings is remarkably fine. By negotiations concluded recently the art treasures of the palace became the property of the Italian Government.

BORGHESE, VILLA. The summer palace of the Borghese family, situated outside the Porto del Popolo, Rome, in an extensive garden, ornamented with artificial ruins and fountains. It was built by Cardinal Scipio Borghese, nephew of Pope Paul V., on the Cenci estate. Many of its former treasures of ancient sculpture were removed to Paris in 1806. The Casino contains the collection of antiques formed to replace those carried off under Napoleon and includes a number of important statues, although some have recently passed out of the possession of the family.

BORGHESE GLADIATOR. A work of Agassias of Ephesus, formerly in the Borghese collection in Rome, whence the name. By order of Napoleon it was sent to the Louvre, in Paris, where it now is. It is in the Græco-Roman manner, representing a warrior, with shield and sword, in the act of striking. Its date is about the First Century B.C.

BORGHESE MARS. A fine example of ancient sculpture once in the Borghese collection in Rome, now in the Louvre, Paris.

BORGHESI, bôr-gâ'zâ, BARTOLOMMEO (1781-1860). An Italian numismatist and epigraphist, born at Savignano, near Rimini. His earliest studies were on documents of the Middle Ages; afterwards he turned his attention to Roman numismatics and epigraphy. During the troubled times of 1821 he retired to the little Republic of San Marino, where he made his home until his death. By his publication *Nuovi frammenti dei fasti consolari capitolini* (2 vols., 1818-20), Borghesi established himself as one of the most eminent epigraphists of modern times; indeed, he may be called one of the founders of present-

day epigraphy. His writings were very numerous. After his death a collected edition was begun at the order of Napoleon III., which has only recently been completed—*Œuvres complètes* (10 vols., 1862-97).

BORGIA, bôr'já. An Italian family of Spanish origin which acquired great eminence after the elevation of Alfonso Borgia to the Papacy as Calixtus III., in 1455. He had previously been a counselor of the King of Aragon. He died in 1458.—**RODRIGO BORGIA**, nephew of the foregoing, ascended the Papal throne in August, 1492, under the name of Alexander VI. (q.v.). Before his elevation to the Papacy, he had a number of children by a Roman woman named Vanozza (Giovanna de' Catanei), of whom the most celebrated were Cesare and Lucrezia.—**CESARE** or **CÆSAR BORGIA** was one of the most unscrupulous men of an unscrupulous age. He stopped at no means to advance his ambitious design in Italy. He had early received high ecclesiastical preferment, and his father, soon after becoming Pope, made him cardinal. But on his father's conferring upon his brother Giovanni the Duchy of Benevento, with the counties of Terracina and Pontecorvo, Cæsar, as was believed, caused his brother to be assassinated. He obtained the duchy and counties for himself, and was permitted by his father to resign the purple and to devote himself to the profession of arms. He was sent, in 1498, to France, to convey to Louis XII. a bill of divorce and dispensation from his marriage with Anne of Brittany. Louis rewarded him for the Pope's complaisance with the Duchy of Valentinois, a bodyguard of 100 men, 20,000 livres of yearly revenue, and a promise of support in his schemes of ambition. In 1499, Cæsar married a daughter of the King of Navarre, and accompanied Louis XII. to Italy, where he undertook the conquest of the Romagna for the Holy See. The rightful lords of that region, who fell into his hands, were murdered, notwithstanding that their lives had been guaranteed by his oath. In 1501 he was named by his father Duke of Romagna. In the same year he wrested the principality of Piombino from Jacopo D'Appiano, but failed in an attempt to acquire Bologna and Florence. He took Camerino, and caused Giulio Di Varano, the lord of that town, to be strangled along with his two sons. By treachery as much as by violence, he made himself master of the Duchy of Urbino. A league of Italian princes was formed to resist him, but he kept them in awe by force until he succeeded in winning some of them over by advantageous offers, employed them against the others, and then treacherously murdered them on the day of the victory (December 31, 1502), at Sinigaglia. He now seized their possessions, and seemed to have removed every obstacle in the way of becoming King of Romagna and of Umbria, when, on August 17, 1503, his father died, probably of poison which had been prepared for twelve cardinals. Cæsar, also, who was a party to the design (and who had long been familiar with that mode of dispatching those who stood in the way of his ambition, or whose wealth he desired to obtain), had himself partaken of the poison, and the consequence was a severe illness, exactly at a time when the utmost activity and presence of mind were requisite for his affairs. Enemies rose against him on all hands, and one

of the most inveterate of them ascended the Papal throne as Julius II. Cæsar was arrested and conveyed to the castle of Medina Del Campo, in Spain, where he lay imprisoned for two years. At length he contrived to make his escape to the King of Navarre, whom he accompanied in the war against Castile, and was killed on March 12, 1507, by a missile from the castle of Biano. With all his baseness and cruelty, Borgia was temperate and sober. He loved and patronized learning, and possessed in a remarkable degree a ready and persuasive eloquence. Machiavelli, who was at one time dazzled by the energy and ability of Cæsar and believed that he was capable of unifying Italy, has delineated his character in his *Principe*.—**LUCREZIA BORGIA**, sister of Cæsar Borgia, a woman of great beauty, was born in Rome in 1480. She was married first to Giovanni Sforza, Lord of Pesaro, June, 1493; but her father, ambitious of a more advantageous alliance, annulled this marriage (December 20, 1497), and gave her (June 20, 1498) to Alfonso, Duke of Bisceglie, nephew of the King of Naples. The same motive induced her father and brother to separate her from her new husband, who was assassinated August 18, 1500, by Michelotto, Cæsar's bravo. For the third time free, the Pope's daughter became, in spite of the repugnance of the Duke Ercole d'Este, the wife of the latter's son, Alfonso, who soon after inherited the Duchy of Ferrara. Lucrezia has been represented as placed outside the pale of humanity by her wantonness, her vices, and her crimes, but the recent researches of most accurate and impartial historians have demonstrated that in her youth, with no initiative, no choice permitted to her, she was rather the too pliant instrument in the hands of Alexander and Cæsar Borgia. She died June 24, 1519.

BORGIA, FRANCISCO (1510-72). A general of the Jesuit Order, born at Gandie, Valencia. His early life was spent at the Court of Charles V., and in 1545, after the death of his wife, he entered the Order of Jesus and was appointed by Loyola vicar-general of the order in Spain and Portugal, which position he held until the death of Lainez, the successor of Loyola. Under his administration numerous reforms were instituted. He was canonized in 1671.

BORGIA, STEFANO (1731-1804). An Italian antiquarian and prelate, born at Velletri. In

1759 he was appointed Papal Governor of Benevento, and in 1764, by precautionary measures, protected the city and district against an impending famine. He became secretary of the Propaganda in 1780, and, in 1789, cardinal. He was well known for his valuable archaeological collection, to which admission was freely granted to scholars, and from which, it is said, he once sold a gold plate to defray the expense of imprinting San Bartolommeo's *Systema Brahmanicum*. He wrote *Istoria della città di Benevento* (1763-69) and other works.

BORGNE (börn'y') **LAKE**. An inlet of the Gulf of Mexico extending into the southeast of Louisiana and covering an area 60 miles long by 10 broad (Map: Louisiana, F 3). It is connected by the Rigolet Pass with Lake Pontchartrain, and is used by steamers plying between New Orleans and Mobile.

BORGO, Pozzo di. See Pozzo di Borgo.

BORGOGNONE, bôr'gô-nyô'nâ, **AMBROGIO** (c. 1445-c.1523). An Italian painter, whose real name was Ambrogio Stefani da Fossano. His best work is found in the Certosa in Pavia. The influence of Da Vinci is noticeable in his pictures, the latest undoubted example of which is in San Simpliciano, Milan.

BORGU, bôr-gôo', or **BUSSANGO**, bus-saŋ'gô. A kingdom in Sudan (q.v.), west of the Niger, and bounded by the States of Gurma and Gando on the north, and Chanjo on the south. The country is generally level and supposed to be very fertile. The population is mostly composed of Fulahs and Mohammedans. The principal settlements are Bussang, on the Niger, and Niki, the seat of a British resident. It was near the former place that Mungo Park met his death. At the demarcation of the western boundary line of Nigeria in 1885-86, the eastern part of Borgu was included in the British possession of Northern Nigeria (q.v.). Consult "The Struggle for Borgu," in *Blackwood's Magazine*, No. 65 (London, 1899).

BORIC or **BORACIC ACID** (from *boron*, or *borax*). A soluble, solid substance that crystallizes in the triclinic system, and is known mineralogically as *ussolite*. It is found in the waters of the Tuscan lagoons of Monte Rotondo, Castelnuovo, and elsewhere; also as an incrustation on sulphur in the crater of Vulcano in the Lipari Islands; it has been found in the borax lakes of California in combination with various elements, as borates. It is also found native. (See BORON.) It was discovered in the Tuscan lagoons in 1777 by Höfer, a Florentine apothecary, who named it *sal sedativum hombergii*. The principal source of its supply is the Tuscan lagoons, the hot vapors from which, consisting largely of boric acid, are passed through water, which absorbs the acid. The acid is then used in the manufacture of borax. Boric acid is a white translucent crystalline compound that is readily soluble in water, and besides its use in the production of borax, is employed for glazing porcelain, in the manufacture of glass and certain pigments, and in preparing the wicks of stearine candles.

BORING MACHINERY. The simplest implement for boring holes in wood is the awl, which displaces the fibres of the wood and leaves a hole without removing the wood to any great extent. For boring small holes of larger size

than can be easily bored with awls, gimlets are employed. A gimlet has a conical screw-point followed by a spiral groove for clearing the hole and is fitted with a wooden or metal cross handle or with a square shank for insertion into a bit-stock or brace. For boring larger holes than can be bored with gimlets augers and bits are employed. These tools are too familiar to require description. Bits and augers are operated by hand by means of bit-braces or bit-stocks, or by some simple mechanism operated by power. In recent years pneumatic boring machines have come into extensive use for wood-boring in car-shops, ship-yards, and other places where large amounts of heavy boring are done. These machines are fully described under PNEUMATIC TOOLS. In boring holes in metal and rock the drills used are different from those employed in wood-working; they will be found described under METAL-WORKING MACHINERY and DRILLS.

BORIS GODUNOFF, bôr-rës' gô'dy-nôf'. A play by Pushkin based on the Russian interregnum.

BORISOVKA, bôr-rë'sôf-kâ. A town in the Russian Government of Kursk, situated about 120 miles south of the town of Kursk (Map: Russia, E 4). It has a considerable tanning industry and holds five fairs annually. In the vicinity is situated the Tikhvin-Borisov Convent, founded by Count Sheremetieff in the Eighteenth Century, and the house which Peter the Great occupied during the war with the Swedes. Population, in 1897, 16,400.

BORISSOGLIEBSK, bôr-rë'sô-glyëpsk' (in honor of the two canonized princes, Boris and Gljeb). The capital of a district in the Government of Tambov, Russia, on the left bank of the Vorona, 110 miles southeast of the city of Tambov, and 424 miles southeast of Moscow (Map: Russia, F 4). It is an active commercial town, with good harbor, and contains, among other educational institutions, a school for railway mechanics. From a commercial point of view, Borissogliëbsk is situated very advantageously. It is in direct communication with ports on the Azov and Black seas by means of the waterways of Vorona, Khoper and the Don, and is connected by rail with Tzaritzin and the territory on either side of the Volga, on the one hand, and with the ports on the Baltic on the other. Grain, timber, kerosene, fish, caviar, watermelons, destined for Saint Petersburg and Moscow, as well as salt from the lakes of Astrakhan, pass through Borissogliëbsk. About 2000 rafts and barks are built here annually and are laden with goods for Rostov and

BRACE AND BITS.
1, Ring-bit; 2, 3, gimlet bits; 4, auger-bit; A, ratchet-brace.

Taganrog. Borissogliëbsk was founded in 1646 for defense of the frontiers against the incursions of the Crimean Tartars. Population, in 1885, 13,000; in 1897, 22,370.

BORISSOV, bô-ré'sôf. The capital of a district in the Government of Minsk, Russia. It is situated on the Beresina, 50 miles northeast of Minsk, near the place where Bonaparte's army crossed the river Borissov, in 1812 (Map: Russia, C 4). Flour-mills, breweries, and tobacco-factories are the chief industrial establishments of the town. Borissov is known to have existed in the Twelfth Century, and came into the possession of Russia in 1795. Population, in 1897, 14,931, including about 10,000 Jews.

BÖRJESON, bër'ye-son, JOHAN HELENUS LAURENTIUS (1835—). A Swedish sculptor. He was born in Halland, studied in Rome and Paris, and in 1886 was appointed professor in the academy at Stockholm. His works include genre and ideal subjects, and portrait-statues of various sizes. The following may be enumerated: "The Bowler" (Gothenburg Museum); "Youth with a Tortoise" (National Museum, Stockholm); and the colossal statues of Holberg at Bergen, of Axel Oxenstjerna in the House of Lords, Stockholm, and of King Charles X. Gustavus at Malmö.

BÖRJESSON, JOHAN (1790-1866). A Swedish poet and dramatist, born in the Parish of Tanum. He studied theology at the University of Upsala, and in 1828 became pastor of Weckholm. He published two volumes of poems, *Kärlek och poesi* (1849) and *Blommor och tårar på en dotters graf* (1854); but his reputation rests chiefly on his tragedies. Of these, *Erik den Fjortonde* (Erik the Fourteenth, 1846), is his best, accessible in the German rendering of Winterfeld (1855). His collected works were edited by Dietrichson (Stockholm, 1873-74).

BORLAND, SOLON (1811-64). An American soldier and politician. He was born in Virginia, but early removed to Arkansas. He served as major of volunteers during the Mexican War, was in the United States Senate from 1849 to 1853, and in 1853-54 was Minister to Central America. While returning to the United States (1854), the inhabitants of Greytown tried to arrest him for having aided an accused person, and, by order of the United States Government, the town was bombarded by Commander Hollins. In the spring of 1861, before his State had seceded, he organized a body of troops, and, in the name of the Southern Confederacy, took possession of Fort Smith, Ark. Later he was made a brigadier-general in the Confederate Army.

BORLASE, bôr'las, WILLIAM (1695-1772). An English antiquary, born at Pendeen. He graduated at Exeter College, Oxford, and in 1720 was ordained priest. In 1722 he became rector of Ludgvan, and in 1732 he received the vicarage of Saint Just. He was a close student of the antiquities and natural history of Cornwall, and published as the first result of his researches the essay on *Spar and Sparry Productions* (1750). His most important work was his *Antiquities of Cornwall* (1753)—a collection of learned and original essays, followed in 1756 by *Observations on the Ancient and Present State of the Islands of Scilly*. He published, in 1758, a *Natural History of Cornwall*. He was a friend of many con-

temporary men of letters, including Pope, for whose Twickenham grotto he supplied most of the mineral and fossil decorations.

BORMANN, bôr'mân, EDWIN (1851—). A German poet and song-writer. He was born in Leipzig, and educated at the Polytechnic School, Dresden, and the universities of Leipzig and Bonn. His first literary work was a series of humorous sketches in dialect, contributed to the *Fliegende Blätter*. He is also the author, in High German, of a book of humorous songs, entitled *Seid Unschlungen Millionen* (1879), and also *Schelmenlieder* (1891), *Das Buchlein von den Schwarzen Kunst* (1886); *Liederhort in Sang und Klang, in Bild und Wort* (1888), and *Klinginsland, Minnelieder und Spielmanns weisen, alten Meistern nachgesungen* (1891).

BORMANN, bôr'mân, EUGEN (1842—). A classical philologist, professor of ancient history and epigraphy in Vienna, author of *Fastorum Civitatis Tauromenitanæ Reliquiæ Descriptæ et Editæ* (1882); *Inscriptiones Emilie Etruriæ Umbriæ Latine* (1888). He is also a corresponding member of the Imperial Academy of Sciences, Vienna, and was one of the assistant editors of the *Corpus Inscriptionum Latinarum*.

BORMIO, bôr'mê-ô (Ger., Worms). An antiquated town in the Province of Sondrio, north Italy, 4020 feet above the sea, in the upper valley of the Adda, at the south entrance of Stelvio Pass (q.v.) (Map: Italy, E 1). The nearest railway station is at Sondrio, 44 miles to the southwest, which is 25 miles east of Colico, on Lake Como. Two miles northwest of Bormio are the New Baths (Bagni Nuovi di Bormio), 4380 feet above the sea, which are frequented by tourists in July and August. The water is piped to the establishment from seven salt and sulphur springs (100°-105° F.) that rise in the cliffs near the Old Baths, 4750 feet above the sea. These springs were mentioned by Pliny and by Cassiodorus, and the old Roman baths (*piscinæ*) hewn in the rock, can still be seen. The water is prescribed for rheumatism, gout, and kindred diseases. Population, in 1881 (commune), 1800; in 1901, 1814. Consult: Kilia, *Rhätische Kurorte und Mineralquellen* (Chur, 1883).

BORN, börn, BERTRAND DE (1140-1215). A French soldier and troubadour, who traced his descent from the dukes of Aquitaine. He was born at the Castle of Born in Périgord. Born fought with his brother for the family possessions, and defeated him. But Richard the Lion-hearted sided with his brother and deprived Born of his possessions. He is generally represented as a breeder of dissensions, and especially as embittering the strife between Henry II. of England and his sons. Dante refers to this in the *Inferno* (XXVIII.). In the latter part of his life, Born entered the Monastery of Dalon, and is supposed to have joined the Cistercian Order. He wrote some poems of love and war, which breathe the spirit of a passionate man. There are two complete editions of his works edited by Albert Stimming (Halle, 1879), and A. Thomas (Toulouse, 1881). See Maurice Hewlett's novel, *Richard Yea-and-Nay* (1900).

BORN, börn, IGNAZ VON (1742-91). An Austrian mineralogist and metallurgist, born in Karlsburg, Transylvania. He studied law in

Prague, and went into the Department of Mines there in 1770. In 1776 he went to Vienna and took charge of the Imperial mineralogical collections. Against much opposition he succeeded in substituting amalgamation for smelting and cupellation for extracting silver from the ores in the mines of Hungary, and also introduced other practical improvements in mining, salt-working, and chemical bleaching.

- **BÖRNE**, bër'ne, LUDWIG (1786-1837). A German political pamphleteer and satirist, born in Frankfort-on-the-Main. He renounced his Hebrew faith and name (Löb Baruch), and published various political journals that were successively suppressed, of which the best known is *The Balance* (*Die Wage*). He was an able and caustic critic of the political condition of Germany, and after the *Wage* was discontinued (1821), led a restless life in Paris, Heidelberg, Frankfort, Berlin, and Hamburg. After the July Revolution he returned to Paris (1830), where he established the *Balance*, for the purpose of promoting a closer intellectual union between France and Germany. He is now best remembered for his dramatic criticism and for a bitter controversy with his fellow-exile Heinrich Heine. His collected *Works* appeared in 1863. His best-known satire is *Menzel der Franzosenfresse*. His *Denkrede auf Jean Paul* is famous for its beauty of thought and style. Consult: Heine, *Ueber Börne* (Hamburg, 1840); and Holzmann, *Leben Börnes* (Berlin, 1888).

BORNEËNE. See BORNEOL.

BORNEIL, bôr'ná'y', GIRAUD DE. A French poet belonging to the close of the Twelfth Century. He was born at Exideuil (Dordogne), and won high rank for his verses. Mention is made of him in the *Purgatory* by Dante, who also, in the *De Vulgari Eloquio*, classes him with Arnaut Daniel and Bertran de Born. Of his work there have been preserved eighty-two specimens, many satiric, most of them obscure.

BORNEMANN, bôr'ne-mán, FERDINAND WILHELM LUDWIG (1798-1864). A German jurist. He was born in Berlin, and studied jurisprudence there. In 1848 he became Minister of Justice in the Camphausen Ministry, and in the same year second president of the Superior Court at Berlin. In 1849 he was elected to the First Chamber of the Prussian Diet, and in 1860 he became a member of the House of Peers. He is known as one of the most eminent authorities on Prussian civil law, of which his *Systematische Darstellung des preussischen Civilrechts* (1834-39) was the first adequate presentation.

BORNEO (corrupted from *Brunai*, Malay *Burni*, *Bärni*, a district, the island having no comprehensive native name, though sometimes called *Pulo Kalamantin*, after one of the native fruits). The fifth largest island in the world, only Australia, Greenland, Baffin Land, and New Guinea or Papua exceeding it in area (Map: East Indies, D 4). It is situated in the East Indian Archipelago and extends from just north of latitude 7° N. to 4° 10' S., and from longitude 108° 53' to 119° 22' E. It is bounded on the north by the China and Sulu seas, the latter separating it from the Philippine Islands; on the east by the Celebes Sea and Straits of Macassar, which separate it from Celebes; on the south by the Java Sea, which separates it from the island of Java; and on the west by the southern part

of the South China Sea, which separates it from Malacca and Sumatra, and by Karimata or Billiton Strait. It is 850 miles long and 600 miles wide in the broadest part, and has an area of about 290,000 square miles, with a population conjectured to be nearly 2,000,000. The interior has been but partially explored, much of the country being one vast, almost impenetrable jungle.

A little north of the middle of the island there is a central highland region called the Madei Mountains, from which stretch out in different directions mountain ranges that in most cases continue to the coast, and which include between them low valleys. A mountain range which, with a certain discontinuity, extends toward the northeast, divides the northern part of the island into eastern and western sections and culminates near the extreme north in the isolated peak Kini Balu, which attains an altitude of 13,700 feet. Other ranges diverge, one toward the west (the Klinkang Mountains); another range toward the southwest, which, with that toward the northeast, forms a central chain; another range toward the southeast, which in approaching the coast bends toward the south and continues to the extreme southeastern corner of Borneo; and still another range toward the east. These mountain ranges do not appear to have had names assigned to them as complete chains, although the different portions have distinctive local names. A number of the summits rise to 7000-9000 feet. In the extreme west are a few small volcanic cones. Between the two main ranges, which diverge to the west and southwest, lies the valley of the Kapuas, which river flows southwest to the west coast, forming there a broad delta after the manner of several of the Borneo rivers. The region on the north of the Klinkang and Madei mountains is drained chiefly toward the west by the Batang Lupar, Rejang, Barram Limbang, and other rivers. The northeast section is drained toward the east by the Koti, Segah, Kajan, and other rivers. The whole southern lowland region is drained toward the south by the Barito (which is nearly 600 miles in length), Little and Great Dyak, Katingan, Pembuan, Kotaringin, Djellei, and other rivers. Many of the rivers are navigable, but only for small boats, as most of the river-mouths are closed by bars which prevent the entrance of sea-going vessels. The rivers are subject to frequent floods at all seasons, and to wide expansion during the rainy season. The southern and eastern sections possess extended areas of lowland, which become flooded during the rainy season and form great lakes, and in the dry season are intersected by numerous watercourses of both river and canal or ditch-like character.

The coast of Borneo is, in the main, indented only by open bays. It has few islands, the chief of which are Labuan on the northwest coast, Banguay on the north coast, Nanokong on the northeast coast, Laut on the southeast coast, and Maivang on the southwest coast.

The geological formations are Tertiary and post-Tertiary, except in the central and western mountains, which are pre-Tertiary, and consist largely of Devonian and Carboniferous schists and slates. Economically, the most important formations are the coal deposits of the Tertiary period, and they show the remains and much of the detailed structure of the luxuriant vegetation of this period. The chief products of the

rich mineral deposits are gold, diamonds, silver, platinum, mercury, tin, and antimony, to which must be added petroleum, sulphur, rock salt, marble, rock crystal, and porcelain-clay. Most of the streams appear to be auriferous.

During the year the lowland average temperatures range from 77° F. to 80° F., and the midsummer maximum seldom exceeds 95° F. The climate is, however, trying, on account of the great humidity of the air. The rainfall in Borneo is enormous. On the west coast over 160 inches of rain falls in a year, and even in the drier districts 80 inches is received. There is, however, no actually dry period, such as occurs farther from the equator, except for accidental droughts. Thunder-storms are frequent and severe. The lowland climate is unhealthy for Europeans. The winds partake of both trade and monsoon characteristics.

The rich fauna of Borneo belongs to the Malayan sub-region of the Oriental region of Wallace, and indicates past connection with the Continent. Of the mammalia, the most typical are the apes and monkeys (the orang-outang and proboscis monkey), the elephant, rhinoceros, and tapir in limited areas, the honey-bear, wild cattle, wild pigs, deer (especially the 'mouse-deer'), flying lemurs, the feather-tailed tree-shrew, and several members of the cat family. Birds are numerous. The avifauna includes among other birds various hornbills, the argus pheasant, and the edible-nest swallow. Snakes are common, and in the waters of the lower regions dangerous crocodiles abound. The coast and inland waters abound in fish, some of which are dried and form an article of export. Butterflies are very numerous and exceedingly beautiful; beetles, while abundant and of many species, are not so prominent. Insect pests are very annoying; mosquitoes and sand-flies in the air, fire-ants on the ground, and leeches in the waters.

The vegetation of Borneo is rich in species and luxuriant in growth. In the flooded regions the vegetation consists of tangled and matted reed and bush growth, which presents a marked contrast to the forests of the adjacent dry lands. Upward of fifty kinds of trees furnish timber; among them are the mohor, tappau, ironwood, ebony, sandalwood, and teakwood. Various trees furnish saps, gums, and resins, such as gutta-percha, camphor, and dragon's-blood. Numerous palms flourish; among others the useful fan, cocoanut, and sago palm. Spices, nuts, and numerous tropical fruits are produced in profusion. Sugar-cane, cotton, and tobacco are cultivated extensively. In the mountain region rhododendrons grow in profusion, and ferns, orchids, and clinging plants are common, the huge pitcher-plants deserving special mention.

Politically, Borneo is divided into British Borneo and Dutch Borneo, the two being separated by the mountain barrier which extends from the central west coast in a northeasterly direction nearly across the island. British Borneo consists of Saba, or British North Borneo, Brunei, and Sarawak. British North Borneo occupies the northern part of the island, and extends from the eastern shore of Brunei Bay, on the northwestern coast, to the shore of Saint Lucia Bay, on the northeastern coast. It has an area of 31,106 square miles, a coast-line of nearly 1000 miles, and a mixed population of perhaps 175,

000, only a few hundred of whom are Europeans. The chief town and seaport is Sandakan, situated on a fine harbor of the same name, on the northeastern coast. Kudat, Gaya, Papar, and Silam are important stations. While this territory is held by the British North Borneo Company, which receives grants from the native sultans, yet since May 12, 1888, the British Government has exercised a formal protectorate over it.

The exports (1899) amounted to \$3,500,000, and the imports to \$2,500,000. The revenue reaches nearly \$500,000. The chief products are timber, tobacco, rice, sago, coffee, spices, gums, sea and jungle produce. The Government issues its own paper notes and copper coinage, accounts being kept in dollars and cents. A marine cable connects Labuan (which was placed under the protectorate of the British North Borneo Company in 1889), on the northwestern coast, with Singapore; and a telegraph-line to Sandakan places the capital in telegraphic communication with the civilized world. A railroad is being constructed from Brunei Bay to Jesselton.

Brunei (Borneo) lies southwest of British North Borneo, occupies the coast as far west as Baram River, covers an area of 15,000 square miles, and has a mixed population of about 45,000. Its chief town is Brunei, on a bay of the same name. It is governed by a sultan of Brunei, but is under British protection. Brunei has been called the 'Venice of the East.' Its trade is of little importance, the chief article of export being sago.

Sarawak lies southwest of Brunei, and extends along the northwestern coast of Borneo for a distance of 400 miles, from Cape Baram to Cape Datu. Its southern limit is the watershed of the Krumbang and Klinkang mountains. It covers an area of about 50,000 square miles, and has a mixed population of about 600,000. The chief town is Kuching or Sarawak, with a population of 20,000, about 25 miles from the coast, on the Sarawak River. Sibuan, on the Rejang River, which is navigated for some distance by large steamers, is another important town. The territory is governed by a rajah, but is under British protection. Commercially, Sarawak is of considerable importance, the import trade (1899) amounting to \$3,250,000, and the export trade to \$4,500,000. The Government budget amounts to about \$850,000, the revenue being derived from both import and export duties and various personal taxes. The chief products are tobacco, sago, rice, gums, coffee, spices, jungle produce, and dried fish. Coal is abundant, and the precious metals, diamonds, and mercury are found. Both the Church of England and the Roman Catholic Church have established missions and built churches. A boys' and girls' school has been established at Kuching.

Dutch Borneo, which occupies the southern and most of the eastern part of the island, has a coast-line extending from Saint Lucia Bay (latitude 4° 10' N.) in northeast Borneo to Cape Datu on the west coast. It has an area of about 213,000 square miles and a population estimated to be 1,180,000. The country is divided into two residencies—West Borneo and South and East Borneo. The Dutch govern the country, so far as possible, through the native rulers. West Borneo embraces the valley of the Kapuas, and has great mountain ranges on the northern and

southeastern boundaries; on the coast it extends from Cape Datu on the north to Cape Sambur on the south. It has an area of 55,825 square miles and a population of (approximately) 370,800. There are two provinces—Pontianak and Montrado. The chief city is Pontianak, on the Kapuas River. Sambas, Sintang, and Sukadana are important towns. The exports amount to over a million and a half dollars a year. The chief of these are copra, gutta-percha, rattan, and coconut-oil.

South and East Borneo, which extends from Cape Sambur to Saint Lucia Bay, and occupies the southeastern half of the island, has an area of 156,900 square miles and a population of 809,800. The chief city and capital is Banjarmasin. Other important towns are Kotaringin in the southwest, Matapura in the south, Pasir in the southeast, Tangarung, Samarinda, and Koti in the east, and Gunung Tebui in the northeast. The regions best known and most densely populated are in the south and west. North of the Pasir River the interior and even the coast is but little known. The exports amount to \$750,000 a year, gutta-percha and rattan being the most important.

Inhabitants.—Although the vast extent of the island, with its numerous cave and other shelters, shell-heaps, etc., has not been completely explored, the human remains and evidences of man's industry so far discovered go to prove that man is a much less ancient resident than in Java and Sumatra. The native population, recent immigrants of other races like the Arabs and Chinese excluded, belong, as their languages show, without exception, to the Malayan family, no traces of a previous Negrito occupation being discernible. The interior and certain portions of the coast are peopled by the Dyaks (nomadic and sedentary, land and sea Dyaks, the farther away from the coast, the less mixed with other Malayan peoples, Chinese, etc.), the characteristic aborigines of the island. A great part of the coast region is controlled by Malays, the descendants of colonists from the peninsula of Malacca, the islands of Java, Sumatra, and other islands of the great East Indian Archipelago, Bugis from Celebes, and, in the extreme north, Suluans from the Sulu Archipelago in the Philippines. The Malays and the Bugis are the more civilized classes, and are more devoted to trade, commerce, and a sedentary life; and it is from the Malay State of Brunei, north of Sarawak, that the island has received its name. The Malays profess Islam; the Dyaks, those of the interior especially, retain much of their primitive Shamanism and nature-worship. Borneo has been the classic land of the 'head-hunter,' and here are to be found in their purity many other curious Malayan customs. It is also the home of a species of blowgun and the poisoned arrows that belong with it.

Borneo was first discovered by Europeans in the early part of the Sixteenth Century, when both the Portuguese and Spaniards visited it. The Portuguese soon established commercial relations with the natives. In the latter part of the century the Spaniards also entered upon similar relations. Neither of these European peoples, however, had any very marked influence on the country. The Dutch began trading in Borneo in 1604, and five years later the English appeared and gained a foothold in the

south, which they held for nearly a century. In the early part of the Eighteenth Century the Dutch forced the English out of this section; but about the middle of the century the latter reappeared in the northern part. Then, after a lapse of about twenty-five years, the English influence waned for half a century, to be renewed in the early part of the Nineteenth Century, chiefly through the activity of Sir James Brooke. Meanwhile the Dutch slowly but surely strengthened their position in the southern and eastern parts of the island, by affiliating their governing officers with the native chiefs, through whom they controlled the people.

W. S., *European Settlements in the Far East* (New York, 1900); Breitenstein, *Einundzwanzig Jahre in Indien* (Leipzig, 1899); Bock, *Head-Hunters of Borneo* (London, 1881).

BORNEO CAMPHOR. See BORNEOL.

BORNEOL, or BORNEO CAMPHOR ($C_{10}H_{18}O$). A substance often used as a substitute for common or Japan camphor. It is a crystalline organic compound, similar to common camphor, but having an aromatic, pepper-like odor. It sinks in water, and is thus readily distinguished from common camphor. Borneol is obtained chiefly from the *Dryobalanops camphora*, growing in Borneo and Sumatra. It is one of the constituents of oil of rosemary, and occurs in the rhizome and roots of the *Valeriana officinalis*. It can be produced by reducing common camphor with nascent hydrogen. The hydrocarbon *Borneène* ($C_{10}H_{18}$) is obtained by distilling borneol with anhydrous phosphoric acid.

BORNET, bôr'nâ', JEAN BAPTISTE EDOUARD (1828—). A French botanist, born at Guérisny (Nièvre). He studied medicine in Paris, and botany, especially fungi, under the direction of Tulasne (q.v.) and Leveillé. Afterwards he accompanied Thuret to Cherbourg, where he devoted his attention chiefly to the study of marine algæ, with which several of his books deal. His works, in some of which he collaborated with Thuret, include: *Recherches sur la structure de l'éphèbe pubescens* (1852); *Recherches sur la fécondation des Floridées* (1867); *Recherches sur les gonidies des Lichens* (1873); *Notes algologiques, recueil d'observations sur les Algues* (1876-80); *Revisions des Nostocacées hétérocystées*, in collaboration with Flahault (1886).

BORNHOLM, bôr'nôlm (anciently, *Borgundarkholmr*, Burgundians' Island, from Old Norse *hólmr*, Ger. *Holm*, Engl. *holm*, an islet). An island in the Baltic Sea, belonging to Denmark, and situated about 90 miles east from Zealand, and one-third of the distance from the Swedish to the German coast, in latitude 55° N., longitude 15° E. Area, about 220 square miles (Map: Denmark, G 2). The surface is partly mountainous and rocky and partly low. The chief formation is granite, of which large quantities are taken for building purposes. There are also some coal deposits, and a fine grade of porcelain-

clay is also obtained for industrial uses. The inhabitants carry on successfully agriculture and cattle-raising and the manufacture of porcelain-ware. With the exception of the capital, Rønne (population over 8000), there are no settlements, but separate farms are scattered over the island. Population, in 1901, 40,877. Independent prior to 1000, the island became a Danish possession, subsequently belonging to Lübeck in the Sixteenth Century and to Sweden in the Seventeenth Century, but was returned to Denmark in 1660.

BORNIER, bôr'nyâ', HENRI, Vicomte de (1825-1901). A French poet and dramatic author. He was born in Lunel (Hérault), December 27, 1825, and after pursuing his studies in Montpellier and elsewhere, went to Paris to become a law student. About the same time he published his *Premières feuilles de vers* (1845), and had a play, *Le mariage de Luther*, accepted conditionally at the Théâtre Français. He received a post at the Bibliothèque de l'Arsenal, where he rose successively, till in 1889 he became its administrator. Meantime he continued writing, among his dramas being: *Le Monde renversé* (1853); *Dante et Béatrix* (1853); *Agamemnon*, a tragedy in imitation of Seneca, produced at the Théâtre Français in 1868; *La fille de Roland*, which had a great success in 1875; *L'Apôtre* (1881); *Mahomet*, which, though received at the Théâtre Français, was in 1890 forbidden representation, at the request of the Turkish Ambassador; and *Le fils de l'Arétin* (1895). Besides his dramatic works, he was the author of numerous other publications in verse and prose. His poems on *L'Isthme de Suez* (1861) and *La France dans l'extrême Orient* (1863), and his *Eloge de Chateaubriand* (1864), were crowned by the Academy. His verses on *La muse de Corneille* (1884), written for the Odéon, are also well known. He wrote several novels, among them *La lizardière* (1883) and *Le jeu des vertus, roman d'un auteur dramatique* (1885). In 1893 he was elected a member of the Academy, and his *Poésies complètes* were republished the next year. His death occurred in Paris, January 27, 1901.

BORNU, bôr'nô' (from the tribe *Berauni*, *Bernduni*). A State of the Sudan, occupying the northeastern end of Northern Nigeria, between latitudes 11° and 15° N. and longitudes 10° and 15° E., and bounded by Sokoto, the Sahara, Lake Chad, and Kamerun (Map: Africa, F 3). Its area is estimated at 50,000 square miles. The surface is mostly level, with the exception of the southwestern part, where some of the mountains rise to an elevation of about 2000 feet. The climate is excessively hot and unhealthful, the temperature not infrequently rising above 100° during the summer. The rainy season lasts from five to seven months, and produces malaria and other diseases. The two principal rivers are the Shari and the Waube, both of which fall into Lake Chad. The soil is fertile, and, although the cultivation is very imperfect, produces plentiful crops of maize, millet, barley, rice, various kinds of pulse, cotton, and indigo. In its flora and fauna Bornu does not differ much from the rest of Northern Nigeria. The industries of Bornu are not numerous, and are chiefly confined to the manufacture of cotton fabrics. In former years slaves were very extensively dealt in, and exported

to many countries, slave-hunting constituting at that time one of the principal occupations of the natives. At the head of the State is a Sheik, who has absolute power. He is assisted by a council. Bornu is divided into several provinces, and has also a number of vassal States and dependencies. There is an army of about 5000 men. The capital is Kuka (q.v.), with a population of about 60,000. The population of Bornu is estimated at 5,000,000, and consists of a number of mixed negro races. The bulk of the population are known as the Kanowry, who are characterized by a finer physique and a higher standard of intelligence than the rest of the population. The territory of Bornu was invaded in the Twelfth Century by the Mohammedan ruler of Kanem. After 200 years of warfare the aborigines were either extirpated or completely subjected, and from 1353 a line of kings ruled over the country. Bornu was at the height of its power at the close of the Sixteenth Century, when its western frontier extended to the Niger River. After 1600 it underwent a rapid decline. In the beginning of the Nineteenth Century it was conquered by the Fellatahs, whose yoke, however, was soon shaken off, under the leadership of a fanatical fakir, named Mohammed el Kanemi, whose services were called in by the Sultan. Mohammed founded the town of Kuka, and ruled there under the title of Sheik, while the Sultan enjoyed only nominal power. Mohammed's son, Omar, became Sultan as well as Sheik. In 1882 Omar was succeeded by the Sultan Abu Bekr. Our scant knowledge of the country is due to the travels of Barth, Nachtigal, and subsequent French and German explorers.

BORO BUD'DOR (Hind., great Buddha). The ruin of a Buddhist temple in Java, Residency of Kadu, Regency of Magelang, and District of Minoreh, near the junction of the Ello and Progo. It is the most elaborate monument of the Buddhist style of architecture anywhere existing. Buddhism (q.v.) was early introduced into Java, and the building of Boro Buddor is assigned to the Seventh Century. It is a pyramid of a square form, each side at the base measuring 600 feet, and consists of seven walls, which are built like the steps of a stair up a hill. Between the walls are narrow terraces running round the building. The walls are richly ornamented with statuary. Outside are niches, each of which is occupied by a statue of Buddha, larger than life, seated in the usual attitude, with the legs crossed under the body. The number of these figures is about 400. Between each two of these are bas-reliefs representing the god in the same attitude, besides architectural ornaments and carvings of all sorts. Below the niches, on the lower story, is an immense bas-relief encircling the whole building, representing scenes from the life of Buddha, and religious subjects. The inner faces of the building are also profusely ornamented with bas-reliefs, seated figures, and architectural ornaments. The whole is a splendid artistic epitome of Buddhism just before its decline. The five lower concentric terraces are on a square plan, and may represent a Buddhist *vihara* (q.v.) or monastery. The three uppermost terraces are circular, and represent the *tope* (q.v.). They are surmounted each by a tier of small domes,

72 in all, each containing a statue of Buddha; while in the centre, rising high above everything else, is the large dome or pagoda (q.v.) for the relic of Buddha.

BORODIN, bó-rŭ'dén, ALEXANDER PORFIRYEVICH (1834-87). A Russian composer and chemist. He was born in Saint Petersburg, of a very ancient family. He studied medicine and chemistry at the Medico-Surgical Academy, practiced medicine for a while, and, being appointed to the chair of chemistry at his *Alma Mater*, went abroad to prepare for his duties. It is claimed that, during his studies in Paris, Heidelberg, and Italy, he had anticipated Wurtz in the discovery of aldol. In all, he wrote 21 articles and monographs of importance. During the Liberal movement of the sixties (see *RUSSIAN LITERATURE*), he espoused the cause of university education for women in Russia, and from 1872 till his death gave gratuitous instruction in chemistry at the Medical School for Women, opened by Professor Rudnyeff and Mme. Farnookaya. Amid his arduous professional duties he found time for composition as a recreation only. His musical studies had begun quite early. At nine he played on his piano the music performed by regiment bands, and at thirteen wrote a concerto for the flute. With a friend he played over all the symphonies of Beethoven, Mozart, and Haydn in arrangements for four hands. Besides, for chamber music, Borodin learned to play the 'cello, and his friend the violin. Later he joined the circle of Balakireff (q.v.), and took up music seriously. While abroad he met Liszt, who later classed him as one of the greatest musicians of the age, and made his works known in Western Europe. He wrote his first symphony in 1862-67, and then in 1869 began the opera *Prince Igor*, on a libretto based on the epic *Prince Igor's Band* (q.v.), but soon left the work and utilized the composed parts for his second symphony (1860-76), the so-called 'heroic.' He then resumed work on the opera, which, however, was still unfinished at his death. It was orchestrated and finished by Rimsky-Korsakoff (q.v.) and Glazounoff (q.v.), and scored an enormous success at its first performance in November, 1890. He also wrote two string quartets besides a score of songs of wonderful lyric depth. His *In Central Asia* (1880), a 'musical picture' is one of the mainstays of the concert-room. Two movements of his third symphony were reconstructed by Glazounoff, partly from rough draughts and partly from memory. Though a member of the Balakireff circle, Borodin could not give up the rounded forms of the classical opera. His talent was essentially melodic, and his cantilenas are stamped with the breadth and power of a giant. The epic might and the Oriental coloring of his orchestration in *In Central Asia* hold a place among the most notable musical achievements in the Nineteenth Century. Consult Habets, *Life and Works of a Russian Composer*, English trans. by Rosa Newmarch (London, 1897).

BORODINO, bó-rŭ'dé-nŏ. A village of Russia, in the Government of Moscow, about 70 miles west of the city of that name. It is situated on the Kaluga, an affluent of the Moskva, and gave its name to the great battle fought between the French Army under Napoleon and the Russians under Kutusoff, Barclay

de Tolly, and Bagration, September 7, 1812. The battle of Borodino was one of the most obstinate in history, and the loss on both sides was almost equally great. The struggle consisted chiefly in the attempt of the French to capture three lines of redoubts barring the way to the city of Moscow. These were thrice won and lost during the day. Out of 257,000 men engaged, between 70,000 and 80,000 were killed and wounded. The Russians retreated on the following day, but in the most perfect order, and without the enemy's venturing to attack them. The Russians, therefore, have always regarded this battle as a victory, and in 1839 raised a fine mausoleum on the battlefield. To the French, however, certainly belongs the honor, as they not only remained on the field of battle, but soon after pushed on to Moscow. The French call it the battle of the Moskva, from the river of that name, and it gave Marshal Ney his title of Prince of Moskva. A magnificent description of the weird splendor and the horrors of the battle may be found in Count Leo Tolstoi's novel, *War and Peace*.

BO'RON (from *borax*, of which it is a component). A non-metallic element, which was isolated in 1808 by Gay-Lussac and Thénard in France, and by Sir Humphry Davy in England. Some of the compounds of boron were known to the ancients. The element is not found native, but occurs in combination in the following minerals: *Sassolite*, a boric acid; *borax*, a sodium borate; *boracite*, a magnesium borate with magnesium chloride; and *ulexite*, a sodium and calcium hydrous borate. Boron was originally obtained by heating boric oxide with metallic potassium, then boiling the fused mass with hydrochloric acid to remove the soluble salts; while the residue, consisting of amorphous boron, was washed with water and dried. It can also be obtained by the electrolysis of fused boric oxide. As thus prepared, boron (symbol B, atomic weight, 11.0) is an odorless, grayish-brown amorphous powder. It is a non-conductor of electricity and fuses only at a very high heat. It may be melted by placing it between the poles of a battery of 600 Bunsen cells. The specific gravity of amorphous boron is upward of 1.84. A crystalline variety of boron was prepared by Wöhler and Deville in 1856. It may be obtained by heating the amorphous variety for two hours with metallic aluminum to a temperature of from 1500° to 1600° C. Small monoclinic crystals are produced by this process, which, however, contain a small amount of aluminum. These crystals have been called *boron diamonds*, owing to their lustre and hardness, as they scratch both ruby and corundum. They have a specific gravity of 2.68. Boron is the only non-metallic element that forms no compound with hydrogen. Its principal commercial compounds are boric acid, boric oxide, and certain borates, especially borax.

BORO'RO. A native American tribe inhabiting the Upper Paraguay and Upper Parana basins. They are tall (m.1.74) and athletic, and live by the chase, using bows of great length with arrows of cane tipped with bone or tooth. They are reputed to be both polygynous and polyandrous. They number several thousand.

BOROUGH, bū'rŏ (AS. *burh*, *burg*, Ger. *Burg*, a fort, from AS. *beorgan*, to protect). In Great

Britain, an incorporated municipality, either village, town, or city, having the right of returning one or more members to Parliament. The word *burgh* appears in many forms in the names of towns, as in Canterbury, Edinburgh, Peterborough, Hamburg, and has kindred forms in several of the Continental languages, such as the French *bourgeois*. It originally signified a hill or mound; as places of defense were thrown up on elevated positions it came to mean a castle or fort, and afterwards the collection of houses and other buildings which gathered naturally beneath the fortified hill. Boroughs existed in England from the earliest times. According to the Domesday Book, there were eighty-two boroughs. Each of these had a market or an annual fair, was ruled by an elective officer, usually called the port-reeve, and had the privilege of a special borough-court, which was independent of the larger divisions, known as hundreds and shires. The Normans utilized these units of government, supplanted the port-reeves with officers deriving their authority directly from the throne, and in time the boroughs received the privileges belonging to municipal corporations. By the time of Henry VI. the boroughs had generally become municipalities, with the power of government vested in the members of the principal guilds. During the same period the boroughs obtained the right of sending burgesses to Parliament. In course of time many of these boroughs decreased in population and became little more than names, but without losing their Parliamentary representation; others came entirely under the control of members of the nobility, and acted in elections only under such restraint. These two classes of boroughs received the names respectively of 'rotten boroughs' and 'pocket-boroughs.' Many of these were swept out of existence as regarded their Parliamentary rights by the Reform agitation, which culminated in the Reform Bill (q.v.) of 1832. The borough system of Scotland is even of greater antiquity than that of England. A confederation of boroughs for purposes of mutual defense and of the protection of trades existed in the reign of David I., and was called a Hanse.

In Connecticut, New Jersey, Minnesota, and Pennsylvania, the term borough is applied to incorporated towns or villages of a lower grade than a city. William Penn's charter to the territory west of the Delaware River authorized him in 1681 to erect the country, among other divisions, into boroughs similar to those of England. This system of boroughs continues in Pennsylvania to the present time. In 1619 Virginia had eleven boroughs, the delegates of which sat in the House of Burgesses; but boroughs, as in incorporated towns, never obtained a footing in that State. The charter granted to Lord Baltimore entitled him to create boroughs in Maryland, but they were never so created. In New Jersey boroughs date back to the early part of the Eighteenth Century, but they were erected by special acts and without uniformity of system until 1818, when a General Borough Act was passed.

Greater New York, by an act passed by the Legislature of 1897, was made a city, composed of five boroughs—Manhattan, the Bronx, Brooklyn, Queens, and Richmond.

BOROUGH, THE. See CRABBE, GEORGE.

BOROUGH ENGLISH (from Anglo-French *tenure en burgh englois*, tenure in an English borough). A curious custom that prevails in some parts of England, according to which the youngest son inherits the property in preference to his elder brothers. The reason assigned for the custom by Littleton is that the youngest son, on account of his tender age, is not so capable as his elder brothers to maintain himself. Blackstone, however, suggests, what is doubtless nearer the truth, that the custom is a survival out of the conditions of primitive society—a view which is strengthened by the sporadic occurrence of the custom in widely separated parts of the Continent of Europe. A posthumous son is entitled to this privilege, and dispossesses his elder brother. The right of representation also exists with reference to it; for should the youngest son die in his father's lifetime, leaving a daughter, she will inherit the property. See GAVELKIND; INHERITANCE; PRIMOGENITURE. Consult: Blackstone, *Commentaries on the Laws of England*; Elton, *Origins of English History* (London, 1882); Pollock and Maitland, *History of English Law* (2d ed., Boston, 1899).

BOROUGH JUSTICES. Local justices first appointed in the time of Charles I. Under the Municipal Corporations Act (1882, 45 and 46 Vict. c. 50), these justices consist of the mayor during his year of office, and for one year after it determines, the recorder *ex officio*, and such persons as the Crown may appoint by commission. Their duties cannot be delegated; and before acting, they must take the oath of allegiance and the judicial oath. See BOROUGH; JUSTICES.

BOROUGH LAWS. In Scottish legal history, a code of ancient laws which have long ceased to have any force, but serve to throw light on the ancient manners and customs of the country. The authenticity of the compilation is beyond question. It is supposed to have been made in the reign of David I., in the Twelfth Century. See BRETT'S AND SCOTS; and consult Erskine, *Principles of the Law of Scotland* (18th ed., Edinburgh, 1890).

BOROVITCHI, bō'ro-vē-chē'. A town in the Russian Government of Novgorod, situated on both sides of the Msta, near the famous rapids of Borovitchi (Map: Russia, D 3). The inhabitants are engaged in ship-building, the dyeing of cloth and cotton goods, and the production of earthenware. The natives are famous for their skill as pilots (for which the proximity of the rapids is mainly responsible); and Peter the Great considered them of such importance to the commerce of the country that he freed the town of all State taxes, in order to induce its inhabitants to continue their dangerous occupation. Borovitchi has a salubrious climate, and, owing to its comparative proximity to Saint Petersburg (200 miles), is a favorite summer resort of the residents of the capital. Population, in 1897, 9421.

BORROMEAN ISLANDS (so named after the Borromeo family). Four small rocky islands in Lago Maggiore (q.v.), in northern Italy (Map: Italy, C 2). These islands are famed for their beauty, due partly to their surroundings and partly to the degree of their artificial development from mere rocks to luxuriant gardens. The one best known to tourists is Isola Bella, on which Count Vitaliano Borromeo, in the latter part of

the Seventeenth Century, built a castle, which contains some good paintings and other art treasures, but the north wing of which is still unfinished. The garden, which rises in ten terraces on the southern slope, contains rare plants and numerous shell-grottoes, and is adorned with fountains and statues. On Isola Madre the terraced garden is less extensive. The population of the islands is about 300.

BORROMEO, bŏr'rŏ-mă'ŏ, CARLO (1538-84), Count. A saint of the Church of Rome. He was born October 2, 1538, at the castle of Arona, on the west bank of Lago Maggiore, the family seat of his ancestors. He studied law at Pavia, and took the degree of doctor in 1559. His uncle, Pope Pius IV. (1559-65), soon after being raised to the Pontificate, appointed him, notwithstanding his youth, to a number of high offices, and made him a Cardinal and Archbishop of Milan. Borromeo displayed great faithfulness and ability in governing Ancona, Bologna, and other parts of the States of the Church as Legate, and in discharging the duties of offices connected with ecclesiastical administration in Rome. Surrounded, as he was, with magnificence and luxury, he was always grave, pious, and rigid in his life, studious, and a patron of letters.

Pius IV. made him his grand plenipotentiary, and did nothing important without his coöperation. It was in a great measure through his influence that the reopening of the Council of Trent was accomplished, and that its deliberations were brought to a conclusion so favorable to the Papal throne. He committed its decrees to memory, had the principal part in drawing up the *Catechismus Romanus* for exposition of them, and proceeded to give all possible effect to them in his archiepiscopal province. Borromeo's exertions, not only for the improvement of ecclesiastical discipline, but also for the reformation of morals in the Archbishopric of Milan, drew upon him the hostility of the monastic orders, and also, to some extent, that of the Spanish authorities in Milan, who were jealous of the extension of his jurisdiction. An attempt was even made upon his life in 1569. He spent a great part of his income in beautifying the cathedral and other churches. With a view to providing well-qualified priests, he founded in 1570 the Helvetic College in Milan. He brought about an alliance of the seven Catholic cantons, known as the Golden Borromeo League, for the united defense of their faith. He exerted his energies successfully in extirpating Protestantism from Milan by means of the Inquisition. In the famine of 1570, and during the plague in Milan in 1578, he displayed great energy and benevolence, saving the lives of multitudes by the prompt arrangements which he made for necessary relief. Exhausted by his labors and his austerities, he died on November 3, 1584. He was canonized in 1610. His embalmed body, enshrined in a silver sarcophagus and visible through a lid of rock-crystal, lies in Milan Cathedral in the Cappella San Carlo Borromeo beneath the dome—a subterranean crypt, noted for its wealth of decoration and accumulation of priceless jewels and costly gifts. The saint's body and other relics may be viewed by permission. Many miracles are said to have been wrought at his tomb.

His theological works were published at Milan, in 1747, in five volumes folio. On the western bank of Lago Maggiore, in the neighborhood

of his birthplace, a colossal brazen statue of him, 70 feet high, was erected in 1697. His brother's son, Count Federigo Borromeo, born 1564, was also a cardinal, and from 1595 to 1631 Archbishop of Milan, and was the founder of the Ambrosian Library (q.v.). He died in 1631. For the best biography of Borromeo, consult Sylvain. 3 vols. (Bruges, 1884).

BORROMINI, bŏr'rŏ-mĕ'nĕ, FRANCESCO (1599-1687). An Italian sculptor and architect, born at Bissone (Lombardy). He studied sculpture in Milan, and architecture in Rome under Carlo Maderno, then architect of Saint Peter's, whom he assisted in some of his work. After Maderno's death he continued for some time under the direction of Bernini, the succeeding architect. But an unreasoning hatred for Bernini sadly disfigured both his character and his art. Bent upon surpassing his rival, he attempted the arbitrary and the bizarre, and became one of the chief representatives of the baroque style. He built the Church of San Ivo alla Sapienza, the Oratory and Cloister of San Filippo Neri, the facade of the Church of Santa Agnese in the Piazza Navona, and the interior of San Giovanni in Laterano. Mortified at Bernini's success, he killed himself in an access of hypochondria.

BORROW, GEORGE HENRY (1803-81). An English author. He was born at East Dereham, Norfolk, July 5, 1803, the son of Capt. Thomas Borrow, of the West Norfolk Regiment. Moving with his father's regiment from one station to another, he saw much of England. He was also for a short time in Edinburgh, where he attended the high school, and then in Ireland. In 1816 the family settled at Norwich, and three years later George was articled to the law. He had already acquired some knowledge of seven languages; and now, instead of attending to the law, he proceeded to study seven more. He had also become interested in the gypsies, and had read many tales of wild adventure. On the death of his father (1824) he went to London, where he was employed as compiler and hack; his longest production was *Celebrated Trials* (1825), giving the record of all sorts of criminals. To this period also belongs *Romantic Ballads* (1826), translations from the Danish. In 1838 Borrow was appointed agent for the British and Foreign Bible Society. Now began, in the service of this society, his extensive tours through Russia, and afterwards through Portugal and Spain. Later he traveled as far east as Constantinople. True to his youthful predilection, he made the gypsies scattered over every part of Europe one of the principal subjects of his study. And he was continually adding to his vast linguistic knowledge. In 1840 he married and settled on Culton Broad, near Lowestoft. From here he made many excursions through Celtic Britain—Cornwall, Wales, Ireland, etc.,—and for a time lived at Yarmouth. In 1860 he removed to London, and in 1874 returned to Culton, where he died, July 26, 1881. Borrow was a man of splendid physique. His knowledge of languages was probably more extensive than profound. But in literature he has left a name. His first important work—*The Zingali*, an account of the gypsies in Spain—appeared in 1841. It was followed two years later by *The Bible in Spain*, the most widely read of all Borrow's works. In 1851 was published *Lavengro*, and in 1857 its sequel, *The Romany Rye*. These

three fascinating books are largely autobiographical. Of almost equal interest is *Wild Wales* (1862). For an authoritative life of Borrow, consult Knapp, 2 vols. (London, 1899). Knapp has also carefully edited *Lavengro, The Romany Rye*, and other works (London, 1900).

BORROWING (AS. *borgian*, Ger. *borgen*, to borrow; literally, to give a pledge, AS. *borg*, *borh*, Ger. *Borg*, pledge, security). The taking or receiving something from another on trust, with the intention of returning it or giving an equivalent for it. As sometimes used, the word borrowing implies that the borrower is under the obligation of returning the specific thing borrowed, as to borrow a book or any other thing to be returned again. In this case, it is that form of the contract of bailment (q.v.) legally termed *commodatum*, if no pay is to be given; but when payment is to be made, the borrowing is a *locatio*, so called. Where the agreement is to return another article of the same kind and value, the contract is rather in the nature of a barter or sale. Where money is borrowed, the identical money is not expected to be returned, so that to borrow in this sense is to make a contract for the use of money. While theoretically borrowing may be of real estate, or an incorporeal right, in practice the use of the term is confined to personal property.

Unless the agreement of lending specifies the time when the borrowed article shall be returned, it is returnable at the demand of the lender. Where the lending is gratuitous and without consideration, it imposes no obligation on the lender, and he may terminate the arrangement at his will. See **BAILEMENT**.

BORROWING DAYS. The last three days of March in the old-style calendar, or April 11-14 in the present new style. These days were from most ancient times in Scotland called 'borrowing days,' because they are usually cold and snowy, so that it is said:

"March borrows frae April
Three days, an' they are ill;
The first o' them is wun' an' weat;
The second it is snaw an' sleet;
The third o' them is a peel-a-bane,
And freezes the wee bird's neb tae stane."

The meteorologist, Buchan, says that he has examined the records of temperature for a number of years, and has shown that there is a distinct cold period between the 11th and 14th of April, corresponding to this old popular saying, the origin of which is lost in the mist of antiquity. Consult Buchan, *Handy Book of Meteorology* (Edinburgh, 1868).

BORROWSTOUNNESS ('the cape near Burward's dwelling,' from AS. *Nasu*, in composition *naes*, headland, nose, Lat. *nasus*, Ger. *Nase*, nose); usually shortened to *Bo'ness*, *bô-nēs*. A seaport in Linlithgowshire, Scotland, in the Firth of Forth, 15 miles west-northwest of Edinburgh (Map: Scotland, E 3). It has coal-mines extending under the bed of the Forth, and manufactures of salt, soap, malt, vitriol, and earthenware. It has an export trade in coal, iron, and steel manufactures, and manures, and imports maize, timber, iron ore, paper-making materials, etc. Ironstone, limestone, and freestone exist in the parish. Graham's Dike, a port of the Roman Wall of Antoninus, traverses the parish. Dugald Stewart (q.v.) lived near Borrowstounness. Population of police burgh, in 1901, 9100.

BORS. The name of the King of Gaul in the Arthurian story. He was brother of King Ban of Benwicke, and both were Arthur's faithful allies.

BORS, or **BO'HOET**, SIR. One of King Arthur's knights, and nephew of Lancelot. When Guinevere was accused by Sir Nador, Bors was appointed to fight for her; but on the day of the contest his place was taken by Sir Lancelot.

BORSIPPA, bôr-sîp'pâ (probably from *bul-sîf*, mixture of languages; cf. *Babel*, which, according to the Bible, means the same). A town situated on the west bank of the Euphrates, opposite the city of Babylon, and forming, in the days of the Neo-Babylonian monarchy, a suburb of Babylon itself. There are indications that the place was fully as old as Babylon, and it would appear, indeed, that its religious significance even antedates that of Babylon itself. The chief deity worshipped at Borsippa was Nabu (or Nebo), to whom Tashmîtu is given as a consort. Nabu, originally, as would appear, a water-deity, becomes the patron of letters and learning in Babylon. He is the god of writing and wisdom in general. His temple at Borsippa, known as E-zîda the 'true' (i.e. fixed and legitimate house), becomes in the course of time, with E-sagîla, the 'lofty house,' the temple of Marduk, the most significant sacred structure of the south, to which a solemn pilgrimage was made on the Babylonian New Year's festival. The site of Borsippa is represented by Birs-Nimrud, and the remains of the temple-tower at that place are associated in both popular and learned tradition with the legendary Tower of Babel (q.v.). See **BABYLON**.

BORSTELL, bôr'stêl, KARL HEINRICH LUDWIG VON (1773-1844). A Prussian soldier, born at Tangermünde. He served as commander-in-chief in Pomerania in 1812, and in this capacity did much to check the excesses of the French. As major-general he took a prominent part in the campaigns of 1813, and his bold though unauthorized move at Dennewitz decided that conflict. At the battle of Leipzig (October 16-19, 1813) his brigade was the first to enter the gates of the city. Soon afterwards appointed lieutenant-general, he accompanied Bülow's corps to Holland (1814), and after the departure of that general remained behind with 10,000 men to complete the conquest of the country. While engaged in the organization of the Second Prussian Army Corps, which had been intrusted to him (1815), a revolt, engendered by political discontent, broke out among several Saxon battalions stationed at Liège; and although promptly suppressed, Blücher ordered seven of the leaders to be shot and the flags of the insubordinate battalions to be burned. By reason of his failure to comply with this request, Borstell was sentenced to four years' military confinement. Several months later, however, he was pardoned by the King, who appointed him commander of Magdeburg.

BORT. See **DIAMOND**.

BORTNYANSKI, bôrt-nyân'ské, DMITRI STEPANOVITCH (1751-1825). A Russian composer of church music. He was born in Glukhov, Government of Chernigov, and at seven joined the Court Choir at the capital, where he studied under Galuppi. Catharine II., struck by his

musical gifts, sent him to Italy. Under Galuppi, who had left Russia, and other famous masters, he studied for eleven years in Venice, Rome, Bologna, and Naples. He won success with his operas *Creonte* (Venice, 1776) and *Quinto Fabio* (Modena, 1778), but did not mistake his true vocation, and clung to the study of the great Italian church composers. His own compositions of this period are distinguished by the lofty nobility and serenity of his models, with hardly a trace of the floritures and pyrotechnics then in vogue in Italian music, and abundant in his operas. On returning to Russia (1779) he was appointed composer to the Court Choir. Paul I. transformed it in 1796 into the *Imperial Capella*, of which Bortnyanski was director till his very death. Finding the choir in a poor state, Bortnyanski sought out the best voices in Russia, and in a few years the capella became the most famous in the world. In the service he also found many evils: ignorant choir-masters had altered the antique melodies to make their task easier, or had set the texts to secular melodies, trivial and out of keeping with the church atmosphere. He obtained a decree of the Holy Synod to the effect that all part-music was to conform strictly with printed texts. For this purpose the music was revised and edited by Bortnyanski.

Bortnyanski, often styled 'the Russian Palestrina,' made an epoch in Russian church music. His compositions, especially the "Cherubim Song" (which, according to O. Fouque, is the only one deserving that name), are performed in Christian churches the world over. They combine the austerity of the Greek psalmody with the Italian polyphony. Their simple harmonies embody the deeply devotional spirit of the texts, without studied effects that only distract worshippers. Among his compositions, edited by Tschaiowsky in 10 volumes, are 35 sacred concertos, 8 church trios with choir, a liturgy for three voices, 7 cherubim songs, a collection of psalms, hymns of praise for four voices and two choirs, etc.

Berlioz thus characterizes Bortnyanski: "All his works are imbued with a genuine religious feeling, at times a sort of mysticism which raises the hearer to an exalted state of emotion. In addition, Bortnyanski has a rare skill in grouping vocal masses, an extraordinary knowledge of nuances, a sonorousness of harmony, and, what is most remarkable, an incredible freedom in the disposition of the vocal parts; a contempt for the rules honored both by his predecessors and his contemporaries, especially the Italian masters, among whose pupils he is usually counted."

BORY DE SAINT VINCENT, bô'rê de sãn' vãn'sãn', JEAN BAPTISTE GEORGE MARIE (1780-1846). A French naturalist, born at Agen. In 1798 he started with Captain Baudin on a scientific mission to Australia, but was separated from his companion and explored the Ile de France, Réunion, and Saint Helena, alone. On his return he wrote his *Essai sur les Iles fortunées et l'antique Atlantide* (Paris, 1803), and his *Voyage dans les quatre principales îles des mers d'Afrique* (Paris, 1804). He served at Ulm and Austerlitz, on Soult's staff in Spain, and as a colonel at Waterloo. After this he had to retire to Belgium, and at Brussels he edited, along with Van Mons, the *Annales des sciences physiques* (8 vols). He also published an admirable work on the subterranean quarries in the limestone

hills near Maestricht (Paris, 1821). He returned to France in 1820, and wrote for Liberal journals, and for Courtin's *Encyclopédie*. In 1827 appeared his *L'Homme, essai zoologique sur le genre humain*. He rendered an important service to science by editing the *Dictionnaire classique de l'histoire naturelle* (1836). When, in 1829, the French Government sent a scientific expedition to the Morea and the Cyclades, the first place in it was assigned to him; and the results of his researches are given in his *Expédition scientifique de Morée* (Paris and Strassburg, 1832) and in the *Nouvelle flore du Péloponnèse et des Cyclades* (Paris, 1838). In 1839 he undertook the principal charge of the scientific commission which the French Government sent to Algeria.

BORYSTHENES, bô-ris'thé-nêz. See DNIÉPER.

BORZNA, bôrz-nã'. A town in the Russian Government of Tchernigov, situated a short distance north of the Desna and about 90 miles southeast of the town of Tchernigov (Map: Russia, D 4). It has a number of tanneries and oil-presses, and a population of (1897) 12,458.

BOBZOI. A Russian wolfhound. See GREY-HOUND; WOLFHOUND.

BOS, bôs, LAMBERT (1670-1717). A Dutch philologist. He was born at Workum, West Friesland, studied at the University of Franeker, and in 1704 was there appointed professor of Greek. All his works are characterized by thorough scholarship and remarkable acuteness. They include *Vetus Testamentum ex Versione Septuaginta Interpretum* (1709; new ed. 1805); *Ellipses Græcæ* (1702; last reëdited in 1808); *Antiquitatum Græcarum Præcique Atticarum, Descriptio Brevis* (1714; Eng. trans., 1839); and *Animadversiones ad Scriptores Quosdam Græcos* (1715).

BOSA, bô'sã. An episcopal city in the Province of Cagliari, Sardinia, on the west coast, near the mouth of the Temoe (Map: Italy, C 7). It is an unhealthy town, surrounded by decaying walls, has an old castle, a cathedral, coral fisheries, and tanneries, and is visited fortnightly by coasting steamers. The country produces wine and oil. Population, in 1881 (commune), 6696; in 1901, 6846.

BOSANQUET, bô'sãn'kã', BERNARD (1848—). An English philosopher. He was born at Rock Hall, Alnwick, and was educated at Oxford. He has been president of the Aristotelian Society and of the London School of Ethics and Social Philosophy. From 1871 to 1881 he lectured at University College, Oxford. He is largely engaged in social work, particularly in connection with the Charity Organization Society. Among his numerous important publications are the following: *Civilization of Christendom* (1893); *Essentials of Logic*; *Aspects of the Social Problem* (1895); *Philosophical Theory of the State*. He has also edited a translation of Lotze's *System of Philosophy* (London, 1887).

BOSBOOM-TOUSSAINT, bôs'bôm-tô'sãn'. See TOUSSAINT, ANNE LOUISE GEERTUIDA.

BOSC, bôsk, LOUIS AUGUSTIN GUILLAUME (1759-1828). A French naturalist. He visited the United States in 1796 to study the natural history of America, and afterwards traveled in Italy, and was a professor at the Versailles

Zoölogical Garden. He was the author of *Histoire naturelle des coquilles* (1801); *Histoire naturelle des vers et des crustacées*; *Nouveau dictionnaire d'histoire naturelle* (1803); *Dictionnaire raisonné et universel d'agriculture* (5 vols., 1801); and published the *Mémoires* of his adopted daughter, Madame Roland, the Girondist (Paris, 1886).

BOSCAN-ALMOGABER, bô-skân' âl'mô-gâ-vâr', JUAN (c.1493-c.1542). A Spanish poet. He was born in Barcelona, of an old patrician family, served for a time in the army of Ferdinand the Catholic, and in 1519 went to Granada, the Court of Charles V., becoming soon after tutor to the Duke of Alva. His later years were passed in Barcelona, and he died near Perpignan, in 1542, while visiting his former pupil. Boscan's earlier verse was all cast in the old Castilian measures. It was not until 1526 that the idea of experimenting with Italian metres was suggested to him by a certain Andrea Navagero, a learned Italian who was then Ambassador of Venice at the Court of Charles V. He forthwith began to experiment with sonnets and cancioneros, blank verse, and the octave stanza, and has naively recorded his satisfaction with the result. The innovation was adopted and still more successfully popularized by his friend and disciple, Garcilaso de la Vega (q.v.), and thus he became the founder of a new school of Spanish poetry. He is also remembered as the translator of Castiglione's famous manual for courtiers, *Il cortegiano*. Boscan's poems were published after his death by his widow, together with some of Garcilaso's, in 1543. The latest edition, including a biographical sketch, is that of W. T. Knapp (Madrid, 1875).

BOSCACAWEN, EDWARD (1711-61). An English admiral, popularly known as 'Old Dreadnought.' He was born August 19, 1711, and was the second son of Viscount Falmouth. He entered the navy in his fifteenth year, passed his examination for lieutenant in 1732, and in 1738 received a command. He won distinction at the taking of Porto-Bello and at the siege of Cartagena in 1740. He had an important share in the victory off Cape Finisterre (May 3, 1747). In 1751 he became a lord of the Admiralty. In 1755 as vice-admiral he intercepted the French fleet off Newfoundland, capturing two 64-gun ships and 1500 men, including the French commander, Hoquart, whom he had taken prisoner twice before. In 1758, as Admiral of the Blue, he was commander-in-chief of the expedition against Cape Breton, capturing that island and Saint John's after some hard fighting. The crowning success of his career was the defeat he inflicted on the French Toulon fleet, in the Bay of Lagos, August 18, 1759. For this he received the thanks of Parliament, a pension of £3000 a year, a seat in the privy council, and the command of the marines. He died near Guildford, January 10, 1761. Consult: Norway, "Admiral Boscawen, 'Old Dreadnought,'" in *Cornish Magazine*, Vol. II. (Truro, 1899); Standing, "Sir Edward Boscawen, K.C.B. Admiral of the Blue," *United Service Magazine*, Vol. CXIII. (London, 1900).

BOSCH, bôsh, ERNST (1834—). A German painter. He was born at Crefeld, and studied at the Düsseldorf Academy. In 1854 he exhibited "The Smuggler." His works excel through buoyancy and humor. They include "Gipsy Gang"

(1866); "Rogues' School" (1866); and "Far Sighted and Near Sighted" (1873).

BOSCH, bôsh, HIERONYMUS (properly VAN AKEN) (1462-1516). A Dutch painter. He was born at Hertogenbosch (Bois-le-Duc), whence his name, and affected fantastic subjects, particularly the torments of the damned. His chief work, "The Last Judgment," is in the Vienna Academy.

BOSCH, HIERONYMUS DE (1740-1811). A Dutch poet and philologist, born in Amsterdam. He was a philologist of varied acquirements and an accomplished Latin poet. His *Poemata* first appeared at Leyden in 1803 (2d ed., 1808). He rendered an important service to classical literature by his edition of the *Anthologia Græca*, with a metrical translation by Hugo Grotius, never before published (4 vols., 1795-1810, to which Van Lennep added a fifth volume, 1822). His discourses and treatises on subjects of literature, which are mostly composed in the Dutch language, display profound learning, excellent judgment, and refined taste.

BOSCHBOK, bôsh'bôk. The Dutch form of 'bushbuck' (q.v.).

BOSCH/VARK (Dutch *bosch*, wood, bush + *vark*, hog). The South African river-hog (*Potamochoerus africanus*). See RIVER-HOG.

BOS/COBEL ('Fairwood,' from It. *bosco*, thicket, OE. *bosch*, *bosk*, Engl. *bush* + *bel*, *bello*, beautiful). An English farmhouse near Shifnal, Shropshire, famed as the hiding-place of Charles II. after his defeat by Cromwell, at Worcester, September 3, 1651. With Major Carlisle or Careless, who had led the forlorn hope at Worcester, he climbed the 'Royal Oak' in Boscobel Wood, and was concealed in its thick foliage for twenty-four hours, while Puritans in quest of him passed to and fro, unaware of his presence. The farmhouse still stands, and the oak is represented by a tree grown from one of its acorns.—The title of BOSCOBEL TRACTS has been given to certain contemporaneous writings, published in 1662, giving a graphic description of this passage of the monarch's life.

BOSCOREALE, bôsh'kô-râ-â'la (It. *bosco*, forest, Engl. *bush* + *reale*, royal). A city in the Province of Naples, south Italy, a mile and a half from Pompeii (Map: Italy, F 2). Its name was brought to the notice of the world in 1895, when Baron Edmond de Rothschild presented to the Louvre a mass of First-Century silverware discovered in the excavation of a villa there. In the collection are 40 vases, jugs, bowls, etc., and 100 small pieces. The chief trade of the town is in wine and silk. In 1850 a stream of lava from Vesuvius, about a mile and a half broad and 12 feet deep, divided only just in time to leave Boscoreale unharmed, the fiery torrents destroying the woods on either side. Population, in 1881 (commune), 8756; in 1901, 9340. Consult: Héron de Villefosse, "Le trésor de Boscoreale," in *Monuments et mémoires de l'Institut de France*, Vol. V. (Paris, 1899); *Boscoreale Collection* (New York, 1898).

BOS/COVICH, RUGGIERO GIUSEPPE (1711-87). A celebrated Italian mathematician and astronomer, born in Ragusa. At an early age he joined the Jesuits, and spent his life in scientific pursuits and important public labors. Before the completion of his course of studies in Rome, he

was appointed teacher of mathematics and philosophy in the Roman College there. In 1758 he published his famous work, *Theoria Philosophiæ Naturalis Reducta ad Unicam Legem Virium in Natura Existentium*, in which he advanced a molecular theory of matter, maintaining that substances consist of a system of material points which attract or repel each other, according to the distance between them. In 1764 he was appointed to a professorship at Pavia. After the suppression of the Jesuit order, he went to Paris, in 1774, and received a pension from the King. In 1783 he went to Bassano, to superintend an edition of his works, on the completion of which he returned to Milan, but fell into a depression of spirits, which at last grew into complete insanity. His works, which were the first to advocate in Italy the theories of Newton, include dissertations on a great variety of important questions in mathematical and physical science, and were published collectively under the title, *Opera Pertinentia ad Opticam et Astronomiam* (5 vols., 1785).

BOSE, bō'ze, JULIUS, Count (1809-94). A Prussian general, born at Sangerhausen. In 1861 he entered the Ministry of War, where he was active in the reorganization of the army. During the War of 1866 he conducted the celebrated night attack on Podol, which resulted in the retreat of the Austrian brigade. He was commander of the Eleventh Army Corps in the Franco-Prussian War, but, in consequence of severe wounds received at the battle of Wörth (August 6, 1870), he was prevented from further participation in that campaign.

BOSIO, bō'zē-ō, FRANÇOIS JOSEPH, Baron (1769-1845). A French sculptor. He was born at Monaco, March 19, 1769, and rose to eminence in the reign of Louis XVIII. He was a pupil of Pajou, but his work was influenced by the study of the antique. He has left behind him many examples of his talent and industry. His prominent works in Paris are a bronze group of "Hercules Struggling with a Serpent" in the garden of the Tuileries, an equestrian statue in the Place des Victoires, the triumphal chariot of the arch in the Place du Carrousel. The "Nymph Salmacis" and a "Hyacinth" are in the gallery of the Louvre. He executed many busts of the royal family, and the figure of the King of Rome. In 1830 Bosio completed the monument of the Countess Demidoff. He was the recipient of many honors. Louis XVIII. made him Court sculptor, and Charles X. made him a baron. He was a member of the French Institute and of the Royal Academy of Fine Arts in Berlin. Consult: Richard Muther, *History of Modern Painting* (London, 1896); A. G. Radcliffe, *Schools and Masters of Sculpture* (New York, 1894).

BOSNA-SERAI, bōs'nā-sā-rī'. See SERAJEVO.

BOSNIA, bōz'nī-ā (from the river *Bosna*, an affluent of the Save). Previous to 1878 the north-westernmost portion of the Turkish Empire, now (together with Herzegovina) virtually a province of Austria-Hungary. Bosnia (with Herzegovina) is bounded by Croatia and Slavonia on the north and west; Servia, the Turkish district of Novi-pazar (occupied by Austro-Hungarian forces), and Montenegro on the east; and Dalmatia on the southwest (Map: Austria-Hungary, E 4).

Its area, including Herzegovina, is about 19,700 square miles; exclusive of Herzegovina, about 16,170 square miles. The surface of Bosnia is exceedingly mountainous, a large portion being covered by the numerous offshoots of the Dinaric Alps. The highest summit rises nearly 8000 feet above sea-level. The northern chains are generally well wooded, and inclose fertile valleys, while the mountain regions of the south are mostly rocky and barren. On the northern frontier the country inclines toward the Save. The chief rivers are the Save, which forms most of the northern boundary, and the Drina, which separates Bosnia from Servia. The southern part is watered chiefly by the Narenta. There are, besides, several minor streams, such as the Vrbas, the Bosna, and a few others. The climate is generally healthy, but exceedingly variable. The average annual temperature at Serajevo is over 48°, but the mercury falls in the winter as low as -2°, while in the summer it rises occasionally to 95°. Bosnia is principally an agricultural country, agriculture engaging nearly 90 per cent. of the population. The methods employed are of a primitive character, and extensive areas of fruitful land remain uncultivated. The chief European cereals are raised, and much attention is paid to the cultivation of fruits, especially plums, of which great quantities are exported in a dry state. Tobacco is an important product, the annual crop amounting to over 3000 tons. Sugar-beets are also grown, and silk-culture has been introduced. The Austro-Hungarian Government has recently taken steps toward furthering the agricultural interests of Bosnia by establishing several agricultural experiment stations and model farms. Sheep and goats are raised extensively, while horned cattle and horses receive less attention. The mountains of Bosnia are rich in minerals, some of which were worked in the days of the Romans. The mineral industry is chiefly in the hands of the Government. The chief mineral products are iron, copper, manganese, quicksilver, coal, and salt. The manufacturing industries are also in a backward state, and are confined chiefly to the production of coarse metal articles and some textiles for the home market. There are several extensive State tobacco factories. The exports consist mainly of cereals, fruit, animals, and animal products. Since the Austro-Hungarian occupation the transportation facilities of Bosnia have been considerably extended and improved. In 1901 there were over 600 miles of railway lines, extending from Serajevo to all parts of the province. The highways and telegraph lines have also increased in length. The social and economic condition of Bosnia presents strange contrasts in the intermingling of institutions and customs handed down from the past with the innovations that reflect the spirit of modern progress.

In accordance with the agreement of 1878, the supreme control of the province is nominally vested in the hands of the Sultan of Turkey, but the immediate administration is directed by the Bosnian Bureau, under the supervision of the Minister of Finance of Austria-Hungary. The provincial government is divided into the four departments of internal affairs, finance, justice, and public works. For administrative purposes Bosnia is divided into 5 districts and 43 counties, administered by separate officials, with the assistance of representative councils. The annual bud-

get amounts to a little over 40,000,000 kronen (\$8,120,000). The Austro-Hungarian Government maintains an army of about 20,000 men. Military service is compulsory for every able-bodied male for a period of three years. Education is free, but not compulsory, and, although the number of schools, as well as the standard of instruction, has been raised since the Austro-Hungarian occupation, education is still very backward, and a large proportion of the population is illiterate. The population of Bosnia and Herzegovina in 1895 was 1,591,036, against 1,336,091 in 1885. According to religion, they were divided as follows: Greek Orthodox, 42.94 per cent.; Mohammedans, 34.99 per cent.; Roman Catholics, 21.31 per cent.; Jews, 0.52 per cent. The inhabitants, Bosniaks and Herzegovinians, belong to the Serb branch of the Slavic race, with stature for soldiers of 1.710 metres. In the necropolis of Glasina, with its 20,000 tumuli, were found crania which show that the dolichocephalic Hallstatt race was once as pronounced here as is the opposite type to-day. With a few unimportant exceptions, the people speak the Serb language. The Mohammedans, who call themselves Turks, are descendants of Slavic Christians converted to Islam during the Mohammedan conquest, and do not adhere so closely to Islam as the Mohammedan inhabitants of the Turkish provinces. The Turkish element of the population is insignificant. There is an Albanian element in the south. Capital Serajevo, with a population of about 38,000.

Bosnia constituted a part of the Roman provinces of Dalmatia and Pannonia, and was celebrated in ancient times for its rich mines of silver and gold. After the passing of the Goths the region was occupied by a Slav population, about the beginning of the Sixth Century. For a long time the various parts of the country had their own petty princes. The Bosnian rulers begin to figure under the name of Ban in the Twelfth Century. About this time the heretical Christian sect of Patarenes rose to importance. In the course of the Middle Ages the country passed through periods of Servian, Croatian, and Hungarian overlordship. A succession of powerful chiefs extended the limits of the principality over Dalmatia and a part of Servia, and in 1376 Ban Tvertko proclaimed himself King of Bosnia. In 1401 came the beginning of Turkish invasion, which burst upon the country in all its force in 1463. The Turks now made themselves rulers of nearly the whole of Bosnia, and the fragment which had become attached to Hungary fell into their hands after the battle of Mohács in 1526. Bosnia became thoroughly Islamized, and submitted quietly to the ruthless Ottoman rule. In 1850-51 the Mohammedan nobility, crushed by the heavy weight of taxation, rose in arms against the Porte, but the revolt was stamped out with sanguinary efficacy by Omer Pasha. An unsuccessful insurrection in Bosnia and Herzegovina took place in 1875-76, and was followed by Servia's disastrous war with Turkey. The facts of Turkish misgovernment were recognized at the Congress of Berlin (1878), and Austria-Hungary was authorized to occupy and administer Bosnia and Herzegovina, though the Sultan retained the nominal suzerainty over them. The Austro-Hungarian occupation was effected in 1878, but only after a desperate resistance on

the part of the Mohammedan inhabitants. In 1881 compulsory military service was introduced. The administrative order and military organization of Bosnia have been assimilated to the Austro-Hungarian system. Bosnia has made great strides under the Austro-Hungarian rule, its prosperity being in great measure due to the wise and vigorous administration of Baron Kállay.

Consult: Miller, "Bosnia Under the Austrians," *Gentleman's Magazine*, CCLXXXV. (London, 1898) and *Travels and Politics in the Near East* (1899); Munro, *Rambles and Studies in Bosnia* (Edinburgh, 1895); Diehl, "En Bosnie-Herzégovine," *La grande revue*, Vol. XVII. (Paris, 1901).

BOSPORUS, or **BOSPHORUS** (Gk. *Βόσπορος*, *Bosporos*, literally *ox-ford*, from *βοῦς*, *bous*, ox, *πόρ* + *ῥος*, *poros*, ford, crossing. Called also the Strait of Constantinople). The narrow channel which connects the Black Sea with the Sea of Marmora and separates the two continents of Europe and Asia (Map: Turkey in Europe, G 4). It has a length of about 18 miles, and in width varies from about 1800 feet to about two miles, with a depth of over 100 feet.

The surface currents are from the Black Sea to the Sea of Marmora, while underneath and along the shore the direction is opposite, which fact accounts for the undiminished salinity of the Black Sea, in spite of the great quantities of fresh water which it receives through its affluents. The swift currents and the occasional fogs which envelop the northern entrance make the channel very dangerous for navigation, and a number of lighthouses have been erected to insure greater safety. The shores are for the most part elevated, and in the vicinity of Constantinople are lined with palaces, picturesque villages, vineyards, and numerous ancient ruins. The name Bosphorus, which means an ox-ford or a cow-ford, is supposed to have been derived from the legend according to which the strait was crossed by Io after she was transformed into a cow. Other authorities attribute the name to the narrowness of the channel, which makes it possible for an ox to cross it. The channel was also known at one time as the Thracian Bosphorus. At the middle of this strait, where it is about 2800 feet in breadth, Darius made his bridge of boats when he marched against the Scythians. The Bosphorus has long been under Turkish control. Repeated European conferences, including that of Berlin, in 1878, have confirmed the stipulation of the treaty made in 1841, providing that no ship of war belonging to any nation but Turkey shall pass through the Bosphorus without the consent of the Ottoman authorities.

BOSPORUS, KINGDOM OF. An ancient Greek State on both sides of the Cimmerian Bosphorus (the Strait of Yenikale, connecting the Sea of Azov with the Black Sea). It was founded probably about the beginning of the Fifth Century B.C. in the Tauric Chersonesus (Crimea). In 393 the kingdom was extended along the Asiatic coast, and Theodosia was united with it in 360. The kingdom became tributary to the Scythians in 290, and toward the close of the Second Century B.C., Mithridates, King of Pontus, vanquished the Scythians and set his son, Machares, on the throne of Bosphorus.

On the death of Machares, soon followed by that of Mithridates, the Romans gave the country in B.C. 63 to Pharnaces, the second son of Mithridates, and after his assassination to several princes who gave themselves out for descendants of Mithridates. When at last the family became entirely extinct, in A.D. 259, the Sarmatians made themselves masters of the kingdom.

BOSQUET, bô's'kâ', PIERRE FRANÇOIS JOSEPH (1810-61). A marshal of France. He was born at Mont de Marsan, in the Department of Landes, November 8, 1810, entered in 1829 the Polytechnic School in Paris, and in 1838 joined the artillery as sub-lieutenant. He became colonel in 1847, general of brigade in 1848, and general of division in 1854. In the earlier part of his career he displayed such skill and valor in several Algerian campaigns that he was intrusted with the Second Division of the French Army in the Crimean War, 1854-55, in which he especially distinguished himself at the Alma, Inkerman, and at the storming of the Malakoff. Having been seriously wounded at Sebastopol, he was compelled to retire from active service, and France, in recognition of his services, made him Senator and field-marshal. The British Parliament voted its thanks to him in a special resolution.

BOSS, bôs (Fr. *bosse*, probably OHG. *bôzo*, tuft, bunch, *bôzan*, MHG. *bôzen*, to beat). In architecture, a raised ornament, usually that of the projecting keystone at the intersection of ribbed vaulting. The term is extended to similar projections on running moldings. It first became common in developed Gothic work, where bosses were usually enriched with figures or foliage in high relief and of great beauty. (See **BOSSAGE** in its first meaning.)—The boss of a bit is the ornament with which a bridle-bit terminates at each end.

BOSS. A term derived from the Dutch *baas*, originally meaning a master, overseer, or superintendent of any kind. So a *boss* shoemaker or carpenter is the head of a gang of shoemakers or carpenters, who deals out work to them and fixes the amount of their pay. The term seems to have arisen from aversion to the word 'master,' regarded as savoring too much of the relations between master and slave, and it has come largely into use among the American negroes since their emancipation. In the vocabulary of American politics it denotes a professional politician who regards the public service as a means of rewarding his personal friends, and of buying the support of the ignorant and unscrupulous. In this sense the word came into general use at the time of the exposure of the Tweed Ring in New York City in 1872.

BOSS, LEWIS (1840—). An American astronomer. He was born in Providence, R. I., graduated in 1870 at Dartmouth College, and from 1872 to 1876 was astronomer of the United States northern boundary commission. In connection with the determination of the latitude of various specified points on the boundary line, he compiled a list of the *Declinations of Fixed Stars* (Washington, 1878), which forthwith made him favorably known. In 1876 he was appointed director of the Dudley Observatory at Albany, N. Y., which, through his efforts, was reconstructed in 1893, and provided with an increased endowment. He was chief of the expedition sent

in 1882 by the United States Government to Santiago, Chile, to observe the transit of Venus, is an honorary member of the Royal Astronomical Society, and variously connected with other learned bodies, and has published, besides many monographs, a *Catalogue of 8241 Stars* (1890), a contribution to the coöperative catalogues of the stars prepared by leading scientists of the Continent.

BOSSAGE (for derivation see *Boss*). A term used in two senses: either (1) to denote the stones in a building left rough and projecting, afterwards to be worked into a decoration, as in carved Gothic keystones (see *BOSS*), or in memorial tablets; or (2) to designate stones left in the same rough manner as a permanent feature, as in the rustic masonry of Florentine palaces.

BOSSCHA, bôs'sâ. JOHANNES (1831—). A Dutch physicist. He was born in Breda, and was educated in Deventer and Leyden. He became director of the Polytechnic School in Delft in 1878. He has made important investigations on galvanic polarization, the rapidity of sound-waves, the mechanical theory of electrolysis, and he was one of the first (1855) to suggest the possibility of sending two messages simultaneously over the same wire.

BOSSE, bôs, ABRAHAM (1611-78). A French engraver and etcher, born in Tours. He taught perspective in a special school of design in Paris, and subsequently was a professor at the Royal Academy of Painting. Most of his bold and spirited plates were executed from his own designs. He published a *Traité des manières de graver en taille douce* (1645), and other works.

BOSSE, bôs'se, ROBERT (1852—). A German statesman. He was born at Quedlinburg, and studied law at the universities of Heidelberg, Halle, and Berlin. He became Under-Secretary of State in the Ministry of the Interior in 1889, in which capacity he had the principal share in the preparation of the laws providing insurance for workmen. In 1891 he was appointed Secretary of State in the Imperial Ministry of Justice, and he was chairman of the commission intrusted with the preparation of the new Civil Code of Germany. His appointment as Prussian Minister of Education in 1892 followed. In 1883 he became editor of the *Monatsschrift für Deutsche Beamte* (Berlin). Among his publications are: *Kommentar zum Invaliditäts- und Altersversicherungsgesetz* (3d ed., 1891); *Eine Dienstreise nach dem Orient* (1900).

BOSSI, bôs'sâ, ENRICO MARCO (1861—). An Italian composer, born at Salò. He studied at the Milan Conservatory, became organist in the cathedral of Como, and subsequently instructor in the theory and practice of organ-playing in the conservatory of Naples. He has written chamber music; requiem masses; an organ concerto; an opera, *Il Cieco* (first presented at Venice in 1898); and *Canticum Cantorum*, a biblical cantata, rendered for the first time in 1901 with much success by the Cäcilienverein of Frankfort-on-the-Main, Germany. His *Metodo di studio per l'organo moderno* (1893; with G. Tebaldini) is an extremely valuable work.

BOSSI, GIUSEPPE (1777-1815). An Italian painter and writer on art. He was born at Busto Arsizio, August 11, 1777, and studied in

Milan, but also passed several years in Rome in close association with artists of the Italian school. On his return to Milan he was made secretary of the Academy of Fine Arts, and for his services in that academy and those of Bologna and Venice, he was, in 1804, awarded the decoration of the Iron Crown. In 1805 he exhibited a drawing of Michelangelo's "Last Judgment." He copied the "Last Supper" of Leonardo in order that this great work, almost obliterated, might be reproduced in mosaic by Rafaelli. In 1810 Bossi published *Del cenacolo di Leonardo da Vinci*, which attracted the interest of Goethe. On his death, December 15, 1815, a monument by Canova was erected to his memory in the Ambrosian Library in Milan. Much of Bossi's life was devoted to the study of the works of Leonardo, and his last work was a series of drawings representing incidents in the life of that master. He left unfinished a large cartoon in black chalk of "The Dead Christ in the Bosom of Mary, with John and Magdalene."

BOSSI, LUIGI, Count (1758-1835). An Italian antiquary and historian. He was born in Milan, studied in Pavia, and became a canon of the Cathedral of Milan; but when the French entered Italy he took the side of the invaders, and was appointed by Bonaparte agent of the French Government in Turin, and afterwards prefect of the archives of the kingdom of Italy. He was an extremely prolific author, and produced more than eighty works on antiquarian, historical, and art subjects. The best known of his antiquarian writings is *Observations sur le casé que l'on conservait à Gènes sous le nom de Sacro Catino* (1807). His most important historic works are a much-enriched translation of Roscoe's *Life of Leo X.*, 12 vols. (1816-17); *Vita di Cristoforo Colombo* (1818); and *Istoria d'Italia*, 20 vols. (1819-23).

BOSSUET, bô'swâ', JACQUES BÉNIGNE (1627-1704). A distinguished French pulpit orator. He was born September 27, 1627, in Dijon; received his earlier education in the Jesuit College there; and then went to Paris to the College of Navarre, where he studied the Sacred Scriptures, the works of classical antiquity, and the Cartesian philosophy. In 1652 he was made a priest, and a doctor of theology, and canon in Metz. Here he was called by the bishop to reply to the catechism of the Protestant minister, Paul Ferri, and this he did (1655) in a way that commanded the admiration even of Protestants. He soon attained great distinction as a pulpit orator, and in 1661 he was made preacher to the Court. His discourse on the occasion of Marshal Turenne's conversion to the Catholic Church obtained for him the bishopric of Condon (1669). Louis XIV. having in 1670 intrusted to him the education of the Dauphin, he resigned his bishopric in 1671, because he believed that he would be unfaithful to his duty if he retained it during a continued absence from his diocese. He was now made a member of the Academy. The care with which he attended to the education of the Dauphin was rewarded, in 1680, by his nomination as first almoner of the Dauphin, and in 1681 by his appointment to the bishopric of Meaux. He was the author of the four articles which secured the freedom of the Gallican Church, and the rights of the King in regard to it, against the aggres-

sions of the Pope; and his eloquence in the famous assembly of the French clergy in the year 1682 secured the adoption of these articles. In 1697 he became a member of the Council of State, and in the following year first almoner to the Duchess of Burgundy. He spent the last year of his life in his diocese, but died in Paris, April 12, 1704. He was alike strict in morals and in religious doctrine; his strictness in the latter he showed particularly in his controversy with Fénelon, whom he accused of heresy for his defense of the Quietists (q.v.). Bossuet is considered the greatest ecclesiastical orator known in history. His orations at the funerals of the Duchess of Orleans and the great Condé are particularly famous as masterpieces of this kind of eloquence. All his writings attracted much attention. For the defense of those dogmas of the Catholic Church which are rejected by the Protestants he wrote his *Exposition de la doctrine de l'église catholique sur les matières de controverse* (Paris, 1671).

His greatest controversial work is his celebrated *Histoire des variations des églises protestantes*, 2 vols. (1688), in which he founds his arguments chiefly upon the doctrinal diversities of the churches of the Reformation. To the defense of the four articles of the Gallican Church he devoted his *Defensio Declarationis Celeberrimæ, quam de Potestate Ecclesiæ Sanxit Clerus Gallicus a.* [1682], 2 vols. (1730). With a view to the instruction of the Dauphin, he wrote his *Discours sur l'histoire universelle jusqu' à l'empire de Charlemagne* (1681), a work particularly deserving of notice, as the first attempt at a philosophical treatment of history. The continuation of it to the year 1661 (1805) is entirely derived from materials which he left behind him, but to which the last touch of his own hand was wanting. Another fruit of his political and historical studies was the *Politique tirée de l'Ecriture Sainte* (1709). There are modern English translations of the following: *Select Sermons and Funeral Orations* (London, 3d ed., 1801); *A Conference on the Authority of the Church* [1679] (1841); *A Survey of Universal History* (1819); *Elevations to God* (1850); *An Exposition of the Catholic Faith* (new edition, 1841); *The History of the Variations of the Protestant Churches* (2d ed., Dublin, 1836, 2 vols.); A. Rebellian, *Bossuet, historien du protestantisme, Etude sur l' "Histoire des variations"* (Paris, 1892); *Sermon on the Mount* (New York, 1900); *Meditations* (London, 1901). His works appeared in Paris, 1862-66, 31 vols., appendix *Œuvres inédits* (1881-83, 2 vols.). For his life, consult: A. Réaume, 3 vols. (Paris, 1869-70); G. Lanson (Paris, 1891); François Ledieu (Bossuet's secretary), *Mémoires et journal sur la vie et les ouvrages de Bossuet*, 4 vols. (Paris, 1855-57); and Mrs. H. L. Sidney Lear (London, 1880).—His nephew, JACQUES BOSSUET, died bishop of Troyes, July 12, 1743. His very extensive correspondence, chiefly devoted to the elucidation and investigation of the views of Fénelon, is included in the above-mentioned edition of the works of his uncle.

BOSSUT, bô'su', CHARLES (1730-1814). A French mathematician and physicist, born at Tartar, near Lyons. He studied with the Jesuits in Lyons, and received his ordination. In 1752

he became professor of mathematics at Mézières, and in 1768 was received into the Academy of Sciences. The Revolution deprived him of his situation and his income, and he lived in the greatest seclusion, till under the Empire he was appointed a professor in the Polytechnic School. His works are very numerous. The following may be mentioned as particularly valuable: *Recherches sur la construction la plus avantageuse des digues* (1764); *Recherches sur les altérations que la résistance de l'éther peut produire dans le mouvement des planètes* (1776); *Nouvelle expérience sur la résistance des fluides par d'Alembert, Condorcet, et Bossut* (1777); *Traité élémentaire de mécanique et de dynamique* (1763); *Cours complet des mathématiques*, 7 vols. (1795-1801); *Cours de mathématiques à l'usage des écoles militaires* (1782); *Essai sur l'histoire générale des mathématiques* (2d ed., 1810); and *Traité du calcul différentiel et intégral* (1798). He was a great admirer of Pascal, and edited his works (15 vols., Paris, 1779), to which he prefixed an introductory *Discours sur la vie et les ouvrages de Pascal*, in 5 vols. Bossut is especially entitled to fame for his researches in experimental hydrodynamics, which have formed contributions of great importance to that science. He is best known, however, for his history of mathematics mentioned above, a work which, while open to serious criticism, awakened much interest in the subject.

BOSTAN'GI (from Turk. *bostan*, Pers. *bustân*, garden). A class of men in Turkey who, originally the Sultan's gardeners, now perform a variety of duties, such as mounting guard at the seraglio and rowing the Sultan's barge. Their chief, called Bostangi Bashi, holds the rank of pasha, is governor of the Sultan's residences, and chief of police of the capital. The bostangi at one time numbered 3000, and were united with the janissaries in military duty. In war time their strength was 12,000. Their present number is about 600.

BOSTON, bôs'ton or bôs' (Saint Botolph's town'). An ancient English borough and seaport in Lincolnshire, on both sides of the Witham, 28 miles southeast of Lincoln (Map: England, G 4). Boston is supposed to be the ancient Icanhoe, the site of the abbey founded by Saint Botolph in 654. After the conquest it became an important trading town and the home of a Hanseatic guild. Henry VIII. granted it a charter of incorporation. The ancient Guildhall is interesting historically as the place of trial of Brewster and his companions. The parish church of Saint Botolph (1309), 290 × 98 feet, is one of the largest without cross-aisles in England, and has a fine tower 290 feet high, surmounted by a lantern visible 40 miles out at sea. The church was partially restored in 1857, at the expense of the inhabitants of the town's American namesake. Boston returns one member to Parliament. The town owns extensive docks. The clearing of the river of silt and the closing of the adjacent fens have greatly promoted the trade of Boston. Population, in 1891, 14,570; in 1901, 15,700.

BOSTON. The capital of Massachusetts, and the county-seat of Suffolk County, the commercial metropolis of New England, and the fifth city of the United States in population (Map: Massachusetts, E 3). It is in latitude 42° 21'

27" N., longitude 71° 3' 30" W., 232 miles by rail northeast of New York City, on Boston Harbor, an arm of Massachusetts Bay, at the mouth of the Mystic and Charles rivers.

DESCRIPTION. The original site of Boston, including Beacon, Copp's, and Fort hills, all of which have been considerably cut down, though the first still rises to a height of 110 feet, was a peninsula of less than 800 acres in extent, connected with the mainland by an exceedingly narrow neck, one mile in length and so low that it was not infrequently submerged. The shore, deeply indented, was surrounded by tidal marshes, which have been filled in at great expense, adding over 1000 acres to the original area, a part of which, on the Charles River, is now the location of the well-known Back Bay district of the modern city. The limits of the old town have been extended to include East Boston, on Noddle's Island, added in Colonial times; South Boston, originally Dorchester Neck, annexed in 1804; Roxbury, in 1868; Dorchester, in 1870; and Charlestown, West Roxbury, and Brighton, in 1874—the modern Boston occupying a total area of about 43 square miles.

The appearance of the old town is still retained in the narrow and irregular streets of the North End, now one of the most squalid parts of the city. As historical relics remain three old burying-grounds—Copp's Hill Burial Ground, containing the graves of the Mathers; Central Burying-Ground, dating from 1756; and Old Granary Burial Ground, in which are buried several persons noted in history. A few old buildings are still standing—Christ Church (Old North Church) (1723), from the spire of which were hung the lanterns for Paul Revere; Faneuil Hall (q.v.); the old State House (1748), restored in 1882 as nearly as possible to its provincial appearance, one of the most noteworthy historic buildings in the United States and the repository of an interesting collection of relics and paintings; King's Chapel (1754), occupying the site of the first Episcopal church, of 1688, with the oldest cemetery in Boston; the Old Corner Bookstore, long known as a rendezvous of literary persons; and the Old South Meeting House (1729), with which are connected many notable events in the history of the city, and which now contains historic relics and in winter is used as a hall for lectures on American history.

The modern city has about 590 miles of streets, of which all but 95 miles are paved—the greater part with macadam, granite, Belgian blocks, and gravel. In the new sections they are handsomely laid out. Beacon Street and Commonwealth Avenue, the latter 240 feet wide and one of the finest boulevards in America, with other streets of the Back Bay region, are representative of the beauty of Boston's residential avenues. Washington and Tremont streets are the headquarters of the retail trade, and State Street is the important financial centre—the Wall Street of Boston. Intercommunication between the various districts of the city is afforded by an efficient street-railway system which operates about 200 miles of track, and by a number of bridges, East Boston alone being connected by ferry.

BUILDINGS. Boston is replete with objects of architectural interest. The State House, on Beacon Hill, built in 1795 after designs by Charles Bulfinch, and subsequently enlarged at various

times, is a prominent structure some 400 feet long, crowned by a gilded dome. The Shaw Monument, by Saint Gaudens, the reproduction of the Beacon Monument which was erected in 1790, and statues of Daniel Webster and Horace Mann, are of interest in this locality. The City Hall, an Italian Renaissance structure, on School Street, is fronted by statues of Benjamin Franklin and Josiah Quincy, and the granite County Court House, a type of German Renaissance, is 450 feet long, erected at a cost of \$2,500,000. On State Street stands the Custom House, of granite, in form a huge Greek cross; not far distant is the United States Government Building, which covers an entire block and accommodates the post-office, sub-treasury, and United States courts. The total cost of this edifice, including construction and land, was nearly \$6,000,000.

Copley Square is perhaps the city's greatest architectural centre. Here are the Public Library, facing Trinity Church, and the Museum of Fine Arts, and the Second Unitarian and the New Old South churches. The library is built of Milford granite, in Italian Renaissance style, and is nearly square, inclosing an open court which contains a fountain by Martigny and is surrounded by a fine arcade. Over the main entrance are reliefs by Saint Gaudens, while the interior is richly decorated with colored marbles and mural paintings by well-known artists, among them Puvis de Chavannes, Edwin A. Abbey, and John S. Sargent. The entrance hall leads to a magnificent marble staircase flanked with lions. Statues of Emerson and Sir Harry Vane add to the interior decoration. The Boston Public Library is the largest free circulating library in the world. It has accommodation for 2,500,000 books and contains about 775,000 volumes, among which are included several valuable special collections, that of Shakespeariana being one of the finest in the world. The general reading-room (Bates Hall) is of spacious dimensions, 42 feet wide by 217 feet long, and extends across the Copley Square front. The churches on this square are worthy examples of ecclesiastical architecture, and, with the Roman Catholic Cathedral of the Holy Cross in Washington Street, the First Church of Christ (Scientist), and the First Spiritual Temple (Spiritualist) are perhaps the most striking church edifices in the city. The New Old South Church is in Italian Gothic, with a fine campanile and an interior noticeable for its rich marble. Trinity Church, by Richardson, said to be the finest church in New England, is a specimen of French Romanesque. It has the form of a Latin cross, and is particularly notable for its beautiful interior decorations and stained-glass windows. The Museum of Fine Arts, on the east side of the square, is of red brick, in Italian-Gothic style, and is the repository of works of inestimable value, the collection of Japanese art and that of antique casts being among the best in the world. Other points of interest in various parts of the city are the buildings of the Massachusetts General Hospital, the great Exchange Building, containing the Stock Exchange Chamber, the Chamber of Commerce, the tall Sears and Ames buildings, the Unitarian and Congregational buildings, the Masonic Temple, Tremont Temple, the *Youth's Companion* Building, the Natural History Museum, with a library and valuable collections, the Massachusetts His-

torical Society Building, the Armory of the First Corps of Cadets, and the new buildings of the New England Conservatory of Music.

In Charlestown are the famous Breed's Hill and Bunker Hill. In this section of the greater city the principal points of interest are the Bunker Hill Monument, a granite obelisk 220 feet high, which affords from the top an extensive view, and the navy yard, occupying nearly 90 acres, and containing machine-shops, ship-houses, etc., and a large granite dry-dock. Charlestown has also statues of Col. William Prescott and Gen. Joseph Warren, a soldiers' monument, and a monument to John Harvard.

PARKS. The Common, a most characteristic feature of Boston, esteemed by the people as few other public parks are, because of its intimate connection with the history of the city, was set off in 1634 as a training-field and common ground, and has since been carefully preserved for public use. Its 48 acres are crossed by paths shaded by grand old elms, while toward the centre, near where the 'Great Elm' stood until blown down in 1876, is the Soldiers' Monument, erected in memory of the men of Boston who "died for their country." Near the Tremont Street Mall stands the Crispus Attucks Monument, commemorating the 'Boston Massacre of 1770.' The bronze figure represents Revolution breaking the chains, and the scene of the massacre is portrayed in bas-relief on the base; the names of the victims are on the shaft. Adjacent to the Common is the Public Garden, of 24 acres, the entrance to the Back Bay district, tastefully laid out and in season a mass of brilliant flowers. It contains an artificial lake, spanned by a ponderous bridge, and an equestrian statue of Washington by Ball, statues of Edward Everett and Charles Sumner, a representation of "Venus Rising from the Sea," and the group by J. Q. A. Ward, commemorating the discovery of ether, first successfully used in 1846 by Dr. Morton, in an operation at the Massachusetts General Hospital.

Among other noteworthy statues of the city are a bronze statue of Governor Winthrop in Scollay Square, one of Samuel Adams in Adams Square, another of Governor Andrews in the State House, the statues of Alexander Hamilton, John Glover, William Lloyd Garrison, and Leif Ericson in Commonwealth Avenue, the statue of Farragut in the Marine Park, of Beethoven in the Music Hall, and of Columbus in front of the Roman Catholic Cathedral.

Owing to the natural beauty and accessibility of its suburbs, and the existence of the Common and the Public Garden in the heart of the city proper, Boston was late in initiating a system of public parks. There are now two phases of park development—the municipal, dating from the seventies, and the metropolitan, of more recent inauguration and of vast extent, requiring years for its completion as planned. The municipal system, of over 2600 acres, includes, besides numerous playgrounds and open-air gymnasias, and independent parks in various parts of the city, a chain of parks connected by fine parkways, and almost encircling the city from the Charles River Embankment to the Marine Park in South Boston. From its terminus at the Charles River, the boulevard extends through a narrow section, Charlesgate, to 'The Fens,' then by the narrow Riverway to Leverett Park, approaching Ja-

maica Park with Jamaica Pond, passing the Arnold Arboretum, where may be found every tree and shrub that will grow in Boston's climate, reaching Franklin Park, of 520 acres, in West Roxbury, the central feature of the system, and ending with the Marine Park at City Point, South Boston. The Marine Park is connected by a pier with Castle Island, also a part of the park system. This locality is a popular headquarters for yachts, and affords facilities for boating and bathing (municipal bath-houses). The Metropolitan Parks District, in which are included a number of municipalities, is administered by a commission of five members, appointed by the Governor. The scheme comprises such reservations as the Blue Hills (4000 acres), Middlesex Fells (3200 acres), Stony Brook Woods (400 acres), connecting the first-named with the Boston municipal system at the Arnold Arboretum, Lynn Woods (2000 acres), Beaver Brook Reservation, of greater interest than its small extent presupposes, Revere Beach, which is open to public use for several miles, and improvements along the Charles, Mystic, and Neponset rivers.

EDUCATION, LIBRARIES, ETC. Boston is noted as one of the greatest educational and literary centres of the country. Its public-school system comprises, besides kindergarten, primary, and grammar schools, a liberal number of high schools, and also normal and Latin schools. The Boston Latin School, founded in 1635, and the English High School occupy the largest school building in the United States. Among the higher institutions of learning are Boston University (Methodist Episcopal), Boston College (Roman Catholic), Massachusetts Institute of Technology, the medical and dental schools of Harvard University, Tufts College Medical School, College of Physicians and Surgeons, Saint John's Ecclesiastical Seminary (Roman Catholic), and the Massachusetts College of Pharmacy. The New England Conservatory of Music has an enviable reputation, and the Lowell School of Design, the Massachusetts Normal Art School, and the school connected with the Museum of Fine Arts are representative of Boston as a centre of art education. Besides these regular institutions, the great system of free lectures on a wide variety of subjects practically constitutes a great university. The lectures in the Old South Meeting House have been mentioned; the work of the Lowell Institute, which is specially endowed for this purpose, is also worthy of note.

The Boston Public Library maintains fifty-seven or more agencies, including several branch stations with large permanent collections, besides numerous reading-rooms and delivery and deposit stations. In the metropolitan district there are some 30 free libraries, with a total of 1,300,000 volumes, while the collections open to investigators aggregate 3,000,000. Among other noted collections in the city are those of the American Academy of Arts and Sciences, the Boston Athenæum (founded in 1807, with nearly 200,000 volumes), Boston Library Society, Congregational Library, Massachusetts Historical Society (founded in 1791), Massachusetts Horticultural Society (founded in 1829), New England Historic Genealogical Society, State Library, Social Law Library, and

Natural History Society, besides those of the leading educational institutions.

CHARITABLE INSTITUTIONS. In the number and efficiency of institutions of this class, both public and private, Boston holds high rank. Among these, mention may be made of the Massachusetts General Hospital, one of the best equipped in the world; Massachusetts Homeopathic Hospital, Carney Hospital (in South Boston), the City Hospital, Women's Charity Club Hospital (in Roxbury), Massachusetts Charitable Eye and Ear Infirmary, New England Hospital for Women and Children, Boston Insane Hospital (separate establishments for males and females), Children's Hospital, the Horace Mann School for Deaf Mutes, and the Perkins Institute for the Blind, which has a large library of raised-character books. On islands in the harbor are the principal almshouse, House of Correction, and House of Refuge for Boys.

THEATRES, CLUBS, SOCIETIES, HOTELS. The Boston Theatre, seating 3000, is the largest in New England, and the Colonial, Boston Museum, Tremont, Hollis Street, Park, Castle Square, Columbia, Keith's, Howard Athenæum, Bowdoin Square, and Bijou theatres have seating capacities ranging from 1000 to 2000. The Boston Museum, noteworthy for the first appearance of several famous actors, is the oldest in the city. The old Tremont Theatre, which occupied the site of the present Tremont Temple, was also known for the eminent persons who appeared on its stage. The celebrated Boston Symphony Concerts are given in Symphony Hall, one of the finest music halls in the country.

Boston is the home of a large number of historical, scientific, literary, and musical societies. In the last-mentioned class are such well-known organizations as the Apollo, Cecilia, Harvard Musical, Handel and Haydn, and Orpheus. The social and literary clubs include, among numerous others, the Somerset, Algonquin, Saint Botolph, the University, Boston Art, Union, New England Women's, Mayflower, Boston Athletic Association, Appalachian Mountain, the Temple (the oldest in the city), and the Country Club, at Clyde Park, Brookline.

The principal hotels include the Adams House, the Parker House, Young's Hotel, the Hotel Touraine, the Somerset, the Lenox, and the Essex.

COMMERCE AND INDUSTRY. Boston is the terminus of the Boston and Albany, the Boston and Maine, the Fitchburg, and the New England railroads, the Old Colony System of the New York, New Haven and Hartford Railroad, and the Boston, Revere Beach and Lynn (narrow-gauge) Railroad. There are two large union stations on the water-fronts and on opposite sides of the business district; the northern used by the Boston and Maine and the Fitchburg railroads, and the southern, one of the largest stations in the world, over 800 feet long by 700 feet wide, used by the Boston and Albany and the New York, New Haven and Hartford railroads. There are several regular steamship lines to Europe. The harbor is spacious and safe. It is about 8 miles wide and more than twice as long, with a minimum depth in the main channel of 23 feet at low tide. There are several lights and beacons, and numerous islands, upon certain of which are situated the old Fort Independence and Forts Warren and Winthrop, besides the charitable and reformatory institutions already mentioned.

BOSTON
TRINITY CHURCH (UPPER)
THE NEW STATE HOUSE (LOWER)

Boston's interests are commercial rather than industrial, the factories owned by Boston capital being mostly out of town; the manufactures, however, are extensive and varied. According to the census of 1900, a total of nearly \$145,000,000 was invested in the various manufacturing industries, which had a production valued at over \$205,000,000. The city is the second wool market in the world, ranking next to London, and is second to New York only among American ports in the value of its foreign trade, which amounts to about \$200,000,000 annually. The exports, which represent five-eighths of the total, comprise provisions (including animals), breadstuffs, cotton and its manufactures, leather and its manufactures, iron and steel manufactures (the above-named classes constituting 90 per cent. of the whole amount), wood and its manufactures, and distilled spirits. The principal imports are wool and woollen manufactures, fibres, sugar, hides and skins, cotton and cotton manufactures, chemicals, manufactures of iron and steel, leather and manufactures of leather, wood and wooden products, fruits, fish, and paper-stock. The facilities for handling this great traffic are excellent; a system of freight terminals brings together the railroads and ships, deep-water terminals making accessible docking facilities for the largest vessels. In 1900 the internal revenue collections at Boston were about \$8,000,000, and the post-office receipts \$3,200,000. The fishing industry, which formerly was one of the chief sources of Boston's prosperity, is still of importance, the value of its products amounting annually to more than \$500,000. Boston is the centre of immense mining, railroad, and insurance interests, which are operated all over the country, particularly in the West.

ADMINISTRATION, MUNICIPAL ACTIVITIES. The government is vested in a mayor, elected every two years, a bicameral city council composed of 13 aldermen and 75 councilmen, and subordinate administrative officials, of whom the city clerk and street commissioners are chosen by popular vote, the city messenger and clerk of committees elected by the council, the police board appointed by the State Governor and council, and all others appointed by the mayor, a number of the appointments, however, being made subject to the consent of the upper house of the municipal council. A prominent feature of the municipal government is the large number of public-spirited citizens who administer, without remuneration, important departments; among these may be mentioned the trustees of the Public Library, trustees of the City Hospital, overseers of the poor, Park Commission, boards governing the institutions for paupers, children, and insane; also the Board of Municipal Statistics, which published weekly, until 1900, the *City Record*, an official gazette.

There has been of recent years a great increase in the activities undertaken by the municipality, which is one of the most progressive in the United States. These now extend to a municipal printing plant, work in the repair and construction of city buildings, watering of the streets, municipal bath-houses, lectures and concerts, free excursions for children, a camp for boys, etc. Besides these, and the greatest of municipal enterprises, the new subway, there are the combined municipal works comprised in the

metropolitan systems of parks (already mentioned), of sewerage, and of water supply. The metropolitan districts are not, however, co-extensive. The sewerage system comprises a network of mains (550 miles in Boston) which discharge into deep water in Boston Bay. The water-supply is obtained from the Nashua River, each municipality controlling its distributing system; and the plan is arranged to include other sources in case the demand exceeds the capacity of the present source. Boston, since the completion of the first works in 1848, has had an efficient system of water-works, which has cost about \$23,000,000, and includes 715 miles of mains.

The new subway, constructed in 1895-98 at a cost of \$4,350,000, was the first example in the United States of municipal enterprise in this field—a notable work of engineering undertaken for the relief of the congested traffic in the business district and to afford rapid communication with the suburbs of the south and west. It was partly opened for traffic in 1897, when it was leased for operation to a private company for a term of 20 years. The subway is substantially constructed, is well lighted and ventilated, and is attractively finished at the stations with glazed white brick. Its immediate success has led to an extension of the system to the suburban districts on the east. With the facilities afforded by the subway, the Boston transit system has attained a high degree of efficiency; the elevated and electric roads supplement each other, and connect also with the steam-railway terminals. The elevated road system, opened in 1901, extends through the city, from Roxbury to Charlestown, and is connected with each end of the subway. The structure is of steel and the trains are operated by electricity.

The annual expenditures of the city for maintenance and operation amount to about \$20,000,000 (including \$1,500,000 by the county), the main items of expense being about \$3,000,000 for schools, \$2,000,000 for interest on debt, \$1,750,000 for the police department, \$1,500,000 for street expenditures (other than street cleaning and sprinkling, which amount to \$500,000), \$1,250,000 for the water-works, \$1,250,000 for the fire department, \$1,200,000 for charitable institutions, \$750,000 for municipal lighting, over \$600,000 for garbage removal, and about \$500,000 for parks and gardens. The assessed valuation of property, real and personal (the basis of assessment being 100 per cent.), is about \$1,130,000,000: the bonded debt is, approximately, \$82,000,000, including \$3,500,000 county bonds. The legal borrowing limit is fixed at 2½ per cent. of the average assessed valuation for three years.

POPULATION. From the earliest date of the country's history, Boston has ranked among the largest American cities. The growth of its population has been gradual and steady, as seen from the following figures: 1790, 18,320; 1800, 24,937; 1850, 136,881; 1870, 250,526; 1890, 448,477; 1900, 560,892. As in nearly all large modern cities, two interesting facts may be noted in connection with the distribution of the population in Boston—the segregation of various classes in certain localities, and the gradual shifting of the quarters of the various classes following in the wake of industrial changes.

The first section to be settled in Boston was the northern end of the peninsula. Until the middle of the Nineteenth Century the population was still largely confined to the peninsula. After that period the population began to spread out into Charlestown, East Boston, South Boston, and of late years has turned to Roxbury, West Roxbury, Dorchester, and Brighton. Boston proper contains now less than a third of the total population, business buildings crowding out dwellings. What was once the most fashionable quarter—the North End—has become the business section of the city, and is partly taken up with the dwellings of the poorer, largely immigrant people. The fashionable quarters first moved to the South End, and, after being crowded out once more by business interests, have become located in the Back Bay section.

While it is claimed for Boston that it still retains its old American spirit and character, the city has a larger foreign element than many other large American cities. The percentage of people of foreign birth in 1890 was 35.27, and those of foreign parentage constituted 60.9; while in 1900 the former constituted 35 per cent. of the total population. Of the foreign nationalities, the Irish are most strongly represented. The largest immigration of Irish took place in the decade 1845-55, the immigrants settling in the once fashionable section of the North End. The Scotch, English, and Germans are represented in much smaller numbers, while lately the immigration has been made up largely of Italians and Russian Jews, the latter having taken the place of the Irish in the North End of the city. The colored population is very small, having been less than 12,000 in 1900. The geographical conditions, unlike those of New York, have allowed of an easy expansion of the city limits, thus preventing excessive overcrowding. However, the North and South ends have a congested population huddled largely in tenements.

HISTORY. The peninsula on which old Boston was built was known as Shawmut, or Sweet Waters, to the Indians, and was named Trimontaine by the early colonists, from the three-peaked top of one of its hills. It was first visited by an exploring party from Plymouth in 1621. In July, 1630, the colonists brought by John Winthrop to Salem established themselves at Charlestown; but on the invitation of William Blackstone, or Blaxton, a 'bookish recluse,' who had lived on the peninsula since 1626, Winthrop and the greater part of his company moved to Trimontaine on or before September 17, 1630, when the place was renamed Boston, after the Lincolnshire town whence many of the colonists had come. The old 'Trimontaine,' changed to Tremont, is preserved in Tremont Street and several buildings. Early in 1632 the first meeting-house was erected, at the head of the present State Street, and three years later the first free schoolhouse was built on the present School Street. In 1635 the first grand jury of the country met in Boston. Boston soon became the chief town of the Massachusetts Bay Colony, and the centre of Puritan religious life and learning. In 1636 the Antinomian controversy (see HUTCHINSON, ANNE) broke out, and, with the disturbances caused by Roger Williams (q.v.), led to the emigration of many prominent citizens. Between 1648 and 1688 four women—Margaret Jones, of Charlestown; Mary Parsons,

of Springfield; Ann Hibbins, and Goody Glover—were executed for witchcraft; and between 1650 and 1661, during the excitement caused by the Quaker immigration, four Quakers were hanged on the Common for returning after banishment on pain of death. A post-office was opened in 1649. Two years later a mint was established, at which the 'pine-tree' shillings were coined for many years. A printing-office was opened in 1674, and in 1704 the *Boston News Letter*, the first regular newspaper to be printed in America, began publication. At the beginning of the Eighteenth Century Boston was the largest and most important town in America, and its citizens took a leading part in the expression of public opinion in the conflict of the colonies with Great Britain. The impressment of seamen by the home Government in 1747 caused several riots, and the spirit of independence increased till the Stamp Act in 1765, and later the revenue acts, incited riots, which led to the quartering of two British regiments in Boston. On March 5, 1770, the 'Boston Massacre' (q.v.) occurred. On December 16, 1773, occurred the famous Boston Tea Party which caused Parliament to pass the Boston Port Bill (q.v.)—in effect June 1, 1774—virtually closing the Boston Harbor to commerce. At the outbreak of the Revolution, Boston was occupied by British troops, but was besieged by the American Army after the skirmish at Lexington, and attempts to fortify Charlestown were followed by the battle of Bunker Hill (q.v.), June 17, 1775. By fortifying Dorchester Heights, Washington forced the British to evacuate the town, March 17, 1776.

Since the Revolution Boston's prosperity has been almost continuous, the most important interruption having been caused by the Embargo of 1807. The city received its charter in 1822, and had then a population of 47,000. In 1840 the *Britannia*, the first of the Cunard liners, entered Boston harbor and began the present system of transatlantic passenger traffic. In 1849 there was an epidemic of cholera, 5080 dying out of a population of 130,000. Slaves were owned in Boston as early as 1635, and continued to be held till after the Revolution. In 1831 William Lloyd Garrison began the publication of *The Liberator*, and organized (1832) the New England Anti-Slavery Society, the first society to advocate immediate emancipation. Boston thus became the centre of the radical Abolitionist movement, though in 1835 there was an Anti-Abolitionist riot. Intense excitement was caused throughout the country by the rescue here of Shadrach, in February, 1851, and the return to slavery from here, under the provisions of the Fugitive Slave Law of 1850, of Thomas M. Sims (q.v.), in April, 1851, and of Anthony Burns (q.v.), in May, 1854. During the Civil War Boston strongly supported the measures of the Federal Government, and sent more than 26,000 men to join the army and navy. The city has suffered severely from fires, the most destructive occurring in 1676, 1679, 1711, 1760, 1872, 1889, and 1893. That of 1872 was especially disastrous, 50 acres in the business portion of the city having been thoroughly devastated, and property valued at over \$75,000,000 destroyed. On September 17, 1880, the two hundred and fiftieth anniversary of the settlement of Boston was celebrated with great enthusiasm.

BOSTON
THE OLD STATE HOUSE (UPPER)
FANEUIL HALL (LOWER)

Consult: Dr. Winsor's exhaustive and scholarly *Memorial History of Boston, Including Suffolk County*, 4 vols. (Boston, 1880-81); also Quincy, *A Municipal History of the Town and City of Boston, from 1630 to 1830* (Boston, 1852); Hale, *Historic Boston and Its Neighborhood* (New York, 1898); Drake, *History and Antiquities of Boston, from 1630 to 1670* (Boston, 1854); Drake, *Old Landmarks and Historic Personages of Boston* (Boston, 1900); and Lodge, "Boston," in the *Historic Towns Series* (London, 1891); Sprague, *Government of Boston; Its Rise and Development* (Boston, 1890); *Directory of the Charitable and Beneficent Organizations of Boston* (Boston, 1899); "The Completion of the Boston Subway and New Arrangements of Street Cars," in *Railroad Gazette*, No. XXX. (New York, 1898).

BOSTON, THOMAS (1677-1732). A Scottish divine and author, born at Dunse (Berwickshire). He was educated at the University of Edinburgh (M.A., 1694), and in 1699 was ordained to the Presbyterian ministry and appointed to the parish of Simprin. In 1701 he was clerk of synod, and in 1707 became pastor of Ettrick (Selkirkshire). It was through his reading and recommendation to friends of the treatise *The Marrow of Modern Divinity* that the well-known Marrow controversy (q.v.) was instituted. He wrote *Human Nature in its Fourfold State* (1720), a strongly Calvinistic work, frequently reprinted, and a popular sermon styled *The Crook in the Lot* (1863). Consult: His *Memoirs* (1776) and the *Whole Works* (ed. by S. McMillan, London, 1854).

BOSTON ART SCHOOL. This school, organized in 1876, is the most important school of design in Boston. The course includes drawing and painting from life and casts, anatomy, modeling, and perspective. The student has also the benefit of the Museum for copying purposes. There are two valuable scholarships—the Paige traveling scholarship for two years, and the Longfellow traveling scholarship for three years. Besides these there are ten scholarships of free tuition awarded each year. The annual prizes are the Sears prizes of \$50 each for a drawing from a cast, the nude, and a portrait in oils; and the Thayer prize of \$150, in three parts of fifty dollars each, for work in decorative design. The fee is from \$90 to \$125 for three terms.

BOSTON COLLEGE. A Roman Catholic institution under the direction of the Fathers of the Society of Jesus. It was chartered in 1863, and opened in Boston, Mass. There are fifteen founded scholarships; the value of the buildings and grounds is placed at \$537,800; and the annual income from tuition fees at \$16,000. The college faculty in 1901 numbered 19 and the students 205; at the same time the number of students in the allied preparatory school was 247. The library contains 43,000 volumes. The college course is four years, leading to the degree of A.B.

BOSTONIANS, THE. A novel by Henry James (1886).

BOSTON MASSACRE, THE. After the quartering of British troops in Boston (1768), there was continual friction between the soldiery and the people. Several minor riots oc-

curred early in 1770, and the trouble culminated on March 5, when seven soldiers under Captain Preston, who were being pelted with snowballs and stones by fifty or sixty of the populace, headed by one Crispus Attucks (q.v.), fired into the crowd, killing three and wounding seven more, of whom two died. This act infuriated the Boston people, who met in mass-meeting and compelled the withdrawal to Castle Island (March 12) of the two regiments of troops. The seven soldiers, with Captain Preston, were tried for murder in October and November, were defended by John Adams and Josiah Quincy, and were finally acquitted, though two of them were declared guilty of manslaughter and received light punishments. There is much difference of opinion with respect to the 'Massacre,' some writers regarding it as a lawless affair discreditable to the people and the soldiers alike and without any great historical significance; others, as the "first act in the drama of the Revolution." In 1816 John Adams wrote: "Not the Battle of Lexington or Bunker Hill, not the surrender of Burgoyne or Cornwallis, were more important events in American history than the battle of King Street on the 5th of March, 1770." The day was annually commemorated in Boston until 1783, and in 1888 a monument was erected to the memory of the ten victims. Consult: Kidder, *History of the Boston Massacre* (Albany, 1870); and Winsor, *Memorial History of Boston*, Vol. III. (Boston, 1880-81).

BOSTON PORT BILL. A bill passed by the British Parliament, and signed by the King in March, 1774, to punish the people of Boston for their destruction of tea in Boston Harbor, December 16, 1773. (See BOSTON.) It was to go into effect on June 1 and provided for the virtual closure of Boston Harbor to commerce, for the removal of the seat of government to Salem, and for the supplanting of Boston by Marblehead as a port of entry, until the people of Boston should indemnify the owners of the property destroyed and fulfill other specified conditions. This, the greatest encroachment yet made by Parliament upon the liberties of the colonists, aroused an instant and wide-spread feeling of indignation and alarm. Assurances of sympathy and support were immediately sent to the people of Boston by the legislatures and committees of correspondence of other Colonies, and by many town meetings, and June 1 was widely observed as a day of fasting and prayer, bells being tolled, flags placed at half-mast, and houses draped in mourning. Material aid was also given from all quarters, food-supplies being sent from as far as South Carolina. Non-importation agreements were everywhere urged, pamphlets and broadsides were issued, and finally a general congress—the first Continental Congress—was called to discuss this and other obnoxious acts passed in the same year, and to devise measures for relief. Consult Frothingham, *Rise of the Republic* (Boston, 1872); and, for text of the bill, Pickering, *Statutes at Large*, Vol. XXX. (London, 1842).

BOSTON SYMPHONY ORCHESTRA. One of the finest orchestras in the United States. Ever since the beginning of the Nineteenth Century, the works of the great instrumental masters had been performed by amateur orchestras. In 1881 Mr. Henry L. Higginson established a per-

manent orchestra, which was to give a series of 24 subscription concerts on Saturday nights throughout the season. Each concert is preceded by a public rehearsal on Friday afternoon. Originally, the orchestra consisted of 67 pieces. The first conductor was Georg Henschel. He was succeeded by Wilhelm Gericke, who soon made his orchestra the equal of any body of performers in Europe. Arthur Nikisch kept the orchestra at its high degree of technical excellence, and infused his wonderful personality into interpretation of the works of the great classical masters. His successor, Emil Paur, was a conductor of wonderful temperament, with strong leaning toward the Neo-German School, whose works figured extensively on his programmes. He, in turn, was again succeeded by Wilhelm Gericke, the present conductor, who is of the academic type. After 1890 the Boston Symphony Orchestra regularly visited New York, where they gave five concerts on Thursday nights. A new feature was the establishment, in 1900, of afternoon concerts on Wednesdays in New York. These were not public rehearsals, in so much as different programmes with different soloists were performed on Wednesdays and Thursdays. At present the orchestra numbers about 80 performers. Rehearsals are held daily during the season. This, and the fact that the organization plays only at concert performances, are the principal reasons of the high perfection that marks the playing of this orchestra. The conductor is now always appointed for five years. Franz Kneisel, the concert-master, organized from among the members of this orchestra his famous quartet, which is not surpassed by any kindred organization in the world.

BOSTON TEA-PARTY, THE. A popular designation of the summary action of a party of Bostonians, on December 16, 1773. After an unavailing protest against the importation of tea as part of the policy of taxing the Colonies without representation in Parliament, a number of citizens, in Indian disguise, proceeded to three ships carrying cargoes of tea, and threw about 350 chests of tea into the harbor. In retaliation for this action, the port was declared closed.

BOSTON UNIVERSITY. A system of allied schools and colleges. The university is situated in Boston, Mass., and was chartered by the Massachusetts Legislature in 1869, the original incorporators being Isaac Rich, Lee Claflin, and Jacob Sleeper. The university is divided educationally into (1) a College of Liberal Arts (1873), and a College of Agriculture (Massachusetts Agricultural College, situated at Amherst, Mass., 1875), neither of which requires a collegiate training for matriculation; (2) a School of Theology (1871), a School of Law (1872), and a School of Medicine (1873), admission to all of which is conditional upon a collegiate education; and (3) a general post-graduate department, conferring the higher degrees in the various branches of the arts and sciences, and known as the School of All Sciences. By special arrangement with the National University of Athens and the Royal University of Rome, students in the School of All Sciences may study without expense in those universities, the work done there being counted toward a degree from Boston University. The administration of the university is vested in a university council, consisting of the president of

the university and the deans of the constituent schools; a university senate, consisting of the council and the professors of the several faculties; and a corporation, composed of trustees, not less than 10 in number nor more than 30, elected for a term of five years each. The chief benefactor of the university is Isaac Rich, in whose honor the institution founded 64 free scholarships; since then the university has founded over 200 other scholarships as well as two fellowships. The property held by the institution is valued at \$1,500,000. The number of instructors in 1900 was 114, and the number of students, 1430.

BOSTRA. See BOZRAH.

BOSTRÖM, bō'strēm, CHRISTOFFER JACOB (1797-1866). A Swedish philosopher. He was born at Piteå and studied at the University of Upsala. In 1838 he was appointed an adjunct professor of philosophy at the university, and from 1842 to 1863 held the chair of practical philosophy. He wrote little, but his system has been very influential in Sweden, where it is still the most prominent in centres of higher education. He has been termed by Falckenberg (*History of Modern Philosophy*, Armstrong's trans.) "the most important systematic thinker of his country." His teaching, defined by himself as 'rational idealism,' presents reality as spiritual only, and God as an absolute, self-conscious unity, in which all living beings, according to degree, are forever immutably contained. Each living being is a thought of God, and as such potentially emancipated from space and time. Yet man belongs also to a sensible world, which exists for him until he rises beyond the limited to the real, and becomes for himself that which he is in God. Boströmian ethics, recalling that of Krause, makes society, as well as the individual, a thought of God; holds constitutional monarchy to be the sole reasonable form of state; and regards an all-comprehensive system of states as the ultimate ideal of political development. Boström's writings have been edited by Edfeldt (Upsala, 1883). Consult Höffding, "Die Philosophie in Schweden," in the *Philosophische Monatshefte*, Vol. XV. (Berlin, 1879).

BOSWELL, bōz'wēl, JAMES (1740-95). An English lawyer and writer celebrated as the biographer of Dr. Samuel Johnson. He was born October 29, 1740, in Edinburgh, where his father, who had the title of Lord Auchinleck, from the name of his property in Ayrshire, was one of the judges of the Court of Sessions. He was intended by his father for the law. He studied first in Edinburgh and Glasgow, and afterwards at the University of Utrecht, where he went in 1763. When in London in that year, May 16, he made the acquaintance of Johnson, an event of decisive importance for his whole subsequent life. The acquaintance was earnestly sought by himself, and originated in his ardent admiration of Johnson's writings. He spent one winter in Utrecht, and then proceeded on a tour through Germany, Switzerland, and Italy, and visited Corsica with a letter of introduction from Rousseau to Paoli, with whom he contracted a warm and lasting friendship. He enthusiastically adopted the cause of Corsican independence; and after his return to Scotland, published his *Account of Corsica* (1768), which was speedily translated into sev-

eral languages. Boswell became a member of the Faculty of Advocates in 1766, but never devoted himself with earnestness to the law. In 1773 he was admitted into the Literary Club, instituted by Johnson, of which Burke, Goldsmith, Reynolds, and Garrick were members. From this time he made it his principal business to note down the sayings and doings of Johnson, with whom he associated on most intimate terms, and whom he accompanied on his tour to Scotland and the Hebrides in 1773. It has been estimated that, taken all together, Boswell met Johnson on 276 days. Boswell was married in 1769 to his cousin, Margaret Montgomerie, by whom he had several children. After Johnson's death, in 1784, he employed himself in arranging the materials which he had collected for his long-contemplated biography. His *Journal of a Tour to the Hebrides* appeared in 1785; his *Life of Samuel Johnson*, 2 vols., in 1791. Both have gone through many editions. Boswell has been emphatically styled by Macaulay 'the first of biographers.' His work is indeed full of details, and these are such as exhibit character, and are arranged in the most interesting manner. He conceals neither his own faults nor those of Johnson, but presents a picture of which the truthfulness is too vivid to be questioned: and Johnson is, unquestionably, better known by the pages of Boswell than by any of his own writings. Boswell died in London, May 19, 1795. Besides the works already mentioned, he was the author of several productions of great interest to the curious. In 1857 appeared a posthumous volume of *Letters of James Boswell, addressed to the Rev. W. J. Temple, from the Original MSS.*, in which the gay, insouciant character of the man very strongly appears. The sketches of Boswell by Macaulay and Carlyle are famous. Consult: Rogers, *Boscelliana* (London, 1874); and Fitzgerald, *Life* (London, 1891). For the best edition of *The Life of Johnson*, consult Hill (Oxford, 1887).

BOSWELLIA, bōz-wĕl'li-ā (named after Dr. John Boswell). A genus of trees of the natural order Burseraceæ. Few species are known, of which the most interesting is *Boscellia serrata*, the tree which yields olibanum (q.v.), now very generally believed to have been the frankincense (q.v.) of the ancients. It is a large timber-tree, with pinnate leaves, which have about ten pairs of hairy serrated oblong leaflets, and an odd one, each leaflet about one to one and a half inches in length. The flowers are small and numerous, in axillary racemes, and of a pale-pink color. When the bark is wounded, the olibanum, of a delightful fragrance, flows out, and hardens by exposure to the atmosphere. The tree is found in the mountainous parts of Coromandel, and is supposed to be also a native of other parts of India, and of Persia, Arabia, and perhaps Abyssinia. A very similar species, a native of India, also yields a resin, comparatively coarse, which is used as a substitute for pitch. *Boscellia papyrifera* is indigenous in parts of Africa, extensive forests of this species being reported in the mountains of Morocco. *Boscellia Carteri* is also common in Africa and yields large quantities of olibanum.

BOSWORTH, bōz'wŭrth, or MARKET BOSWORTH (AS. *Bosan*, *Bosa's* + *worth*, farm). A small market town of Leicestershire, England, famous for the moor, two miles to the south,

where the battle of Bosworth Field was fought (August 22, 1485). In this battle, which terminated the Wars of the Roses, Richard III. was slain, and on a near elevation called Crown-hill Lord Stanley placed the crown on the head of the Earl of Richmond as Henry VII.

BOSWORTH, FRANCKE HUNTINGTON (1843—). An American physician, born at Marietta, Ohio. He studied at Yale, and at the Bellevue Hospital Medical College, where he subsequently became professor of diseases of the throat. He was also appointed consulting physician to the Presbyterian and Saint Vincent's hospitals, New York. His publications include a *Treatise on Diseases of the Nose and Throat* (1893), and a *Text-Book of Diseases of the Nose and Throat* (1896).

BOSWORTH, JOSEPH (1789-1876). An English philologist. He was born in Derbyshire. He graduated at Aberdeen and also took degrees from Oxford and Cambridge. In 1817 he obtained the vicarage of Horwood Parva, Buckinghamshire. He devoted such time as an active discharge of his parochial duties left at his disposal to literature, and especially to researches in Anglo-Saxon. The result of his labors appeared in 1823 in *Elements of Anglo-Saxon Grammar*. Fifteen years later he published the work by which his name is best known: *A Dictionary of the Anglo-Saxon Language* (new edition, very much enlarged and improved by T. N. Toller, 1882-98). Bosworth lived in Holland from 1829 to 1840 as British chaplain, and during this period he translated the Book of Common Prayer into Dutch. On his return to England he was presented to the vicarage of Waith, in Lincolnshire. In 1857 he became rector of Water Shelford, in Buckinghamshire, and in the following year Rawlinson professor of Anglo-Saxon at Oxford. In 1865 he published the Gospels in Gothic and Anglo-Saxon, in parallel columns with Wyclif's version of 1389, and Tyndale's of 1526. In 1867 he established a professorship of Anglo-Saxon at the University of Cambridge. He died May 27, 1876.

BÖSZÖRMÉNY, be'sër-mā-ny' (cf. Russ. *basurman*, Mussulman, Hung. *hajdu*, Turk. *haiduk*, a light-armed Turkish or Hungarian guard), or **HAJDU-BÖSZÖRMÉNY**. A town of the Kingdom of Hungary, about 10 miles north-northwest of Debreczin (Map: Hungary, G 3). It is situated in the midst of a fertile district. Vegetables and fruit, particularly melons, are raised in large quantities. Population, in 1890, 21,000; in 1900, 25,065. (The population is given for the municipal district, which includes five villages besides Böszörmény.)

BOT, BOTFLY (cf. Gael. *botus*, belly-worm). Names common to several dipterous insects of the family Eristidæ, which are parasitic in their early stages upon or within certain domestic and wild animals.

The **HORSE-BOT**, or bot-fly of the horse (*Gastrophilus equi*, Fab.), is a creature well known to stockmen and veterinary surgeons. The adult fly is about three-quarters of an inch in length; the body is very hairy and brown in color. The female has an extensible abdomen. She poises herself in flight near a horse, then darts suddenly toward the animal, gluing an egg to a hair almost instantly, then retreating for a yard or two until another egg is ready to be deposited.

In this way hundreds of eggs may be deposited upon a horse in a short time. The larvæ, or maggots, soon form within the eggs, but these do not hatch unless the horse licks itself, in which case the eggs are carried to the alimentary canal, hatch almost immediately, and the larvæ enter the stomach, where they attach themselves to its wall and remain until fully grown. The inner stomach-wall of a horse is frequently covered with large patches of these larvæ densely crowded together. This attachment to the walls of the stomach probably causes an irritation which interferes with the normal action of the glands, or reduces the glandular surface; the grubs also probably extract some nutriment from the walls of the stomach. There can be little doubt that the presence of these grubs is injurious to the horse, although some stock-raisers consider this injury insignificant. When fully grown the larvæ loose their hold and pass through the pyloric orifice of the stomach and down through the intestines, occasionally attaching themselves to the intestinal wall or to the wall of the rectum, causing irritation which is sometimes severe. They are finally voided with the excrement, transformed to pupæ near the surface of the ground, and eventually the adult flies appear. There seems to be but one generation annually. Horses kept in stables are little troubled if they are well groomed. In pastures or on ranges, however, unless the stock is washed every two or three weeks, bots are apt to be present. Turpentine, used with care, is considered a remedy for those which succeed in establishing themselves in the stomach.

The Ox-Bot, ox-warble, ox-worm, or heel-fly, as it is termed in the West (sometimes simply 'the grub'), belongs to a different genus of *Æstridæ* and has quite different habits. The American species is *Hypoderma lineata*, Villers, and the European species is *Hypoderma bovis*, L. The 'grubs' of this species are found in lumps or pockets in the skin of cattle and it was formerly supposed that the fly laid its eggs upon the hairs and that the larvæ worked their way through the skin, forming cysts in which they remained through the entire larval life, but it has recently been discovered that the life of the species is more complicated. The flies appear early in the spring and attach their eggs to the hairs, particularly of the legs, of cattle, and especially the part just above the hoof, whence comes the name 'heel-fly.' The eggs, or the quickly hatching larvæ, are carried into the mouth of the animal when it licks its legs, and the larva penetrates the walls of the *œsophagus* by means of its strong spines. After penetrating the *œsophagus* it casts its skin and becomes nearly smooth, and for several months works through the connective tissue between the skin and the flesh, penetrating gradually down the neck and ultimately reaching a point beneath the skin in the region of the back. In the meantime, all traces of inflammation have disappeared from the *œsophagus*. When the final position is reached the grub molts again, becomes more spiny, and bores a hole through the skin through which it gets air for breathing. Its presence causes much irritation, and it feeds upon the pus and bloody serum which collect. Several individuals usually join together in one of these punctures or sores. When fully grown it forces its way through the skin, drops to the ground,

where it transforms to a pupa, and the following spring the adult fly emerges. The adult looks much like the common honey-bee. It is about half an inch long, black in color, and is clothed with reddish-brown hairs. An oily application to the wound will kill the grubs, and some simple antiseptic, like carbolic acid, causes a rapid healing. When the insects are common, however, cattle become emaciated and their skins are spoiled for commercial purposes by the perforations. The money lost in the United States through the work of this insect is very great.

The SHEEP-BOT (*Æstrus ovis*, L.) belongs to still another genus of *Æstridæ* and differs again radically in habits. The adult flies are smaller than those of the other species mentioned and resemble large house-flies. The color of the head and thorax is dull yellow, but so spotted with brown as to appear brownish. The abdomen is velvety and variegated with dark brown and straw-color. The female fly lays her eggs in the noses of sheep. They hatch almost immediately, and the larvæ at once commence to work their way up the nostrils and the nasal passages, causing great irritation, until they reach the frontal sinuses, which are cavities located between the two plates of the skull, and lying one on each side of the central line of the head and between and a little above the eyes. Here they attach themselves to the membranes which line the sinuses, and feed upon the mucus. The damage caused by this insect has probably been underestimated. Stiles has found that in Colorado, in some large flocks, at least 25 per cent. of the animals are affected; and after conducting a number of post-mortems he is convinced that in many cases the bots cause the death of the animal. It is the custom in some places to prepare 'salt logs' for the sheep to visit. The salt is placed in cavities in the log and the edges of the cavity are smeared with tar, so that the sheep in eating the salt gets a certain amount of tar upon its nose. This is supposed to deter the flies from laying their eggs. A recent remedy proposed by Stiles consists in puncturing the frontal sinuses with a trochar and syringing in a small quantity of gasoline.

Other bot-flies affect domestic animals and in tropical regions even man himself. The *Æstrus hominus* of Linnæus and the *Dermatobia noxialis* of Goudot, in Guiana, Mexico, and other tropical regions, lay their eggs upon the skin of monkeys and of human beings, and the larvæ form cysts under the skin, much like those of the ox-bot. The emasculating bot-fly (*Cuterebra emasculator*, Fitch) lives in the larval state in the inguinal and axillary regions (testicles) of squirrels and gophers. The rabbit bot-fly (*Cuterebra cuniculi*, Clark) in the larval stage forms a large tumor in the skin of the common rabbit. Other species affect reindeer in Europe, and deer, elk, and antelopes in America. The history of many American species, with illustrations, may be found in Osborn's *Insects Affecting Domestic Animals* (Bulletin No. 5, n.s., Div. of Entomology, U. S. Dept. Agri., Washington, 1896), which also contains an extensive bibliography of the *Æstridæ*.

BOTANIC GARDEN (Gk. *botanikos*, botanical, pertaining to herbs, plants; see BOTANY). An area upon which is grown a collection of plants primarily for scientific purposes. In such a collection the idea may be to include as

many forms of vegetation as can grow in the conditions of the garden; it may be to illustrate some special phase of botany, as natural relationships, ecology, economic botany, etc.; or it may be to furnish material for instruction and research. The Benedictine monks of Italy are said to have established the first botanic gardens in the Ninth Century, but they were designed entirely for growing the various medicinal plants. It was not until the latter part of the Sixteenth Century that plants began to be collected into gardens for scientific purposes. Since that time the botanic garden has been a growing factor in connection with research work, until now a college or university does not seem properly equipped without the facilities of such a garden.

The "Jardin des Plantes" of Paris, established in 1633, probably contains the largest collection of living plants, the catalogue enumerating 15,000 species. One of the most famous gardens is the Royal Garden of Kew, near London, which has its branches in every English colony. It lays stress primarily upon the economic value of plants, the stations in the numerous colonies being almost entirely engaged in testing the economic qualities of plants. In addition to serving this purpose, the garden is a great pleasure-park; and its herbarium and library make it one of the great centres of work in systematic botany. The botanic garden which is most favorably situated and best equipped for scientific research is that of Buitenzorg, Java, established by the Government of Holland in 1817. Its original purpose was to test the economic value of plants for the East Indian colonies, but its rare contact with tropical vegetation and the scientific spirit of its director have made it a great centre of research. Notable and very old European gardens are those of Bologna, Leyden, Montpellier, Giessen, Strassburg, Jena, and Upsala. In Germany the botanic garden is an essential adjunct of the botanical institutes, and in such conditions the most notable advances in botanical knowledge have been made. Conspicuous among those gardens, with their botanical institutes, which are prominently identified with botanical progress, are those of Munich, Würzburg, Tübingen, Göttingen, and Leipzig.

In the United States a few botanic gardens are in the process of development, but their importance has never been appreciated by those who are able to establish them. That they are necessary adjuncts to any university which professes to do research work is an idea which has never taken any hold upon boards of management. The few gardens which have been started in the United States, and which bid fair to get beyond the initial stage of elementary instruction, are as follows: the Missouri Botanical Garden (the old "Shaw Gardens") at Saint Louis, in connection with Washington University; the Botanical Garden at Cambridge, in connection with Harvard University, where, upon an area of seven acres, there are about 5000 growing plants; the Arnold Arboretum at Brookline, a public park of Boston, also in connection with Harvard University, and devoted entirely to hardy trees and shrubs; and the New York Botanical Garden, the most recent and one of the most promising of garden establishments, occupying an area of 250 acres in Bronx Park, New York City.

BOTANICAL SOCIETY, ROYAL. This society, incorporated in London in 1839, organized the Botanical Gardens in London, and has established a school of practical gardening, which annually distributes thousands of cut specimens among the various schools and colleges. The society holds exhibitions in the spring and fall. The Duke of Teck is president, and the library and office are at Inner Circle, Regent's Park, N. W. The society has issued a *Quarterly Record* since 1880. For other English botanical societies, see **HORTICULTURAL SOCIETY, ROYAL**.

BOTANICAL GEOGRAPHY. See **DISTRIBUTION OF PLANTS**.

BOTANICAL SOCIETY OF AMERICA. A national scientific association organized in 1893 as an outgrowth of the Botanical Club of the American Association for the Advancement of Science. The membership includes many of the best-known botanists of the country.

BOTANY (Gk. *βοτάνη*, *botania*, or *βοτάνη*, *botanē*, grass, plant). The science which treats of plants.

HISTORY. The history of the scientific study of plants probably begins with their classification by Aristotle and Theophrastus into trees, shrubs, and herbs. The study was, however, scarcely carried any further until in the Sixteenth Century the authors of the oldest herbals, Brunfels, Fuchs, Bock, and others, made a beginning again of the scientific examination of plants. It is true that these old herbalists regarded plants chiefly as "the vehicles of medicinal virtues," and that their chief object was to discover the plants employed by the physicians of antiquity, the knowledge of which had been lost in later times. Unscientific as was the purpose, it nevertheless led straight to nature and to a description of the wild plants. As a result of this intimate contact with many plants there was a gradual perception of the truth that plants have many points of resemblance to one another, which have nothing to do with their medicinal powers or their usefulness to man. Thus the idea of natural alliances began, alliances which were distinctly felt but not technically defined.

The first period of classification may be said to have culminated in the so-called 'artificial system' of Linnæus (1735). It was by no means the intention of Linnæus and his predecessors to propose a merely artificial classification of plants, a sort of ready-reference arrangement; but in their philosophy the natural affinities are indicated by certain predetermined marks, and therefore may be arbitrarily expressed. The system of Linnæus, which was really a better expression of the system of his predecessors, had such an influence upon botanical science for a hundred years that it deserves some fuller statement. He grouped the plant kingdom into twenty-four classes, based upon the number, relative position, and union of the stamens with regard to each other, and also to the carpels. For example, his Class I. (Monandria) comprises flowers with one stamen, and up to Class X. (Decandria) the classes succeed one another by the increment of a single stamen. Class XI. (Dodecandria) lumps together flowers with eleven to nineteen stamens, Class XII. (Icosandria) includes twenty or more stamens inserted on the calyx, and Class XIII. (Polyandria) includes twenty or more stamens inserted on the receptacle. From this point on

the basis shifts, as Class XIV. (Didynamia), stamens didynamous; Class XV. (Tetradynamia), stamens tetradynamous; Class XVI. (Monadelphia), filaments united into one bundle; Class XVII. (Diadelphia), filaments united into two bundles; Class XVIII. (Polyadelphia), filaments united into more than two bundles; Class XIX. (Syngenesia), anthers united; Class XX. (Gynandra), stamens and pistil united; Class XXI. (Monœcia), flowers staminate and pistillate, the two forms on the same plant; Class XXII. (Diœcia), flowers staminate and pistillate, the two forms on different plants; Class XXIII. (Polygamia), staminate, pistillate, and perfect flowers on the same plant; Class XXIV. (Cryptogamia), flowerless plants.

It can be seen that by this scheme flowering plants may be referred readily to different categories, but that many of the categories would not at all represent natural alliances, any more than the accident of the first letter groups words together naturally in a dictionary. During the long use of this great artificial system, a far more natural one was being developed slowly, through the work of such botanists as A. L. Jussieu (1789), A. P. de Candolle (1818-21), Stephen Endlicher (1836-40), A. T. Brongniart (1843), John Lindley (1846), Alexander Braun (1864), Bentham and Hooker (1862-1883), A. W. Eichler (1883), and A. Engler (1892—).

CLASSIFICATION. The general classification most in use among botanists at present, though doubtless to be modified very soon, is as follows: The plant kingdom is divided into four great fundamental groups: (1) Thallophytes (Algæ and Fungi); (2) Bryophytes (Liverworts and Mosses); (3) Pteridophytes (Ferns, Horsetails, and Club-mosses); and (4) Spermatophytes (Gymnosperms and Angiosperms). The Thallophytes, as at present constituted, doubtless represent several groups coordinate with the other great groups; and probably the gymnosperms and angiosperms are each to be regarded as worthy of first rank. In any event, the general categories have become fairly well established. The subordinate classification of angiosperms is of most general interest, as the group comprises the most conspicuous and best-known forms, the true flowering plants. The two great subdivisions are Monocotyledons (grasses, palms, lilies, orchids, etc.) and Dicotyledons (the ordinary trees, buttercups, roses, peas, heaths, mints, sunflowers, etc.). The overwhelmingly large assemblage is the Dicotyledons, which are now grouped under two heads: (1) Archichlamydæ, with calyx or corolla lacking or of distinct parts; and (2) Sympetalæ, with corolla present and its petals more or less united.

All subordinate classification is constantly shifting, in order that it may keep step with the very rapidly accumulating body of morphological data; for Classification, or Taxonomy, as it is more technically styled, must include the last expression of our knowledge of plants.

MORPHOLOGY. While from the historic standpoint taxonomy (classification) deserves first mention, probably the most fundamental subdivision of botany is Morphology, which treats of the structures of plants and their development, and upon whose data taxonomy must build. There was an older morphology which dealt merely with the forms of mature plants and their

organs, and whose conception of organs was that everything about a plant could be referred to a very few categories, the favorite ones being root, stem, and leaf. Under this belief, every structure which was not evidently root, stem, or leaf was disguised, and the business of morphology was to strip off these disguises and reveal the real nature of the structure. This phase of morphology was dominated by Goethe's doctrine of metamorphosis—a doctrine which has been a serious impediment to botanical progress.

The present morphology, however, concerns itself more with the development of structures than with the mature forms, a point of view which dates at least from Hofmeister's classic researches of 1851. It is essentially an embryological subject, therefore, whose purpose is to discover from developing structures every possible suggestion as to the relationships and origin of great groups. In such study the life-history of a plant is traced from the single cell with which it starts to its mature form, and this life-history at more than one point may give suggestions of relationships. To develop a plant through all of its individual history, or to obtain all the stages in the history of some kind of plant, is a long and difficult piece of work. When this is done for the hundreds of thousands of species of plants recorded, morphology will be in a position to supply the data for a real and relatively permanent classification.

At the present stage of morphological progress, however, large problems, such as the origin of the great groups, still confront us. In a general way, morphologists may be said to agree to the following statement: The algæ represent the most primitive known forms from which the higher plants may be said to have been derived. The fungi are largely regarded as degenerate algæ, which have made a certain amount of progress, but have developed no higher groups. The algæ, therefore, represent the great ancestral group, and directly from them the liverworts seem to have arisen. The liverworts have certainly given rise to the mosses, and many claim that they have also given rise to the ferns. It certainly seems true that the ferns have come either through the liverworts or directly from the algæ. Whatever may be the origin of the ferns, they have undoubtedly given rise to the seed-plants (flowering plants). Just what seed-plants have come from what fern-plants is a matter of discussion at present, but it is probable that several lines of seed-plants have arisen from as many branches of the fern stock. For a fuller statement of the modern development of morphology, see the articles **ALTERNATION OF GENERATIONS** and **HETEROSPORY**.

ANATOMY. It was early observed that the bodies of the more complex plants consisted of layers of different constitution, but the real nature of the various structures was not determined until the great improvements made in the microscope in the latter half of the Seventeenth Century. The first observers of the anatomy of plants (q.v.) with the microscope were Robert Hooke, Malpighi, Grew, and Leuwenhoek, and their descriptions of the constitution of plant-bodies remained authoritative for over a hundred years. Although the discovery was made that plant-bodies are made up of cells of various forms, the real study of cells and their development dates from 1840, following

the researches of Schleiden and Nägeli. From that time the science of Plant Anatomy (Phytotomy, Plant Histology) has developed enormously, until now the recognized plant-tissues are very numerous, and their origin and relation to one another in position and function are fairly well understood. Anatomy is associated on the one hand with morphology, since the tissues enter into the structure of organs; and on the other hand with physiology, since the nature of the tissues has to do directly with the various functions of the plant.

CYTOLOGY. In recent years another definite field of botanical research has been developed, which deals exclusively with the problems of the cell, and is called Cytology (q.v.). It is related to anatomy in that it deals with cells, which in their aggregation form the tissues that are the subject of anatomy. At the same time, it studies cells from the standpoint of morphology, since it is concerned with cell-organs, their origin and mutual relationships; while it also has its distinct association with physiology, inasmuch as the functions of its organs furnish the ultimate problem of the cell. It is through cytological investigation that the technique of research with the microscope has been developed so greatly. The discoveries in methods of killing material, in imbedding, sectioning, and staining, have brought to view structures which were invisible to the observers of a few years ago. The principal problems of cytology at present are the structure and activities of protoplasm, the life-history of plastids (protoplasmic organs of the cell, of which chloroplastids, the green color-bodies of leaves, are examples), the structure and function of the nucleus (an essential and permanent organ of the living cell), the reduction of chromosomes (bodies which enter into the structure of the nucleus), the origin and development of the achromatic figure (a peculiar spindle-shaped body which appears in connection with a dividing nucleus), the centrosome (a cell-organ supposed to be prominently concerned in the division of the nucleus), the cell-wall, the development of the sex-cells, fertilization, the embryo, and the problem of heredity.

PHYSIOLOGY. Nothing was known of the life of plants in the early part of the Seventeenth Century except what had been learned through agricultural and horticultural operations. It was in the latter half of the Seventeenth Century that the science of Plant Physiology (q.v.) was founded, long after the physiological significance of the different organs of the human body and of most animals was generally known. The history of the gradual discovery of the various functions of plant-organs is long and full of interest. The foundation of all physiology is the direct observation of vital phenomena, and these must be evoked or altered by experiment. It is by means of this experimentation that a definite knowledge of physiological processes has developed, until now the student of plant physiology is in possession of a vast body of facts. Vital phenomena in plants are essentially the same as in animals, but are often simpler; and hence plants frequently furnish the clues for the interpretation of the more complex activities of animals.

The important general functions of plants, which furnish the subject-matter for physiological research, are as follows: Absorption of ma-

terial and of energy from the outside world; transfer of water through the plant-body, by which materials are properly distributed; transpiration, by means of which water is lost from the plant's surface; nutrition, including photosynthesis (the manufacture of carbohydrates), digestion (the conversion of foods into soluble form for transfer), and assimilation (the organization of protoplasm from food-material); secretion; respiration, by means of which energy is liberated for the activities of the body; growth; and movement, which includes irritable responses to many stimuli.

For example, in the higher plants the root is an absorbing organ for water and soluble soil substances; in the root, stem, and leaves there are certain sets of vessels along which water and food-materials travel readily; the leaves and the young stem surface are organs for the absorption and evolution of the carbon dioxide and oxygen, they also give off water by evaporation (transpiration), and are most important organs for the manufacture of carbohydrate foods. Although these various processes are distributed among the organs of a complex plant, they may all go on in a single cell of the simplest plant.

ECOLOGY. A phase of plant physiology which has recently come into prominence as an independent subject is Ecology or (Ecology (q.v.)), which deals with the mutual relations between plants and their environment. Certain phases of ecology, such as pollination, seed-dispersal, protection, symbiosis, have long been studied, and have been called 'plant biology'; but the subject as a whole is of very recent organization. Ecology as at present organized was first presented by Professor Warming, of Copenhagen, in 1895, and its fullest recent statement is that of Professor Schimper, in 1898. The subject is yet in a very formative state, and its formulated statements must be regarded as largely tentative. Three rather distinct lines of ecological investigation have been developed. One deals with the reactions of plants, tissues, and organs to their environment, and may be called physiologic ecology. A second line has to do with the origin, development, and life relations of the plant communities known as plant societies, and may be called physiographic ecology. The third line is a study of the great forest, grass, desert, and other formations of the globe in relation to climate, and may be called geographic ecology.

Various special subjects connected with plants are also organized into distinct fields of work. *Paleobotany* (q.v.) is a study of fossil plants, a subject which has been developing with remarkable rapidity. *Bacteriology* is the science which treats of that very peculiar group of plants known as bacteria, whose relationships to the interests of man are often of great importance, and whose life-processes are so peculiar that they demand special manipulation. *Pathology* is that division of the subject which deals with plant diseases, chiefly those inflicted by other plants. It is this subject which has attracted a great deal of attention in connection with the work of agricultural experiment stations. *Economic botany*, closely allied to agriculture and horticulture, is a growing subject, which deals with plants from the standpoint of their usefulness to man. *Forestry* is a special division of

economic botany which studies the proper handling of forests.

The literature of botany is too extensive to cite in any complete way, so that below are given only some of the more important works of a general nature. Under the articles ANATOMY, DISTRIBUTION OF PLANTS, ECOLOGY, MORPHOLOGY, PHYSIOLOGY, and TAXONOMY a selected list of elementary and advanced books treating those subjects is given. Also, in connection with the treatment of the larger groups of plants, the most important available literature is cited.

BOTANY, FOSSIL. See PALEOBOTANY.

BOTANY BAY. The popular name for any distant penal colony. It is the geographical name first given by the botanist Joseph Banks, who went with Cook on his first voyage in 1770 to an inlet near Sydney, New South Wales, on the eastern coast of Australia. Here the British Government, in pursuance of Pitt's policy to

deport criminals, directed Commodore Phillip, in 1787, to establish a penal settlement. He selected a better site, however, farther north (1788). England altogether discontinued the transportation of criminals to New South Wales in 1840. It has often been proposed to establish an international 'botany bay' for the permanent seclusion of the worst criminal classes of all countries. See PENOLOGY.

BOTANY BAY KINO. See EUCALYPTUS.

BÖTEL, bē'tel, HEINRICH (1854—). A German tenor singer, born in Hamburg, where his first occupation was that of a cabman. Educated by Pollini, he made his début at the Stadttheater, Hamburg, in 1883, in the rôle of Lionel, in Flotow's *Martha*. The beauty of his voice has made Bötél a popular favorite upon the operatic stage of Germany, though he is considerably handicapped by his defects as an actor.

BOTELHO DE OLIVEIRA, bô-tā'lyô dâ ô-lê-vâ'ê-râ, MANOEL (1636-1711). A Brazilian poet, born in Bahia. He studied law at the University of Coimbra, Portugal, and upon his return to Brazil practiced as an advocate. In imitation of Góngora, he wrote a volume of Latin, Portuguese, and Italian poems, reckoned by the Academy of Lisbon as a classic work—*Musica do Parnasso* (1705).

BOTERO, bô-tā'rô, GIUSEPPE (1815-85). An Italian poet. He was born in Novara, studied at the University of Turin, fought in the campaign of 1848, was appointed professor of Italian literature in the College of Cortemilia in 1849, and was subsequently director of various lycées. His published works include *Ricciarda* (1854), *Raffaele* (1858), *Il Galeotto* (1859), and *Specranza* (1870).

BOTETOURT, bôt'e-tōört, NOBBORNE BERKELEY, Baron (1717-70). A Colonial Governor of Virginia, appointed in 1768. Though he dissolved the Colonial Legislature in 1769 for passing resolutions condemnatory of several recent acts of Parliament, he nevertheless consistently opposed the arbitrary measures of the British Ministry for Colonial taxation, and, finding his protests unheeded, resigned in 1770.

BOTH, bôt, JAN and ANDRIES. The names of two Dutch painters. They were born in Utrecht about 1609-10. Their art united them closely, for they worked upon the same canvases, Jan painting in the landscape, in the style of Claude, and Andries doing the figures, in the manner of Bamboccio. They were pupils of Abraham Bloemart, but later went to Italy, where it is said the beauty of the scenery influenced Jan to devote himself to landscape painting. An example of the individual work of Andries is in the Dresden Gallery, but the best work of the brothers was done together, and so completely did their art blend that their paintings seemed to bear the impress of but one hand. Good examples of their style are in the National Gallery, the Louvre, the Amsterdam Museum, and at The Hague. The etchings of Jan, after his landscapes, are considered to equal his pictures. Andries was drowned in a canal at Venice, and his brother survived him but six years. Consult: H. J. W. Buxton and E. J. Poynter, *German, Flemish, and Dutch Painting* (London, 1881); C. E. Clement, *Painters, Sculptors, Architects, and Engravers* (Boston, 1899); A. G. Radcliffe,

Schools and Masters of Painting (New York, 1898).

BOTH'NIA. The name formerly given to the territory on both sides of the Gulf of Bothnia (q.v.). The eastern portion is now comprised in Finland and the western belongs to Sweden.

BOTHNIA, GULF OF (Med. Lat., for Scand. *botten*, lake, sea). The part of the Baltic Sea lying to the north of the island of Åland, having on its eastern shore Finland, on the western, Sweden. Its greatest length is about 400 miles, and its average breadth 120 miles. At its narrowest point, the Strait of Qvarken (46 miles wide), the gulf is divided into two parts, the northern, which is more shallow and narrow, and the southern. Its depth varies from 20 to 50 fathoms, but both along its shores and in the middle are many small islands, sandbanks, rocks, and cliffs, called skaers, which render the navigation difficult, though on the whole it is less dangerous than other parts of the Baltic, and has many good harbors. The rivers which fall into this gulf, both from Sweden and Finland, are numerous, and the waters of the gulf itself are but slightly salt. In winter it is usually frozen so hard that the journey from Sweden to Finland can be made on sledges. The shores of the gulf are gradually rising, causing increasing shallowness of its ports, some of which have become inland towns. The rise of the bottom is estimated at nearly 5 feet per century.

BOTHWELL, bōth'wēl. A village in Lanarkshire, Scotland, on the right bank of the Clyde, 8 miles east-southeast of Glasgow (Map: Scotland, D 4). The river is here crossed by the celebrated *Bothwell Brig*, the scene of the bloody encounter between the Covenanters and the Royalists under Monmouth on June 22, 1679, when the former were defeated. Near the village are the magnificent Norman ruins of Bothwell Castle, to which the Earl of Bothwell carried Mary, Queen of Scots. Population, in 1900, 2500. Consult Duncan, "Bothwell Castle," in *Archæological Journal*, Vol. XLV. (London, 1889).

BOTHWELL, JAMES HEPBURN, fourth Earl of (†1536-78). A Scottish nobleman, husband of Mary, Queen of Scots. He was born probably in 1536 or 1537, and was brought up and educated by his granduncle, Patrick Hepburn, Bishop of Moray, at Spynie Castle. He was reputed a good scholar. His character, however, was vicious and unruly. On his father's death in 1556, as Earl of Bothwell and one of the most powerful nobles in Scotland, he proved himself an irreconcilable enemy of the English. At first he opposed the Reformation party, but on their accession to power changed his politics, and in 1561 formed one of the deputation of lords sent to convey the youthful Queen of Scotland to her kingdom. He was shortly after made a privy counselor; but his violence and misconduct became intolerable, and he was ordered to quit Edinburgh. In March, 1562, he and the Earl of Arran were committed to the castle for conspiring to seize the Queen's person. Bothwell made his escape, was recaptured at Holy Island, again got free, and sailed to France. He speedily returned, but, finding Moray close on his trail, embarked for the Continent. Not appearing at his trial, he was outlawed. In 1565, after the Queen's marriage with Darnley, he reappeared,

and, having strongly espoused her cause against Moray and his party, was restored to favor and high influence. In October, 1566, while performing a judicial tour in Liddesdale, he was attacked by an outlaw and wounded, and the Queen manifested her interest in his danger by riding 20 miles and back to see him, a journey which brought on a dangerous fever. At Craigmillar, some time after, Bothwell attempted, unsuccessfully, to overrule her objections to a divorce from Darnley. A more thorough method presented itself to him, and on the night of February 9, 1567, Darnley was blown up at the Kirk of Field. Public opinion charged Bothwell with the murder, and he was formally indicted, March 28. He came to the trial attended by 4000 followers and received an easy acquittal. Two days after he carried the sword of State before the Queen at the opening of Parliament, and at its close all his lands and offices were confirmed to him. The leading nobles signed a bond approving of Bothwell's acquittal, and, commending him as a fit husband to the Queen, pledged themselves to stand by him. On April 24 Bothwell, accompanied by a strong force, carried off the Queen to Dunbar Castle; on May 6 he was divorced from his wife, and on the 15th his marriage with Mary was solemnized at Holyrood. He had previously been created Duke of Orkney. His triumph was short; the wrath of the nation was roused; at the end of one month Mary was a prisoner in Edinburgh, and Bothwell, pursued in his voyage to the Orkneys, where he had collected a small navy and turned pirate, fled to Norway, whence he was sent under arrest to Denmark, and there imprisoned for the rest of his life. The confinement drove him insane, and he died at Dragsholm Castle in 1578, leaving no heirs. His titles and estates were forfeited to the Crown. Consult: Schiørn, *Life of Bothwell* (Edinburgh, 1880); Ellis, *Later Years of James Hepburn* (1861); Burton, *History of Scotland* (Edinburgh, 1873).

BOTOCUDO, bō'tō-kōō'dō (Portug. *botoque*, plug; see below), or AIMORÉ. A Tapuyan tribe living in the Sierra dos Aimorés and on Doce and Pardo rivers, in Minas Geraes, in southeastern Brazil. Like all the tribes of that stock, they are undersized, their features are repulsive, and their grade of intellect is very low. Until brought under subjection by the Government, they were naked cannibals. The name Botocudo, 'barrel-bung,' was given them by the Portuguese in allusion to large wooden labrets and ear-blocks with which they disfigure their ugly countenances. See TAPUYAN.

BOT'ONÉ, or **BOTT'ONY** (OF. *botonné*, from *boton*, Fr. *bouton*, button). In heraldry, a cross botoné is a cross of which the ends are in the form of buds or buttons.

BOTOSHANI, bō'to-shá'né. A town of Rumania, in Moldavia, situated 60 miles northwest of Jassy, on a branch line of the Lemberg-Czerinowitz-Jassy Railway (Map: Turkey in Europe, F 1). It is irregularly built and contains a lyceum and a theatre. It carries on a considerable trade in cattle, grain, and wood. Population, in 1899, 32,193, of whom one-half were Jews.

BO-TREE. The name given to the sacred fig-tree, *Ficus religiosa*, or pipal (see PEEPUL), under which the Buddha, Prince Siddhārtha, sat

during the night in which he received supreme enlightenment and attained to the Buddhahood. As bo-tree literally means 'Tree of Wisdom,' from Sinhalese *bo* = Skt. Pāli *bodhi*, wisdom, enlightenment, the name is applicable to any tree under which a Buddha receives the great spiritual enlightenment. The particular bo-tree, or pipal, under which the Sākya sage, Gotama, was seated when he became Buddha was situated at Uruvelā, the modern Gayā, in Behar, 150 miles southeast of Benares. The scene attendant upon the coming of the supreme enlightenment at dawn, under the bo-tree, is described with poetic imagination in the Pāli writings of the Buddhists, and is familiar to English readers in Sir Edwin Arnold's *Light of Asia*. The spot thus hallowed by tradition is marked by an ancient temple, nine stories high, which is now undergoing restoration. The present bo-tree at Gayā can hardly itself be very old, but from its sacred connections it is one of the two most venerated trees in the world. The second sacred bo-tree is situated at Anurādhapura, in northwestern Ceylon. This is said to be the oldest historically authenticated tree in existence. It is stated that when Buddhism was established in Ceylon, the Buddhist abbess Sanghamitta, a sister of the royal missionary Mahinda, brought a branch from the original bo-tree at Gayā, and planted it at Anurādhapura, B.C. 245. From this branch the present tree grew up, and its history is traced with the utmost detail for centuries in the native chronicles. Its leaves are most sacred relics for the thousands of Buddhist pilgrims that visit it. Buddhist temples elsewhere have bo-trees planted by them.

BOTRYCHIUM, bō-trīk'ŭm (Gk. *βόρυχος*, a curl or lock of hair, *botrys*, grape-cluster; refers to its fruit-clusters). A genus of ferns of the order Ophioglossaceæ, having a short, erect rootstock, with clustered, fleshy roots, bearing a stalk, one part of which is sterile and fern-like, the other fertile and carrying the clusters of sporangia or spore-cases. The species are of little importance economically. The only British species is the *Botrychium lunaria* (moonwort), a little plant pretty frequent in dry mountain pastures, but not applied to any particular use. A species more worthy of notice is *Botrychium virginianum*, of which the geographical distribution is very remarkable. It abounds in many parts of the United States, in the mountains of Mexico, in Australia, in some parts of Asia, as the Himalaya Mountains, and is found also in Norway, although in no other part of Europe. It is large and succulent, and is boiled and eaten in the Himalaya, in New Zealand, etc. It is called rattlesnake-fern in some parts of America, from its growing in places where rattlesnakes are found. In the United States, *Botrychium virginianum* ranges from Washington to Colorado and Texas, and eastward, including Florida. *Botrychium lunaria* ranges from Colorado to New England, Lake Superior, and sparingly northward. *Botrychium simplex*, a rare species, with small fronds, is found from California and Yellowstone Park to Lake Superior and eastward. A variety, *compositum*, occurs in Alpine regions. *Botrychium lanceolatum* ranges from Colorado to Lake Superior, Ohio, New Jersey, and New England. *Botrychium lunarioides* is found from Massachusetts to Florida in dry,

rich woods and shady pastures. It has two varieties: *obliquum* and *dissectum*. *Botrychium ternatum*, a variable species, occurs throughout North America.

BOTRYTIS, bō-trī'tis (Gk. *βόρυς*, *botrys*, a cluster of grapes). A genus of mold-fungi belonging to the Mucedinæ. The plant consists of a mycelium (see FUNGI) of more or less entangled threads, with shoots of the same nature rising up from them, and bearing the fructification at their extremity. Most of the species live upon dead leaves, decaying wood, and other vegetable material. Some are found on living animal tissues, whether always previously diseased or not is a question still unsettled. A remarkable species of this genus is the Muscardine (q.v.). Many of the species of Botrytis belong to what are known as the imperfect fungi, i.e. those of which the life-history is not fully known, the Botrytis being the only form discovered. A number of Botrytis forma are known to produce disease in plants by attacking them through their young tissues, but most of the fungi causing diseases, formerly referred to species of Botrytis, are now referred to other genera. *Botrytis douglasii* is the cause of a destructive disease of the Douglas fir and other conifers. *Botrytis cinerea*, which causes the ripe rot of grapes, is now referred to *Sclerotinia fuckeliana*, and a number of other species are considered as belonging to the same genus of fungi. The potato-rot (q.v.) fungus once referred to Botrytis is now called *Phytophthora infestans*.

BOTT, JEAN JOSEPH (1826-95). A German violinist. He was born in Cassel, Germany, where he received his first musical instruction from his father, the Court musician. After further studies with M. Hauptmann and L. Spohr, he won the Mozart scholarship (1841), and successively became solo violinist in the Electoral orchestra (1846) and Court kapellmeister at Meiningen (1857) and Hanover (1865). In 1885 he came to New York, where he died. His works comprise two operas—*Der Unbekannte* (1854) and *Aktäa, das Mädchen von Korinth* (1862)—and symphonies, overtures, violin concertos, pianoforte music, solos for violin, and songs.

BOTTA, ANNE CHARLOTTE LYNCH (1820-91). An American author; born in Bennington, Vt. In 1855 she married Prof. Vincenzo Botta (q.v.). She published a book of poems (1848), besides many essays and reviews, promoted the establishment of Barnard College (q.v.), and founded the prize awarded every five years by the French Academy for the best essay on "The Condition of Women." Her *Handbook of Universal Literature* (1860) was formerly widely used as a text-book.

BOTTA, CARLO GIUSEPPE GUGLIELMO (1766-1837). An Italian historian. He was born in San Giorgio del Canavese, Piedmont, November 6, 1766, studied medicine in Turin, and, because of his active sympathy with the French Revolution, was arrested and imprisoned in 1792. Upon his release, in 1794, Botta went to France and became a physician in the Army of the Alps, taking part later in the expedition to Corfu. In 1799 he was appointed, with Carlo Giulio and Carlo Aurelio de Bossi, a member of the provisional government of Piedmont, hence called the 'Triumvirate of the Three Carli.' After the battle of Marengo he became a member

of the Piedmontese Consulta, and later, after the union of Piedmont with France, was a deputy to the Corps Législatif, an office that he filled until the return of the Bourbons to power, despite the offense that he gave to Napoleon by designating his government as a despotism. In 1831 he was allowed to return to his native country, and was pensioned by Charles Albert. He died in Paris, August 10, 1837. His earliest volumes (Italian and French) are: *Storia naturale e medica dell'isola di Corfu* (1797); *Souvenirs d'un voyage en Dalmatie* (1802); *Précis historique de la Maison de Savoie* (1803); and *Storia della guerra dell'indipendenza degli Stati Uniti d'America* (1809). This work was originally suggested to Botta in the course of a conversation with Manzoni's mother in Paris. It was received with great favor when first published, and was speedily translated into French and English. Even recently it has been pronounced by an English critic the best history of the subject written outside the United States. Botta's great work, however, is his *Storia d'Italia dal 1789 al 1814* (1824), which received the quinquennial prize of 1000 Tuscan dollars from the Accademia della Crusca at Florence, and in a short time ran through fourteen editions. Later it was included in a *Storia d'Italia*, in 20 volumes, consisting of Guicciardini's work (1490-1534) and Botta's continuation of it (1535-1789). Botta's style is marked by dignity, which at times is almost severe, and by a pervading consciousness of an historian's responsibility. For his biography, consult: Dionisiotti (Turin, 1867); Pavesio (Florence, 1874); Scipione Botta (Florence, 1877).

BOTTA, PAUL EMILE (1802-70). A French archæologist and traveler. He was born in Turin, the son of Carlo Giuseppe Guglielmo Botta. While still young he undertook a voyage round the world, and remained some time on the west coasts of America, where he zealously collected treasures of natural history. In the year 1830 he went to Egypt, where he entered the service of Mehemet Ali as physician, and in this capacity accompanied the Egyptian expedition to Sennar. Here he formed a very considerable zoölogical collection, with which he returned to Cairo in 1833. The French Government now appointed him consul in Alexandria, from whence he undertook a journey to Arabia, the results of which he published in a work entitled *Relation d'un voyage dans l'Yémen, entrepris 1837, pour le muséum d'histoire naturelle de Paris* (1841). At the suggestion of the Orientalist Julius Mohl, of Paris, he was by the Government sent as consular agent to Mosul, and at this place he commenced a series of discoveries which form an epoch in archæological science. Early in the spring of 1843 he began his diggings in the heaps of ruins at Khorsabad, near the Tigris, for monuments of Assyrian antiquity. These excavations revealed much valuable archæological material, including the ruins of the palace of Sargon, King of Assyria (B.C. 722-705). The *Journal Asiatique* soon contained accounts of the success with which his enterprise and perseverance were rewarded, and also disquisitions on the extremely difficult subject of the cuneiform writings of the Assyrians, which afterwards appeared as a separate publication under the title *Mémoires de l'écriture cunéiforme assyrienne* (1846). The French Government took up the

matter warmly; Flandin, a practiced draughtsman, was sent out for the purpose of making sketches on the spot of the sculptures on alabaster, so apt to fall to pieces; and a commission of learned men was appointed for the purpose of conducting the publication of a magnificent archæological work, which shortly afterwards appeared under the special superintendence of Botta himself, with the title *Monuments de Ninive découverts et décrits par Botta mesurés et dessinés par Flandin* (1847-50). In 1848 he published the *Inscriptions découvertes à Khorsabad*. In 1846 Botta was appointed consul at Jerusalem, and in 1857 at Tripoli. He returned to France in 1868, and died at Achères, near Poissy. See ASSYRIA.

BOTTA, VINCENTO (1818-94). An Italian-American educator. He was born in Piedmont, Italy, was educated at the University of Turin, became a professor there, was elected to the Sardinian Parliament in 1849, and was appointed commissioner to examine the German educational system in 1850. He came to the United States for the same purpose in 1853, and soon afterwards was naturalized and appointed professor of Italian language and literature in the University of the City of New York. He remained in this position till his death. In 1855 he married Anne Charlotte Lynch, a well-known author. His best-known works are: *Account of the System of Education in Piedmont; Character and Policy of Cavour* (1862); *Dante as a Philosopher, Patriot, and Poet* (1865); and "An Historical Account of Modern Philosophy in Italy," in Ueberweg's *History of Philosophy from Thales to the Present Time* (1872).

BOTTALLA, bôt-tâl'la, PAOLO (1823—). An Italian historian. He was born in Palermo, Sicily, and was educated at the Jesuit colleges in his native city and in Rome. He subsequently held successive professorships in Church history and theology in Palermo, in Rome, at the College of Saint Bruno, Wales, and in Poitiers. He writes in the Italian, French, and English languages, among his works being the following: *Corso di storia e di geografia universale* (Palermo, 1860); *L'Autorità infallibile del Papa nella Chiesa e le sue relazioni collo stato* (1880); *The Papacy and Schism* (1869); *The Pope and the Church Considered in Their Mutual Relations*, etc. (1868); *Pope Honorius Before the Tribunal of Reason and History* (1868).

BOTTARI, bôt-tî'râ, GIOVANNI GAETANO (1689-1775). A learned Italian prelate, born in Florence. He studied ancient literature and eloquence under Biscioni, and subsequently applied himself to mathematics, philosophy, and theology. He soon obtained a great reputation for the delicacy of his style. The Accademia della Crusca intrusted him with the care of a new impression of its famous dictionary. Clement XII. appointed him librarian of the Vatican. The works of which Bottari was either the author or editor are very numerous. The principal are his edition of Vergil from the Vatican manuscript; his elaborate treatises on the catacombs of Rome and on the Vatican; his *Del Museo Capitolino*, and his dissertations on Dante, Boccaccio, and Livy.

BOTTESINI, bôt'te-zè'nè, GIOVANNI (1823-89). An Italian musician and composer; born at Crema, Lombardy, December 24, 1823. He

was one of the greatest performers on the double bass that ever lived, and practically the only one known to fame as a concert soloist. He entered the Milan Conservatory, and studied double bass under Rossi and Basili, and theory under Vaccai, Piantanida, and Ray. From 1840 to 1845 he was a concert virtuoso throughout Italy. In 1846 he went to Havana, Cuba, where, during his régime as conductor, his opera *Cristoforo Colombo* was produced. During his residence in Cuba he made occasional visits to the United States. In 1849 he made a tour through England; for two years following was conductor at the Théâtre des Italiens, Paris; afterwards resuming his concert tours. In 1861 he was appointed conductor at the Bellini Theatre, Palermo, and in 1863 held a similar post in Barcelona. He established in Florence a society for the cultivation of German classical music, conducted the opera at Cairo, Egypt, and at the Lyceum, London, in 1871. Ultimately he settled in Parma and became director of the conservatory there. His oratorio, *The Garden of Olivet*, was given under the composer's direction at the Norwich (England) Musical Festival in 1887. His published works include operas, symphonies, overtures, quartets, etc., but although he wrote many compositions for the double bass, none of these appear to have been published. He died in Parma, July 7, 1889.

BÖTTGER, bôt'kër, ADOLF (1815-70). A German translator and poet, born in Leipzig. He studied at the University of Leipzig and won high praise as a translator of the English poets, including the complete works of Byron (1840, and in frequent and variously arranged editions), and the poems of Goldsmith (1843) and of Milton (1846). He also made renderings of Ossian (1847) and (1856) of Longfellow's *Hiaucatha*. His own works, displaying often the influence of English prototypes, include: *Gedichte* (1846); *Die Pilgerfahrt der Blumen-geister* (1851); *Das Buch der Sachsen* (1858); and *Neue Lieder und Dichtungen* (1868).

BOTTGER, BÖTTCHER, or BÖTTIGER, JOHANN FRIEDRICH (1628-1719). The inventor of Saxon porcelain. He was born at Schleiz, in the Principality of Reuss-Schleiz. He was apprenticed to an apothecary in Berlin, but became an enthusiast in the search for the philosopher's stone, and carried on extensive researches under the patronage of Prince Egon von Fürstenberg in Dresden. As he did not succeed in making gold, he was induced to use the chemical knowledge he had acquired in experiments upon clays, with a view to the manufacture of porcelain, and factories for this purpose were erected under royal patronage, and the celebrated Meissen porcelain was the result. As a security against the revelation of the art of making it, Böttger and his assistants were treated as prisoners, and when Saxony was invaded by Charles XII. of Sweden in 1706, they were secretly removed from Dresden to Königstein. His success was not without its reward. He was appointed to supervise the porcelain manufacture in 1708, and shortly afterwards the Meissen porcelain was brought out. In 1716 he entered into negotiations to reveal the secrets of the process, but was discovered and imprisoned.

BOTTICELLI, bôt'ti-chêl'li, ALESSANDRO FILIPEPI (c.1447-c.1510). An Italian painter,

born in Florence. His birth is differently stated as in 1446 and 1447, his death as in 1510 and 1515. His father, Mariano Filipepi, a well-to-do citizen, wished to give his son a good education; but the boy's strong will showed itself in a violent distaste for learning, and his father, despairing of turning him into a scholar, placed him in the shop of a goldsmith named Botticello. From this master Botticelli took not only the name by which he was to become famous, but also the use of the gold which he afterwards turned to account in the foliage of his backgrounds, in his angels' rippling hair, and in the embroidered tissues of his virgins' robes.

Before long, however, he evinced a strong desire to become a painter, and accordingly entered the studio of the Carmelite monk Fra Filippo Lippi, then at the height of his reputation. Many of his early works show a marked influence of Andrea del Verocchio, an allegorical figure of "La Fortezza," and one of them is painted in the manner of the brothers Pollajuoli. When Filippo Lippi died, in 1469, Botticelli, then only about twenty-two years of age, was considered one of the first painters in Florence. His high reputation at this time is proved by the distinguished patrons who employed him—namely, the families of Tornabuoni, Vespucci, Palmieri, Pucci, and, above all, Lorenzo de' Medici, who from the first showed Botticelli a generous patronage which he never withdrew. At that time, also, many important commissions were assigned to him. Thus, in 1475, when the Pazzi plot nearly overthrew the Medici, Botticelli was called upon to paint the portraits of the offenders, according to usage, on the walls of the Palazzo Vecchio. In 1480, to the order of the Vespucci family, he painted the fresco of Saint Augustine on the wall of the Church of the Ognissanti.

Finally, about 1481, Botticelli was summoned to Rome by Sixtus IV., to assist in painting his newly erected chapel in the Vatican. According to Vasari, he was made chief superintendent of the work; but it is more probable that his supervision was mainly in the distribution of the spaces for the frescoes. His co-workers were Ghirlandajo, Perugino, Cosimo Rosselli, and Luca Signorelli. Botticelli himself painted a number of the twenty-four portraits of Popes in the upper niches of the chapel, and three of the twelve frescoes—namely, "The Life of Moses," "The Temptation of Christ," and the "Punishment of Korah, Dathan, and Abiram." These compositions illustrate both the vigor of his imagination and the limitations of his genius; for, while many of the separate groups are strikingly beautiful and exhibit an extraordinary amount of life and motion, there is a want of harmony in the whole, and in several cases the figures are crowded together in confused groups.

Botticelli returned to Florence about 1484, and, according to Vasari, "being a man of profound thought, composed a commentary on Dante's poem, illustrated the *Inferno*, and had it printed." The commentary has not come to light, but the first Florentine edition of Dante (published by Baldini in 1481) contains engravings on copper to illustrate the *Inferno* which were made from Botticelli's drawings, and it is believed that Botticelli himself executed several of these plates. Moreover, ninety-six sheets of his drawings, representing all but seven cantos of the *Divine Comedy*, are still intact,

BOTTICELLI (ALESSANDRO FILIPEPI)
"PRIMAVERA" (SPRING), FROM THE PAINTING IN THE ACADEMY OF THE FINE ARTS, FLORENCE

eighty-six of them being in the Berlin Museum. All of these were sketched in silver point and finished with the pen. Some were completed in body colors, and it is supposed that the original scheme was for the whole to be carried out in colors, in the style of the earlier illustrations of Dante.

It was also after his return from Rome that Botticelli became a disciple of the Dominican friar Fra Girolamo Savonarola, who came to Florence about 1490. Vasari says that in his religious frenzy Sandro entirely abandoned painting, and was reduced to misery and want. But there is abundance evidence of the falsity of this statement; for though he naturally ceased painting profane subjects, and was a firm believer in the friar's prophecies until his death, he was to the last one of the counselors of the Medici in the public works. Thus, in 1491 he and Ghirlandajo had charge of the mosaic work in the cathedral at Florence, and competed in plans for finishing the facade; and in 1503 he was one of those consulted as to the best place for Michelangelo's statue of David. But of more significance than all is the fact that while Savonarola was burned in 1498, it was in 1500 that Botticelli painted one of his most beautiful religious pictures, "The Nativity," in the National Gallery, London. This work is doubly interesting because it shows that though the artist was still constant to the memory of Savonarola, he had lost nothing of the wealth of his fancy, nothing of his tender sentiment, and nothing of that distinction of attitude which characterized his early works.

The story of his poverty is also probably exaggerated, for Botticelli's income tax for 1498 shows that he was then keeping house with his nephew in Florence, and at the same time possessed 'a gentleman's villa' and vineyards outside the gates of San Frediano. His father, too, seems to have been in comfortable circumstances, since in 1510 he purchased the family vault in the Church of the Ognissanti, where Sandro is now buried.

Probably no artist in the entire range of the Italian Renaissance has evoked such contrary opinions of his merits as has Botticelli. As has been seen, his reputation among his contemporaries was high; but later, when the merely technical excellences of the art of painting, and especially the quality of surface fidelity, had assumed an exaggerated importance, he went out of favor, and for three hundred years his work was not considered as a factor in the development of art. To-day, however, with the freedom from the tyranny of conventional criticism, with the opportunities of forming individual opinions instead of echoing those of the acknowledged critic of the day, Botticelli has fully regained favor. One reason for his present popularity is that in the breadth and richness of his culture, in the varied character of the subjects he chose, and in the greatness of his aim, he represents the most striking features of the memorable period in which he lived. For the range of his subjects extended from the great scriptural compositions, "through the most touching scenes in the life of the Virgin," to events in classic history, and thus in his works the brilliancy of the Medicis' Court, the force of Christian traditions, and those classic myths that were the de-

light of Renaissance scholars, are all present in varying degrees. Nor did he escape the errors of his day. The superabundance of his ornament, the graceful yet mannered form of his draperies, and the introduction of gold into these and other accessories were to some extent due to the demands of his patrons.

But though he is thus a reflex of his time, Botticelli's works are yet pronounced and individual. Living in a generation of naturalists, he might have been a mere naturalist among them. There are traces enough in his work that he was deeply impressed by nature, by man, and by things considered as plastic objects. The sea, rocky mountain scenery, soft woodland landscapes, and gardens of every variety of rose, appear again and again in his paintings. But Botticelli was essentially a visionary painter, and to represent merely the outward image was not enough for him. Instead, he clothed all he saw with the color of his own moods and ideas, and thus made each of his works an outgrowth of his own personality. In color, too, he showed independence, for while in his youth he used the gay colors common in his age, in his later works his color scheme was more subservient to the central idea and sentiment of his work. He was also one of the first to accept art as an instrument of general culture, and as much at the service of the world as of the Church. Before him, few ventured outside the range of subjects provided by the Scriptures. But while Botticelli painted religious works, he painted them with an originality of feeling which appeals to the spectator as the real matter of the work through the veil of its ostensible subject. On the other hand, his Venuses have so much feeling and such tender grace that they seem "Madonnas masquerading in mythology."

In his Madonnas the chief characteristics of his art are revealed. Nowhere does he give greater proof of his personal feeling and creative energy than in depicting Mary and her Child. In the Madonnas at Palazzo Corsini (Rome) and at the Spedale degli Innocenti (Florence), the influence of Filippo Lippi is apparent. Like those of the friar, these virgins, though lacking in religious feeling, are full of a naive tenderness and affectionate maternity. Even the style of arrangement and mode of drapery are copies of the mode carried out by Filippo. In the later Madonnas Filippo's influence is still seen in the Virgin's slenderness. The motive, too, is almost the same—Mary embracing the Child, who stands in her lap and raises His right hand in blessing toward the throng of worshipers. But the veil of sorrow has fallen over the youthfulness that delighted in his earlier works; Mary's joy as a mother is under the shadow of a prophetic foreboding of woe to come. This mystic union of the highest blessedness with the sharpest anguish, the result of Savonarola's mighty influence on the painter, is the keynote of all his later Madonnas. Sometimes the Virgin's sadness is communicated to the angels, but usually it is the Child who feels the burden of an inexorable destiny and turns to His mother with tender caresses. Even to his profane subjects Botticelli communicates this element of sadness, and nothing is stranger than to see the bright Greek myths tinged with medieval colors and shadowed with the "grim humor of Florentine thought."

Equally interesting and important are his mythological works, painted for the most part in the period after his return from Rome, before he came under the influence of Savonarola. The most famous of these is the "Realm of Venus," usually known as "Spring"—a charming composition of classical figures, over life-size, in a beautiful spring landscape, redolent with flowers. Its companion piece, the "Birth of Venus," represents the goddess perfectly nude, except for the covering of her wind-blown hair, being wafted ashore by the breath of the wind-gods. It is the most chaste and refined treatment of the nude, except perhaps Giorgione's "Sleeping Venus," in modern painting. Both these pictures were painted for the Medici; the former is in the Uffizi, the latter in the Florence Academy. Among his other important mythological works are "Calumny," after a description of a painting of Apelles by Lucian, in the Uffizi, Pallas taming a centaur (Pitti), and "Mars and Venus," in the National Gallery, London.

Although too subjective to be a great portraitist, Botticelli executed a number of portraits of a subtle charm. Among the best known are those of the Medici and other Florentine notables in the "Adoration of the Magi" (Uffizi); his "Giuliano dei Medici," the original being in the Gallery of Bergamo, not in Berlin, as Morelli has shown; and, most beautiful of all, the portrait of an unknown woman in the Frankfort Museum.

Those who demand that a work of art shall merely please the eye will not be satisfied with Botticelli's works. There is none of the beauty of Raphael's figures in his typical Madonna, with her long, thin, and melancholy face, her over-ripe lips, her prominent chin, and her long, lank limbs. But the lines that give character to a face, and those qualities which are directly life-communicating and life-enhancing, are almost never lacking in his works, and it is these characteristics that give all his productions, religious, political, or allegorical, an eternal human interest.

Since Botticelli, except in one instance, neither signed nor dated his works, it is impossible to arrange them chronologically. The greater number of his best productions are in Florence, but the Berlin Museum is also well supplied. A number of these have been mentioned in the course of this narrative. Sandro also had an important school, by whom many works assigned to him, like the "Venus" in the Berlin Museum, a copy of the figure in the "Birth of Venus," were probably painted. Among his chief works not mentioned above are his two best-known Madonnas, both circular pictures, and in the Uffizi. The "Magnificat" represents Our Lady dreamy and passionate, crowned and surrounded by angels with wistful, eager faces. It is the best specimen of his early period, as its companion piece is of his later. Among the best-known of his remaining works are "Scenes from the Life of Saint Zenolius," in Dresden; his frescoes of the Villa Lemmi, now in the Louvre, and his large "Assumption of the Virgin," in the National Gallery, London.

BÖTTICHER, bêt-tî-kër, KARL (1806-89). A German archaeologist, born in Nordhausen. He studied at the Academy of Architecture in Berlin, and was afterwards appointed an instructor in the School of Design of the Industrial Institute there. In 1844 he was appointed a professor in the Academy of Architecture. His chief work is the *Tektonik der Hellenen* (1844-52), a splendid contribution to the study of Greek architecture. Others of his works are: *Bericht über die Untersuchungen auf der Akropolis in Athen* (1863); *Der Zophoros am Parthenon* (1875); and *Die Thymele der Athena Nike auf der Akropolis von Athen* (1880).

BÖTTICHER, KARL HEINRICH VON (1833—). A German statesman. He was born in Stettin, and was educated at the universities of Würzburg and Berlin. He was Governor of Schleswig in 1876, Lieutenant-General of Schleswig-Holstein in 1879, Secretary of the Interior in 1881. In 1888 he became vice-president of the Prussian Ministry of State, and in 1898 Lieutenant-General of the Province of Saxony. As the representative of the Chancellor he introduced numerous social reforms, and the enactment of the invalid and old-age insurance laws, in 1889, was due principally to his splendid energy and executive ability.

BÖTTICHER, PAUL. See LAZARDE, PAUL ARSTON DE.

BÖTTIGER, bêt-tî-gër, CARL VILHELM (1807-78). A Swedish writer. He was born in Westcrås, and studied at the University of Upsala, where, after extensive travels, he was appointed professor of modern literature in 1845, and in 1858 professor of æsthetics, from which post he retired in 1867. He was exceedingly active as translator, poet, dramatist, and literary critic. Most of his publications in the latter capacity appeared among the *Transactions* of the Swedish Academy. It is perhaps by his verse that he is known to best advantage. His publications include: *Lyriska stycken* (Lyrical Pieces, 1837-39); *Religiösa sånger* (Religious Songs, 1841); and translations of Tasso's *Gerusalemme Liber-*

ata (1842-51), and Dante's *Divina Commedia* (1846-51). His collected works appeared at Stockholm (6 vols., 1856-81).

BÖTTIGER, bêt'ti-kēr, KARL AUGUST (1760-1835). A German archaeologist. He was born June 8, 1760, at Reichenbach, in Saxony, and studied in Leipzig. In 1791, chiefly through the influence of Herder, he was appointed director of the gymnasium, and consistorial councillor at Weimar. Here he enjoyed the stimulating society of Herder, Wieland, Goethe, and others. His literary activity at this period was prodigious. He edited several journals, and wrote multitudes of reviews, biographical notices, etc., for the *Allgemeine Zeitung*. In 1804 he was called to Dresden, where he began to deliver lectures on special branches of classical antiquities and art. In 1832 Böttiger was elected a member of the French Institute. He died November 17, 1835. Among his important works are: *Sabina oder Morgenscenen im Putzzimmer einer reichen Römerin* (Leipzig, 1803; 3d ed., Munich, 1878), a study of the household life of the Roman women; *Die Aldobrandinsche Hochzeit* (Leipzig, 1810); *Kunstmythologie* (Dresden, 1811); *Vorlesungen und Aufsätze zur Altertumskunde* (Leipzig, 1817); *Amalthea oder Museum der Kunstmythologie* (3 vols., Leipzig, 1821-25); *Ideen zur Kunstmythologie* (2 vols., Dresden and Leipzig, 1826-36). His minor writings in Latin and German were collected by Sillig and published in 1837-38. Consult: Karl Wilhelm Böttiger, *Karl August Böttigers Eine biographische Skizze* (Leipzig, 1837); and his *Litterarische Zustände und Zeitgenossen* (Leipzig, 1838); which he published from his father's papers.

BOTTLE (Fr. *bouteille*, dim. of *botte*, *boute*; from Low Lat. *buticula*, dim. of *but[t]is*, *butta*, flask, Eng. *butt*). A vessel, generally of a round shape, with a narrow neck, for holding liquids. Bottles are now usually made of glass or earthenware; but the first bottles were made of the skins of animals, mostly goats. Of this kind were the bottles spoken of in Scripture. Skin bottles are still used in southern Europe for the transport of wine, and by tribes of Africa and Asia for carrying water. The ancient Egyptians made bottles of most elegant form and exquisite workmanship, of alabaster, stone, gold, ivory, and other substances. The Italian peasants carry, slung round their necks, bottles made of the rind of the gourd, which, when dry, is as hard as wood. Bottles made of glass will be treated under GLASS.

BOTTLE-CHART, BOTTLE-PAPERS. A chart which purports to show the track of sealed bottles thrown from ships into the sea. It is a well-known practice, on long voyages, to throw sealed bottles containing some intelligence into the sea, in the hope that these messengers may be picked up, and the information inclosed may reach its proper destination. The frequency of these instances at length led to the inference that by such means the determination of currents might be illustrated. Lieutenant Beecher, an English naval officer, has the merit of having constructed, in 1843, a chart of bottle voyages in the Atlantic, his facts being drawn from the numerous cases that had occurred. The time which elapses between the launching of the bottle from the ship and the finding it on shore, or picking up by some other ship, has varied from

a few days to sixteen years; while the straight-line distance between the two points has varied from a few miles to 5000 miles. Of the actual length of the curved line followed by the bottle, little or nothing is known; but some are believed to have exceeded 8000 miles. The bottle-chart has been re-edited and re-engraved from time to time, and published in the *Nautical Magazine*; it is marked by several hundred straight lines, each drawn from the latitude and longitude of immersion to the latitude and longitude of the finding. Charts of this sort are now prepared at the United States Hydrographic Office, not for general circulation, but for information of the office; and from the records thus established current-charts are prepared and corrected. Papers printed in several languages are furnished by the hydrographer to masters of ships for the purpose of putting in bottles; the paper contains a request for their return when found to the nearest United States consul, who will forward them to Washington, with a statement in regard to the circumstances of their discovery.

BOTTLE-FISH, BOXFISH. See SWELLFISH.

BOTTLE-GLASS. See GLASS.

BOTTLE-GOURD (gourd used for making bottles; see below), *Lagenaria*. A genus of plants of the natural order Cucurbitaceæ, nearly allied to the Gourd (*Cucurbita*), in which it was until recently included. One of the most marked distinctions between them is the very tumid border of the seeds of the bottle-gourds, which have also all the anthers separate, and have white flowers, while those of the gourds proper are yellow. The common Bottle-Gourd or False Calabash (*Lagenaria vulgaris*) is believed to be a native of India and other warm parts of the Old World, but is now common almost everywhere in warm climates. It is a climbing, musky-scented annual, clothed with soft down, having its flowers in clusters, and a large fruit, from 1 to even 6 feet in length, which is usually shaped like a bottle, an urn, or a club. The fruit has a hard rind, and when the pulp is removed and the rind dried, it is used in many countries for holding water, and is generally called a Calabash. The bottle-gourd, in its wild state, is very bitter, and is said to be poisonous, and even in cultivation some of its varieties exhibit not a little of the bitterness and purgative properties of colocynth. The bottle-gourd appears to have been introduced into Europe about the close of the Sixteenth Century; but it requires for its advantageous cultivation a warmer climate than that of any part of Great Britain, where, although it succeeds well enough in a hotbed, it is chiefly known as an object of curiosity. It is, however, much cultivated in warmer countries as an esculent, and is an important article of food to the poorer Arabs, who boil it with vinegar, or make a pudding of it in its own rind with rice and meat. It is also used when young as we employ summer squash. This plant is often grown in the United States, where it is known as Hercules'-club, sugar-trough, snake, dipper-gourd, etc. For illustration, see CUCUMBER.

BOTTLEHEAD, or **BOTTLENOSE** (so named from the shape of the snout, or head). A whale (*Hyperoodon rostratus*) closely allied to the sperm-whale, frequenting the Arctic and North Atlantic. It reaches a length of 30 feet, and has the snout produced into a beak, as in

the dolphins; the forehead rises suddenly from the beak, and is remarkably elevated, owing to large bony crests rising over the bones of the upper jaw. The teeth are only two in number, and are situated in the fore part of the lower jaw, pointed, but sometimes completely hidden. There is a dorsal fin, rather small in proportion to the size of the animal, and placed farther back than in the common dolphin. The blowhole is crescent-shaped, the points of the crescent directed backward. The skin is smooth and glossy, of a blackish lead-color on the back, gradually becoming lighter on the sides, and whitish on the belly, turning yellowish-brown in old age.

These small whales travel in bands of four to ten, and keep just south of the limits of the Arctic ice, moving northward in summer and southward in winter. They are active, leaping out of the water, and curious rather than alarmed by the presence of boats. They feed mainly on squids, for which they are believed to dive to a very great depth. They are pursued and harpooned for the sake of their oil, resembling and equal to sperm, of which a large one will yield two tons, besides 200 pounds of spermaceti.

The same name is often applied to several other of the smaller cetaceans, such as dolphins and blackfish, with protruding snouts.

BOTTLENOSE. In Great Britain, a puffin (q.v.).

BOTTLE-TREE (so named from the shape of the trunk and the water it contains; see below), *Sterculia rupestris*. A native of Australia, noted for great globular expansion between the ground and the branches; or, where the soil is without rocks, for a trunk in the shape of an ordinary bottle, the limbs appearing to grow from the mouth. It belongs to the order Sterculiaceae, and is of middling stature. The wood is soft and brittle; the leaves are from 2 to 4 inches long, entire, stalked, and lance-shaped; the flowers inconspicuous, on short panicles, arising from the axils of the leaves; calyx in the males, five-cleft, the stamens numerous; the fruit, of five-stalked, leathery follicles containing six seeds. According to von Müller, the stems of this tree hold considerable quantities of water, a fact often taken advantage of by travelers and the aborigines, who cut holes into the soft wood to get the supply of water. There are a number of other species to which the name 'Bottle-tree' is applied. Some of them are important food-plants of the natives of Australia, who eat their roots, which are filled with a gum similar to gum tragacanth. For illustration, see BREAD-FRUIT.

BOTTLING AND BOTTLING MACHINERY. Bottling is practiced wherever liquids or merchandise of any kind is placed in bottles for preservation or sale. The materials bottled on the largest scale are beers, wines, and liquors, mineral and other table waters, and such non-alcoholic beverages as soda-water, ginger ale, and sarsaparilla. Some or all of the following processes usually are involved: (1) Cleansing the bottles; (2) cleansing the corks; (3) filling, corking, labeling, and tin-foiling or capping the bottles. In addition, some goods, such as beer, are steamed or pasteurized after the bottles are corked. In some bottling establishments the operations include the preparation of the ma-

terials bottled, such as carbonated waters; but in this article it is assumed that the various liquids are ready for bottling, and that machines are used throughout. Clean bottles are essential, particularly for the higher grades of goods. The slightest speck of dirt might seriously damage a bottle of champagne or mineral water, and fermentable matter left in old bottles might ruin other beverages. New bottles are easily cleaned by washing and rinsing; but in many industries the bottles are used repeatedly, and must be cleaned as often as they are returned to the bottler. Old corks are removed from the bodies of bottles by special apparatus. Before being washed bottles are soaked, where necessary, in tanks containing hot water, or some other cleansing solution. Soaking-wheels are sometimes employed. These contain pockets in which the bottles are laid horizontally, mouth outward. The weight of the bottles as they are successively added causes the wheel to revolve slowly through the water in the tank. After having been soaked the interiors of the bottles are washed or scrubbed by means of brushes revolving at speeds as high as 2800 revolutions per minute. Both bristle and rubber brushes are used, though the former are less durable and leave bristles in the bottles. Some of the rubber brushes consist of elastic rubber stretched between two forked springs, and a more recent rubber brush has three prongs, which are spread by centrifugal action. A single steam-driven washer will clean 60 to 75 dozen bottles per day. The bottles are then placed upside down on rinsers, the essential features of which are vertical tubes, closed at the top, except for small holes, through which jets of water under pressure are emitted. Each rinser includes 24, 36, or more spouts, mounted on horizontal plates, with water-supply pipes beneath.

Filling-machines may be operated by siphonage from open tanks or by air or gas pressure from closed tanks. The latter is preferable, and sometimes essential, for carbonated beverages or any other liquids that might be injured by exposure. In the siphon-fillers the bottles are placed on the long leg of a siphon, the short leg of which is immersed in the filling-tank. The weight of the bottle tilts the siphon sufficiently to free the end of its short leg from the sloping side of the tank, thus permitting the liquid to flow into the bottle. An automatic float maintains a uniform supply of liquid in the filling-tank. In the pressure fillers the siphons and open reservoir give place to a system of piping, and the barrel or other closed receptacle containing the supply of liquid. Air or gas under pressure is admitted to the supply-barrel and forces the liquid into the bottles. The pipes to the latter are controlled by cocks or gates. Pressure fillers, like the rinsers, are also mounted so that they may be revolved. Waters highly charged with carbonic acid gas, like seltzer in siphons, present a different problem in filling. They may supply their own pressure, wholly or in part, and special precautions may be necessary to prevent injury to the operators from bursting bottles. Siphon bottles are extra strong, and are tested in advance of use. In addition, the bottles are placed in strong iron cages or traps while being filled, and the workmen wear masks, gloves, sleeves, and aprons of rubber as a protection against flying glass from bursting bottles. Siphon bottles are filled upside down, through the siphons. Com-

posite beverages may be mixed during the bottling process. Thus the sirup for flavored soda-water is admitted to the bottle from one receptacle and the carbonated water added from the pressure-tank.

After the bottles are filled, with the exception of the siphon bottles just described, they must be closed in some manner. The most common method is to cork them. Besides ordinary soaking and rinsing in pails or tanks of water, the corks may be placed in revolving drums and cleansed by either the wet or the dry process. In the latter process, the corks roll about in 'rumblers' and rub against each other for hours until the loose fragments and the edges that might easily chip off, together with much dust, are all removed by attrition and shaking. The corks are then thoroughly soaked and rinsed.

The essential feature of corking-machines is a compressor, which shapes the cylindrical corks used in power-corkers, and a plunger-rod, which forces each cork home into the neck of the bottle. The machine may be driven by hand, foot, or other power. The self-feeding machines may be operated at the rate of 2000 bottles per hour. Bottle-wiring machines secure the wire around the corks and necks of bottles at the rate of from several hundred to 1000 per hour; according to the dexterity of the operator. Bottle-labeling machines affix labels in place, and in some cases date them, at the rate of 10,000 to 12,000 bottles per day. In some machines the bottle is stationary and the label is picked up and pressed against the bottle; in others, a plunger forces the bottle against the label. The corks and bottle-necks are covered, chiefly for decoration, with tinfoil by hand, or caps by machine. Branding-machines to burn the brand into the corks consist of a heated die or stamp forced home by a lever or other pressure. Besides the well-known corks composed of the material of that name (see CORK), there are a great variety of other stoppers. Permanent stoppers are attached to the bottle by means of wires. They often consist of a metal cap, beneath which is a rubber cork or plug. The wiring may be so hinged and bent as to give a leverage to force the cork tightly into the bottle and hold it securely in place. When the chief function of stoppers is to cover a bottle for a brief period, pasteboard disks are sometimes used. They are particularly well adapted to the wide-mouthed bottles in which milk is delivered for final consumption. Millions of these are now made from wood pulp. See PAPER.

BOTTOM (AS. *botm*, Ger. *Boden*, Lat. *fundus*, ground, bottom). A term used to designate either the whole ship, itself, or that part of it which is under water when laden. Commodities are often said to be imported 'in foreign bottoms,' or in 'American bottoms'; in which cases the phrase is applied to the whole ship. A 'full ship,' or a 'full bottom,' denotes such a form given to the lower half of the hull as to allow the stowage of a large amount of merchandise. A 'sharp ship,' or a 'sharp bottom,' implies a capacity for speed.

BOTTOM HEAT. The heat communicated to certain soils from below, either by the fermentation of fresh stable manure, tan-bark, leaves, etc., buried for the purpose, or by steam-pipes, flues, or other like arrangements. It is

one of the most important agents used in forcing-houses and hotbeds in the artificial cultivation of vegetables, flowers, or fruits.

BOTTOM, NICK. In Shakespeare's *Midsummer Night's Dream*, an ignorant and conceited weaver. In the play of "Pyramus and Thisbe," he takes the rôle of Pyramus. Puck gives him an ass's head, and Titania is compelled by the fairy king to be enamored of him.

BOTTOMRY BOND or CONTRACT (for derivation, see *bottom*). An agreement for a definite period of time or for a voyage by the owner or master of a ship, pledging the ship or the ship and its freight or cargo as security for the repayment of money lent for the use of the ship. It is so called because a ship's bottom or keel is figuratively used to express the whole of it. When the cargo alone is pledged for its safe arrival, the agreement is strictly called a *respondentia bond* (q.v.). The loan is made upon a maritime risk, i.e. upon the condition that the loan or debit, *together with the stipulated interest*, is repayable only on the safe termination of the voyage; otherwise the lender loses his debt. In consideration of the hazard, he may exact any rate of interest, not grossly extortionate, which the nature of the adventure may justify. The agreement is usually in the form of a bond, and must set forth all the necessary terms, especially the maritime risk. The owner may hypothecate the vessel or its freight, and execute a bottomry bond at any time and for any purpose; but the master can do so only under stress of necessity in a foreign port, destitute of funds and unable to communicate with, or to receive instruction from, the owners.

Contrary to the rule of ordinary mortgages, preference among bottomry bonds is not had according to order of date, but inversely, the latest having priority, on the theory that the last loan saved the ship. The United States statute which provides for the recording, in the office of the collector of customs of the port, of registry or enrollment, bills of sale, mortgages, hypothecations, and conveyance of vessels, under penalty of their being otherwise invalid as against others than parties having actual notice, and the grantor or mortgagor, his heirs and devisees, expressly except the lien of a bottomry bond from the operation where such lien has been created by loan of money or materials necessary to repair the vessel or to enable her to prosecute the voyage, so that the lien does not lose its priority and is not affected in any way by the requirements of the act. A bottomry bond is, however, subordinate to the lien of the seamen for wages, even though in some cases given after the wages were earned, and to liens for repairs or supplies indispensable for the safety of the ship. Where the holder is compelled to satisfy a lien for wages, it seems that he is entitled to compensation from the owners, and has a lien upon the proceeds of the ship for reimbursement. See ADMIRALTY; MARITIME LAW; and the authorities there referred to.

BOTTONY. See BOTONÉ.

BOTTS, JOHN MINOR (1802-69). An American lawyer and politician, born in Virginia. He served several terms in the Virginia Legislature after 1833, and in 1839 was chosen to Congress, where he served three terms (1839-43 and 1847-49), and where he was conspicuous

as an advocate of a protective tariff, of a national bank, and of the repeal of the gag rules (q.v.). When President Tyler left the party that elected him, Botts separated from and antagonized him, although a warm personal friend. He opposed secession, and was faithful to the Union through the Civil War. He published *The Great Rebellion: Its Secret History* (New York, 1866).

BOTURINI BENADUCI, bō'tōō-rē'né bā'nā-dōō'ché, LORENZO (c.1702- ?). An Italian historian, and one of the first great collectors of American antiquities. He went to Mexico in 1736, and gathered a very large collection of aboriginal writings and other records, which eventually passed into the archives of the Mexican Government, where most of them were lost or destroyed. Boturini returned to Spain, and was appointed historiographer for the Indies in 1745. He included a valuable catalogue of his collections in his only published work, *Idea de una nueva historia de America* (1746).

BOTZARIS, bō-tsā'rēs, MARCO. See BOZZARIS, MARCO.

BOUAYANAN, bō'wā-yā-nān'. A wild Malay people, inhabiting the central Palawan Islands. See PHILIPPINES.

BOUCHAIN, bōō'shān' (anciently Lat. *Lucinium*; the first part of the name was probably taken from Baudouin, or Baldwin, IV., who fortified the town). A fortified town in the Department of Nord, France, 12 miles southeast of Douai, situated on an eminence about 300 feet above the sea-level (Map: France, K 1). By two sluices the adjacent land may be laid under water in time of war. There are beet-root sugar refineries, dye-works, and tanyards at Bouchain, which has also a considerable trade in cattle. Population, in 1896, 1527.

BOUCHARD, bōō'shār', CHARLES JACQUES (1837—). A French physician, born in Montier-en-Der (Haute-Marne). He was educated in Lyons, and subsequently went to Paris, where he was appointed professor of pathology in 1879. He was one of the physicians sent to the International Congress of the Medical Sciences, held in Berlin, in August, 1890, and took a prominent part in the deliberations of that body. Among his principal works may be mentioned: *Des Dégénération secondaires de la moelle épinière* (1866); *Sur quelques points de la pathogénie des hemorrhagies cérébrales* (1867); *De la pathogénie des hemorrhagies* (1869).

BOUCHARDON, bōō'shār'dōn', EDMÉ (1698-1762). A French sculptor, born in Chaumont (Haute-Marne). He was a pupil of Coustou the younger, and afterwards studied in Rome, where he executed a bust of Pope Clement XII., and a copy (Munich Gallery) of the "Barberini Faun." His most celebrated works were the "Fountain of Grenelle" (Paris) and the equestrian statue of Louis XV. (Tuileries Garden), destroyed in 1792.

BOUCHER, bōō'shā', ALFRED (1850—). A French sculptor, born in Bouy-sur-Orvin. He was a pupil of Dumont and Paul Dubois, and received twice in succession the Grand Prix de Rome (1876 and 1878); but the Academy annulled one of the decisions. In 1880 the Government bought his two statues, "Vénus As-

tarté" and "Au but" ("At the End"), now in the Gardens of the Luxembourg. The decision and force of Boucher's work make him an artist to be remembered. Among his best statues are: "Eve après sa faute," 1878 ("Eve after the Fall"); "La terre" ("The Earth"); "Aux champs," 1897 ("In the Fields"); and "A Sleeping Woman," in the Luxembourg Museum.

BOUCHER, FRANÇOIS (1703-70). A French painter, born in Paris. He was a pupil of Le-moine, but formed his style rather after the model of Watteau; went to Rome in 1725, and after his return speedily won a great reputation. He became a member of the Academy in 1734, and its director in 1765, when he was also appointed first painter to the King. He was an artist of prodigious facility and indefatigable industry; was endowed with a brilliant imagination, and painted everything, from religious subjects and mythological and pastoral scenes to still life, from portraits, landscapes, and animals to decorations for the opera. His works are the true mirror of his time, when libertinism reigned supreme, and voluptuousness was the keynote of the Court and aristocratic society. Pastoral scenes were his favorite subjects, painted with a spirited touch and a freshness and transparency of color resembling that of Rubens, but all pervaded by that atmosphere of sensuality which emanated from the boudoirs of Madame de Pompadour and Madame du Barry. His figures of children alone conveyed a sense of purity. To the end of his days he was celebrated as the "Painter of the Graces," and also styled the 'Anacreon of Painting.' He was in high favor with Madame de Pompadour, whose portrait he painted, and who engraved some of his works. Among his numerous productions may be mentioned: "Rinaldo and Armida," "Diana Leaving the Bath," "Venus Demanding of Vulcan Arms for Æneas," "Jupiter and Callisto," "Rape of Europa," all in the Louvre; "Leda and the Swan," "Triumph of Galatea," "Toilet of Venus," in the Stockholm Museum. Among his portraits, that of Madame de Pompadour is the most famous.

BOUCHER, bou'chèr, JONATHAN (1738-1804). A British-American clergyman, prominent as a Loyalist at the time of the Revolutionary War. He was born in Blencow, England; emigrated to America in 1759; conducted a boarding-school in Virginia; was ordained a priest in 1762, and was a rector in Virginia and Maryland until 1775. He was then driven from his pulpit on account of his opposition to the principles of the Revolution, and returned to England, where from 1776 until his death he was Vicar of Epsom. He wrote many essays and papers on political and theological subjects, but is chiefly remembered for his *View of the Causes and Consequences of the American Revolution* (1797)—a collection of fifteen discourses delivered in Virginia and Maryland between the years 1763 and 1775. Of this book Professor Tyler has said: "Nowhere else, probably, can be found so comprehensive, so able, and so authentic a presentation of the deeper principles and motives of the American Loyalists, particularly from the standpoint of a High-Church clergyman of great purity and steadfastness of character, of great moral courage, of great learning, finally of great love for the country."

thus torn and distracted by fratricidal disagreements." The book was dedicated to Washington, between whom and Boucher there existed for many years an intimate friendship. A *Glossary of Archaic and Provincial Words*, an unfinished work, was published in London, in two parts, in 1832-33. Extracts from Boucher's *Autobiography* were published in *Notes and Queries*, 5th series, Vol. VI. (1850), and the "Letters of Jonathan Boucher to George Washington," in the *New England Historical and Genealogical Register*, Vol. LII. (Boston, 1898). Consult Tyler, *Literary History of the American Revolution* (New York, 1897).

BOUCHER, bō'shā', PIERRE, Sieur de Boucherville (1622-1717). A French pioneer, who came to America in 1635, and was engaged in the wars with the Iroquois. He was sent by the Colony of New France as deputy to France in 1661, about which time he published his *Histoire véritable et naturelle des mœurs et des productions de la Nouvelle France* (1663). He was ennobled and appointed Governor of Three Rivers. Shortly before his death he addressed to his children *The Adieu of Grandfather Boucher*.

BOUCHER DE CRÈVECŒUR DE PERTHES, de krēv'kēr' de pārt', JACQUES (1788-1868). A French archaeologist. He was employed by Napoleon in several diplomatic missions to Italy, Germany, and Austria, and after the Restoration was most active as president of the Society of Emulation at Abbeville. He collected Roman and Celtic antiquities, which he presented to the Government, and gained much celebrity by archaeological discoveries and by his work *De la création* (1839-41). Even more noteworthy are *Antiquités celtiques et antédiluviennes* (1847-65) and *De l'homme antédiluvien et de ses œuvres* (1860).

BOUCHER-DESNOYERS, bō'shā'dā'nwā'-yā', AUGUSTE GASPARD LOUIS, BARON. See DESNOYERS, AUGUSTE GASPARD LOUIS BOUCHER, BARON.

BOUCHES-DU-RHÔNE, bō'sh' dū-rōn' (Fr., Mouths of the Rhône). A southeastern department of France, bordering on the Mediterranean, formerly a part of Provence (Map: France, L 8). Area, 1971 square miles. Population, in 1896, 679,646; in 1901, 737,112. About one-half of the department is under cultivation; heaths, woods, wastes, and water occupy the other half. The Rhône—which between Arles and the sea separates into several branches, forming a delta called Ile de la Camargue—and its affluent, the Durance, are the principal rivers. The department is intersected by several canals of importance. The Ile de la Camargue produces corn and rice, and affords pasture for large numbers of sheep and cattle. The vine, olive, and mulberry also thrive there, and timber is plentiful. Marble, limestone, gypsum, and lignite are the chief mineral products. Capital, Marseilles.

BOUCICAULT, bō'sā-kō, DION (1822-90). An Irish-American playwright and actor, born in Dublin, of French parentage, December 26, 1822. He was brought up under the guardianship of Dr. Dionysius Lardner, after whom he was named, and was educated at University College, London. His first dramatic work, produced before he was 19 years old, was *London Assurance*, Covent Garden, in March, 1841. Its signal success determined his career. It has ever

since remained a favorite with British and American play-goers. The plot was slight, but ingenious; it abounded in comic situations; the dialogue was brisk and sprightly; there was no lack of wit, and there were perhaps more than enough of those flippancies and pleasant impertinences which average theatre-goers prefer to wit. Boucicault next produced, in rapid succession, *Old Heads and Young Hearts*; *Love in a Maze*; *Used Up*; *Louis XI.*; and *The Corsican Brothers*. When he went upon the stage, in 1852, he added the vogue of an actor to the reputation he had previously gained as an author. From 1853 till 1860 he was in America, where his popularity was scarcely less than it had been in England. On his return to London in 1860, he produced at the Adelphi Theatre a play, *The Colleen Bawn*, which proved among the most successful of modern times, and which, if not the first of a new school, has at least supplied a new descriptive name to our dramatic literature. The author made a fortune by it. It has been performed in almost every theatre in the United Kingdom; it had a great run in America; it was even translated into French, and brought out at the Ambigu Theatre in Paris. Boucicault subsequently produced at the Adelphi—of which he was for some time joint manager—another 'sensation' drama, *The Octoroon*, the popularity of which was only a little less than that of *The Colleen Bawn*. In 1862 he opened a new theatre in London, the Westminster; but this speculation turned out unfortunately. He afterwards reestablished his fortunes by new plays, in some of which he and his wife—formerly Miss Robertson, a very popular actress—took the leading parts. *The Streets of London*, *Flying Scud*, *After Dark*, and *The Shaughraun* were among the most popular of his later works, all of which are of the type with which he had familiarized the public. His character of Con in *The Shaughraun* was perhaps his most effective and amusing creation. In collaboration with Charles Reade he wrote the novel *Foul Play*, which was afterwards dramatized. In all he wrote more than 300 dramatic pieces; and in illustration of the facility with which he composed works which—all deductions made—are of considerable merit, it may be said that he once even wrote to a royal commission that he would undertake to write plays for all the theatres in London. As an actor, Boucicault was always very popular, without attaining to high excellence in his vocation. His lack of marked histrionic talent was, in part at least, made up by his keen sense of humor; and whatever his artistic ability may have been, it is certain that he was immensely popular with his audiences. In 1876 he took up his residence in New York, where he died, September 18, 1890. Consult Clement Scott, *The Drama of Yesterday and Today* (London, 1899).

BOUCICAULT, Mrs. DION. An English actress. As Agnes Robertson she had already made a reputation in Taylor's *Our Clerks* and other comedies at the Princess's Theatre, London, when, in 1853, she became the wife of Dion Boucicault (q.v.), and accompanied him to America. Returning in 1860 to London, she played successively at the Adelphi, Drury Lane, and other theatres, taking leading parts in several of her husband's dramas, notably as Eily

O'Connor in *The Colleen Bawn* (1860), Zoe in *The Octoroon* (1861), and Jane Learoyd in *The Long Strike* (1866). For a time she again lived in America, but in her later life was separated from her husband.

BOUDINOT, bōō'dé-nōt, ELIAS (1740-1821). An American philanthropist, first president of the American Bible Society, born in Philadelphia, Pa. He studied law, was admitted to the New Jersey bar, and was in 1777 appointed by Congress Commissary-General of Prisoners. In 1777-79, and again in 1781-84, he was delegate from New Jersey to the Continental Congress, of which he was in 1782 elected president. In the latter capacity he signed the ratification of the definitive Treaty of Peace with Great Britain. In 1789-95 he was a member of the First, Second, and Third Congresses of the United States, and from 1795 to 1805 was Director of the Mint at Philadelphia. He assisted in 1816 in founding the American Bible Society, whose first president he became. He aided also in the education of Indians and deaf-mutes, in the relief of the condition of the poor, and in the preparation of youth for the ministry. His publications include: *The Age of Revelation* (1790), a reply to Thomas Paine's *Age of Reason*, and *Star in the West: or, An Attempt to Discover the Long-lost Tribes of Israel* (1816), in which, with an extensive array of evidence, he supports the theory of James Adair, that the North American Indians are the lost tribes in question. Consult Boudinot, *Life of Elias Boudinot* (1896).

BOUDINOT, ELIAS (?-1839). The name taken, with Dr. Boudinot's permission, by a Cherokee Indian in the missionary school at Cornwall, Conn., where he married a white lady of the village. An Address to the Whites on behalf of his nation, delivered May 25, 1825, in Philadelphia, was published in 1826. He edited the *Cherokee Phoenix* (1828-34), and was a man of talent and influence in his nation. Being, with others, persuaded to make a treaty with the United States in December, 1835, for the expatriation of the Cherokees, he was accused of having sold his country, and was killed by the John Ross party, June 10, west of the Mississippi. His son, ELIAS CORNELIUS BOUDINOT (1835-90), was educated in New England and became a well-known lawyer, a lieutenant-colonel in the Confederate Army, and a delegate from his nation to the Second and Third Confederate Congresses.

BOUFFARIK, bōō'fā-rēk' (the 'Hanging Well'). A town in the Department of Algiers, Algeria, 21 miles southwest of Algiers by rail. Originally called Medina Clausel, after Marshal Clausel, who platted the town on the site of an intrenched camp of 1835, it has a thoroughly French aspect. It is the centre of a rich agricultural district, is an important market-town, and has manufactures of cotton goods and perfumes. Population, in 1901, of town, 5243; of commune, 9284.

BOUFFLERS, bōō'flar', LOUIS FRANÇOIS, Duke de (1644-1711). A marshal of France. He was descended from one of the oldest noble families of Picardy. He began his military career as a lieutenant, and rose very rapidly in rank. Under the great Condé, Turenne, Créquî, Luxembourg, and Catinat, he fought with distinction in Germany, the Netherlands, and on

the Spanish frontiers. His defenses of Namur in 1695 and of Lille in 1708 are famous. The siege of the former place, conducted by William III., cost the Allies more than 20,000 men; and although Louis XIV. sent to Boufflers an order written by his own hand for the surrender of the place, he did not surrender it until all the means of defense were exhausted. After the defeat of Malplaquet (September 11, 1709), due to the incapacity of the French commander-in-chief, Marshal Villars, he led the French Army so admirably that the retreat seemed rather a triumph than the result of a lost battle. He was a man of highly honorable and upright character. Consult La Rue, *Oraison funèbre* (Paris, 1712).

BOUFFLERS, STANISLAS, Marquis de (1738-1815). A French wit and author, commonly styled the Chevalier de Boufflers. He was born in Nancy and trained for the Church; but, dissatisfied with the clerical profession, the young abbé entered the military service of France, and was made Governor of Senegal in 1785. He was a member of the Constituent Assembly in 1789. He emigrated in 1792, and was well received at the Court of Frederick William II. of Prussia. Returning to France in 1800, he resumed his old place of Academician, and continued a devoted adherent of light literature till his death, in January, 1815. Boufflers was celebrated in his day as a master of that delicate, charming, and meaningless verse which every gentleman in France and England deemed it necessary to be able to write at that time. He was a brilliant conversationalist, and a fine wit; a friend of Voltaire's, a romancer, and a *débauché* after a gentlemanly fashion. The monument on his grave bears the following inscription, dictated by himself: *Mes amis, croyez que je dors* (My friends, believe that I sleep). His best-known work is the story *Aline, reine de Golconde*. A collection of his works was published after his death (8 vols., Paris, 1815). Consult: Uzanne, *Notice sur la vie de Boufflers* (Paris, 1886); and his *Lettres de Boufflers*, published in Paris in 1875.

BOUGAINVILLE, bōō'gān'vel' (after the navigator Bougainville). The largest of the Solomon Islands (q.v.) under German control in the Pacific, situated in about latitude 6° S. and longitude 155° E. (Map: Australasia, H 3). Area, 3000 square miles. It is well wooded and densely populated. It contains two active volcanoes, Mount Balbi rising to over 10,000 feet above the sea. Bougainville Strait separates it from Choiseul Island on the southeast. The name Bougainville is also applied to a strait in the New Hebrides group between the island of Marina and Mallicolo, a cape on the northwest coast of Australia, and a cape on the south coast of New Ireland.

BOUGAINVILLE, LOUIS ANTOINE DE (1729-1811). A French soldier and navigator, born in Paris. He studied law, was admitted as an advocate before the Parlement, and published a *Traité du calcul intégral* (2 vols., 1754-56). Having subsequently entered the army, he was in 1756 appointed aide-de-camp to the Marquis de Montcalm in Canada. He presented the terms of capitulation at the fall of Oswego (1756), was dispatched to Montreal with news of the victory at Fort William Henry (1758), and was slightly wounded at the capture of

Ticonderoga (1758). In the autumn of 1758 he went with Doreil to France to request supplies and reinforcements. During the siege of Quebec (1759) he was stationed with 1500 troops at Cap Rouge, there to watch the movements of the English squadron under Admiral Holmes. With the rank of colonel he left the army in 1763, entered the navy, and was authorized by the Government to establish a French colony in the Falkland Islands (Iles Malouines). In 1766-69 he circumnavigated the globe. Through the scientific and geographical discoveries of this voyage he won for the nation a glory not unlike that obtained by Cook for England in a similar expedition. When, in 1778, France came to the assistance of the United States in the Revolutionary War, he was appointed to the command of a ship of the line, took a distinguished part in the battle between De Grasse and Admiral Rodney, and rose to the rank of *chef d'escadre*. He subsequently reentered the army as a brigadier-general, but retired in 1790, and later became a Senator and Count of the Empire. The *Journal* kept by him during his service in Canada is highly praised by the historian Parkman; he also wrote *Voyage autour du monde*, 2 vols. (1771-72). Consult Parkman, *Montcalm and Wolfe* (Boston, 1884).

BOUGH, bou, SAMUEL (1822-78). A Scottish landscape painter, born in Carlisle. He was entirely self-taught. In 1845 he obtained a position as a scene-painter in Manchester; but several years later he began to devote himself almost entirely to landscape painting. His most celebrated picture is "Shipping at Dumbarton." Among his other productions, nearly all of which are characterized by great breadth, freedom, and boldness of execution, the following are especially noteworthy: "Canty Bay," "London from Shooter's Hill," "Bannockburn and the Carse of Stirling," "Guildford Bridge," "Winton Castle."

BOUGHT AND SOLD NOTES. The written statements of a transaction of purchase and sale, which are delivered to the principals by the broker who conducted it. The copy delivered to the seller is the sold note; that which he delivers to the buyer is called the bought note. In the United States, brokers' bought and sold notes have not been a source of much litigation. Their object is to inform the buyer and seller of the fact and of the terms of the contract, and at times also to satisfy the requirements of the Statute of Frauds (q.v.). No particular form of words is necessary to a valid bought or sold note. Perhaps the most complete form of a sold note is the following: "Sold for A B to C D 1000 bushels of Early Rose potatoes, now in A B's cellar, for \$300 cash, to be paid on delivery at C D's warehouse, within one week from date." Dated, and signed by the broker. The bought note would begin, "Bought from A B for C D," but otherwise it would contain the same language as the sold note. For other forms of bought and sold notes, and for the various legal rules deducible from the English decisions relating to them, see Benjamin, *Treatise on the Law of Sale of Personal Property* (7th American ed., by Bennet, Jersey City, 1889), and Campbell, *Law Relating to the Sale of Goods and Commercial Agency* (2d ed., London, 1891).

BOUGHTON, bə'ton, GEORGE H. (1833-). An English painter. He was born near Norwich.

Soon after his birth his family came to America and settled at Albany, where he began to paint at a very early age. He went to Paris to study in 1860, and to live in London in 1862. His work shows a fine sense of color and much sympathy with nature. He was elected an associate of the Royal Academy in 1879, and a Royal Academician in 1896. He was made a member of the National Academy of Design, New York, in 1871. One of his early pictures, very popular in America, was the "Return of the Mayflower." Other pictures are "The Scarlet Letter," "Puritans Going to Church," "Edict of William the Testy," "The Heir Presumptive." Boughton's work is marked by much grace and refinement, and he may be mentioned as one of the most successful men who came under the influence of that charming painter of idyllic English scenes, Frederick Walker. Boughton has also written for the magazines, and illustrated his stories with taste and skill. Consult: G. W. Sheldon, *Hours with Art and Artists* (New York, 1882); Richard Muther, *The History of Modern Painting* (London, 1896).

BOUGIE, bō'zhé, or **BOUGIAH**, bō-jé'a (from the tribe *Bujayah* or *Bejaia*). A fortified Mediterranean seaport on the Bay of Bougie, in the Department of Constantine, Algeria, 112 miles east of Algiers. It has a deep and well-sheltered roadstead, and an inner basin with quays (Map: Africa, E 1). It has a trade in grain, wine, oranges, oil, and wax—the last article giving the name of the port to the 'bougie' surgical appliance, which was originally made from this local product. The town is built on the slope of Mount Guraya, which rises to a height of 2310 feet. The chief buildings are the Abd-el-Kader fort, used as a prison, and the French church. Founded by the Carthaginians, it was the Roman *Saldæ*. Genseric, King of the Vandals, who for a time made it his capital, built walls around it. In the Tenth Century it was the greatest commercial city of the north African coast, with a population of 100,000, and in the Twelfth and Thirteenth centuries Italian merchants had their own warehouses and churches there. After the successive occupation by Spain and Turkey in the Sixteenth Century, it dwindled into insignificance. Its modern rise dates from the French occupation in 1833. Population, in 1891, 12,381.

BOUGIE, bō-zhé' (Fr., wax candle, a bougie; from the Algerian town Bougie, whence these candles were first imported). A solid rod of whalebone, gutta-percha, woven thread covered with gum elastic or other substances, used for distending contracted mucous canals, as the gullet, bowels, or urethra. (See STRICTURE.) Similar instruments made of silver, steel, or other metals are called 'sounds.' Bougies vary from a filiform to a half inch in diameter. They are cylindrical, tapering to a blunt point, or tipped with olive-pointed or conical extremities. The name is also given to rods of gelatin or cocoa butter, impregnated with medicine, which are placed in the urethra to be dissolved by degrees, as the heat of the body melts them, thus causing a continuous application of the medicine. Special medicated bougies are also made for the nasal cavity.

BOUGIVAL, bō'zhé'vål'. A favorite pleasure resort of Parisians in the Department of Seine-et-Oise, France, on the left bank of the

Seine, 8 miles northwest of Paris. Its Romanesque church dates from the Twelfth Century. Population, in 1901—of town, 2189; of commune, 2584.

BOUGUER, bōŷgā', PIERRE (1698-1758). A French mathematician and physicist, the founder of photometry. He was born at Croisic, in Bretagne, and studied in the Jesuit College at Vannes. In 1713 he succeeded his father as professor of hydrography in Croisic, whence he removed to a similar office in Havre in 1730. In 1729 he published his *Essai d'optique sur la graduation de la lumière*. In 1731 he was made associate geometer of the Academy of Sciences, and was promoted to the office of pensioned astronomer in 1735. In that year also he was chosen to proceed, along with Godin, La Condamine, and Jussieu, to South America, for the purpose of measuring a degree of the meridian at the equator. They had to contend with many difficulties, and were more than seven years away from home, during which time Bouguer made valuable observations on the length of the seconds pendulum at great elevations, the deviation of the plumb line from a vertical position through the attraction of neighboring mountains, the line of perpetual snow, etc. He published an account of his labors and those of his colleagues in a magnificent work, entitled *Théorie de la figure de la terre* (Paris, 1749). Bouguer's investigations concerning the intensity of light laid the foundation of photometry; and their results, which had been partly exhibited in the optical work already noticed, were more fully embodied in his *Traité d'optique sur la graduation de la lumière*, which was edited after his death by Lacaille (1760). He is the inventor of the heliometer (q.v.). He published an excellent *Nouveau traité de navigation et de pilotage* (1753), and numerous works in the *Mémoires de l'Académie des Sciences* (1726 to 1757).

BOUGUEREAU, bōŷgrō', GUILLAUME ADOLPHE (1825—). A French painter. He was born in La Rochelle, November 30, 1825, and studied in Bordeaux under Alaux, and in Paris under Picot. Although he follows the classical line and contour, he may be called an academic realist in his treatment of the figure. As a painter of flesh he is considered preëminent by his chief admirers, but there are critics who take exception to many of his effects. For example, though he is a consummate draughtsman, he is charged with a lack of sincerity in his painting, and it is thought that his work does not suggest a faithful reference to nature. He was president of the Société des Artistes in 1885. The following works represented him in the Exposition of 1900: "Compassion," "L'Admiration," "Psyche et l'Amour," and "Portrait de Madame la Comtesse C." Consult: C. H. Strahan, *A History of French Painting* (New York, 1899); G. W. Sheldon, *Hours with Art and Artists* (New York, 1882).

BOUILLABASSE, bōŷyā'bās', THE BALLAD OR. A poem of Thackeray's on the Marseilles chowder called bouillabaisse.

BOUILLÉ, bōŷyā', FRANÇOIS CLAUDE AMOUR, Marquis de (1739-1800). A French general. He was born at the castle of Cluzel, in Auvergne, entered the army at the age of 14, and served with distinction in Germany during the Seven Years' War. He was Governor of Guadeloupe in

1761, and soon after became Governor-General of Martinique and Saint Lucia, and commander-in-chief of the French forces in the West Indies. In the war against England which broke out in 1778 he captured the islands of Dominica, Tobago, Saint Christopher's, Saint Eustatius, Saint Martin, Saba, and Nevis. For this he was rewarded with the rank of lieutenant-general. In 1784 he visited England, and was received with extraordinary respect on account of his kindly behavior to his enemies during the war just concluded. Louis XVI. nominated him a member of the Assembly of Notables in 1787-88; in 1790 he was made commander-in-chief of the army of the Meuse, the Saar, and the Moselle. His decision of character prevented the dissolution of the army and the outbreak of civil war. He quelled the insurrection of the garrison of Metz and of the three regiments at Nancy. For this he received the thanks of the National Assembly and of the King. From 1789 to 1791 Bouillé was regarded with suspicion by the Revolutionists and rumors were often spread of his joining with the Austrians to march on Paris. After Louis XVI.'s flight to Varennes, of which he declared himself the instigator, he repaired to Coblenz to the King's brothers, and in 1791 attended the conference at Pilnitz. In the same year he entered the service of Gustavus III. of Sweden, and after the assassination of that monarch served in the corps of the Prince of Condé. He rejected an offer, which the French princes made to him in 1793, of the chief command in La Vendée, and went to England, where his advice in West Indian affairs was useful to the Government; here he wrote his *Mémoires sur la révolution française*, a useful work, throwing much light on the transactions of that time. He died in London. Consult Gabriel, *Louis XVI. le marquis de Bouillé et Varennes* (Paris, 1874).

BOUILLÉE, bōŷyā', FRANCISQUE (1813—). A French philosopher, born in Lyons. He studied at the Normal School, Paris, and in 1839 was appointed professor of philosophy at the University of Lyons. From 1849 to 1864 he was dean of the faculty of Lyons, and from 1867 to 1870 director of the Normal School. His works, the best of which display both a finished style and high scholarship, include *Histoire et critique de la révolution cartésienne* (1842); *Théorie de la raison impersonnelle* (1844); *La vraie conscience* (1882); and *Souvenirs d'un vieil universitaire* (1897).

BOUILLON, bōŷyōn' (Med. Lat. *Bullonium*). An old duchy, included in the Belgian Province of Luxembourg, consisting of a woody and hilly district in the Ardennes, about 157 square miles in extent, with a population of 22,000. This duchy was the possession of the famous Crusader Godfrey of Bouillon (q.v.), who, in order to raise money for his Crusade, pledged it, in 1095, to the Bishop of Liège, from whom it passed to the Lords of Sedan. In the Seventeenth Century it became the possession, under French suzerainty, of the family of La Tour D'Auvergne. In 1793 it became a part of France. After the Napoleonic wars it belonged for a time to the King of the Netherlands, and in 1830 it was united with Belgium. The little town of Bouillon, above which towers the mediæval castle of the Dukes of Bouillon, is situated about 10 miles northeast of Sedan. Consult Ozery, *Histoire de Bouillon* (Luxembourg, 1827).

BOUILLON, FRÉDÉRIC MAURICE DE LA TOUR D'AUVERGNE, Duc de (1605-52). A French general, son of Henri. He first served in Holland under Maurice of Nassau, his uncle, and entered the French service in 1635. Joining the rebellion of the Comte de Soissons against Richelieu in 1641, he defeated the royal forces at La Marfée, but, abandoned by the Spaniards, retreated to Sedan and managed to make his peace with Richelieu, whereupon he received command of the French army in Italy. Implicated in the plot of Cinq-Mars only a year afterwards, he was arrested, and was in danger of execution, but his wife had possession of Sedan and threatened to surrender the place to the Spaniards unless he should be saved. After the death of Louis XIII. he went to Rome, where he had command of the Papal forces. Returning to France in 1649, he took an active part in the war of the Fronde against Cardinal Mazarin.

BOUILLON, GODFREY DE. See GODFREY OF BOUILLON.

BOUILLON, HENRI DE LA TOUR D'AUVERGNE, Duc de (1555-1623). A French general, at first known as Vicomte de Turenne. He became a Calvinist and partisan of Henry of Navarre, who, when King, gave him the hand and estate of Charlotte de La Marck, the heiress of the Duchy of Bouillon. On the night in which he was to be married, he suddenly left his prospective bride, and stormed the fortress of Stenay, then held by the Army of Lorraine. Soon afterwards he was made marshal of France, and intrusted with two diplomatic missions to England, Holland, and Germany. Compromised in the Bironconspiracy, he was obliged to take refuge in Geneva in 1603, but became reconciled to the King in 1606. After the assassination of Henry IV., he was one of the Council of the Regency, and was alternately for and against the Queen. The Assembly of La Rochelle appointed him general-in-chief of the Reformed forces, but he refused the appointment and retired to Sedan, where he established a college and valuable library. His second wife, a daughter of William, Prince of Orange, left him two sons, the younger of whom was the celebrated Marshal Turenne.

BOUILLY, bō'yé, JEAN NICOLAS (1763-1842). A French dramatist. During the Revolutionary period he was first a judge, then a public prosecutor in Tours, and later he was called to Paris to aid in the establishment of primary schools throughout France. He retired from public life in 1790. The sentimental character of most of his works earned for him the name of 'poète lacrymal.' The most noteworthy among them are: *Pierre le Grand*, a comic opera, for which Grétry wrote the music; *L'Abbé de l'épée*; *Les deux journées*, set to music by Cherubini; *Pancho*; and *Madame de Sévigné*. Of his writings for the young, the *Contes offerts aux enfants de France, Contes à ma fille, and Conseils à ma fille* (1809), have passed through several editions, and have been translated into several languages.

BOULAINVILLIERS, bō'lān'v'é'yā', HENRI, Comte de (1658-1722). A French historian, born at Saint Saire, Normandy. He studied for a time and entered the military profession, but soon devoted himself exclusively to the investigation of the genealogy of the ancient families of France. He regarded the feudal system as the

most perfect form of human government, and his writings are pervaded by extreme aristocratic sentiments. They were published after his death. The most valuable of them are his *Histoire de l'ancien gouvernement de France* (1727); *L'état de la France* (1727); *Histoire de la pairie de France et du parlement de Paris* (1753); and his *Abrégé chronologique de l'histoire de France* (3 vols., 1733).

BOULANGER, bō'lān'zhā', GEORGES ERNEST JEAN MARIE (1837-91). A French general. He was born at Rennes, and educated at Saint Cyr. He served in Italy and China, was with Bazaine at Metz, but escaped to Paris, and held a lieutenant-colonelcy under the Government of National Defense. In 1881 he headed the deputation of French officers at the celebration of the centenary of the battle of Yorktown; he became brigadier-general through the influence of the Duc d'Aumale, and in 1884-85 commanded the army of occupation in Tunis. He was Minister of War from January, 1886, to May, 1887, and through the introduction of some desirable army reforms, and the appearance of a popular music-hall song in his praise, was adopted as the embodiment of the 'revenge' policy by the Parisians. In 1887, while commanding an army corps, he was arrested for remarks on the acting War Minister, and in March, 1888, for disobedience to orders, was deprived of his command and placed on the retired list. Supported by a combination of malcontents of all parties, chief among them the Orleanists, he aroused for a time that reckless popular enthusiasm which is so easily stirred in France by a little bravado. For a brief period the 'man on horseback' fixed the attention of all observers, and aroused some fear as to the safety of the Republic. In 1888 and 1889 he was elected deputy from a number of departments. A coup d'état was momentarily expected; but Boulanger's courage was not equal to his ambition. When the danger of prosecution by the Tirard Ministry for conspiracy seemed imminent he fled to Brussels. He was convicted of malfeasance by the Senate. Politically discredited, he finally took up his residence in the island of Jersey. In 1890 one of his former adherents, M. Mermeix, published in the Paris *Figaro* a series of revelations concerning the inner history of the Boulangist movement, under the title *Les coulisses de Boulangisme*, furnishing conclusive evidence that Boulanger was a tool in the hands of the Royalists. The funds, amounting to 3,000,000 francs, for his propaganda, were furnished by a Royalist noblewoman, the Duchesse d'Uzès. Boulanger committed suicide at Brussels, September 30, 1891, on the grave of Madame Bonnemain, his mistress. Consult pamphlets and broadsides of the time, articles in the periodical press and the following: Chincholle, *Le Général Boulanger* (Paris, 1889); Guyot, *Le Boulangisme* (Paris, 1889); Turner, *General Boulanger: A Biography* (London, 1889); Verly, *Le Général Boulanger et la conspiration monarchique* (Paris, 1893); De Vermont, *Les coulisses de Boulangisme revues et augmentées de plusieurs chapitres inédits* (Paris, 1890).

BOULANGER, GUSTAVE RODOLPHE CLARENCE (1824-88). A French painter, whose subjects are mainly Oriental, after the manner of Gérôme. He was born April 25, 1824, at Paris, and studied under Delaroche and Jollivet. He took the

Prix de Rome in 1849, and was made a member of the Institute in 1882. He died in Paris, September 22, 1888. He was a constant exhibitor at the Salon, and in 1869 was represented by the "Street of the Tombs at Pompeii," and in 1874 by the "Appian Way in the Time of Augustus," afterwards in the collection of A. T. Stewart. Consult C. H. Stranahan, *A History of French Painting* (New York, 1899).

BOULANGER, LOUIS (1806-67). A French painter, born at Vercelli (Piedmont). He was a pupil of Guillon-Lethière and Déveria, and from 1860 was director of the School of Fine Arts at Dijon. He first attracted attention in 1827 with his "Mazeppa" (Rouen Museum). His other works include: "Spanish Mule-Drivers" (1833), many excellent water-colors, chiefly in series depicting scenes from *Notre Dame de Paris*, *Othello*, *King Lear*; "The Triumph of Petrarch" (1836); "Macbeth" (1859); and "Concert in Picardy" (1866). He illustrated many of Hugo's works.

BOULAY DE LA MEURTHE, bôl'la' de là mœrt', ANTOINE, Count (1761-1840). A French statesman, born at Chaumouzey in the Vosges, the son of a peasant. He espoused the cause of the Revolution, but held moderate views, and in the Council of Five Hundred opposed both Jacobinism and the despotism of the Directory. Under the Empire he took an important part in the preparation of the *Code Civil*, and afterwards labored with zeal in the administration of the national domains. Napoleon created him Count in 1813. After the Second Restoration he was banished to Nancy, whence the Russians carried him off into Germany. He was kept under surveillance at Halberstadt, and then at Frankfurt until 1819, when he returned to France and lived in retirement at Paris. His *Essai sur les causes qui en 1649 amenèrent en Angleterre l'établissement de la république* (1799) had a wide circulation, and considerably influenced the French mind in favor of the coup d'état of the 18th Brumaire. Of his other numerous political writings the most important is *Tableau politique des règnes de Charles II. et de Jacques II.* (1888). In conjunction with others he wrote *Bourrienne et ses erreurs volontaires et involontaires* (1830), valuable regarding the history of Napoleon.

His son, **HENRI BOULAY DE LA MEURTHE** (1797-1858), born in Paris, took an active part in the Revolution of 1830, but became an opponent of the Government of Louis Philippe. He devoted great attention to questions of social economy, contributing much to promote the establishment of houses of refuge (*salles d'asile*), the extension of elementary education, and many improvements in the condition of the laboring classes. In the National Assembly of 1848, he associated himself with the moderate Republicans, and in January, 1849, was elected vice-president of the Republic. Nevertheless, he tacitly acquiesced in the coup d'état of December, 1851, and became a member of the new Senate.

BOULDER, bôld'ër. A city and the county-seat of Boulder County, Col., 28 miles northwest of Denver; on the Union Pacific, the Colorado and Southern, and other railroads (Map: Colorado, E 2). It has a public library, and is the seat of the State University, established in 1877, and of the Colorado Chautauqua. There

is a public park of 1800 acres, and among other attractions of the vicinity are the famous Boulder Cañon, and the gold, silver, and telluride mines of Sunshine, Salina, Gold Hill, and Jamestown. Boulder is noted as a summer and health resort, medicinal springs being but a few miles distant and the Colorado Sanitarium in the city. It is in an agricultural and stock-raising, as well as a mining region, and has flour-mills, large smelting and sampling works, lumber-mills, etc. Recently, considerable excitement has centred in the discovery of oil, a large number of wells having been drilled within a radius of two miles of the city. Chartered as a city in 1871, Boulder is now governed under a charter of 1882, which provides for a mayor, elected biennially, and a city council. The water-works are owned and operated by the municipality. Population, in 1890, 3330; in 1900, 6150.

BOULDER (origin obscure, usually compared with Sw. *bullersteen*, a large rolling stone, so called from the noise with which it rolls, from *bullaa*, to thunder, roar), ERRATIC. A large mass of rock of rounded form found at a distance from the formation to which it belongs, and lying detached on the surface or imbedded in the superficial deposits. Boulders originate, chiefly, either in corrosion by torrential waters or in erosion with solution along joint planes of rock, and owe their present distribution to torrential waters, glacial ice, and icebergs. Boulders often furnish most beautifully preserved fossils, which cannot be collected from the more coherent portions of the parent ledge. From their magnitude and number, they frequently give a striking expression to the landscape of the northern portion of the United States, especially in New England and Wisconsin. One at Nottingham, N. H., is estimated to weigh 6000 tons; another at Whitingham, Vt., weighs about 3000 tons. Large blocks of Scandinavian rock are scattered over the plains of Denmark, Prussia, and Northern Germany. The pedestal of the statue of Peter the Great, in Saint Petersburg, was hewn out of a large erratic boulder, 1500 tons in weight, that lay on a marshy plain near that city. See **BOULDER CLAY**; **GLACIER**; **ICEBERG**; **GLACIAL PERIOD**; **GEOLOGY**.

BOULDER CLAY. A term applied to a deposit of compact blue or red clay occurring in the glacial drift, and having boulders diffused throughout its mass, with here and there thin lenticular beds of gravel and sand interspersed. It is found in many parts of the United States north of the terminal moraine of the Continental ice-sheet that existed in early Quaternary times. The boulders, which are the most striking feature of this bed, differ in size from small pebbles to masses many tons in weight. They are portions of rocks of all ages, more or less worn and often striated. The older rocks, when transported from a distance, are rounded, while those that have been derived from rocks in the neighboring districts are more angular. These masses are scattered without order in the clay, the heaviest blocks occurring frequently in the upper portions of the bed. The clay represents rock-flour, produced by the grinding action of glaciers, aided by the harder rock fragments held in the ice. Layers of boulder clay vary in thickness, usually diminishing with the elevation of the point at which they are found. See **GLACIER**; **GLACIAL PERIOD**; **QUATERNARY PERIOD**.

BOULE, βούλῆ (Gk. βούλη, council). In ancient Greece, a council or senate. The *boule* of the Homeric times was composed of princes or leading men, and was a purely consultative body, being convoked to assist the King in matters of public policy with information and advice. The Athenian *boule*, which was employed by Solon as a check on the *ecclesia* (ἐκκλησία), was at first composed of four hundred members, selected, not, as at a later time, by lot, but by election of the people, from the four tribes, one hundred from each tribe, and from the three upper classes. Its duties were to prepare matter for the discussion of the assembly, to convoke and superintend its meetings, and to insure the execution of its decrees. The number was increased by Cleisthenes (B.C. 508-507) to 500, fifty members being taken from each of the ten tribes into which the people were then divided; from this time its duties became more extensive, embracing matters of administration and general oversight. From early in the Fifth Century all free-born Athenian citizens above thirty years of age were eligible to membership. At a still later time (B.C. 306) the number was further increased to 600, there being now twelve tribes, but in the time of Hadrian it was again reduced to 500. See Schoemann, *Griechische Alterthümer*, I^o, pp. 394 ff.; Hermann, *Griech. Staatsalterthümer*, sec. 125-127; Gilbert, *Griech. Staatsalterthümer*, I^o, pp. 295 ff. (Eng. trans. pp. 265 ff.); Heydemann, *De Senatu Atheniensium* (Strassburg, 1880).

BOULENGE (βούλινζή) **CHRONOGRAPH**. See BALLISTICS.

BOULEVARD, βούλε-βάρ', or βούλε-βάρδ (Fr., from Ger. *Bollwerk*, bulwark, bastion). A broad avenue, especially designed for promenades or driving. It was originally the rampart to a fortress or town. In France and Germany these ancient works have generally been leveled, the ditches filled up, and the space thus obtained employed for the formation of parks, promenades, and streets lined with trees. These, in France, still bear the name of boulevard. The boulevards of Paris are celebrated, and are of great service as open spaces promoting the circulation of air amidst the dense mass of habitations. Some parts of them present a bright and interesting spectacle; and as a whole, they afford a striking exhibition of the life and character of the French capital in all the different classes of society. The Boulevard des Italiens is particularly known as the rendezvous of the fashionable, and the Boulevard du Temple as the place where the small theatres are to be found which are frequented by the common people and the inhabitants of the suburbs, for which reason the expression *théâtre de boulevard* is often employed to denote a theatre for the common people, or one of an inferior kind. The Thames Embankment is essentially a boulevard. Many American cities have spent large sums of money in laying out spacious boulevards of considerable length. New York has a number of fine parkways or boulevards, especially in the boroughs of Brooklyn and Queens; and Boston and Chicago are also well supplied with these driveways.

BOULGARIS, βουλ-γά'rés. See BULGARIS.

BOULGEE, būl'jēr, GEORGE SIMONDS (1853—). An English botanist. He was born

at Blechingly, Surrey, and was educated at Wellington and Epsom colleges. He was appointed professor of natural history at the Royal Agricultural College, Cirencester, in 1876, and professor of botany and geology at City of London College, in 1884. His publications include: *Familiar Trees* (1886-89); *The Uses of Plants* (1889); *Biographical Index of British and Irish Botanists* (with J. Britten, 1893); *The Country Month by Month* (with J. A. Owen, 1894-95); *Elementary Geology* (1896); *Flowers of the Field* (1900).

BOULLE, būl, or **BOULE** (formerly erroneously called Buhl), ANDRÉ CHARLES (1642-1732). A French cabinet-maker, born in Paris. He studied designing, engraving, and carving, and elevated cabinet-making to an art-industry by the invention of a kind of marquetry since known by his name. This work, which is very sumptuous in effect, consists in a skillful piercing and inlaying of metal, the materials used being tortoise-shell, enamel, or metals of other colors. He was patronized by Louis XIV., whose elaborate tastes this work well suited, and it continues to be valued highly by collectors. Reissner, a German contemporary of Boulle, used a ground of tulip-wood, inlaid with designs in darker woods, and varied by margins and bands of lighter color, with the grain crossed for contrast. This modification is correctly called Reissner-work. For his life, consult Asselineau (1855).

BOULLONGNE, būl'lon'y', or **BOULONGNE**, LOUIS DE (1654-1734). A French painter. He was one of the ten original members of the Academy of Painting, and became its president. He was first painter to the King, and was designer of medals and devices for the Academy of Inscriptions. The Gobelins tapestry for the King's apartment was made after his designs in imitation of Raphael, and he completed the decorations of Poussin in the great gallery of the Louvre. He was also an excellent engraver, and the few of his pictures that are known exhibit a delicate sense of line and color.

BOULOGNE-SUR-MER, būl'lon'y'-sur-mār' (Fr., Boulogne on the sea; anciently, *Gesoriacum*, *Bononia*). A fortified seaport in the Department of Pas-de-Calais, France (Map: France, H 1). It stands at the mouth of the river Liane, on the English Channel, 22 miles southwest of Calais, and 130 north-northwest of Paris. The city is divided into the upper and lower, or the old and new districts. The upper city was once a great stronghold, and its ramparts are now spacious boulevards, commanding a fine marine view, with the coast of England as a horizon. At the east end stands an old castle with six turrets, which dates from 1231. In this part of the city are the fine Hôtel de Ville and the Cathedral of Notre Dame, in Græco-Roman style, with a colossal statue of the Virgin surmounting the dome, which is 300 feet in height. The building was erected (1827-66) on the site of a Gothic cathedral destroyed in 1793. The lower or new town is the centre of modern trade and social life—merchants, pleasure-seekers, fishermen, and factory hands throng the streets, which are broad, clean, and bright. The beautiful sands are crowded in summer by bathers, etc., and the fine pier is a pleasant promenade. One of the chief objects of interest is the marble Column of

the Grand Army, 176 feet high, surmounted by a bronze statue of Napoleon I., commemorating his projected invasion of England. In the lower town stand the barracks, the theatre, the museum of art, a hospital, and a library. While the industries include the manufacture of steel pens, linen thread, carriages, glass, tubes, cement, etc., the main source of wealth of Boulogne is the sea, and the oyster, herring, cod, and mackerel fisheries. Boulogne is one of the most frequented terminals of steamer routes from England, and a large English colony is found there. Population, in 1896, 46,807. Gesoriacum was a fortress of the Gallic tribe of the Morini. In the time of Constantine the place was called Bononia. Under the Carolingians the name was changed to Bolonia. After the death of Charlemagne the Normans sacked it; it was taken by the Burgundians in 1435, and held until Louis XI. added it to the French Kingdom in 1477. It was besieged by Henry VII. of England in 1492, taken by Henry VIII. in 1544, but restored to France by Edward VI. in 1550. It was at Boulogne that Napoleon I., in 1804, assembled an army 180,000 strong for the invasion of England, which, however, was not attempted. On August 6, 1840, Louis Napoleon attempted to raise here an insurrection in his favor. He was imprisoned in the castle above mentioned.

BOULOGNE-SUR-SEINE, bōō'lō'ny'-sur-sān' (Fr., Boulogne on the Seine). A town of France, in the Department of Seine, about 5 miles west of Paris, opposite Saint Cloud, on the river Seine, which is crossed at this point by a fine stone bridge. It gives its name to the Bois de Boulogne, the great park and promenade of Paris. (See PARIS.) It has extensive linen bleacheries and perfume manufactories. Population, in 1890, 37,418. The ancient name of Boulogne was Menus-les-Saint-Cloud, but in 1319 some returning pilgrims who had sailed from Palestine to Boulogne-sur-Mer erected a church in Menus and called it Notre Dame de Boulogne-sur-Seine. The church was restored in 1863.

Boulton, bōl'ton, CHARLES ARKOLL (1841-99). A Canadian soldier and legislator. He was born at Coburg, Ontario, and served in the British Army from 1858 to 1868. During both of the insurrections in Manitoba, led by Louis Riel, he took an active part in the struggle against the rebels, was imprisoned and sentenced to death by them in 1870, and at the outbreak of the second rebellion, in 1885, organized and commanded a corps of mounted riflemen known as Boulton's Scouts. He was called to the Senate of the Dominion Parliament in 1889, and sided with the Liberal Party in that chamber. He is the author of an interesting book: *Reminiscences of the North West Rebellion* (1886).

BOULTON, MATTHEW (1728-1809). An English mechanician. When still very young, he undertook at his father's death the business of his steel manufactory, which he carried on with great energy, and extended, in 1762 founding the famous Soho works near Birmingham. One of his first inventions was a new mode of inlaying steel. He entered into partnership with James Watt (q.v.), who had obtained a patent for the great improvements in the steam-engine which have immortalized his name, and they established a manufactory of steam-engines in 1769. They jointly contributed also to the improvement of

coining machinery, and so to the perfection of the coinage itself. For his biography, consult S. Smiles, *Lives of Boulton and Watt* (London, 1865).

BOU MAZA, bōō mā'za, SI MOHAMMED BEN ABDALLAH (1820—). An Arab leader of Algeria, who, as a dervish, in 1845, excited the people of Dahra against the French, and, with the support probably of Abd-el-Kader (q.v.), engaged in several conflicts. Saint Arnaud made him a prisoner (1847), and sent him to Paris, where he received a pension and was provided with a home. He escaped in 1848, but was caught and sent as a prisoner to Ham, where he was kept a year and a half. He subsequently entered the Turkish Army and fought in the Crimean War.

BOUNCE, BENJAMIN. The name assumed by Henry Carey as the author of the burlesque *Chrononhotonthologos*.

BOUNCER, MR. A character in the novel *Verdant Green*, by Cuthbert Bede (the Rev. Edward Bradley).

BOUNCER, MRS. The landlady in J. M. Morton's farce *Box and Cox* (1847).

BOUNCING BET. See SOAPWORT.

BOUND, or BOUNDARY (OF. *bonne, bonde, bodne*, from Low Lat. *bodina, bodena*, bound, limit). The utmost limits of land by which the same is known and can be described; being in this sense synonymous with *abuttals*, which means the buttings and boundings of lands east, west, north, and south, with respect to the places by which they are limited and bounded. An adjoining parcel of land, stream, or road, named in a deed as a boundary of the land conveyed, is a monument (q.v.), and in the interpretation of the deed prevails over the courses and distances given in the description. See REAL PROPERTY, and the authorities there referred to.

BOUND, or BOUNDE, NICHOLAS. See BOWNDE.

BOUND BAILIFF. In England, a deputy sheriff or sheriff's officer, whose duty is to discover and arrest debtors. As the sheriff is responsible for the misconduct of these bailiffs, they are annually bound in an obligation, with sureties, for the due execution of their office, whence the name *bound bailiffs*, which Blackstone is at pains to inform us "the common people have corrupted into a much more homely appellation"—*bum-bailiff*. See BAILIFF.

BOUND BROOK. A borough in Somerset County, N. J., 30 miles west-southwest of New York, on the Raritan River, the Delaware and Raritan Canal, and the Baltimore and Ohio, the Central of New Jersey, the Lehigh Valley, and the Philadelphia and Reading railroads (Map: New Jersey, C 2). It has manufactures of woolen goods, engines, electric dynamos, gas fixtures, roofing paper and paint, graphite journal-bearings, cash-registers, and lumber. The borough contains a public library. Settled about 1700, Bound Brook was first incorporated in 1892, the date of the charter now in operation, which provides for a mayor, elected biennially, and a city council. On April 13, 1777, 4000 English and Hessians under Lord Cornwallis and Count Donop surprised here about 1000 Americans under General Lincoln, who, after a short resistance, retreated, having lost 60 men inkilled,

wounded, and prisoners. Population, in 1890, 1462; in 1900, 2622.

BOUND'ERBY. The overbearing merchant who marries Louisa Gradgrind in Dickens's *Hard Times*. He is a mill-owner and banker in Coketown, and the son of Mrs. Pegler, whom he bribes to keep her from disclosing her identity.

BOUNDING CHARTER. In the Scotch law, an instrument of title which describes the lands thereby conveyed by their boundaries or limits. It gives right to everything within the bounds, and, on the other hand, it excludes what lies beyond these. In American and English law, instruments for the conveyance of land are called *deeds*, and generally contain a description of the plot conveyed according to its metes and bounds. See the authorities referred to under CONVEYANCE.

BOUNTIFUL, LADY. A character in the comedy of *The Beau's Stratagem*, by Farquhar, distinguished for her beneficence.

BOUNTY (Fr. *bonté*, goodness, from Lat. *bonitas*, goodness, excellence, from *bonus*, good). A term applied to any sum granted by law as an inducement to some undertaking believed to be of national importance. (1) Payments of bounties are sometimes made for the encouragement of commercial or industrial enterprises. The payment contemplated is a direct one, but the term is also applied to indirect pecuniary benefits which arise through legislation. The so-called sugar bounties of Germany, for instance, consist nominally in an abatement of internal taxes upon exported sugar. But as the abatement is so measured that it is greater than the original tax, it constitutes in fact, if not in name, a bounty upon exportation. For a discussion of industrial bounties, see FREE TRADE; SUBSIDIES.

(2) Monetary inducements to encourage men to join the army, or extend their service, are common. Usually bounty is only given in those countries whose armies are recruited by voluntary enlistment. The amount given varies with the need and difficulty of procuring recruits. During the Civil War in the United States, as much as \$1000 was sometimes offered for enlistment. This was, however, owing to the magnitude of the war and the immense number of men required. The English Government gives a bounty to men already serving in India to induce them to extend such service.

(3) In the United States Navy, money is awarded a ship which sinks or destroys an enemy's ship of war. When the vessel destroyed is of equal or superior force the victors are awarded \$200 for each person on board the enemy's ships at the beginning of the engagement; if of inferior force, \$100 for each person. If the ship is destroyed after the capture, for public interest, \$50 is awarded for each person on board the ship at the time of capture. The amount awarded is divided among the officers and crew in the same manner as prize-money (q.v.). When the number of persons on board the destroyed ship cannot be accurately ascertained, an estimate is made, based on the complement of a ship of the same class in the United States Navy. This bounty is authorized by the United States laws, but Congress must first make an appropriation for that purpose.

BOUNTY, THE. The name of an English vessel under the command of Captain Bligh, the crew of which in 1789 mutinied near the Friendly Islands, and abandoned nineteen men, including the captain, in a small boat with scant provisions. After many hardships, the boat at last reached Timor, whence Bligh returned to England. In 1814, by the accidental discovery of a settlement on Pitcairn Island (q.v.), it was found that eight of the mutineers of the *Bounty* had escaped to the island and colonized it. The last of the mutineers died in 1829. The incident was used by Lord Byron in his poem "The Island."

BOUNTY-JUMPER. In American history, one of the class of men who, while bounties were being paid for enlistments during the Civil War, entered the service with the intention of deserting at the earliest opportunity after obtaining the promised reward. They would frequently reenlist under different names, and repeat the process until caught, one man, in 1865, confessing that he had 'jumped the bounty' thirty-two times. The bounties differed in amount in different parts of the country, being greatest in the State of New York. Consult Fry, *Report of the Provost Marshal-General* (Washington, 1866).

BOUQUET, bō'kă', HENRY (1719-66). A British soldier, who served for many years in America. He was born in Rolle, Switzerland, entered the army of the Low Countries in 1736, served alternately with the Dutch and the Sardinians, and in 1756 entered the English service in America as lieutenant-colonel of the 'Royal American Regiment.' He was second in command of the army which, under General Forbes, captured Fort Duquesne in 1758 (see PITTSBURG), and was left in command when Forbes returned to Philadelphia. In 1763, while in command at Philadelphia, he was sent with 500 men to relieve Fort Pitt (formerly Fort Duquesne), then closely besieged by Pontiac's followers, and at Bushy Run, about 20 miles from the fort, defeated the Indians (August 5-6) and thereby virtually suppressed the great conspiracy. (See PONTIAC.) In October, 1764, he forced the Ohio Indians to make peace at Tuscarawas. He was raised to the rank of brigadier-general, and in 1765 was placed in command of the Southern Department of America with headquarters at Pensacola, where soon afterwards he died of the fever. For the best account of his military services, consult Parkman, *Conspiracy of Pontiac* (Boston, 1867). Consult also an article on the subject in the *Pennsylvania Magazine of History and Biography*, Vol. III. (Philadelphia).

BOUQUET DE LA GRYE, bō'kă' de là gré', JEAN JACQUES ANATOLE (1827—). A French hydrographer and astronomer. He was born in Thiers (Puy de Lôme), and was educated at the Ecole Polytechnique. One of his most important and difficult surveys was that of New Caledonia, of which region he prepared forty charts (1853). He was the promoter of the project to make Paris a seaport by means of a ship-canal and the widening of the Seine. Bouquet de la Grye is almost equally famous as an astronomer and as a perfecter of astronomical instruments. His works include: *Pilote des côtes Ouestes de France*; *Notes sur la sondage à la mer*; *Etude*

hydrographique sur la baie de La Rochelle; Paris, Port de Mer; Notes sur les sondes faites par de grandes profondeurs.

BOUQUETIN, bōō'k'-tān' (Fr., for OF. *bouc d'estain*: *bouc*, goat + *de*, of + *estain*, carded wool). A wild goat, steinbock, or ibex, especially that of the Alps or Pyrenees. See **IBEX**.

BOUQUET (bōō-kā') OF WINE (Fr. *bouquet*, nosegay, bunch of flowers, OF. *bosquet*, dimin. from Low Lat. *boscus*, thicket). A flavor or aroma characteristic of the better class of wines, and due chiefly to the presence of volatile constituents, as alcohols and ethers. According to some authorities, the characteristic bouquets of wines are caused by the different kinds of yeast used in the various districts; the same must, fermented with yeasts from several different districts, has yielded wines possessing different bouquets. On the other hand, the bouquet of the wine from Riesling grapes is said to be caused by the action of frost.

BOURBAKI, bōōr'bā'kē, CHARLES DENIS SAUTER (1816-97). A French general. He was born at Pau, was educated at Saint-Cyr, served for some time in Algeria and rose to the rank of brigadier-general in 1854. In the Crimean War he won distinction at the Alma, at Inkerman, and in the assault on Sebastopol. He also participated in the Italian campaign of 1859. In 1869 he was commander of the second camp at Châlons, and aide-de-camp to the Emperor. In the war with Germany he was placed in command of the Imperial Guard and took an important part in the conflicts around Metz. After having been for a short time at the head of the Army of the North, he was in December, 1870, placed in command of the Army of the Centre, soon transformed into that of the East. The advance of Bourbaki forced Von Werder to evacuate Dijon on December 27, but his attack upon Von Worder's position at Héricourt before Belfort (January 15-17, 1871) was repulsed. He was compelled to retreat, but, finding his way toward Lyons cut off by the German Army of the South, was driven to despair by his hopeless situation and attempted suicide, but the wound (a pistol-shot in the head) was not fatal. As soon as his condition permitted, he returned to France, and was appointed to the command of an army corps at Lyons in July, 1871. He retired in 1881.

BOURBON, bōōr'bon, Fr. pron. bōōr'bōn', HOUSE OF. A younger branch of the Capetian family of France, representatives of which occupied several European thrones after the Sixteenth Century. The house derived its name from the castle and seigniorship of Bourbon, in the former Province of Bourbonnais, in the centre of France, where now stands the little town and watering-place of Bourbon-l'Archambault. The first lord or *sire* of this family of whom history makes mention was Adhémar, at the beginning of the Tenth Century. The fourth in succession from him, Archambault I., added the name of the family castle to his own. Under his successors, who also bore the name of Archambault, the family possessions were soon very much increased. At length the seigniorship of Bourbon devolved upon an heiress, who in 1272 married Robert, the sixth son of Louis IX. of France. It thus passed to a branch of the royal family of the Capetians, under whom it was converted into

a duchy. The principal branch of this family was, in 1523, deprived of all its dignities and possessions, because the Duke, Charles de Bourbon (q.v.), the famous Constable, allied himself with Charles V. against Francis I. of France. Of the collateral branches, that of Vendôme acquired great importance, first attaining by marriage, in the person of Antoine de Bourbon, Duke of Vendôme, the throne of Navarre; afterwards by inheritance the throne of France, in the person of Henry IV., on the extinction of the male line of the house of Valois (q.v.); and by fortune of war the thrones of Spain, Naples, and Parma. Among the numerous other collateral branches may be mentioned those of Montpensier, De la Marche, Condé, Conti, Soissons, and Orleans. Only a few members of the collateral lines, however, have borne the name of Bourbon; for example, the Cardinal Charles de Bourbon, Duke of Vendôme, who, under the name of Charles X., was set up by the Catholic League as a rival king to Henry IV. The ducal dignity was revived by Louis XIV. in the house of Condé (q.v.), so that the eldest son of that house should bear the title of Duke of Bourbon.

The dynasty of the Bourbons in France begins with Henry IV. (q.v.), who, after the assassination of Henry III., became, by virtue of the Salic law (q.v.), the heir to the French throne. Through his father, Antoine de Bourbon, King of Navarre and Duke of Vendôme, he was descended from Robert, son of Louis IX., and husband of Beatrix, heiress of Bourbon. On his assassination in 1610, he left, by his second wife, Maria de' Medici, five legitimate children: (1) Louis XIII., his successor on the throne; (2) Gaston, Duke of Orleans (q.v.), who died in 1660, and left no male heirs; (3) Elizabeth, married to Philip IV. of Spain; (4) Christina, married to Victor Amadeus, afterwards Duke of Savoy; (5) Henrietta, married to Charles I. of England.—LOUIS XIII., on his death in 1643, left two sons by his Queen, Anne of Austria, daughter of Philip III. of Spain: (1) Louis XIV., his successor; and (2) Philip, who received from his elder brother the title of Duke of Orleans, and was the founder of the family which has become the younger Bourbon dynasty.—The dauphin LOUIS, son of Louis XIV. by his marriage with Maria Theresa of Spain, died in 1711, and left three sons by his marriage with Maria Anna of Bavaria: (1) Louis, Duke of Burgundy; (2) Philip, Duke of Anjou, who afterwards became King of Spain, as Philip V.; (3) Charles, Duke of Berry, who died in 1714.—LOUIS, Duke of Burgundy, died in 1712. By his wife, Maria Adelaide of Savoy, he had three sons, of whom two died in early youth, the only one who survived being Louis XV., who succeeded his great-grandfather, Louis XIV., in 1715.—LOUIS XV. having married Maria Leszczynska, daughter of the dethroned King Stanislas of Poland, had by her a son, the dauphin Louis, who married Maria Josepha of Saxony, and died in 1765, leaving three sons: (1) Louis XVI., who succeeded his grandfather, Louis XV., in 1774; (2) Louis Stanislas Xavier, Count of Provence, afterwards Louis XVIII.; (3) Charles Philippe, Count of Artois, afterwards Charles X.—LOUIS XVI. had three children by his Queen, Marie Antoinette of Austria: (1) The dauphin Louis, who died in 1789; (2) Louis, called Louis XVII., who died

in 1795; (3) Marie Thérèse Charlotte, styled Madame Royale, afterwards Duchess of Angoulême.—Louis XVIII. had no children; but Charles X. had two sons: (1) Louis Antoine de Bourbon, Duke of Angoulême, who was dauphin prior to the Revolution of 1830, and died without issue in 1844; (2) Charles Ferdinand, Duke of Berry (q.v.), who was murdered in 1820.—The Duke of Berry left two children: (1) Marie Louise Thérèse, styled Mademoiselle d'Artois, married to the Duke of Parma; (2) Henri Charles Ferdinand Marie Dieudonné, Duke of Bordeaux, later styled Count of Chambord, the representative of the elder branch of the Bourbons. The latter died childless in 1883, and the legitimists accepted in his stead the Orleanist Count of Paris, grandson of King Louis Philippe, as head of the house of Bourbon. The Count of Paris died in 1894, and his son, the Duke of Orleans, now represents legitimacy.

The founder of the Orleans or younger branch of the Bourbon royal family of France was Philip, Duke of Orleans, the younger brother of Louis XIV. He died in 1701, leaving, by his second marriage, with Elizabeth Charlotte of the Palatinate, a son of his own name as his heir, who was regent of France during the minority of Louis XV. The latter's son, Louis Philippe, Duke of Orleans (born 1703), married a princess of Baden, and died in 1752, leaving an only son of his own name (1725-85), whose son and heir was that Louis Joseph Philippe, Duke of Orleans, so notable in the French Revolution, who, in 1792, renounced his rank, taking the name of Citizen Egalité, and died by the guillotine in 1793. Philippe Egalité left four children: (1) Louis Philippe, who, before the Revolution, was styled Duke of Chartres—that being the ordinary title of the eldest son of the Orleans family—became afterwards Duke of Orleans, was King of the French from 1830 to 1848, and died in England on August 26, 1850; (2) the Duke of Montpensier, who died in England in 1807; (3) the Count of Beaujolais, who died at Malta in 1808; (4) Adelaide, styled Mademoiselle d'Orleans (1777-1847).—LOUIS PHILIPPE left a numerous family by his Queen, Amelia of Naples. His eldest son, Ferdinand, Duke of Orleans, lost his life in an accident on July 13, 1842, leaving by his wife, the Princess Helen of Mecklenburg-Schwerin, two sons, the eldest of whom, Louis Philippe Albert, Count of Paris (1838-94) (q.v.), left as his heir Louis Philippe Robert, Duke of Orleans, born February 6, 1869. Concerning the other members of Louis Philippe's family, see the article LOUIS PHILIPPE.

Louis XIV. having succeeded in placing his grandson, Philip, Duke of Anjou, on the throne of Spain, in 1700, as Philip V., this prince became the founder of the Spanish Bourbon dynasty, as well as of the Bourbon dynasties of Naples, and Parma and Piacenza. These dynasties endured only a temporary overthrow from the policy and arms of Napoleon Bonaparte. Philip V. was succeeded on the Spanish throne by his son, Ferdinand VI., who died without issue in 1750, and the crown fell to his brother, Charles III., whose son and successor, Charles IV., was compelled to resign it in 1808, in favor of a successor nominated by Napoleon, and died at Naples in 1819. The two eldest sons of Charles IV. by his marriage with Maria Louisa of Parma were—(1) Don Fernando, Prince of Asturias, who, after the overthrow of Napoleon, reigned as

Ferdinand VII., whose eldest daughter was Isabella II., the mother of Alfonso XII.; (2) Don Carlos (see CARLOS DE BOURBON), who in 1833 became pretender to the Spanish throne, and in 1845 resigned his pretensions in favor of his son, Don Carlos, who styled himself Count of Montemolin. He died at Trieste, 1855. The Count of Montemolin died in 1861, and his claims to the Spanish throne are now represented by his nephew, Don Carlos, son of his brother Juan.

When the Bourbon dynasty was established on the throne of Spain in the person of Philip V., Naples and Sicily were severed from that monarchy (1713-14). Naples was given to Austria, and Sicily to Savoy, which in 1720 ceded the island to Austria in exchange for Sardinia. In the treaty of Vienna (1735), Don Carlos, son of Philip V., became King of the Two Sicilies, as Charles III. Upon his accession to the throne of Spain in 1759, he gave up that of the Two Sicilies to his third son, Don Fernando, called Ferdinand IV., with the express stipulation that it should never again be occupied by a King of Spain. Ferdinand IV. was deprived of Naples by Napoleon in 1806; but after the overthrow of Napoleon he recovered it, and in 1816 he proclaimed himself King of the consolidated realm of the Two Sicilies as Ferdinand I. His son, Francis I., left the throne in 1830 to his son Ferdinand II. (q.v.), whose son, Francis II., was expelled in 1860, when Naples was incorporated with the new Kingdom of Italy.

By the peace of Aix-la-Chapelle in 1748, Austria made over the duchies of Parma and Piacenza to Don Philip, the youngest son of Philip V. of Spain, but with the stipulation of their reversion to Austria on the failure of male descendants, or on his succeeding to the throne of Spain. He was succeeded in 1765 by his son, Ferdinand I., whose son, the hereditary Prince Charles Louis, was made King of Etruria in 1801, under the guardianship of his mother, Maria Louisa of Spain, the cession of Parma and Piacenza to France on the death of Ferdinand being provided for. Ferdinand died in 1802, and in 1807 Napoleon took possession of Etruria. The Congress of Vienna assigned Parma and Piacenza for life to Maria Louisa of Austria, the spouse of Napoleon, but meanwhile indemnified Maria Louisa of Spain with the Duchy of Lucca. The latter was succeeded in 1824 by her son Charles Louis. He made over Lucca to Tuscany in 1847, and in the same year Parma and Piacenza reverted to the Bourbon family, in his person. He abdicated on March 14, 1849, and was succeeded by his son, Charles III., and he in 1854 by his son Robert—born 1848—whose mother, Marie Louise Thérèse de Bourbon, daughter of the Duke of Berry, then became regent of the duchies. The Bourbon family ceased to reign here in 1859. See ITALY and PARMA.

BOURBON, bōōr'bōn', ANTOINE DE. See ANTOINE DE BOURBON.

BOURBON, CHARLES, Duke of Bourbonnais (1489-1527). A French general, known as the Constable de Bourbon. He was the son of the Count of Montpensier. In consequence of the death of his elder brother, and his marriage with the only daughter of the Duke of Bourbon, he united in his own possession the vast estates of both these branches of the Bourbon family, which alone at that time retained the old feudal power. He distinguished himself by the brilliancy of his exploits in arms, and by his rigid morals. At the age of 26 he was made Constable of France (the highest military office in the kingdom), and was sent to Italy at the head of an army. Crossing the Alps by passes previously deemed impracticable, he surprised the hostile generals, won the battle of Marignano, September 13 and 14, 1515, and within a few days placed the keys of the citadel of Milan in the King's hand. Accounts differ as to his later career. It is charged by French historians that Charles of Bourbon was the victim of an overweening pride and jealousy; that he claimed more credit than really belonged to him, and that his treason was not at all justifiable. On the other hand, he is represented as the victim of a woman's revenge. It is said that Marie Louise, the King's mother, became enamored of the brave Constable; and that he, although a widower, declined her hand, openly declaring that he deemed her a woman devoid of modesty, and not to be thought of for a wife. Through her influence the estates which he had acquired through his wife were seized and his perquisites as Constable were withheld. Thus deeply injured, he renounced the interest of France, and concluded a private alliance with the Emperor Charles V. and with Henry VIII. of England for the conquest and partition of France. The King, who was engaged in an expedition to Italy, received intelligence of this conspiracy. He proceeded forthwith in person to the Constable, and offered him restoration to favor and also to his estates. The Constable, however, did not trust him, but fled in disguise, and reached Franche-Comté in 1523. He attacked, in 1524, the French Army on its march over the Alps, and planned an invasion of France with the Spaniards. But Charles V. did not entirely trust him, and appointed the Marquis de Pescara to assist and watch him. He was forced to relinquish the siege of Marseilles on the approach of Francis I. with a great army. He repassed the Alps, and took his revenge in the battle of Pavia, February 24, 1525, where the King was made a prisoner. (See FRANCIS I.) He now went to Madrid, but soon found himself disappointed in his hopes, and returned to Lombardy to carve out his own fortune. He took Milan from Maximilian Sforza and then assailed Rome. In the assault, May 6, 1527, he was mortally wounded by a bullet, which Benvenuto Cellini afterwards asserted that he had shot. His death was kept secret for a time from the army under his command. The city was sacked, and when the army departed from Rome two months later, his corpse, which the soldiers would not part with, was taken

with them, and buried at Gaeta, under a magnificent monument, which, however, was afterwards destroyed. (See BOURBON, HOUSE of, for genealogy and references.) Consult: Coignet, *Francis the First and His Times* (London, 1888); Robertson, *History of the Reign of Charles V.* (Philadelphia, 1864-67); Laviisse and Rambaud, *Histoire générale* (Paris, 1893-1901).

BOURBON, ILE DE. See RÉUNION, ILE DE LA.

BOURBON, LUIS MARIA DE (1777-1823). A Spanish prelate and politician. He was born at Cadahalso, took orders, was appointed Archbishop of Seville in 1799, Archbishop of Toledo in 1800, and in the latter year received also the cardinal's hat. During the French occupation he was president of the Cadiz regency, and as such approved the decrees of the Constituent Assembly of the Cortes. Thus he signed the Constitution of 1812, and abolished the Inquisition. Upon the return of the King, in 1814, he at first fell into disfavor, but subsequently was appointed president of the governmental junta and a counselor of State.

BOURBON - LANCY, bōōr'bōn' lān'sē'. A watering-place in the Department of Saône-et-Loire, France, 40 miles northwest of Charolles (Map, France, K 5). It is celebrated for its thermal springs, which contain chloride of sodium and iron. The town is beautiful in situation, and has a hospital with 400 beds built by the Marquis d'Aligre. Population, in 1896, 4162. The Romans knew this city as Aquæ Nisinei or Nisinienses, and remains of their baths are to be seen.

BOURBONNAIS, bōōr'bō'nā' (so called from *Bourbon*). A former province of Central France, now comprised within the departments of Allier, Cher, and Nièvre. From 1327 to 1523 it formed the Duchy of Bourbon. In the latter year it was annexed to the Crown, but bestowed, in 1661, on the House of Bourbon-Condé, which held it until the Revolution. Consult: Nicolay, *Description et histoire du Bourbonnais* (Monlins, 1875); Montégut, *En Bourbonnais et en Forez* (Paris, 1881).

BOURBONNAIS. A village in Kankakee County, Ill., 56 miles south of Chicago; the seat of Notre Dame Academy and of Saint Viator's College (Roman Catholic), opened in 1865. Population, in 1900, 595.

BOURBONNE-LES-BAINS, bōōr'būn' lā bān' (Fr., The Baths of Bourbonne, Med. Lat. *Bourbonia*, formerly *Aquæ Borvoni*, Baths of Borvo, Borvo being among the Gauls a name for Apollo). A town and watering-place in the Department of Haute-Marne, France, pleasantly situated by the Amance on an eminence amid wooded country, 20 miles east-northeast of Langres (Map: France, M 4). It has a fine church of the Twelfth Century, a large military hospital, and some interesting ruins of a chateau of the ancient Seigneurs de Bourbonne. Its thermal springs attract some 3000 invalids annually. They are strongly impregnated with chloride of sodium; and their temperature is from 140° to 150° F. Population, in 1896, 4156. The Romans knew these springs under the name *Aquæ Borvoni*.

BOURBOULE, bōōr'bōōl', LA. A health resort in the Department of Puy-de-Dôme, France, on the Dordogne, 22 miles southwest of Cler-

mont. It is noted for its mineral thermal springs and is visited annually by over 7000 persons. Its bottled waters constitute a thriving export industry. Its picturesque situation amid some of the finest scenery of ancient Auvergne adds to its attractiveness. Population, in 1901, of town, 1404; of commune, 1947.

BOURCHIER, bōŕ'chî-ër, *Fr. pron.* bōŕ'-shyâ', **ARTHUR** (1864—). An English actor and manager. He was born at Speen, Berkshire, and educated at Eton and Oxford. While at the university he won distinction as an amateur actor, and in 1889 he went upon the professional stage, playing with Mrs. Langtry, at Wolverhampton, as Jacques in *As You Like It*, in which he appeared in London the next year at the Saint James Theatre. Later he played for a time at the Criterion. In March, 1892, he was at the Shaftesbury Theatre, in his own play of *Mr. Richards*. Soon afterwards he joined Augustin Daly's company and went to America, returning early in 1893 to play at Daly's London theatre, where he had the rôle of Robin Hood in Tennyson's *Foresters*. In 1894 he married Miss Violet Vanbrugh, a talented actress, who has continued upon the stage with her husband. In the fall of 1895 he took the Royalty Theatre, producing among the plays *The Chili Widow*, an adaptation of his own, which ran for over 300 nights. Subsequently he appeared in leading parts at the Garrick, Strand, and Court theatres, and with Charles Wyndham, at Wyndham's Theatre. Then, as Wyndham's partner at the Criterion, he helped to bring out *His Excellency the Governor*, and *Lady Huntworth's Experiment*. He has since taken the Garrick Theatre, producing J. M. Barrie's play *The Wedding Guest* (1900).

BOURDALOUE, bōŕ'da'loo', **LOUIS** (1632-1704). One of the greatest pulpit orators of France. He was born at Bourges, August 20, 1632, and after having, at the age of sixteen, entered the order of Jesuits, obtained in succession the chairs of humanity, rhetoric, philosophy, and theological ethics in the academy of his native place. He showed a great capacity for science, but his remarkable powers of eloquence led his superiors finally to determine upon employing him as a preacher. Disdaining the inflated style prevalent among the tasteless pulpit orators of his time, he assailed with manly vigor and truly religious earnestness the passions, weaknesses, and errors of men. The dignity of his manner and the fire of his eloquence made him famous even when the public mind was occupied with the festivities of Versailles, the victories of Turenne, and the literary masterpieces of Corneille and Racine. At the Court of Louis XIV. he was remarkably well received. After the revocation of the Edict of Nantes (1685) he was sent to Montpellier to convert the Protestants. Bourdaloue particularly understood how to accommodate his eloquence to the minds of those whom he addressed. Simple among the simple, a dialectician among ecclesiastics, he was equally a favorite with the common people and with the learned and the great. He was also much esteemed and beloved as a man and in all circumstances maintained unimpeached a high reputation for candor and honesty. In the later years of his life he relinquished the pulpit and devoted his time to hospitals, prisons, and pious institutions. He died in Paris, May 13,

1704. How thoroughly his religious sentiments were governed by the theological tenets of his Church may be perceived from these remarkable words which he uttered on his deathbed: "It is highly reasonable that God be fully satisfied; and at least in purgatory I will suffer with patience and with love." His *Sermons and Moral Discourses* appeared in English translation (Dublin, 3d ed., 1855), also his *Married Life: Its Obligations, Trials, etc.* (London, 1897); several French editions of his works have been published, e.g. *Collection universelle des orateurs sacrés*, Vols. XIV.-XVI., reprint of François Bretonneau's edition (latest edition, Paris, 1891, 6 vols.). For his biography, consult: Anatole Feugère, *Bourdaloue la prédication et son temps* (Paris, 1874, 5th ed., 1889); M. Lousas (Paris, 1881, 2 vols.); and L. Pouthe (Paris, 1900); also J. B. E. Tousserat, *Etude généalogique sur les Bourdaloue* (Paris, 1900).

BOURDEILLES, bōŕ'da'y'. See BRANTÔME.

BOURDON, bōŕ'don' (*Fr., It. bordone*, a humming, a buzzing, a drone; *Med. Lat. burdo*, drone; cf. *Eng. burden*, refrain of a song). In music, a drone bass produced by a bagpipe or hurdy-gurdy; also an organ-stop, consisting of stopped wooden pipes, usually of 16-feet tone.

BOURDON, SÉBASTIEN (1616-71). A French painter, born in Montpellier. He studied in Paris under a mediocre artist named Barthélemy, and painted frescoes in Bordeaux. In Rome from 1634 to 1636 he carefully studied the works of the Carracci, and copied old masters for a dealer. After his return to Paris he firmly established his reputation by his "Martyrdom of Saint Peter" (Louvre Gallery), and became one of the ten original members of the Academy of Painting. In 1652-53 he was in Sweden as Court painter, and subsequently was rector of the Academy of Painting. He is known chiefly as an historical painter, but he worked also in other styles. His paintings are generally brilliant and of large grasp, but sometimes lack care in drawing and are dull in color. They further include "Descent from the Cross" (Louvre); "Julius Cæsar Before the Tomb of Alexander" (Louvre); "Group of Merchants" (Museum of The Hague); and "Return of the Ark from Captivity" (National Gallery, London).

BOURDON DE L'OISE, bōŕ'don' de lwäz', **FRANÇOIS LOUIS**. A notorious character of the French Revolution. He was born in the middle of the Eighteenth Century, at Saint-Remy, near Compiègne, and became a procurator in the Parlement of Paris. He participated in the storming of the Tuileries on August 10, 1792. He shortly afterwards obtained a seat in the Convention by a trick which, though subsequently discovered, did not lead to his ejection. Bourdon de l'Oise contributed much to bring about the execution of Louis XVI., the insurrection of May 31, and the destruction of the Girondists. He was sent to La Vendée, where, however, he loudly condemned the Revolutionary cruelties and assumed the attitude of a moderate. Obnoxious on this account to Robespierre and Hébert, and fearing for his head, he urged with the greatest eagerness the overthrow of the Terrorists on the 9th Thermidor (July 27), 1794. From this time forth Bourdon de l'Oise showed himself an enemy of the clubs and a

protector of the nobles and the priests. In consequence of the insurrection of 13th Vendémiaire (October 5), 1795, he was sent as a commissioner to Chartres, where he behaved harshly and brutally. He passed from the Convention into the Council of Five Hundred, became a persecutor of the Republicans, and joined a Royalist club. The Directory placed him upon the proscribed list, after the 18th Fructidor (September 4), 1797. He was transported to Cayenne, where, in a short time, he died in great misery.

BOURGELAT, bōŕzh'la', CLAUDE (1712-99). A French lawyer, the founder of the first veterinary school in Europe. He was a learned lawyer, an able writer, and numbered among his friends such men as D'Alembert, Pembroke, Voltaire, Buffon, and Haller. He was impelled to further the cause of veterinary science by his fondness for horses. In 1761 he and a minister of Lyons, named Bertin, opened the first veterinary school in the suburbs of that city. It was patronized by students from all parts of France, Italy, Switzerland, Germany, Sweden, and Denmark. From this school all other colleges in Europe sprang, and with them it has kept pace, being superior to the majority, and rivaling the very best, even those of Paris and Berlin.

BOURG-EN-BRESSE, bōŕg'an-brēs' (Fr., fort in Bresse, an ancient province of France; anciently *Villa de Burgo in Bressia*). The chief town of the Department of Ain, in France, situated on the Reyssouse, 38 miles northeast of Lyons (Map: France, M 5). The streets are crooked and narrow, but clean, and the squares are adorned with statues and fountains. Among its public institutions are the famous church Notre Dame de Brou, containing the courts of the house of Savoy, a lyceum, a school for male and female teachers, a school of obstetrics, two hospitals, a lunatic asylum, a museum, and a library. Its manufactures are falence, artificial mineral waters, and lace. It has an important trade in grain, poultry, fattened cattle, horses, and wine. Population, 1896, 18,501. Consult Charvet, *Les édifices de Brou à Bourg-en-Bresse* (Paris, 1897).

BOURGEOIS, bŕr-jois'. See TYPOGRAPHY.

BOURGEOIS, ANICET. See ANICET-BOURGEOIS.

BOURGEOIS, bōŕ'zhwā', LÉON VICTOR AUGUSTE (1851—). A French politician. He was born in Paris, and studied at the Lycée Charlemagne. In 1877 he became general secretary of the Department of Marne, and in 1880 sub-prefect of Rheims. In 1882 he was appointed prefect of the Department of Tarn, in 1885 prefect of the Department of Haute-Garonne. He became director of the Ministry of the Interior, in 1886, and in 1887 prefect of police. He was elected deputy for Marne in 1888, in the same year was appointed Under-Secretary of State in the Ministry of the Interior, and in 1889 became Minister of the Interior. From 1890 to 1892 he was Minister of Public Instruction, and from December, 1892, to March, 1893, Minister of Justice. In 1895-96 he was Prime Minister. In 1898 he was appointed Minister of Public Instruction, in which post he displayed high efficiency, and from which he resigned in the same year, upon the resignation of the Brisson Cabinet. In 1899 he was the head of the

French delegation to The Hague Peace Conference. His best-known work is *Solidarité* (1897).

BOURGEOIS GENTILHOMME, bōŕ'zhwā' zhān'té'lóm', LE (Fr., The Bourgeois Turned Gentleman). The title of a popular comedy by Molière (1670). Here we meet M. Jourdain, who had been "speaking prose all his life without knowing it."

BOURGEOISIE, bōŕ'zhwā'zē' (from Late Lat. *burgensis*, inhabitant of a borough). A French term, now frequently employed in English, German, and other languages. It denotes the citizens of towns as a rank or class of society, including grades from heads of manufacturing or mercantile establishments down to master-tradesmen. The French Bourgeoisie have long been extremely hostile to the aristocracy, but have themselves become the object of attack on the part of the operatives and of the extreme Radical or Red Republican Party. The term *bourgeois*, from which bourgeoisie is formed, is quite distinct in meaning from *citoyen*, the latter term designating a citizen of the State.

BOURGES, bōŕzh (Lat. *Bituriges*, a tribe of Gaul). The ancient capital of Berry, now of the Department of the Cher, France, the seat of an archbishopric, and a military arsenal, situated in the midst of a fertile plain, at the confluence of the Auron and the Yèvre, 123 miles south of Paris (Map: France, J 4). High towers still mark points on the ramparts, which surrounded the old town. Shady boulevards now take the place of the dismantled walls. The old town is made up of crooked streets and quaint houses; it stands in the heart of the new town. Its most conspicuous building is the noble cathedral of Saint Étienne, with its superb flying buttresses, its five western portals, leading to the five naves of the interior, which is lighted by stained-glass of unique beauty. This church was begun in the Thirteenth Century and completed in the Sixteenth Century. The House of Jacques Cœur, the banished silversmith of Charles VII., is the next most interesting building, and is now used as the Palais de Justice. Bourges is a centre of trade in wine, grain, cloth, cattle, hemp, and mill-stones. It has iron foundries, tan-yards, and cloth factories. Population, in 1896, 43,587. Bourges was the capital of the Gallic Bituriges, and the Roman *Aracicum*, after its capture by Julius Cæsar in 52 B.C. It was successively taken by the Visigoths, under Euric, by Clovis, Pepin the Short, and the Normans. When Orleans was occupied by the English, Charles VII. made it his capital. Its university, at which Calvin, Amyot, and Theodore de Beza studied, was abolished in the Revolution. It was the birthplace of the astute Louis XI., the eloquent Bourdaloue, and the famous Jacques Cœur.

BOURGET, bōŕ'zhā', LAC DU. A beautiful lake in the Department of Savoie, France, 7 miles northwest of Chambéry. A railway which skirts its eastern shore connects Chambéry with the village of Le Bourget (population, in 1901, 1309) at the south end of the lake. The lake, inclosed by picturesque heights, is 10 miles long, 3 miles broad, and 475 feet deep; it is famed for its 'Lavaret,' a species of fresh-water mackerel; its outlet is by the Canal de Savières on the northwest, which connects with the Rhone. The château de Châtillon, the monastery of

Hautecombe, and the ancient château of Bourdeaux are conspicuous features in the vicinity.

BOURGET, LE, or LE BOURGET-DRANCY. A village in the French Department of Seine, about six miles northeast of Paris. In the Franco-Prussian War it was the scene of serious French repulses, especially the disasters of October 30 and December 21, 1870. Population, 1896, 2550.

BOURGET, PAUL. (1852—). A notable French analytic essayist and novelist. He was born at Amiens, September 2, 1852. His father was a Russian, his mother English, while he is himself a cosmopolitan by instinct, study, and travel, lacking provincial prejudices, but also national conviction—a typical scholarly dilettante. After a brilliant school career, finished at the famous Collège de Sainte-Barbe in Paris, he began life as a journalist and, as seems the French custom, made his first bow to literature in a volume of daintily hedonistic and pessimistic verse that earned him from Augier the name of 'Melancholy Pig.' These sighs of *Restless Life* (*La vie inquiète*, 1874), breathed in Latin Quarter cafés, were repeated in *Edel* (1878) and *Les aereux* (1882). With the *Essais de psychologie contemporaine* (1883), followed by *Nouveaux essais* (1885), and two volumes of *Etudes et portraits* (1888-89), Bourget appears in his own words as "a moralist of the decadence," "a maniac of psychology," and "a passionate lover of analysis." He did here as critic what he was to do later as a novelist: he carried realistic observation beyond the externals of Zola and Maupassant to what he called 'states of soul.' Thus he unites the methods of Stendhal and of Balzac, and it is by no accident that one of the first of his essays is devoted to the former writer, whose reputation he did much to reestablish. Bourget called himself a moralist, but he was rather an analyst, offering a brilliant diagnosis, but no prescription. His criticism reflects the dilettante skepticism of Renan; and his early fiction bears strong marks of the same influence, which even the later novels do not wholly avoid. They have been happily described as a seductive if somewhat sickly product of the hothouse of an outworn civilization, uniting intellectual keenness with morbid sensitiveness, dealing by preference with the cosmopolitan types of that low life which is usually called 'high.' In the early novels there is a good deal of snobbishness which he himself mocks in the later ones. *Mensonges* (1887) marks the cardinal point of his fiction. *L'Irréparable* (1884); *Cruelle énigme* (1885); *Crime d'amour* (1886); *André Cornélis* (1887), place the interest in situation and environment rather than in character. Analysis is attempted, but description predominates. In the later fiction, *Le disciple* (1889); *Terre promise* (1892); *Cosmopolis* (1892); *Un scrupule* (1893); *Steeplechase* and *Un saint* (1894); *Idylle tragique* (1896); *Les complications sentimentales* (1898); *La duchesse bleue* (1898); *Voyageuses* (translated as *Antigone*); *Drame de famille* (1900); *Un homme d'affaires* (1900); *La fantôme* (1901); as well as in the cynical *Psychologie de l'amour moderne* (1890), and in the impressions of travel, *Sensations d'Italie* (1891), *Nouveaux pastels* (1891), *Outre-Mer* (1895), the dominant interest is in a morbid psycho-pathology and significantly peculiar 'states of soul,' though the latest volumes of

fiction show increasing subtlety, maturity, and moral strength. Before *Cosmopolis* (1892) the ethical triumph is with cynical selfishness, though common-sense moralists like the Abbé in *Mensonges* occasionally find a tongue to describe their fellow-actors, justly enough, as "wretches who live at the mercy of their sensations." From *Cosmopolis* onward, Bourget swims with the wave of reaction toward religious sentiment and curiosity that came from a union of the spiritual mysticism of the Russians with the sensuous mysticism of Baudelaire and has affected the work of many others (e.g. Voglé, Brunetière, Huysmans, Daudet). Bourget's style is very uneven, affected, incorrect at times, but capable of a terse simplicity that unites strength and beauty to a rare degree. In temper the impression that he leaves is of a passive disillusion. He is never bitter, and one wonders if he is often sincere in posing as a type of "the atrocious modern uneasiness that comes from regret at unbelief and dread of the moral void." Nearly all of Bourget's work since 1892 is translated into English. Consult: Renard, *Les princes de la jeune critique* (Paris, 1890); Doumie, *Ecrivains d'aujourd'hui* (Paris, 1894); Pellissier, *Essais de littérature contemporaine* (Paris, 1893); and Lemaitre, *Les contemporains*, Vol. III. (Paris, 1886-89).

BOURGOIN, böör'gwän'. The capital of a canton in the Department of Isère, France, on the Bourbre, 9 miles northwest of La Tour du Pin. It is the seat of active linen, woolen, paper, and other industries. Situated on the ancient marsh bed of the Rhone, it was known to the Romans as *Bergusium*. Population, in 1901, of town, 5246; of commune, 7279.

BOURGOIN, böör'gwän', EDMÉ ALFRED (1836—). A French chemist. He was born in Saint-Cyr-les-Colons (Yonne) and was educated in Paris. He became chief pharmacist at the Children's Hospital, Paris, in 1867; a member of the Council of Public Hygiene in 1881; and director of the central pharmacy of the Paris hospitals in 1885. Among his numerous important writings are the following: *Electrochimie* (1868); *Chimie organique, Principes de la classification des substances* (1876); *Traité de pharmacie galénique* (1890).

BOURGOING, böör'gwän', JEAN FRANÇOIS, Baron de (1748-1811). A French diplomat, born in Nevers. He so distinguished himself in the military school in Paris that the Government sent him to the University of Strassburg to prepare himself for diplomatic service. After studying there he spent four years in Germany on different military and diplomatic missions. In 1777 he was sent to Madrid as first secretary of legation, and during his seven years' residence there he wrote his best-known book, *Nouveau royaume en Espagne, ou Tableau de l'état actuel de cette monarchie* (1789). In 1791 he was made Minister Plenipotentiary of Louis XVI. to Madrid, and subsequently took a conspicuous share in negotiating the peace preliminaries with Spain. In 1808 he became Minister to Saxony and was present in his official capacity at the Congress of Erfurt. In addition to the above mentioned appointments he held numerous other diplomatic posts in Germany and Holland. His *Mémoires historiques et philosophiques sur Pie*

VI. (1789) was his most important historical work.

BOURIGNON, bōō'rē'nyōn', ANTOINETTE (1616-80). A Flemish religious visionary, once very popular. She was born at Lille, January 13, 1616. Her father was a merchant, and she inherited from him a considerable patrimony. She was so ugly an infant that there was some thought of killing her as a monstrous birth. Her intellect, however, was very acute, and its powers were early developed, along with a tendency to religious mysticism, which was much encouraged by the reading of mystic books, till her imagination became inflamed, and she began to fancy that she saw visions, conversed with God, received special revelations, and was called to restore the pure spirit of the Gospel. By the good offices of the Archbishop of Cambrai, she obtained admission into a convent, where she won over some of the nuns to her opinions, and soon found herself at the head of a considerable party. She afterwards had charge of a hospital at Lille, but from this position she was driven in consequence of her extravagant fancies. She now traveled through various countries, her enthusiasm gaining proselytes, whose conversion, she said, caused her to suffer the pains of childbirth. At last she was appointed head of a hospital in East Friesland. According to Madame Bourignon, religion consists in internal emotion, and not in either knowledge or practice. Among the chief expounders of Bourignonism was Peter Poiret, a Calvinistic minister. It spread to a remarkable extent both among Roman Catholics and Protestants; and about the end of the Seventeenth Century, and beginning of the Eighteenth, prevailed so much in Scotland that a solemn renunciation of it was demanded from every entrant on the ministry at his ordination. A minister of Aberdeen was deposed for it in 1701. The formal renunciation of Bourignonism is still continued in the Established Church of Scotland, but has been given up as needless by other Presbyterian churches. The works of Madame Bourignon were edited by Poiret (Amsterdam, 1680-86, 19 vols., 2d ed. 1717). They exhibit not a little fiery eloquence. She died at Franeker, October 30, 1680. Several of her works—e.g. *Treatise of Solid Virtue* (1699); *Restoration of the Gospel Spirit* (1707)—have been translated into English, and *The Light of the World* (reprinted, London, 1863, from the edition of 1696).

BOURINOT, bōō'rē'nōt, Sir JOHN GEORGE (1837—). A Canadian historian, born in Sydney, Nova Scotia, October 24, 1837. After graduating from Trinity College, Toronto, he turned to journalism, establishing the *Halifax Reporter*, which he conducted for many years. In 1880 he became clerk of the Dominion House of Commons, a post which he long held. He has taken an active part in the proceedings of the Royal Society of Canada (established 1882), of which he has been president and is now honorary secretary. Here first appeared several admirable papers in politics and history, afterwards expanded into books. He has also contributed to the leading periodicals on both sides of the Atlantic. Among his books are *Parliamentary Procedure and Practice* (1884; new ed., 1891); *Manual of Constitutional History* (1888); *Parliamentary Government in Canada* (1892); *How*

Canada is Governed (1895); *Cape Breton and Its Memorials of the French Régime* (1892); *Canada Under British Rule* (1900); *Intellectual Development of the Canadian People* (1880); and *Canada's Intellectual Strength and Weakness* (1893). For his service Bourinot has received academic honors from Laval University, and in 1898 he was created Knight Commander of Saint Michael and Saint George.

BOURMONT, bōō'r'mōn', LOUIS AUGUSTE VICTOR DE CHAISNES, Comte de (1773-1846). A French marshal. He was born September 2, 1773, at Château de Bourmont in the Department of Maine-et-Loire. Bourmont fought against the Republic under Condé, and after 1794 in the struggle in La Vendée. Later he was sent to represent the anti-revolutionary party in England. In 1799, when the insurgents in La Vendée had surrendered, Bourmont reappeared and set himself at the head of a guerrilla band, but after some brilliant successes was forced to capitulate. He soon after won the favor of the First Consul, but, becoming suspected of intrigue, was imprisoned at Besançon, whence he escaped to Portugal. When Lisbon was taken by Junot, Bourmont offered his services, and on a pledge of good faith from Junot, reentered France and received successive commissions from Napoleon until he became general of a division. During Napoleon's final struggle, Bourmont vacillated and proved inconstant to Louis and Napoleon by turns. After Waterloo he received high military employment under Louis XVIII., was Minister of War in 1829, and in the Algerian campaign of 1830 won a marshal's baton. After the July Revolution he went into exile, and served for a brief time under the King of Portugal. He died at Bourmont, October 27, 1846.

BOURNE, bōōrn, ALFRED GIBBS (1859—). An English biologist. He was born in Lowestoft, and was educated at the University College School, the Royal School of Mines, and University College, London. He was the assistant of E. Ray Lankester from 1879 to 1885, and during the last two years of that period was engaged in research at the Zoological Station, Naples. From 1891 to 1899 he was registrar of the University of Madras, botanist to the Government in 1897, and subsequently he was appointed principal and professor of botany at the Presidency College, Madras. His publications comprise numerous papers on the anatomy of Pelomyxa, Limnocoelium, Chetobranchus, Leeches, Earthworms, Rotifera, Early Nautilus, Scorpion Poison, etc.

BOURNE, EDWARD GAYLORD (1860—). An American historian, born at Strykersville, N. Y. In 1883 he graduated with high honors at Yale, where he became professor of history in 1895. He is also a corresponding member of the Massachusetts Historical Society; became chairman of the historical manuscripts commission of the American Historical Association in 1901; and in 1900-01 was president of the New England History Teachers' Association. He has published many critical papers on historical subjects, a number of which have been collected in a volume, *Essays in Historical Criticism* (1901). They are good examples of painstaking research and the critical sifting of evidence and one of them, "The Legend of Marcus Whitman," aroused widespread discussion, and is generally considered

to have settled the Whitman question (see WHITMAN, MARCUS). Professor Bourne has also published *The History of the Surplus Revenue of 1837* (1885).

BOURNE, GEORGE (1780-1845). An American clergyman. He was born at Westbury, Wiltshire, England; came to the United States in 1802, and again in 1804, and after remaining for some time in Baltimore, settled at Harrisburg, Va. There he established a printing-office and did everything in his power to educate the people in his pastorate. He early made himself conspicuous by advocating immediate abolition of slavery. In 1815 he organized a church of non-slaveholders, and wrote a work on *The Book and Slavery Irreconcilable* (1815). His views were ultra-radical for the time, and brought him into constant difficulties, which led him to give up his printing-office and church, and move to Germantown, Pa. From there he went to Sing Sing, N. Y., then to Quebec, and finally to New York City, where he founded a paper called *The Protestant Vindicator*. His works include *Lectures on Ecclesiastical History* (1822); *Pictures of Quebec* (1830); and *Slavery Illustrated in Its Effects Upon Women* (1834).

BOURNE, HUGH (1772-1852). The founder of the sect of Primitive Methodists. He was born April 3, 1772, at Fordhays Farm, Parish of Stoke-upon-Trent, Staffordshire, England. Originally a preacher among the Wesleyan Methodists, he distinguished himself by the fervor of his religious sentiments, and by the zeal which he displayed for the conversion of the ungodly. His enthusiasm for 'revivals' and open-air meetings, however, received no countenance from the leading clergymen of the denomination to which he belonged. In 1808 Bourne was cut off from the Wesleyan connection for following much the same course of earnest evangelization as Wesley himself had done. He was not, however, alarmed. His preaching was wonderfully acceptable, and he quickly gathered round him many devoted adherents. In March, 1810, a committee of ten members was formed. This may be regarded as the first official organization of the body. The first general meeting of the society occurred the next year, and the name Primitive Methodists was adopted in 1812. The opprobrious name 'Ranters' was given to them by their opponents. In 1823, Bourne published *History of the Primitive Methodists*, a narrative of his labors and those of his coadjutors, and in 1824 founded *The Primitive Methodist Magazine*, which he edited for twenty years. In the course of his life he visited Scotland, Ireland, Canada, and the United States, where his ministrations were attended with great success. He died at Bemersley, in Staffordshire, October 11, 1852. For his biography, consult J. Walford, *Memoirs*, of which only Vol. I. appeared (London, 1855).

BOURNE, VINCENT (1695-1747). An English poet. He studied at Westminster School, and entered Trinity College, Cambridge, in 1714. In 1721 he took his degree of A.M., and subsequently he was appointed usher in Westminster School. He died December 2, 1747. Bourne is remembered for a volume of Latin poems published in 1734. It reached a third and enlarged edition in 1743. Of Bourne, Cowper wrote extravagantly: "I think him a better

Latin poet than Tibullus, Propertius, Ausonius, or any of the writers in his way, except Ovid, and not at all inferior to him." Several of his poems were translated by Cowper, and by Charles Lamb, who likewise admired them greatly. Their charm lies in their simplicity and grace. They are marked, too, by a quiet pathos. Special attention may be called to his epitaphs. Consult *Poemata*, ed. Mitford (London, 1840).

BOURNEMOUTH, böörn'müth. A watering-place and winter health resort on the south coast of England in Hampshire, about 30 miles west-southwest of Southampton, on Poole Bay (Map: England, E 6). On account of its sheltered position, surrounding pine woods, and even temperature, it has become a favorite winter resort for persons suffering from pulmonary diseases. The town received its charter of incorporation in 1890. A sanitarium for consumptives was erected in 1855, and there is also a home for convalescents. Bournemouth maintains several parks and winter gardens and a golf course. It has churches, hotels, a library and reading-room, and assembly-rooms, baths, and a pier 800 feet long. Population, in 1901, 47,000.

BOURNONITE, böörn'non-it (after Count Bournon, the discoverer). A lead-copper sulphantimonite that crystallizes in the orthorhombic system. It has a metallic lustre, is of a steel-gray color, and is found both massive and in crystals. The chief localities are the Harz Mountains, Bohemia, Chile, Mexico, and, in the United States, various places in Arizona, Arkansas, and Colorado.

BOURNOUS, býr-nöös'. See BURNOOSE.

BOURRELET, böörn'lét' (Fr., a stuffed cap, worn by children; dimin. of *bourre*, hair, wadding). In elongated projectiles with a pointed head, the imaginary line around the projectile at the junction of the cylindrical body and ogival head. See PROJECTILES.

BOURRIENNE, böörn'yän', LOUIS ANTOINE FAUVELET DE (1769-1834). The secretary and early friend of Napoleon I. He was born at Sens, July 9, 1769. He was educated at the military school at Brienne, where he formed an intimate friendship with Napoleon. The latter, as his influence grew, rapidly advanced Bourrienne, whose avarice, however, brought him into disgrace. Notwithstanding this, he was sent, in 1804, as chargé d'affaires to Hamburg, where he was commissioned to watch over the strict enforcement of the Continental System, but was recalled and obliged to restore a million francs which had been removed by him from the public funds (1810). In revenge, he espoused the cause of Louis XVIII., and he zealously served the Bourbons until the July Revolution. After this his reason failed him, and he died in an asylum at Caen, February 7, 1834. His memoirs concerning Napoleon, the Directory, the Consulate, the Empire, and the Restoration (*Mémoires sur Napoléon*, etc., 10 vols., Paris, 1829) gave many new explanations of the events of the time, but are in many respects untrustworthy. (See BOULAY DE LA MEURTHE.) The work, however, is one which must always constitute an important part of the material of history. A work entitled *Histoire de Bonaparte par un homme qui ne l'a pas quitté depuis 15 ans* has been erroneously ascribed to him.

BOURBU BIENFAISANT, bōō'ru' byān'-fe-zān', LE (Fr., The Beneficent Misanthrope). See GOLDONI, CARLO.

BOURSAULT, bōōr'sō', EDMÉ (1638-1701). A French satirist and dramatist. Boursault won the favor of Louis XIV. by his *Véritable étude des souverains*, a book written for the education of the dauphin. His dramas, *Esopé à la cour* and *Esopé à la ville*, were very popular; his tragedies highly esteemed by the enemies of Racine. His *Le Portrait du Peintre*, an attack on Molière for his *Ecole des Femmes*, provoked from Molière the caustic *Impromptu de Versailles*, where Boursault figures by name, as he did in early editions of Boileau's satires in response to his *Satyre des Satyres*. Later Boursault did Boileau a kindness, and his name was erased from that roll of dishonor. Consult Saint-René Taillandier, *Etudes littéraires* (Paris, 1881).

BOURSE, bōōrs, LA. See BALZAC, HONORÉ DE.

BOUSSA, bōōs'sā. See BUSSANG.

BOUSSINGAULT, bōōs'ān'gō', JEAN BAPTISTE JOSEPH DIEUDONNÉ (1802-87). A French chemist, distinguished for investigations in agricultural chemistry. He was educated at the School of Mines of Saint Etienne, and went, in the employment of an English mining company, to South America, where, besides rendering important professional services, he served under General Bolívar in the South American war of independence. On his return to France he was appointed professor of chemistry at Lyons. In 1839 he became a member of the Institute and was appointed to the chair of agriculture in the Conservatoire des Arts et Métiers, in Paris. In 1857 he was made commander and in 1876 grand officer of the Legion of Honor. Boussingault published a large number of valuable papers embodying the results of his experimental investigations on various topics in general chemistry and particularly in agricultural science; a collection of his more important memoirs appeared in 1854. Among his highly valuable publications may be mentioned his *Economie rurale* (2 vols., 1844), which was republished in enlarged form under the title *Agronomie, chimie agricole et physiologie* (3 vols., 1860-64; and again in 1887-91); this work was translated into English and German and won for its author a European reputation.

BOUSSU, bōō'sū'. A town of Belgium in the Province of Hainaut, situated about seven miles west of Mons, with which it is connected by rail. It contains foundries, smelting-works, and in its vicinity are extensive coal-mines (Map: Belgium, B 4). It was the scene of two engagements between the Austrians and the French on April 28 and on November 4, 1792. Population, in 1900, 10,900.

BOUSTROPHE'DON (Gk. βουστροφηδόν, *boustrophēdon*, from βούς, *bous*, ox + στρέφειν, *strephēin*, to turn). A word descriptive of a method of writing common among the Greeks of the Sixth Century B.C., in which the lines were written alternately from right to left and from left to right. The method took its name from the resemblance to the winding course taken by oxen in plowing, and was transitional between the earlier method wherein the lines all ran from

right to left and the later method wherein they all ran from left to right. See WRITING.

BOUTARIC, bōō'tā'rēk', EDGAR PAUL (1829-77). A French historian, born at Chateaudun (Eure-et-Loir). He was appointed chief of the administrative section of the national archives, whose original documents he utilized in preparing his historical studies, which are distinguished by critical care. They deal chiefly with French institutions of the Middle Ages, and include *La France sous Philippe le Bel* (1861) and *Saint Louis et Alphonse de Poitiers* (1870). He also wrote valuable articles for reviews. For his life, consult Bruel and Bonnassieux (Paris).

BOUTEL', MRS. An English actress of the latter half of the Seventeenth Century. The facts of her life are to a great extent unrecorded, but she appeared at Drury Lane, then the Theatre Royal, about 1663, and before she retired from the stage in 1696 had for years been a popular actress in the London theatres, playing frequently with Betterton, Mrs. Barry, and Mrs. Bracegirdle (q.v.). She was famous, according to an old writer, for her happy presentation of the character of the "young innocent lady whom all the heroes are mad in love with," a part for which her personal charms well fitted her. Among her rôles were Aspatia, in *The Maid's Tragedy* (1666); Melantha, in *Marriage à la mode* (1672); Mrs. Pinchwife, in Wycherley's *Country Wife* (1673); Rosalinda, in *Sophonisba* (1676); Cleopatra, in Dryden's *All For Love* (1678); and Mrs. Termagant, in the *Squire of Alsatia* (1688). Her success on the stage enabled her to retire with a competence before she reached old age. Consult: Genest, *History of the English Stage*, Vol. II. (Bath, 1832); and Doran, *Annals of the Stage*, ed. Lowe, Vol. I. (London, 1888).

BOUTELLE, bou-tél', CHARLES ADDISON (1839-1901). An American journalist and politician, born at Damariscotta, Maine. He entered the merchant marine, enlisted in the United States Navy in the South Atlantic blockading squadron in 1862, and in command of the *Nyanza*, with rank of lieutenant, participated in the capture of Mobile. In 1870 he became managing editor, and in 1874 proprietor, of the *Bangor Whig and Courier*. He was a delegate to Republican national conventions in 1876, 1880, 1884, and 1888, and was a member of the National House of Representatives from the Forty-eighth to the Fifty-sixth Congress. He was particularly active as a member of the House committee on naval affairs, of which he was chairman in the Fifty-first, Fifty-fourth, and Fifty-sixth Congresses, and did much to promote the construction of the new United States Navy.

BOUTERWEK, bou-tēr-vēk, FRIEDRICH (1766-1828). A German philosopher and æsthetical writer, born near Goslar, in the Harz region. He at first studied law at Göttingen, but soon devoted his whole energies to the study of philosophy and of the history of literature. In philosophy, he was at first a zealous follower of Kant, but afterwards inclined more toward Jacobi. He began to give lectures in Göttingen in 1791, and became professor of philosophy in 1797. Of his philosophical writings, *Ideen zu einer allgemeinen Apodiktik* (1799) is the most important; but his great work, on which his reputation really rests, is his *Geschichte der neu-*

ern Poesie und Beredsamkeit (12 vols., Göttingen, 1801-19). The part relating to Spanish literature is especially valuable, and has been translated into Spanish and much enlarged by José Gomez de la Cortina and Nicolas Hugelde de Molinedo (3 vols., Madrid, 1828). A portion of it was also translated into English and published under the title *History of Spanish Literature* (1823).

BOUTMY, bōō'tmē', EMILE (1835—). A French publicist, born in Paris. He was for a time a journalist, and from 1865 to 1869 occupied the chairs of the history of civilization and of the comparative history of architecture at the Ecole Spéciale d'Architecture. He assisted in founding the Ecole Libre des Sciences Politiques (1872), where for a number of years he held the chair of comparative constitutional history. He was elected a member of the Academy of Moral and Political Sciences in 1898. He has published several excellent works, including *Introduction au cours d'histoire comparée de l'architecture* (1869); *Etudes de droit constitutionnel: France, Angleterre, Etats-Unis* (1885); *Développement de la constitution en Angleterre* (1886); and *Les Latins* (1894).

BOUTO, bōō'tō, or INJIA. A blackish or reddish porpoise-like dolphin (*Inia Geoffroyensis*), about 7 feet long, which abounds in the rivers of the Amazon Valley, going far toward their heads. See DOLPHIN and TUCUXI.

BOUTROUX, bōō'trōō', ETIENNE EMILE MARIE (1845—). A French philosopher and professor at the University of Paris. He was born at Montrouge (Seine). In the thesis entitled *De la contingence des lois de la nature* (1896), he declares that contingency lies at the basis of all nature, the laws of which appear to express necessity. His doctrine rests upon a profound analysis of logical and of causal necessity, and in the distinction between the point of view of quality and that of quantity. Of these two points of view, the former permits us to perceive only permanency, immobility, and fatality, while the latter enables us to distinguish motion, finality, contingency, and progress. Boutroux has also published Vols. I. and II. (1877 and 1882) of a translation of the *Philosophie der Griechen*, by Eduard Zeller.

BOUTS, bouts, DIRK or DIERICK, wrongly styled STUERBOUT (c.1410-75). A Dutch painter, born at Haarlem. He was a pupil of Roger van der Weyden at Louvain, where, in 1467, he painted his earliest authentic work now extant, the decoration of the sacramental altar in the Church of Saint Peter. His other works include "Martyrdom of Saint Erasmus" (Saint Peter, Louvain), "Feeding of Elijah" (Berlin Museum), "Martyrdom of Saint Hippolytus" (Bruges Cathedral), and "Last Supper" (Brussels Museum). His brilliant coloring makes him one of the most significant members of the Flemish School.

BOUTS-RIMÉS, bōō'rē-mā' (Fr., rhymed endings). A kind of verse, the making of which forms a social amusement. Some one of the party gives out the rhymes or endings of a stanza, and the others have to fill up the lines as they best may. Suppose the rhymes prescribed are *wave, lie; brave, die*; the following

is one of the ways in which the lines might be completed:

Dark are the secrets of the gulfin	wave,
Where, wrapped in death, so many heroes	lie;
Yet glorious death's the guerdon of the	brave,
And those who bravely live can bravely	die.

Addison ridicules the amusement in the *Spectator*, No. 60.

BOUTWELL, GEORGE SEWALL (1818—). An American politician and Cabinet officer. He was born in Brookline, Mass., was admitted to the bar in 1836, and between 1842 and 1851 was seven times chosen to the Massachusetts Legislature. Thenceforth he was a leader of the Democratic Party in his State, was chosen Governor in 1851, and was reelected the next year. On the repeal of the Missouri Compromise in 1854, he left the Democratic, and assisted in the organization of the Republican Party. In 1862, as commissioner, he organized the new department of internal revenue; in 1863 was elected to Congress, and was twice rechosen. In 1868 he was one of the managers of the impeachment of President Johnson, from 1869 to 1873 was Secretary of the Treasury, and in the latter year was elected United States Senator. In the financial business of the Government, both as a legislator and an executive officer, he had a large share of influence and responsibility. In 1877 he was appointed by President Hayes to prepare a codification of the statutes-at-large. He was an overseer of Harvard and secretary of the Massachusetts board of education, in which capacity he prepared many valuable reports. He wrote *Educational Topics and Institutions* (1859); *Manual of the United States Direct and Revenue Tax* (1863); *The Tax-Payer's Manual* (1865); *Speeches and Papers* (1867); *The Constitution of the United States at the End of the First Century* (1896); and *Reminiscences of Sixty Years in Public Affairs* (1902).

BOUVARDIA, bōō-vār'dī-ā (named in honor of Bouvard, physician to Louis XIII., and superintendent of the Royal Gardens in Paris). A genus of twenty or thirty American shrubs or perennial herbs, mostly Mexican, of the family Rubiaceæ. Bouvardias are cultivated to a considerable extent as late fall or early winter greenhouse plants. The red or white flowers are long and tubular, four-lobed, and contain four stamens. The fruit is a two-celled capsule. *Bouvardia triphylla* is a favorite in flower borders in Great Britain, producing flowers from June till November.

BOUVART, or **BOUVARD**, bōō-vār', ALEXIS (1767-1843). A French astronomer. In 1804 he was a member of the Bureau of Longitudes. He assisted Laplace in the *Mécanique céleste*, and became a member of the Academy and director of the Observatory. Bouvart was the first to point out the irregularities of the planet Uranus, and the investigation of these irregularities led to the discovery of Neptune by Leverrier and Adams in 1846. He published *Nouvelles tables de Jupiter et de Saturne* (1808), and *Mémoire sur les observations météorologiques faites à l'Observatoire de Paris*.

BOUVET, bōō-vā', JOACHIM (c.1662-1732). The founder of the French Jesuit Mission in China, biographer of the famous Manchu Emperor Kang-hi, and initiator of the first survey, by the Jesuits, of the Chinese Empire, which is

still the basis of our maps. He was born at Mons, in Belgium. Louis XIV. directed him and five other learned Jesuits, including Gerbillon, to proceed to China. They arrived there in July, 1686, and were graciously received by the Chinese Emperor. They succeeded so well in the architectural enterprises committed to them that Kang-hi permitted a church and residence to be built for them inside the Tartar city. The first treaty ever signed by the Court of Peking, with the Russians, for trade, definition of frontier, and their evacuation of Albazin and Manchuria, was negotiated largely through the influence of these missionaries. In 1696 Bouvet was commissioned to bring out from France other missionaries, and in 1699 he returned with ten fellow-Jesuits, among them the learned Parrenin, and the survey of the Empire was begun. Bouvet wrote a biography of Kang-hi and an account in four languages of his various travels, besides his book, *Etat présent de la Chine, avec figures gravées par Griffart* (1697). On the basis of the concessions to Bouvet and Gerbillon, the French laid claims in the Treaty of Tientsin to the land and the rebuilding at Chinese expense of the great Pei Tang or Northern Cathedral in Peking, destroyed by the Boxers. Consult: Michie, *The Englishman in China*, Vol. VIII. (Edinburgh, 1900); and Smith, *China in Convulsion* (New York, 1901).

BOUVIER, bōv'vyā', AUGUSTE AMI OSCAR (1826—). A Swiss Protestant theologian. He was born in Geneva and studied at the University of Berlin (1846), and at that of his native city (1847-51). He was engaged in evangelical work in Paris (1853), and later went to London, where he became pastor of the Swiss church. He occupied the pulpit in the Quartier Saint-Gervais at Geneva in 1857, and four years afterwards was appointed professor of practical theology at the Geneva Academy. During his visit to Germany he became strongly influenced by the views of Schleiermacher, Neander, and others, and in his works, which are characterized by scholarly research and independence of thought, he favors the gradual adoption of the principles of modern liberalism by the Evangelical Party. His principal works are the following: *Epoques et caractères bibliques* (1873); *Le pasteur John Bost* (1882); *Paroles de foi et de liberté* (1882); *Théologie systématique* (1887); *Etude sur le prédication de Jésus* (1892).

BOUVIER, bōv-vēr'; French pron. bōv'vyā', JOHN (1787-1851). An American jurist. He was born at Codogno, Italy, but his family emigrated to America when he was very young, and he was brought up in Philadelphia. In 1822 he began to practice law there, and in 1838 became associate judge of the Court of Criminal Sessions. Among his publications are a valuable *Law Dictionary Adapted to the Constitution and Laws of the United States of America, and of the Several States of the American Union* (1839); a new edition of *Bacon's Abridgment of the Law* (1841); and *The Institutes of American Law* (1851), his greatest work.

BOUVINES, bōv-vén' (anciently, Lat. *Bovinæ*). A small village near Lille in France, noted as the scene of a victory gained by Philip Augustus, on July 27, 1214, over the allied German, Flemish, Dutch, and English forces. By this battle the power of Otho IV. (q.v.) of Ger-

many was crushed and the possession of Normandy, Maine, Anjou, Touraine, and Poitou, wrested by Philip from the English, was assured to the French monarch.

BOVARY, bō'vā'rē', MADAME. See MADAME BOVARY.

BO'VATE (from Lat. *bos*, ox, cow), or OX-GANG. In the mediæval manor, the space of land an ox could plow in a year; one-eighth of the carucate (q.v.). Often stated as 18 acres.

BO'VEY COAL. See LIGNITE.

BO'VIA/NUM. The name of two ancient towns of Samnium: (1) Bovianum Vetus, capital of the Caraceni, conquered by the Romans in B.C. 298. Now Pietrabbondante, near Agnone. (2) Bovianum Undecimanorum, now Bojano, capital of the Pentri; conquered by the Romans in B.C. 311, it served as their headquarters in the Second Punic War, and as a confederate headquarters in the Social War until taken by assault by Sulla in B.C. 89.
